The inventor says: I *claim*, first, forming on a block or plate of steel or other material a fac simile of a given pattern, by attaching both block and pattern to a movable table *I*, in the described position, in respect to a revolving drill *e* and stationary tracer *q*, imparting to the table a continuous pressure toward the drill or cutter by means of the weighted arm *M* and its roller *Q*, or their equivalents, and connecting the table to such a system of slides that it can be moved vertically and transversely as set forth.

Second. I claim so constructing the tracer *q* and so connecting it to the frame that it may be adjusted therein in respect to the point of the drill *e*, and in a line with the centre of the drill's rotation, as and for the purpose set forth.

Third. I claim the circular plates *K* and *K*¹, arranged to turn simultaneously on the table *I*, by operating the screw *J*, the whole being combined with the revolving cutter or drill *e*, the stationary tracer *q*, and the weighted arm *M*, or its equivalent, as and for the purpose specified.

Fourth. The anti-friction rollers *n* and *n*, when applied to the longitudinal and dovetailed projection *i* of the slide *H*, and the dovetailed recess of the table *I*, substantially in the manner and for the purpose set forth.

No. 28,041.—SAMUEL J. SEELY, of Buffalo, N. Y., assignor to CHARLES W. DURANT, of New York, N. Y.—*Improvement in Railroad Cars*.—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The application, to the construction of the bodies of railroad cars and other vehicles, of metal plates, corrugated into a continued series of direct and reversed arches, and secured together by and upon the angle irons *a b c d*, and the trough irons *E*, as set forth, whereby a greater degree of strength in the vehicle to bear weight or resist pressure is secured than has ever before been attained with the same weight of material.

No. 28,042.—BRADFORD STETSON, of Uxbridge, Mass., assignor to himself and ELMER TOWNSEND, of Boston, Mass.—*Improvement in Skates*.—Patent dated April 24, 1860.—The object of this invention is to enable a skate to be expeditiously and securely fastened to the foot or boot.

The inventor says: I *claim* the application of the single windlass *C*, the worm gear *D*, and operating screw *F*, and shaft *E*, within the foot rest *B* of the skate, substantially in the manner, and so as to operate both fastening straps *G H* simultaneously, as specified.

And I particularly claim the application of each loop of the windlass or foot rest, but so that both parts or end portions of the loop may wind at one and the same time on the windlass while it may be in the act of being revolved.

No. 28,043.—J. H. WOODWARD, of Nashua, N. H., assignor to W. W. DUTCHER & Co., of Milford, Mass.—*Improvement in Temples*.—Patent dated April 24, 1860.—The object of this invention is to remove the curvature or bend of the cloth beyond the temple, and to cause the deflection to take place entirely within the temple, and is accomplished by closing the lower end of the trough of the roller, or extending a bar across it, and with its upper surface even with the upper or bearing edges of the trough.

Claim.—Making the temple trough with a closed inner end or bar or analogous contrivance, extending across the temple, and with respect to the inner end of the cylindrical roller and the upper edges of the sides of the trough, substantially in the manner and for the purpose set forth.

No. 28,044.—JAMES AIKEN, of Natchez, Miss.—*Improvement in Metal Ties for Cotton Bales*.—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The formation of the bent plate with the holes to receive the hoop, and also the form of the rivet catches, as aforesaid, with the mode of fastening the hoop to the plate.

No. 28,045.—ENOS G. ALLEN, of Boston, Mass.—*Improvement in Steam Gauges*.—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the use, in gauges for indicating the pressure of steam or other fluids, of a volute spring, the coils of which are of uniform width throughout, and which taper in the thickness only, in combination with the rubber disk or diaphragm as set forth.

Second. The thin, flexible metallic disk, interposed between the rubber diaphragm and the outer surface of the coils of the volute spring, for the purpose specified.

No. 28,046.—WILLIAM M. ARNALL, of Sperryville, Va.—*Improvement in Grain Separators and Cleaners*.—Patent dated May 1, 1860.—The nature of this invention consists in constructing and arranging the several parts of the machine.

Claim.—The combination of the distributing and equalizing cylinder I with the cylinders D and E, and with the brush F, when the same are used and arranged substantially in the manner and for the purpose described.

No. 28,047.—FREDERICK ASHLEY, of New York, N. Y.—*Improved Egg Beater*.—Patent dated May 1, 1860.—This invention consists of a shaft, having a screw thread formed upon its upper end, with a nut fitted to work thereon, and a series of beating or breaking wires upon its lower end.

Claim.—The combination of the beating or breaking wires B with the screw threaded shaft A and nut D, as and for the purpose set forth.

No. 28,048.—S. F. ATHERTON, of Fitchburg, Mass.—*Improved Machine for Splitting Hoops*.—Patent dated May 1, 1860.—This invention consists in an improved method of causing the feeding rolls to move equally upon each side of the splitting knife, as the hoop pole passes between them, for the purpose of keeping the knife constantly in the centre of the opening between the rolls.

The inventor says: I *claim* the wedge *h*, in combination with the levers *g*, operating as described for the purpose specified.

Second. I claim the vibrating knife *a*, operating in the manner specified, for the purpose described.

No. 28,049.—N. E. BADGLEY, of Gadsden, Ala.—*Improvement in Cotton Seed Planters*.—Patent dated May 1, 1860.—The operation of this machine is as follows: The hooks *c* draw the seed from the hopper, causing them to fall in the furrow. The teeth *T*¹ throw earth upon the seed, and the spring coverer completes the operation.

Claim.—The arrangement of the bent bifurcated hooks *c c*, slot *b* of hopper bottom, shafts *S* and *S*¹, opener *O*, teeth *T*¹, and spring covered *C*, substantially as before shown and described.

No. 28,050.—HENRY F. BAKER, of Centreville, Ind.—*Improvement in the Mode of Laying Drain Tile*.—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment of the slides *D D*, constructed as described, the rear slide being provided with a shoulder *a*, when the same are used in connection with the mole *B*, for the purpose of drawing the tiles *E E* into the drain, substantially as specified.

No. 28,051.—WILLIAM C. BANKS, of Como Depot, Miss.—*Improvement in Corn Planters*.—Patent dated May 1, 1860.—This invention relates to the arrangement of the seeding wheel, the spring, and the seed cell adjusting device, when operating together.

Claim.—The arrangement of the seeding wheel *F* with its flanges *b*, spring cleaner *d*, and adjusting device *c*, connected together substantially in the manner and for the purpose described.

No. 28,052.—WILLIAM C. BANKS, of Como Depot, Miss.—*Improvement in Corn Planters*.—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the gauge plate *m* for adjusting the size of the seed cell, when combined with the seed slide *a*, or its equivalent, and when constructed and operating in connection with the other parts of the machine, substantially in the manner and for the purpose described.

No. 28,053.—WILLIAM F. BEECHER, of Chicago, Ill.—*Improved Pipe Wrench*.—Patent dated May 1, 1860.—This invention is more specially designed for gas pipe, though it may be used for grasping, holding, or turning solid rods or tubes or cylinders.

The inventor says: I *claim*, first, the thumb or tongue *d*, having the recess *e*, with the edges *ff*, as set forth, and connected and arranged to the sliding block *g*, and with the spring, as described.

Second. The sliding block *g* having clutches to traverse the grooves and the set screw *i*, and arranged in relation to the other parts of the wrench, as shown and described.

No. 28,054.—DANA BICKFORD, of Westerly, R. I.—*Improved Embroidery Sewing Stand*.—Patent dated May 1, 1860.—This invention is a fancy article for ladies' use. A is the body made of cast metal; B is a clasp for holding the work for sewing, in the form of a sewing bird; C is a box for jewelry and other small articles; D is a cushion for pins and needles; E is a rack for spools; F F are adjustable arms fastened with a set screw for winding silk or other material; G is an emery ball.

Claim.—The arrangement of the work holder clasp B, with the heavy block A, and the box C, all substantially as and for the purpose specified.

No. 28,055.—HORACE BILLINGS, of Beardstown, Ill.—*Improved Cement*.—Patent dated May 1, 1860.—The claim explains the nature of this invention.

Claim.—A waterproof coating composition, whose peculiarity consists in its being mainly composed of rosin and pulverized steatite, incorporated with each other in about the proportions and in the manner set forth.

No. 28,056.—S. BOURNE, JR., of New York, N. Y.—*Improved Trunk Lock*.—Patent dated May 1, 1860.—This invention consists in the arrangement of two horizontal sliding spring bolts, in combination with a cam attached to a vertically swinging hasp in such a manner, that by turning down the hasp both bolts are forced out simultaneously, and as soon as the hasp is turned up, both bolts fly back spontaneously by the action of the springs attached to them, thus producing a secure fastening for trunks, &c.

Claim.—The arrangement of the horizontally sliding spring bolts A A, in combination with the vertically swinging hasp E, and cam F, constructed and operating substantially in the manner and for the purpose specified.

No. 28,057.—S. BOURNE, JR., and J. G. CUNNINGHAM, of New York, N. Y.—*Improvement in Locks for Travelling Bags*.—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination with the plate A, casing B, and eyes a a^1 , of a long nose e and a short nose e^1 , when the said noses are attached to the extremities of a longitudinal bolt C, and so arranged to operate that the long nose first enters one of the eyes a , and then the short nose enters the other eye, as and for the purposes shown and described.

No. 28,058.—JAMES E. BOYLE, of Brooklyn, N. Y.—*Improved Vacuum Valve for Water Heating Apparatus*.—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the application to close kitchen or house boilers of a cup leather valve, substantially as described, for the purpose set forth.

No. 28,059.—NOAH BOWLUS, of Middletown, Md.—*Improved Machine for Printing Addresses on Newspapers*.—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the construction of an endless chain with type boxes c , said boxes having one or more spring sides e , substantially as and for the purposes set forth.

Second. The construction of a type box c , with one or more spring sides e , substantially as and for the purposes set forth.

Third. Arranging stationary catches d and f , in combination with the spring sides e of the endless chain of type boxes c , substantially as and for the purposes set forth.

Fourth. The combination of a paper-feeding and printing roller M, with the endless chain of type boxes c , substantially as and for the purposes set forth.

Fifth. The combination of a type feed box A, type wheel B, and shield b , substantially as and for the purposes set forth.

Sixth. Inking the types by means of a series of ink rollers I revolving round a common central shaft K, the roller being held in rigid or spring bearings I^1 , substantially as and for the purposes set forth.

Seventh. Causing type-inking rollers I, revolving round a common central shaft K, to travel in a straight line while in contact with the type, substantially as and for the purposes set forth.

Eighth. Combining a series of ink rollers I, arranged in spring bearings I^1 , with an ink roller H, arranged at a certain distance from the common central shaft K of said ink rollers, substantially as and for the purposes set forth.

Ninth. The combination of the washtub O and brush N, with an endless chain of type boxes c , substantially as and for the purposes set forth.

Tenth. The distributing ink roller G set in a vibrating frame, in combination with the main supply roller F, receiving ink roller H, and type-inking rollers I, substantially as and for the purposes set forth.

No. 28,060.—JOHN C. BRIGGS, of Woodbury, Conn.—*Improvement in Musical Reeds*.—Patent dated May 1, 1860.—This invention consists in certain improvements in the delivery apparatus.

The inventor says: I *claim* making the reed with the heel and toe twist, substantially as described.

I also claim making the reed plate with one or more wind indentations, or notches, against the raised edge of the reed, and with respect to the reed opening, as specified; and when they are arranged on opposite sides of the toe of the reed, one corner of the toe is elevated above the other corner, as described.

I claim making the notch, which is next to the elevated corner of less size than the other, for the purpose of equalizing, or approximately equalizing, the discharge of wind against opposite edges of the toe of the reed.

No. 28,061.—S. T. BRUCE, of Marshall, Mo.—*Improvement in Harvesters*.—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of the polygonally shaped tapering roll L, rotating immediately back of the cutting apparatus, with the obliquely set cylindrical roll M and guards G G¹, and H I and K, the whole arranged and operating as specified, for the purpose set forth.

No. 28,062.—COE S. BUCHANAN, of Ballston Spa, N. Y.—*Improvement in Boilers for Preparing Paper Stuff*.—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination, with a rotary boiler or vessel, of a cylindrical strainer, arranged within said boiler or vessel, substantially in the manner and for the purposes specified.

Second. In rotary boilers or vessels, provided with cylindrical and concentric strainers, I claim the construction and arrangement of ribs in the form of gutters, substantially as described, and for the purposes set forth.

Third. I claim providing the hollow journals of boilers or vessels constructed to operate as described, by rotation with a tubular plug, capable of being shifted on its axis, such plug having one or more openings at the inner end so arranged as to allow of their coinciding with the channels or ways on the boiler heads, for the discharge from the boiler of liquid or steam, or of both liquid and steam, substantially as described, for the purposes specified.

No. 28,063.—M. V. B. BUELL, of Buffalo, N. Y.—*Improvement in Vapor Lamps*.—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Having the burner E connected to the receiver or fount B, by a tube C, so that the top of the burner will extend above the highest level of the fluid in the receiver or fount B, for the purpose specified.

No. 28,064.—JAMES A. BYRD, of Jackson County, Fla.—*Improvement in Plough Stocks*.—Patent dated May 1, 1860.—The inventor says: I make the base or landside of a bar of iron, two inches wide, half an inch thick, and twelve inches long, shaped as shown at A; I make the stock B of two pieces of iron, one and a half inches wide, three eighths of an inch thick, and eighteen inches long, and bend them so as to form a square collar C for the wooden beam D to pass through; I then punch a square hole in one and a round hole in the other, a bolt E passing through these holes and the beam D makes them fast.

Claim.—The arrangement of the bars A and B B, collar C, bolts E and I, hook F, wedge H, and depressions G and K, as described, for the purposes set forth.

No. 28,065.—WILLIAM CHAMBERS, of Muscatine, Iowa.—*Improvement in Governor Valves for Steam Engines*.—Patent dated May 1, 1860.—This invention consists in arranging a disk valve, and rod between two pointed set screws and hinging the valve to its rod by means of a knuckle joint, in such a manner that the valve may be easily adjusted in relation to its seat so as to reduce the friction to a minimum, while there is a steam tight fit between the valve and its seat; also in combining the valve rod with a weighted lever and a spring catch, so that the flow of steam from the boiler to the steam chest shall be shut off whenever the engine attains an excessive speed, while the valve will admit a greater or less supply of steam at any decrease or increase of speed, respectively.

The inventor says: I *claim*, first, in the construction of a governor valve, of the character described, the combination of the knuckle joint *h* and pointed set screws G L, in the manner and for the purpose described.

Second. The combination and arrangement, with the governor valve D and its rod F, of a weighted lever I and spring catch K, the whole being constructed and operating in the manner and for the purpose described.

No. 28,066.—J. O. CONCH, of Middlefield, Conn.—*Improvement in Toy Cannon*.—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, making the barrel, the axletree, axles, body, and trails of the cannon of a single casting, substantially as described.

Second. The attachment of the hammer to the axle tree or other part of the body of the carriage, substantially as specified.

Third. The spring G attached to the axle tree or other portion of the body of the carriage, and operating in combination with the downward extension of the hammer, both as a main and cocking spring, substantially as set forth.

No. 28,067.—GEORGE EATON, of Boston, Mass.—*Improvement in Rails for Street Railways*.—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The improved double-bearing and grooved street rail, as made in two parts *g g*, bolted and arranged together, and with a gutter, water space, or conductor *i*, arranged between such parts and between their connections, as specified.

No. 28,068.—NELSON EDWARDS, of Chittenden County, Vt., and EDWARD G. DAY, of New York, N. Y.—*Improvement in Straw Cutters*.—Patent dated May 1, 1860.—By turning the crank B the blade is made to revolve, passing at every revolution the mouth of the compressor H, of which the engraving is an illustration, presenting its cutting edge so as to cut off an object thrust down through the compressor; I is a sectional view of the yielding self-adjusting jaw, between which and the rim of the compressor the edge of the blade is made to draw.

Claim.—The arrangement of the blade G, the springing guard I, and the compressor H, when the latter is made of tapering form, as described, for the purpose set forth.

No. 28,069.—SAMUEL T. FOWLER, of Brooklyn, N. Y.—*Improvement in the Construction of Concrete Walls*.—Patent dated May 1, 1860.—This invention consists in combining with a concrete wall a wooden framing, made by attaching horizontal ribs or stretchers to upright timbers, in such a manner that the wall shall entirely cover and protect the wood, while at the same time the wood shall bind the wall together.

Claim.—The combination, with a concrete wall, of the framing, composed of the timbers 1 and 2 arranged in the wall, substantially as described, for the purpose set forth.

No. 28,070.—CHARLES FRICKE, of Mobile, Ala.—*Improved Cement*.—Patent dated May 1, 1860.—This invention consists in mixing, in certain proportions, hydraulic cement, poz-zolona, coarse sand, tar, and tallow.

Claim.—The described water proof composition or mortar cement, for laying brick, stone, &c., compounded substantially as described.

No. 28,071.—PHILIP C. FRITZ, of Barrytown, N. Y.—*Improvement in Grain Cleaners*.—Patent dated May 1, 1860.—This invention consists in the combination of two garlic mashing rollers, having India rubber surfaces, with two garlic discharging brushes and a wheat exit spout, when said rollers completely overhang the mouth of the wheat exit spout and run with their surfaces sufficiently close together to mash the garlic and the brushes are situated in such relation to the broadest end of the exit spout that the mashed garlic adhering to the rubber surfaces of the rollers is discharged.

Claim.—The combination of the garlic mashing, India rubber surfaced rollers B b, garlic discharging brushes or doffers C C, and wheat exit spout Z, the whole being constructed and arranged and operating substantially as and for the purposes set forth.

No. 28,072.—A. M. GEORGE, of Nashua, N. H.—*Improvement in Mowing Machines*.—Patent dated May 1, 1860.—This invention consists in the arrangement of mechanism for throwing the cutter in and out of gear.

Claim.—The combination of the compound slide W and O with the guides X X, the stirrup and shipping levers K and G, spring J, and hook or stop H, arranged for operation in the manner and for the purpose specified.

No. 28,073.—LYMAN GIBSON, of Elmira, N. Y.—*Improvement in Water Wheels*.—Patent dated May 1, 1860.—This invention is to obtain a centre vent water wheel that will run without being retarded by dead water, and also one that will be simple in construction and acted upon both by the direct and reactive force of the water.

Claim.—The arrangement and combination of the case A having scrolls B, wheel D E having radial arms *d*, cylinder C having openings *a* and the angular-inclined buckets *f* attached at rim *e*, the whole being constructed and arranged for joint operation in the manner and for the purpose described.

No. 28,074.—JOSEPH H. GOODELL and ALFRED T. GOODELL, of New York, N. Y.—*Improved Method of Sharpening Cylindrical Cutting Knives*.—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Attaching the carriage L to the vibrating bolt or bar or stock F of a veneer cutting machine, when said carriage is provided with a rotating grinding mill M and so arranged as to have a traversing or lateral movement on the bar or stock F and operate on the knife Q, as and for the purpose set forth.

No. 28,075.—JOHN GRAY, of Pittsburg, Pa.—*Improved Machine for Spinning Metallic Hollow Ware*.—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the use, in machines for spinning out hollow ware from disks of metal, of a straight cylindrical mandrel revolving on its axis, of sufficient length to sustain the disk from the circumference to the point where the operation of the tool commences, in combination with a tool having a longitudinal motion parallel to the axis or face of the cylinder, and so arranged as to compress the disk between itself and the mandrel, substantially as described.

Also, the combination of the swinging clamp frame, having its centre of motion in the same vertical plane as the extremity of the mandrel, with the adjustable bar, or its equivalent, for setting the clamps which hold the disk at any required distance from the extremity of the mandrel, for the purpose of regulating at pleasure the diameter of the bottom of the kettle, or other article to be made, and at the same time permitting the side of the kettle, or other article, to lie close to the mandrel while the tool is passing over it, no matter what degree of "dish" is given to the disk.

No. 28,076.—N. F. GRISWOLD, of Meriden, Conn.—*Improved Ice Pitcher*.—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A refrigerating pitcher having double walls and an ice chamber C communicating therewith, arranged in the manner substantially as set forth.

No. 28,077.—ALEXANDER HANVEY, of Steubenville, Ohio.—*Improvement in Wooden Soles for Boots and Shoes*.—Patent dated May 1, 1860.—This invention consists in uniting the sole by an India rubber joint just under the ball of the foot, so that flexibility and elasticity will be combined, at the same time that the joint can be made water proof. It also consists in the employment of an inner and thinner sole, which shall also be jointed but disconnected, and in giving the requisite strength to the sole at the joint by interposing a small piece of wood which will fit down closely on the India rubber over the joint of the outer sole and between and under the edges of the inner sole.

Claim.—Constructing wooden soles for boots or shoes, in the manner substantially as described and represented, and when the parts are united by India rubber, as set forth.

No. 28,078.—WILLIAM W. HARDING, of Philadelphia, Pa.—*Improved Perforating Rule for Printers*.—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the bar A A, provided with a series of teeth, with the form, so that when the impression is taken these sharp points will perforate or deeply indent the paper, substantially as set forth.

No. 28,079.—JOHN D. HEATWOLE and R. C. MAUCK, of Harrisonburg, Va.—*Improvement in Hominy Mills*.—Patent dated May 1, 1860.—This invention consists in constructing the beaters with heads for the better performance of the operation, and in the introduction, between the cylinder and concave on the upper side, of a partition for preventing the free passage of the grain between that portion of the cylinder and concave, and thus ensure its passage between the beaters before it can make its exit from the machine.

Claim.—The combination of the partition P, with the two systems of headed beaters c and d, on cylinder and concave, constructed, arranged, and operating substantially as and for the purpose set forth.

No. 28,080.—ARTHUR HEMENWAY, of Cleveland, Ohio.—*Improvement in Machines for Bending Felloes*.—Patent dated May 1, 1860.—This invention relates to the combination of devices for bending felloes, by means of which broad pieces may be bent without danger of breaking, the same being confined at the ends by gripes, and protected upon the convex surface by an iron band while the bending power is applied.

Claim.—The combination of the gripe, Fig. 6, screw hooks N, and the adjusting plate T, provided with hooks M, when arranged in relation to the forming block, and acting conjointly in the manner and for the purpose set forth.

No. 28,081.—JOSEPH C. HENDERSON, of Albany, N. Y.—*Improvement in Cooking Stoves.*—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the ash tube *t*, passing from the box *S* to the hearth *f*, through the oven or behind the front plate or doors, substantially as specified, whereby I am enabled to confine the ashes and prevent them entering either the oven or roaster placed on said hearth *f*, as set forth.

Second. I claim the arrangement of the openings *1 1*, into the oven on each side of the ash tube *t*, in the manner and for the purposes set forth.

Third. I claim admitting air to the fire from the space *3* by the opening *4*, between the lower end of the plate *p*, and the grate *r*, as and for the purposes specified.

No. 28,082.—A. HENRI, of Louisville, Ky.—*Improvement in Bonnets.*—Patent dated May 1, 1860.—This invention consists in putting together the four parts constituting the bonnet in such a manner that the same may be made to assume a flat state, and in that state be readily and compactly packed away, and when the bonnet is to be worn the parts so put together and furnished with trimmings that the required shape will be given to the bonnet.

Claim.—As a new article of manufacture the bonnet, constructed as described, for the purposes set forth:

No. 28,083.—SAMUEL HOYT, of Wilmington, Del.—*Improvement in Cementing Mill Stones.*—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The use of lead, solder, or other similar molten metal, for the purpose of uniting the sections of a millstone and binding the same together at the eye and circumference, and at the same time giving increased weight to the stone, substantially in the manner described.

No. 28,084.—WILLIAM WHEELER HUBBELL, of Philadelphia, Pa.—*Improvement in Projectiles for Breech Loading Ordnance.*—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the recess *x*, shoulders *v* and *w*, with the band *b*, and the wire coil *o*, secured in the band, as described.

Second. I claim the bevelled, cylindrical lead band *b*, in combination with the flutes *c c c*, and the wire coil *o*, in the recess *x*, so as to easily enter, compensate, and indent the band into the rifled bore, and give it great comparative strength to retain its proper form and position under this action, and with certainty rotate the shell or shot to the breech loading rifled gun.

Third. I claim the bevelled cylindrical canvas covering extending around and in front of the lead band, and secured by the groove and wire *u* to the body of the projectile, in combination with the flutes *c c c*, and the wire coil *o*, so that its bevelled front may easily enter and indent in the rifle bore without stripping, and the flutes allow the lead to compensate under it to the lands and grooves, and the wire strengthen and hold the lead firm that the canvas may be enabled to assume a form and firmness of bearing to coöperate with the lead band in rotating the projectile in the breech loading rifled cannon.

Fourth. I claim the firing holes *j j* in front of the striker, in combination with the striker and the magazine *m*, to facilitate the explosion in shells adapted to long ranged rifled cannon.

Fifth. I claim the circular ribs *y* and *z*, inside of and uniform around the axis of the shell, in combination with and at each end of the circular recess *x* and band *b*, so as to strengthen and support both the front and rear ends of the projectile and the base of the circular recess, resist the shock of discharge, the compression into the grooves and the shock of penetration, by restoring the strength lost in the application of the lead band.

No. 28,085.—THOMAS E. HUGHES, of Birmingham, Pa.—*Improved Shaving Cup.*—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The shaving cup, as a new article of manufacture, consisting of a soap cup, mirror, and water receptacle, arranged and constructed as described and set forth.

No. 28,086.—ELISHA HUGHES, of McCartysville, Cal.—*Improved Writing Desk.*—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A writing box, arranged as described, with paper rollers *E* and *F*, a blotting roller *D* at a table *C*, in combination with an inkstand *G* and with an almanac roller *H*, for the purpose specified.

No. 28,087.—E. F. JEWETT, of Plainville, Ohio.—*Improvement in Car Brakes.*—Patent dated May 1, 1860.—This invention consists in arranging the car body, the truck, and the brake shoes in such relation to each other that the superior momentum of the car body over that of the truck, when the train is checked, serves to operate the brakes; it also consists in

arranging slotted arms on rock shafts, which are actuated by a sliding motion imparted to the car body by its momentum, independent of the truck.

Claim.—The arrangement and combination of the slotted arms H, brake shoes F, rock shafts h, arms I, and standards J, or their equivalents, substantially as and for the purpose described.

No. 28,088.—J. F. KEELER, of Cleveland, Ohio.—*Improved Device for Adjusting Clocks Vertically.*—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

Claim.—In the construction of clocks, the use of the plumb line, the spirit level, or the index under the pendulum, either, or any of them, substantially in the manner and for the purpose set forth.

No. 28,089.—ERNST RUDOLPH KNORR, of Washington, D. C.—*Improved Method of Finding Courses and Bearings on Marine Charts.*—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, putting the two movable compass cards together around a hollow cylinder of metal, or any other fit material, so as to allow their adjustment over any point on the charts of conic or orthographic, or Mercator's projection, and to show at once the true and compass bearings between any two points.

Second. I claim the ruler wire or string radiating from the centre, in combination with said compass cards, for the purposes set forth.

Third. I claim putting on both or either cards constituting my instrument, lines or marks, parallel or at right angles with the zero or any diameter, as means to adjust the instrument into the meridian of the chart, as well for the purpose to use both cards in connection as to use only one, detached from the other, in order to find only one of the relative bearings, either true or compass.

No. 28,090.—GEORGE LINDSAY, of Petersburg, Va.—*Improvement in Pumps.*—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The pump barrel, in combination with the large piston or plunger B, the small piston C, and the hand wheel, or its equivalent, for connecting and disconnecting the pistons, the whole being constructed and operated in the manner and for the purpose set forth.

No. 28,091.—BENJAMIN LIVERMORE, of Hartford, Vt.—*Improvement in the Construction of Cement Drains.*—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* covering or enveloping the cement aqueduct or water pipe, as it is being laid in the ditch or trench, with the flexible material d j, in the manner and for the purposes substantially as described, and set forth.

Also the attachment to the mould or former of the spindle f, for the purpose specified.

No. 28,092.—HENRY LOCKWOOD, of New York, N. Y.—*Improved Door Lock.*—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the arrangement of a number of plugs or pieces, in combination with a revolving cylinder and a fixed frame, when said cylinder acts directly on the bolt while turning, in the manner and for the purpose as described.

I further claim the arrangement of the cap plate F, so constructed as to cover the key as soon as the same shall begin to turn the cylinder, substantially as set forth.

No. 28,093.—WILLIAM MANNHEIMER, of New York, N. Y.—*Improved Table Fork.*—Patent dated May 1, 1860.—This invention consists in providing a fork with a hollow handle, containing a spiral spring attached at one end and at the other an additional prong, by which pieces stuck on the points of the fork may be removed without the use of any additional instrument or the use of the hand.

Claim.—The combination of a hollow handle A with a spring B, knob C, and additional member or prong E, substantially as described, for the purpose aforesaid.

No. 28,094.—PATRICK McMAHON, of Scottsville, N. Y.—*Improved Machine for Filing Saws.*—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the spring S with the stop joint n, in connection with the other parts of the file carrier, the whole operating in the manner and for the purpose substantially as set forth.

Second. I claim the combination of the index plate D and disk d with the shaft C, said shaft being composed of two sections, one cylindric and the other square, the square section

passing through the disk *d* and being carried round by it, the cylindric section passing through the index plate *D* and moving freely in it; the whole operating in the manner and for the purpose set forth.

No. 28,095.—FREDERICK SEYMOUR, of Cincinnati, Ohio.—*Improved Fire Escape*.—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, my mode of forming ladder and shutter, having the blind, shutter, or ladder folding inside of the frame.

Second. I claim the mode of fastening the ladder and shutter to the window sill, as described.

Third. I claim the combination of the ladder and shutter, substantially as described, and for the purposes set forth.

No. 28,096.—WILLIAM S. MAYO, of New York, N. Y.—*Improvement in Water Backs for Ranges, &c.*—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A water back with a compressible body or substance, of whatever form or material, which being placed inside the water back shall take off the pressure of freezing water, and prevent the water back from bursting when exposed to frost.

No. 28,097.—JAMES S. McCURDY, of Brooklyn, N. Y.—*Improvement in Sewing Machines*.—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, so applying the feeding device, in combination with the needle of a sewing machine, and with a device operating in combination with the needle, to enchain the loops of a single thread carried by it through the fabric to be sewed, that the feed movement is imparted to the fabric only after every second withdrawal of the needle from the fabric, and a stitch is produced of the structure described.

Second. Combining the needle arm or needle operating lever with the main shaft, or with any rotating shaft, of a sewing machine, which carries the feeding cam by means of a rectangularly grooved plate *K*, sliding pins *d d*, and slide *N*, the whole applied and operating substantially as and for the purpose set forth.

No. 28,098.—H. A. MEARS, of Pecatonica, Ill.—*Improvement in Car Brakes*.—Patent dated May 1, 1860.—This invention consists in arranging a sliding frame with two friction wheels to act on the opposite side of a corresponding friction wheel secured to the axle of one pair of wheels, in such relation to the brakes, as well as the bumpers, that on slackening the speed of the engine the momentum of the cars causes the sliding frame to be pushed up against the friction wheel on the axle whereby the brakes are applied; and it also consists in arranging the friction wheels in the sliding frame in combination with ratchet wheels and pawls, in such a manner that an application of the brakes in the wrong direction is prevented.

The inventor says: I *claim*, first, the arrangement of the sliding frame *D*, with the friction wheels *d d*¹, in combination with the friction wheel *d*^{*}, chains *g*, and brakes *F F*¹ constructed and operating substantially in the manner and for the purpose set forth.

Second. The combination of the pawls *e*, and ratchet wheels *f f*¹, with the friction wheels *d d*¹ *d*^{*}, arranged in the manner and for the purpose set forth.

No. 28,099.—F. S. MERRITT, of New York, N. Y.—*Improvement in Cooking Ranges*.—Patent dated May 1, 1860.—The heated gasses or products of combustion from the fire place *A* pass down over the sides of the fire chamber and around the ovens *B* through the bottom gas chambers *C* and the side gas chambers *D* to the top gas chamber *E*, and from thence through the pipes *F* to the chimney.

The inventor says: I *claim*, first, the combination of the hollow faucet hinges *i*, with the water back *I*, back plate *b*, and supply pipes *h*, so that the water will be admitted to the back *I*, when the latter is turned towards the fire, and shut off when the back is swung away from the fire, as shown and described.

Second. The arrangement of the water back *I*, and fire brick *H*, to swing from opposite ends of the back plate *b*, substantially as shown, so that, when desired, both fire brick *H*, and water back *I*, may be swung aside, to allow the heat of the fire to act directly upon the air pipe *J*, as set forth.

Third. The arrangement of the fire place *A*, ovens *B*, gas chambers *C*, *D*, *E*, and air chamber *J*, as and for the purpose shown and described.

No. 28,100.—E. WILSON MILLS, of Amber, N. Y.—*Improvement in Wind Mills*.—Patent dated May 1, 1860.—*A* is a bed plate that is made to support the various parts of the mill; *B* is the arbor that supports the wheels and communicates the power of the wings to other machinery; *C* is the fan or vane; *D* is the hub that supports the arms *J*; it is secured to the

arbor. The front surface has a projection in the centre to which to attach a spring; the rear surface has a circular groove for a catch and spring, the arms J are inserted in its periphery.

Claim.—The general arrangement and combination of the several parts, viz: hub D, wheel E, spring L, and wheel G, with its stops N and P, and catch Q, spring M, rods H, and cords K, when constructed as specified, and used for the purpose set forth.

No. 28,101.—O. W. MINARD, of Waterbury, Conn.—*Improvement in Measuring Tapes.*—Patent dated May 1, 1860.—This invention consists in the use of a spring, a graduated plate, and an indicator, in combination with the measuring tape, to determine the tension necessary to be given to the tape.

Claim.—The employment, substantially as described, of the spring *a*, the pointer *b*, and the graduated plate *i*, in combination with the measuring tape, for the purpose specified

No. 28,102.—EDWARD MINGAY, of Boston, Mass.—*Improvement in Stove Grates.*—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Improved arrangement of the shafts B and D, for effecting the rotary and tilting movements of the grate with each other, and in respect to the grate and its surrounding ring or part C, the shaft D, in such arrangement, being tubular and concentric with the shaft B, and the latter being carried through the former, and both made to project from one side of the ring C, in manner as described and represented, the grate being operated by a slotted crank connection, or its equivalent, applied to it and the tubular shaft D.

No. 28,103.—GEORGE W. MORRIS and WILLIAM QUANN, of Philadelphia, Pa.—*Improvement in Restoring Burnt Iron.*—Patent dated May 1, 1860.—The claim explains the nature of this invention.

Claim.—Refining burnt iron while melting in the cupola furnace, by mingling with it a manganesian iron ore, in the proper proportions, and melting the whole mass together in the furnace, as described.

No. 28,104.—WILLIAM T. NICHOLSON, of Providence, R. I.—*Improvement in Spirit Levels.*—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The improvement in the article of manufacture described, consisting of the use of a protecting sheath, or its equivalent, in combination with the fluid tube of a mechanic's level, substantially as described.

No. 28,105.—JESSE R. PARK, of Marlboro', N. Y.—*Improved Basket.*—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* constructing baskets by two laminæ of wood slit towards their ends and laid across each other, and interlaced with filling, so as to form a square box shape at the bottom and a round basket shape near the top, as set forth.

And, in combination therewith, I claim the metal and wood rim, constructed as shown, with the wood rim in the inside, so as not to injure the berries, as set forth.

No. 28,106.—AMOS SEAMAN, of Winnebago County, Ill.—*Improvement in Corn Planters.*—Patent dated May 1, 1860.—F is a hand lever, attached to the pole at g, and hinged with a hook and eye hinge. H is a foot lever, which draws a bolt at the fore end of the lever, setting the pole at liberty, to be shifted by the hand lever F for the purpose of guiding the machine when it becomes necessary to turn the team. I is a post, notched so as to hold the combined lever at the desired position. J is a crank lever, attached to the rotary post K, operated by protuberant knuckles on the wheel so as to drop the corn at the proper distances.

Claim.—The arrangement of the lever A, connecting rod B, iron straps C, plough beams D, axles E, foot lever H, post I, crank lever J, and axles O, operating as described, for the purposes set forth.

No. 28,107.—THADDEUS SELLECK, of Greenwich, Conn.—*Improved Method of Employing Franklinite Pig Metal for Making Grinding and Abrading Surfaces.*—Patent dated May 1, 1860.—The claim explains the nature of this invention.

Claim.—The method herein described of employing Franklinite pig metal as a grinding or abrading surface, as specified.

No. 28,108.—WILLIAM P. MARTIN, of Salem, Mass.—*Improvement in Machines for Finishing Leather.*—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the employment of an adjustable and reversible plate *a*, in combination with a suitable spring, and arranged on the hand, substantially as and for the purposes specified.

I also claim the employment in the hand of a yielding tool *b*, so arranged in the hand as to be capable of yielding uniformly along its whole length, or unevenly as hereinbefore described for the purposes set forth.

I also claim the combination of two or more yielding tools *b c*, when their edges are each ground on a different angle, as hereinbefore specified, the whole arranged to operate as and for the purposes set forth.

I also claim the combination of the spring plate *a*, and yielding tools *b* and *c*, the whole arranged and operating as specified, for the purposes set forth.

I also claim arranging each glass in a separate case *i*, in such manner that while the case always remains in the same relative position with the other parts of the hand, the glass or tool may be set out, as and for the purpose set forth.

I also claim, in combination with the device for adjusting each end of the table separately, the bars *l* and *m*, or their equivalents, for raising the whole table simultaneously, as and for the purposes set forth.

I also claim the combination of the slotted pendant *Q*, pendulum bars *P P*, bent arms *o² o²* and the connecting rod *o*, with the fly wheel *M*, and fixed stud *Y*; the whole arranged to operate as and for the purposes specified.

No. 28,109.—BENJAMIN SINGLETON, of Portsmouth, Va.—*Improvement in Hammer Guards for Fire Arms*.—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of an arched guard *A*, constructed and applied to a fire arm, substantially as described, and a hammer with a laterally projecting thumb piece *B*, working through one side of said guard, substantially as specified.

No. 28,110.—WALTER STEWART, of Natchez, Miss.—*Improvement in Iron Ties for Cotton Bales*.—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The tie or mode of fastening iron hoops on bales of cotton or other compressed material, by means of a link or links and serrated or notched edges of the hoop, as represented in the accompanying drawings.

No. 28,111.—WILLIAM MONT STORM, of New York, N. Y.—*Improved Safety Valve for Steam Boilers*.—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim the valve suspending the weight from and below itself and within the boiler, or a chamber opening to the same, together with an adjustable counterpoise on a lever outside; the valve also to rise independently of such lever, and to be covered by a bonnet or its equivalent; the whole being constructed, arranged, and operating substantially as described.

I also claim, in combination as above, the valve and its seat, at or near the zone of their contact, spherical, so that its pendant weight may slightly oscillate it, without causing escape of steam, while thus preventing it becoming fast in its seat.

No. 28,112.—JOHN STUBER, of Utica, N. Y.—*Improvement in Hot Air Furnaces*.—Patent dated May 1, 1860.—The fire being made in the furnace and the damper *G g* closed, the heat is forced up to the top of the longer extension of radiating surface *D D* through the pipes *C C*, from thence down the extension to the smoke pipe, and thence through the smoke pipe to the smaller extension of radiating surface *E E*.

Claim.—The independent attachment or heating apparatus designated by the letters *A a* and *B*, in Fig. 3, the pear-shaped pipes *C C*, and the bevel or tunnel-shaped extensions of radiating surface *D D E E*, in Fig. 2, as combined and arranged in the drawing accompanying my application, and described in this specification.

No. 28,113.—GEORGE W. THOMPSON, of New York, N. Y.—*Improvement in Gas Burners*.—Patent dated May 1, 1860.—This invention consists of a combination of a valve, an independent weight and a stop, the whole applied, arranged, and operating within a burner, to produce a uniform light.

Claim.—The regulator, composed of the valve *D*, an independent weight *E*, or its equivalent, and a stop *g* or *h*, the whole applied to a burner and operating substantially as described.

No. 28,114.—JAMES P. THORP, of Plantsville, Conn.—*Improved Wagon Shaft Shackle*.—Patent dated May 1, 1860.—This invention consists in the formation of a die for the purpose of turning up the ears, so as to form a joint.

Claim.—An improved article of manufacture, a wagon shaft shackle, constructed substantially in the manner as herein set forth and described.

No. 28,115.—THOMAS THORP, of New York, N. Y.—*Improved Machine for Making Cigars*.—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, causing the belt E to run in a line oblique to the axis of the cigar, for the purpose of giving the latter a traversing motion towards the heading socket K, substantially as and for the purpose set forth.

Second. I claim the employment of the conical rollers D and D¹ and conical drums C and C¹, in combination with the inclination of the axis of either, for the purpose of causing the belt E to retain its oblique position, substantially as described.

Third. I claim the projecting ridges *c* and *c*¹ on the drums C and C¹, in combination with the grooves *d* and *d*¹ in the rollers D and D¹, for the purposes specified.

Fourth. I claim reversing the angle made by the axis of the cigar and the path of the belt E, substantially in the manner described, to enable one and the same machine to wind right and left hand leaves at pleasure.

No. 28,116.—G. H. TIMMERMAN, of St. Louis, Mo.—*Improvement in Governor Valves*.—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a double plunger balanced valve which has its plunger made tapering on the cylindrical seats of the same, made flaring at top, substantially as and for the purposes set forth.

Second. Combining a hand lever *m* with a sleeve *n* through which the valve rod *k* plays, and with a clamp screw *o*, by means of which the sleeve can be clamped to the valve rod, whenever it is desired, by detaching the governor by means of the screw nut *p*, to work the plunger valves by hand, substantially as and for the purposes set forth.

No. 28,117.—GRANT B. TURNER, of Cuyahoga, Ohio.—*Improvement in Smut Machines*.—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the holes *h* in the stationary scouring plates Q and Q¹, for the purpose of causing the grain to pass up and down through them, and thus to facilitate the operation of scouring by attrition between the grain as well as the rubbing surfaces, substantially in the manner described.

I also claim the additional scouring face *d* on the dishes N, when the same is used in combination with the stationary and revolving scouring plates, substantially in the manner and for the purpose described.

No. 28,118.—DAVID S. WAGENER, of Penn Yan, N. Y.—*Improvement in Threshing Machines*.—Patent dated May 1, 1860.—A is a fan; it is placed in connection with the separating case S, and is made to revolve rapidly by any ordinary belt or connection; when revolving it causes a current of air to pass through the case S in the direction of the arrows, meeting the grain while passing through the separating case at B, thus separating the light from the heavy grain.

Claim.—The case S enclosing the winnowing apparatus, with the feeding wheels *g* and *g*¹, when combined with the threshing and separating chamber V, the tube F *t t*, and slats *n*, as above described.

No. 28,119.—WILLIAM B. WEBSTER, of Foxville, Va.—*Improvement in Grain Cleaners*.—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment of a system of rollers R R¹ R² covered with cloth, felt, or other similar fibrous article, arranged in pairs, with their surfaces in contact, in combination with scrapers S, the whole operating substantially as set forth, for removing cockle from grain.

No. 28,120.—WILLIAM WELLS, of Boston, Mass.—*Improvement in Lasting Machines*.—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination, in a lasting machine, of a holding mechanism for the purpose of holding the last and the materials thereon, with the lasting straps *g g*, when these are combined with yielding springs *h h* or are elastic in themselves, and are arranged to operate on the vamp of a boot or shoe, substantially as specified.

Also, the combination, in a lasting machine, of converging toe or heel slides, or both, with yielding or elastic lasting straps.

Also, in combination with converging toe or heel slides, the block *q*, carriage *m*, and screw *r*, or its equivalent, for the purpose set forth.

No. 28,121.—LEWIS WHITEHEAD, of Nunda, N. Y.—*Improvement in Halters*.—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the construction of the gutter piece with two rings, or their equivalents, in such manner that the neck band may be attached to the upper one, while the chin piece or split lead passes through the ring at the lower end.

Second. The construction of the neck band in two parts and its attachment to the upper ring of the gutter piece.

No. 28,122.—R. A. WILDER, of Cressona, Pa.—*Improvement in Hoisting Machinery*.—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, in combination with a hoisting wheel suitably furnished with cogs or other means of turning it, the ring or bearing of wood to receive the rope or cable that runs over it, constructed, arranged, and operating substantially as described.

Second. I claim the shroudings *e* on hoisting wheels, to take the strain of the burden upon the rope or cable, and thus relieve the journals or axles thereof, as set forth.

Third. I claim, in a hoisting apparatus, the arrangement of the hoisting, friction, guiding, and holding wheels, and the rope or cable, as described and represented, the whole forming a compact, reliable, and cheap hoisting apparatus, as set forth.

No. 28,123.—CHARLES A. WILSON, of Cincinnati, Ohio.—*Improved Steam Boiler Regulator*.—Patent dated May 1, 1860.—This invention is designed to extend the range of action and efficiency of those boiler attachments in which a hydrostatic column, acting through an inverted syphon, is made to regulate the generation and pressure of steam.

The inventor says: I *claim*, first, the inverted syphon H I, branches J K, and check valve L, in the described combination with a steam boiler, for the purposes set forth.

Second. The described combination of the inverted syphon H I, with the cup N, float O, and dampers F G, for the purposes described.

Third. The supplementary pipe I¹, provided with a check valve *a*, and connecting the float cup N with the bottom of the syphon H I, for the purposes set forth.

No. 28,124.—YOUNG F. WRIGHT, of Green Hill, Ga.—*Improvement in Cotton Presses*.—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Arranging the revolving screw nut or burr by which the screw shaft and follower of a cotton press are operated within a block, which is hinged to the upper part of the frame of said press, for the purpose of enabling the operator to swing the block and follower on said hinges, so as to clear the press box when it is to be filled, substantially in the manner described.

No. 28,125.—TILLOTSON CLARKSON, of South Adams, Mass., assignor to B. F. PHILLIPS & Co., of said South Adams.—*Improvement in Looms*.—Patent dated May 1, 1860.—This invention consists in the arrangement, relatively to each other, and for united operation, of cams, a ratchet wheel, a pawl, auxiliary treadles, a main actuating treadle, and the harness.

Claim.—The arrangement, relatively to one another and for united operation, of the auxiliary treadles J J¹, pawl I, main treadle B, ratchet wheel G, cams F F, and harness D¹ D², in the manner and for the purpose described.

No. 28,126.—STEPHEN G. COLEMAN, of Providence, R. I., assignor to himself and WILLIAM COLEMAN, of said Providence.—*Improved Mousing Hook*.—Patent dated May 1, 1860.—This invention consists in constructing the hook in two parts, and so locking or connecting such parts together, as not only to add strength and efficiency to the hook, but great facility in connecting or disconnecting it to or from any article or object.

Claim.—As an improved article of manufacture, a hook A, provided with a perforated stud D, and a movable strengthening hasp E, as shown and described.

No. 28,127.—EDWARD COTTY, of Brooklyn, N. Y., assignor to ADAM HAFT, of said Brooklyn.—*Improved Folding Bedsteads*.—Patent dated May 1, 1860.—The object of this invention is to obtain a folding metallic bedstead that may be folded within a small compass, and have its head and foot pieces so arranged that they may be adjusted in a more or less inclined position, or readily detached or so adjusted as to give the bedstead bottom an inclined position like a lounge, and also allow the bedstead to be shortened if desired.

Claim.—The attaching of the head and foot pieces C C to the side pieces *a a* of the bottom A, by means of the sliding or adjustable sockets D and screws *d*, substantially as and for the purpose set forth.

No. 28,128.—JAMES P. ELLICOTT, of Washington, D. C., assignor to PHELAN & COLLENDER, of New York, N. Y.—*Improved Billiard Table Pocket Irons*.—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a pocket iron of a billiard table, substantially as described, so that it may yield when struck by a ball, and regain its original position after the force of the ball has been spent, as and for the purposes set forth.

Second. Hinging the pocket irons to two arms, combined with elastic washers and ball-

shaped nuts, substantially as described, for the purpose of allowing the pocket iron to yield with a parallel motion, as set forth.

Third. The pocket iron, substantially as described, so that the outer side of the pocket iron and of the rail of the billiard table shall be one continuous surface, and a recess for introducing the netting and elastic strap formed, and thus a neat finish secured, and the player not interfered with, as set forth.

No. 28,129.—HUMPHREY JACKMAN, of Elizabethport, N. J., assignor to JAMES H. DEMING and T. H. JENKINS, of New York, N. Y.—*Improvement in Journals and Boxes for Railroad Cars*.—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The said cone on the axle, in combination with the box provided with friction rollers, the journals of which are supplied with oil by projections on the axle, which, by the rotation, carry up the oil from the lower part of the box, and apply it to the journals of the said rollers, the cone having the effect to catch the oil which is scattered by the operation of lubricating the journals of the rollers, and carry it back into the box, as specified.

No. 28,130.—DUNCAN McKENSIE, of Brooklyn, N. Y., assignor to MARY ANN ELIZABETH McKENSIE, of said Brooklyn.—*Improvement in Ovens*.—Patent dated May 1, 1860.—In the centre of the top of the oven is a tubular opening L, which communicates with the main flue I¹ by a flue I². In the oven G are arranged a suitable number of gravitating pans N, which are hung from rods N, which extend across from two circular revolving plates R R, turned by a shaft S, having its bearings in each side of the oven. The bread pans are placed on these pans or swinging shelves N, and the whole number are rotated at one time by turning the shaft S, the bread is thus made to receive a uniform heat.

The inventor says: I *claim*, the combination of the hot air flues D, escapes K K, and flue I, with the lower part or floor of the oven C¹, as and for the purpose shown and described.

I also claim the enlargement and downward extension of the rear end of flue I, in combination with flue I¹, as and for the purpose shown.

I also claim the arrangement, in combination with the oven G, of the flues I¹ I² I D, and the dampers K K and L, as and for the purpose shown and described.

No. 28,131.—H. A. REYNOLDS, of New York, N. Y., assignor to ROBERT T. WILDE, of said New York.—*Improved Clamp for Bonnet Frames*.—Patent dated May 1, 1860.—This invention consists of a metal clasp of an elastic character and peculiar construction, which enables it to be readily applied to secure the wire to the margin of the shape at suitable intervals, and is readily removed when the confinement of the wire is no longer necessary.

Claim.—The elastic clamp, constructed and operating substantially as described, for purposes substantially such as that specified.

No. 28,132.—JOHN STUBER, of Utica, N. Y., assignor to JOHN CARTON, of said Utica.—*Improvement in Lamps*.—Patent dated May 1, 1860.—A is the can; B the opening for filling the can with oil, closed with a screw; C the burner enclosing the wick; D the outer tube; E the cap or chimney holder; F the conducting tube; I is the air chamber; K K² the air tube; L the glass chimney contracted as seen at a; M the button, and N n² the tubes on the bottom of the can for conducting the oil from the can through the opening P P² to the conductor F.

The inventor says: I *claim*, first, the air chamber I, and the air tube K K², as described, or substantially in that form, in combination with a shallow can, as described.

Second. The outer tube D, in combination with the cap E, chimney L, and button M, as substantially described

No. 28,133.—ELI TIFFANY, of Thompsonville, Conn., assignor to himself and GEORGE COOPER, of said Thompsonville.—*Improvement in Knitting Machines*.—Patent dated May 1, 1860.—This invention consists in the arrangement of the needles, and the application of one press bar to a flat ribbed knitting machine.

The inventor says: I *claim*, first, the single presser bar D, and its arrangements, whereby it is made to operate and perform the duty of the two presser bars that are now usually employed.

Second. I claim the arrangement of the two sets of needles, crossing each other at right angles, whereby the barbs of each are acted on by the single presser bar D reciprocally.

No. 28,134.—GEORGE W. WHIPPLE, of West Acton, Mass., assignor to H. ROWELL & Co., of said West Acton.—*Improvement in Powder Flasks*.—Patent dated May 1, 1860.—This invention consists in a circular gate revolving within the charger itself around a pivot central with the axis of the charger and a spiral spring coiled round the post on which the gate revolves, for the purpose of closing the gate when released from the hand of the person using it.

Claim.—The described cut-off for powder flasks, consisting essentially of the gate *f*, disk *d*, and spring *m*, operating substantially as specified.

No. 28,135.—BENJAMIN HARDY, of New York, N. Y., administrator of the estate of AARON WILLIAMSON, deceased, late of New York, N. Y., assignor to himself and THOMAS FRANCE, of said New York.—*Improvement in Narrow Ware Looms.*—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Constructing one portion of the raceway of a tongued plate *G*, applied substantially as described, to constitute a guide which leaves a continuous, unobstructed opening in front of the reed clear across the loom, substantially as and for the purpose described.

No. 28,136.—JOHN A. BROCK, of Chicago, Ill.—*Improved Amalgamator.*—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A revolving disk *e* subdivided into a number of receptacles *ii* in combination with an upper revolving ribbed disk *o*, the two disks revolving in opposite directions, so that the ribs of the upper disk carry the pulverized ore all over the surface of the mercury, and the lower disk carries the mercury in a still plane towards the ore, substantially in the manner and for the purposes set forth.

No. 28,137.—JAMES A. GRAY, of Albany, N. Y.—*Improvement in Pianofortes.*—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, what is termed the full iron plate of a pianoforte with an upward projecting rim *c c* along its back and sides and round the front corners, to form the upper portion of the exterior of the case, substantially as described.

Second. Casting the bottom *C* of the music rack or desk, and the brackets *b b*, to which its sides are attached, with what is termed the full iron plate, substantially as specified.

No. 28,138.—GEORGE H. JONES and JOHN BROWN, of Rose, N. Y.—*Improvement in Water Wheels.*—Patent dated May 1, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment of the regulating lever *f*, float *D*, and gate *e*, actuated by the discharge water of the wheel, to regulate the speed thereof, substantially in the manner and for the purpose shown and described.

No. 28,139.—GEORGE B. ARNOLD, of New York, N. Y.—*Improvement in Sewing Machines.* Patent dated May 8, 1860.—The inventor says: By this invention I am enabled to take two pieces of cloth of unequal lengths, and placing their edges together, with the longer piece at the bottom, and by running them through the machine, not only to gather the bottom cloth to any desired degree of fullness, but to sew them firmly together at the same time.

The inventor says: I *claim*, first, a gathering and feeding mechanism, in two distinct parts, so constructed and operated that the gatherer takes hold of and moves the cloth up to the needle, leaving it immediately after the stitch is formed, or at the point where it is formed, and the feeder, properly so called, takes hold of and feeds the cloth after the seam is made.

Second. I claim the combination of the part *E J* with the part *B G*, or their equivalents, operating together substantially as described and for the purposes specified.

Third. I claim regulating the fullness of the gathers by varying the relative throw of the feeding devices, substantially as described.

No. 28,140.—JAMES E. ATWOOD, of Bucksport, Me.—*Improvement in Pumps.*—Patent dated May 8, 1860.—This invention consists in the combination of the parts of the pump.

Claim.—The combination of the main cylinder *J* with air chamber *K*, regulating screw *L*, stationary chamber *D*, valves *E* and *A*, with the discharge pipe *C*, the whole operating in the manner and for the purpose set forth.

No. 28,141.—STEPHEN L. AVERY, of Norwich, N. Y.—*Improvement in Windlasses.*—Patent dated May 8, 1860.—The object of this invention is to apply a brake to a windlass in such a manner that articles attached to the windlass and raised by it may be lowered with facility, the hitherto slow and tedious manual reverse movement of the windlass being avoided and the invention at the same time permitting the operator to have complete control over the descending movement of the article lowered.

Claim.—The lever *H*, provided with the pins *e f* and projection *g*, and attached to the sleeve or collar *G*, which is placed loosely on the shaft *B*, in connection with the ratchet *E* attached permanently to the shaft *B*, the pawl *F*, and bearing *i*, all arranged for joint operation, substantially as and for the purpose set forth.

No. 28,142.—WILLIAM J. BAKER, of Dimock, Pa.—*Improvement in Seeding Machines.*—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the wheel G having a toothed and blank periphery, spaced as described, the ratchet H, adjustable shaft E, provided with the pinion *b* and the crank pulley *c* connected with the seed slides *q* through the medium of the levers *t t* and rods *s s u w v*, and used in connection with the spring *b*, as and for the purpose set forth.

Second. The frame H, provided with the seed-distributing devices and furrows and covering shares, when suspended to the axle A and used in connection with the mechanism employed for operating the seed slides $q^1 q^1$, as and for the purpose specified.

No. 28,143.—SILAS D. BALDWIN, of Milwaukie, Wis.—*Improvement in Generators for Vapor Lamps.*—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Placing the generator at right angles to the slit of the burner, and so attaching it to the end of the tube or generating chamber as to allow of its being closer upon or further from the top of the burner, and to be susceptible of being used as set forth.

No. 28,144.—EDWARD E. BEAN, of Boston, Mass.—*Improvement in Sewing Machines.*—Patent dated May 8, 1860.—This invention consists in the peculiar arrangement and combination of the different parts of mechanism for producing the single chain stitch.

Claim.—The arrangement and combination of the crotchet needle F, thread carrier *l*, and looper H, consisting of the spring prongs *d d*, operating in conjunction, as set forth.

No. 28,145.—CHRISTIAN B. BECKER, of Lancaster County, Pa.—*Improved Meat Chopper.* Patent dated May 8, 1860.—The revolving block K, with its cogs M, rests on an upright shaft *s* on an adjustable screw point; this screw passes through a burr in the bed piece B of the frame A, differing from those in common use only by having a ring L surrounding the block open, instead of entire; this opening is drawn together by a strap and buckle *l* to the cleats on the ring, so as to overlap each other, thereby made adjustable to the shrinking of the block or its expansion through heat, or otherwise becoming loose.

Claim.—The specific arrangement of the adjustable ring L, hoisting rack and handled ratchet R *r* S, for raising the choppers, binding nut and handle T, in combination with the sliding braces *g g*, and attached cross pieces F G, constructed in manner and for the purpose described.

No. 28,146.—DAVID BEDELL, of Seneca Falls, N. Y.—*Improved Gate Pulley.*—Patent dated May 8, 1860.—This improvement consists in an arrangement of pulleys, an extension bar for adapting the weight used for closing to the weight of the gate and adjusting it to either the right or left hand gate.

Claim.—The reversible extension bar E which bears the fulcrum pulley H, constructed and arranged in combination with its frame or support A, and in relation to the stationary pulley G and gate or door D, substantially as and for the purposes specified.

No. 28,147.—C. T. BOARDMAN, of Bergen Point, N. J.—*Improvement in Making Sheet Metal Pipe.*—Patent dated May 8, 1860.—This invention consists in the use of adjustable rollers, a removable former, a brake or locking bar, and a pipe support, whereby the desired end is attained.

The inventor says: I *claim* the employment or use of the rollers B C C, when used in connection with a removable "former," and while the sheet metal is bent, substantially as and for the purpose described.

I further claim, in connection with the rollers B C C, the brake or locking bar E and the pipe support G, arranged to operate as and for the purpose set forth.

No. 28,148.—GEORGE C. BOVEY, of Chillicothe, Ohio.—*Improvement in Automatic Draw Bridge Canals.*—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of arrangements by which the draws of the bridge are opened, readjusted, and secured, substantially as delineated and described, the whole working as shown in model and drawings.

No. 28,149.—J. L. BRIDGE and W. B. LODGE, of Vernon, N. Y.—*Improvement in Formers for Forming Seamless Felt Caps.*—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment or use of a flexible or sectional "former" R, constructed so as to be capable of being elongated or transformed from an oblate to a prolate spheroid, substantially as and for the purpose specified.

No. 28,150.—SAMUEL B. BROAD, of New York, N. Y.—*Improved Life-Saving Raft*.—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A life raft, constructed as described, by forming it of three or more flexible and inflatable water proof pontons, each incased by a cage or network of rope, in combination with a flexible deck bound and braced by rope, as described, and cross spars arranged to block with the cages of the pontons, and the whole being lashed and united together, essentially as and for the purpose or purposes set forth.

No. 28,151.—STEPHEN BURROWS, of Whitewater, Wis.—*Improvement in Rice and Clover Hullers*.—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of the revolving inclined bolting cylinder D, supported in the frame J, as described, with the thrashing cylinder B, when the said bolting cylinder is driven by the frictional contact of the shaft *b*, the whole being constructed and operating as described.

Second. The combination of a concave C, which has parallel sides, pins *c c*, which gradually diminish in length from the receiving to the discharging end of the machine, and the conical cylinder B, having teeth *d d*, of gradually diminishing length, placed spirally on its circumference, in such manner that the degree of the spirals decreases as the teeth approach the discharging end of the cylinder, substantially as and for the purposes set forth.

No. 28,152.—WILLIAM A. BURY, of Grosse Isle, Mich.—*Improved Bill of Fare*.—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The application of a series of rings (independent and adjustable) to a changeable bill of fare, as described.

No. 28,153.—JACOB BUSSE and JAMES B. HARMER, of Philadelphia, Pa.—*Improvement in Machinery for Propelling Railroad Cars, &c.*—Patent dated May 8, 1860.—*h h* are helical springs for the purpose of keeping the ends of the levers *c c* in place; *i i* are connecting rods, connecting the ends of the levers *o o* with the crank wheels *k k*; *l* the crank; *p p* links connecting the ends of the levers *o o* with the levers *c c*, *c¹ c¹*, at their fulcrum; *s s* are the driving wheels.

Claim.—The levers *o o*, *c c*, *c¹ c¹*, in connection with the crank wheels *k k*, the spur wheels *f f¹*, and the pinions *g g¹*, or their equivalents, the whole combined substantially in manner set forth and for the purposes specified.

No. 28,154.—JAMES CALKINS and PHILIP A. HOVER, of Hudson, N. Y., and CHARLES W. GRANNIS, of Gowanda, N. Y.—*Improved Furnace for the Combustion of Coal Oil and similar Hydro-Carbon Fluids*.—Patent dated May 8, 1860.—This invention consists in placing beneath, or connecting with steam boilers, shallow metallic vessels, or pans, for containing petroleum, coal oil, or other hydro-carbon fluid to be used as a fuel, and so constructing and arranging them that currents of air may be forced into and made to commingle with the flames of the burning fluid.

Claim.—The fuel pan, in combination with the chamber pan, and both constructed and arranged substantially in the manner and for the purpose set forth.

No. 28,155.—D. M. CHURCH and C. H. ELLSWORTH, of Birmingham, Conn.—*Improvement in Bosom Expanders*.—Patent dated May 8, 1860.—This invention consists in an arrangement of bows of cane, whalebone, metal, or other suitable flexible strips united together so as to form a convex, heart-shaped frame covered with any suitable material so as to possess elasticity and flexibility, and provided with suitable hooks and loops for attaching the same to the body.

Claim.—A bosom expander, composed of strips A B C, hooks *b b c*, loops *d*, and otherwise made as shown and described.

No. 28,156.—JOSEPH H. CLARK, of Westbrook, Me.—*Improvement in Wringing Clothes*.—Patent dated May 8, 1860.—To operate this machine, set it upon the tub and fold the clothes to wring and wrap the webbing *W¹* around one end of the clothes and turn at the crank until the friction of the webbing takes hold of the clothes, then place the other end of the clothes in the adjustable holder H, by wrapping the webbing *W* around them and turn at the crank until the water is finally expressed.

Claim.—The employment and use of the adjustable slide H, with its friction holder *W*, in combination with the twisting friction holder *W¹*, in its combination with A and F, substantially as and for the purpose set forth.

No. 28,157.—LORING COES and AURY G. COES, of Worcester, Mass.—*Improvement Rolling the Shanks and Bars of Screw Wrenches*.—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, a pair of cut away rolls having a pair of grooves formed in them, as described, and when said grooves incline in contrary directions to each other, in such a manner that the fin formed in one shall be rolled down in the other, substantially as set forth.

We also claim, in combination with a pair of rolls having inclined grooves in them, as set forth, a guide bar in rear of said rolls with inclined openings corresponding to those between the grooves, for the purpose of preventing the bar from turning in said grooves, as set forth.

No. 28,158.—ERNST CONSTANTINI, of New York, N. Y.—*Improvement in Apparatus for Evaporating Liquids*.—Patent dated May 8, 1860.—This invention consists in forming an evaporator for the rapid evaporation of liquids containing salt, by effecting an increased contact of the liquid with the atmosphere by causing the liquid to be spouted or thrown upwards as in fountains.

Claim.—The rapid evaporation of saline and other liquids by means of spouts or fountains, constructed in the manner and for the purpose substantially as described

No. 28,159.—HARO J. COSTER, of Chicago, Ill.—*Improved Rocking Chair*.—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Combining with a rocking chair a fan acting automatically by means of spring P, in the rocker Y, cord Z, pulley K, spring M, rod F, all arranged substantially as and for the purpose specified.

No. 28,160.—ANDREW CROW, of Middlefield, Mass.—*Improvement in Rifle Canes*.—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of a walking stick with a pistol or rifle barrel, when the explosion of the percussion cap or cartridge is effected by atmospheric pressure, substantially in the manner set forth.

No. 28,161.—J. E. CROWELL, of Chelsea, Mass.—*Improvement in Machinery for Spinning Yarn*.—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination, with the geared rollers A, and revolving flanged casing B, of a stationary box D, which has its inner circumference screw threaded, and encloses the geared rollers and casing, and serves for insuring the turning of the rollers vertically during their movement with the casing horizontally, substantially as and for the purposes set forth.

Second. The combination of the revolving drawhead casing B, with a box made in two parts D and E, in order that on taking off the top of the box the casing with the rollers and gear wheels can be got at or removed when out of repair, while dust is effectually excluded from the rolling gear wheels by having the top closed upon the box when the machine is operated, substantially as set forth.

No. 28,162.—LYMAN DERBY, of New York, N. Y.—*Improvement in Locks*.—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the use of the screw K, and nut L, having a pin or shoulder N on the side of it, in combination, substantially as described, and for the purposes set forth.

Second. I also claim the use of the axis F, having a shoulder d^1 on its outer end, and an adjustable cap plate G on its inner end, in combination, substantially as and for the purposes set forth.

Third. I also claim the use of the stem H, thumb screw I, and knob J, or equivalents, in combination, substantially as described, and for the purposes set forth.

Fourth. I also claim the use of the hollow axis B, in combination with the axis F, and knob J, substantially as described, and for the purposes set forth.

Fifth. I also claim the use of the tumbler barrel or case A, in combination with the hollow axis B, and screw K, substantially as described, and for the purposes set forth.

Sixth. I also claim the use of the tumblers O and O², made substantially as described, in combination with the screw K and nut L, for the purposes set forth.

Seventh. I also claim the use of the reversal guides on the interior of the barrel A, in combination with the tumblers and nut L, substantially as described, and for the purposes set forth.

Eighth. I also claim the use of the latch pin R, and detent spring S, or equivalents, in combination with the barrel or case A, and nut L, substantially as described, and for the purposes set forth.

No. 28,163.—JULIUS C. DICKEY, of Saratoga Springs, N. Y.—*Improved Machinery for Crushing Quartz*.—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment of a revolving cone on a stationary cone, made sufficiently high to form a mortar on the top of the stationary cone, in combination with a stamper or stampers working in the said mortar, for the purpose of crushing, grinding, and pulverizing quartz rock containing gold, in the manner and for the purpose set forth.

No. 28,164.—CHARLES H. DUBS, of Natchez, Miss.—*Improvement in Locks for Metal Bale Hoops*.—Patent dated May 8, 1860.—The object of this invention is to obtain a lock that will firmly secure the two ends of the bale hoop together without weakening the hoop by the formation of the lock, so that the hoop at the lock and at points adjoining will be equally strong as at any other points.

Claim.—The combination of the three prongs *e e f*, with the hoop end B, and plate C, as and for the purpose shown and described.

No. 28,165.—SELAH DUSTIN, of Detroit, Mich.—*Improvement in Alarm Valves for Steam Boilers*.—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

Claim.—So combining with an elevated or separate chamber, into which water or steam may flow from the boiler through a suitable pipe or passage, as the water line in the boiler rises above or falls below a given height, a float and valve, or a float and valves, as that the float shall, by its upward force, when said chamber is supplied with water, close said valve or valves and act by its gravity, when unsupported by water, in conjunction with the steam in that case in the chamber, in opening said valve or valves to allow the escaping steam to ring a bell, blow a whistle, or sound an alarm when the water is too low in the boiler, substantially as described.

No. 28,166.—RICHARD H. EWING, of Nicollet County, Min.—*Improved Rocking Chair Convertible into a Cradle*.—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Attaching the upper part of the chair to a swivel bed by means of bar hinges, in combination with the swivel bed attached to the rocker truck by means of a pin, in the manner described, and for the purposes set forth.

No. 28,167.—CHARLES W. FLIPPEN, of Laurel Grove, Va.—*Improvement in Hydraulic Presses*.—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, combining the piston of a hydraulic or tobacco press with a disk, the bore of which is of the same diameter as the piston, and with a cylinder, the hollow space of which is of a larger diameter than the piston, substantially as and for the purposes set forth.

Second. In the retainers of tobacco presses, combining one of the retainer bolts with a lever and swivel joint on the top of said bolt, for the purpose of keeping the top retainer plate suspended, or raising it when necessary, substantially as set forth.

No. 28,168.—N. S. GILBERT, of Albion, N. Y.—*Improved Method of Feeding the Bolt in Shingle Machines*.—Patent dated May 8, 1860.—To the frame A, and directly below the racks *j j*, levers Q Q are attached by fulcrum pins *q*, the levers Q directly in line with levers O O, the lower ends of the former acting against the latter; against the lower parts of the levers o springs R bear. S is a shaft which is fitted in the bearing *r*, on the frame A, and has a loaded arm *s*, attached to it. The ends of the shaft S are bent in a crank form, and extend underneath the pawls *i i* of the levers O O.

Claim.—The arrangement of the pawls *i i*, racks *j j*, holding pawls *p p*, levers O Q, and wheels N, provided with the projections *f*, for the purpose of feeding the bolt to the knife, as set forth.

No. 28,169.—J. H. GOOCH, of Oxford, N. C.—*Improvement in Ploughs*.—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Making the mould board extension in two parts, A and B, the dividing line between the two parts A and B being horizontal, or nearly horizontal, for the purpose of transforming the plough into a cultivator, sub-soil, or complete turning plough, by simply detaching either one or both of those two parts, substantially as set forth.

No. 27,170.—W. B. GORDNIER, of Coudersport, Pa.—*Improved Churn*.—Patent dated May 8, 1860.—This invention consists in hanging the chamber box, dasher, and dash rod in a swing, and operating the swing by means of a treadle, so as to give to the churn a pendulum motion, and to the dash rod a reciprocating and rotary motion at the same time.

Claim.—The combination, with the vibrating frame C, carrying the churn E, of the arms F F, and the spiral plate G, cord K, pulley J, and treadle L, all being arranged and operating in the manner and for the purposes set forth

No. 28,171.—CHARLES HARVEY, of Richmond, Ind.—*Improvement in Apparatus for Evaporating Sugar Juices.*—Patent dated May 8, 1860.—This invention consists in providing two pans, each the width of the heating surface of the furnace and hinged to each other at their sides to render them more portable and to allow one to be inclined, while the other is on a level, and supported on guides which pass at right angles with the furnace and allow one pan to be in contact with the heat, while the syrup is drawn off from the other not in contact.

Claim.—The hinged pans D E, arranged substantially as described, and for the purpose set forth.

No. 28,172.—GEORGE E. HAYES, of Buffalo, N. Y.—*Improvement in Thermometer Cases for Steam Boilers.*—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim making the case and the part of the thermometer in which the mercury tube is packed in one piece, and screwing the said piece to a socket D, or its equivalent, which secures the thermometer to the boiler or steam apparatus in such manner as to compress the packing and make a steam tight joint round the tube, substantially as specified.

And I also claim the bow m, with cam-like ends applied to a valve i, in the socket D, or its equivalent, in combination with the spring j, substantially as and for the purpose specified.

No. 28,173.—ROBERT J. HILL, of Americus, Ga.—*Improvement in Machines for Sowing Fertilizers.*—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the revolving hooks e e, and small hoes B B, the sliding plates C and D, to regulate the openings, and the sliding rod and bearing on the shaft to connect and disconnect the pinion g, with the wheel of the cart, as specified, for the purposes set forth.

No. 28,174.—HENRY HOCHSTRASSER, of Philadelphia, Pa.—*Improved Moulding for Hanging Pictures.*—Patent dated May 8, 1860.—This improved moulding is designed to be secured to the walls of rooms, halls, &c., by means of wood screws, and placed immediately under the cornice G of the ceiling of the room, leaving from the top a space of about a quarter of an inch for the reception of the hook S.

Claim.—A moulding with a projecting lip or rabbet A, or its equivalent, substantially as and for the purposes as described.

No. 28,175.—WILLIAM HOFFMAN, of Solano County, Cal.—*Improved Frog for Bayonet Scabbards.*—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Making the frog of the bayonet scabbard in two parts, as described, when the said parts are united together by a bolt, or other equivalent device, substantially in the manner and for the purpose set forth.

No. 28,176.—BIRDSILL HOLLY, of Lockport, Mo.—*Improvement in Sewing Machines.*—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, constructing the machine, so that by means of the hollow bearing shaft C, or its equivalent, it may be turned on the axis of the driving pulley B, for access to the parts below the table without unbanding the pulley, substantially as set forth.

Second. I claim the method of setting or adjusting the needle by turning the swivel tubular bearer E, in the posts D D, substantially as shown and described.

No. 28,177.—REUBEN G. HOLMES, of Worcester, Mass.—*Improved Churn.*—Patent dated May 8, 1860.—A shows the main frame of the churn, the same having a cylindrical reservoir H, which is made open at its top, and has its sides formed of metal and attached at their top surfaces to the longitudinal bars B C. Within the reservoir a dasher is disposed, the same being affixed to a horizontal shaft E, which has one of its journals supported in a suitable bearing disposed on the side of the churn, while its other end extends through the end of the reservoir and carries a gear wheel F.

Claim.—My improved churn, having its several parts constructed and arranged in relation to each other, and so as to operate together substantially as shown and described.

No. 28,178.—JACOB HOVEY, of Bedford, Mich.—*Improvement in Hame Tugs.*—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention

Claim.—The combination and arrangement of the box A, spring B, π in a , slide C, tug D, and sliding loop E; the loop being made adjustable upon the box, so that the back and belly straps will have an automatic adjustment; the several parts being connected and used substantially as and for the purpose specified.

No. 28,179.—J. M. HUNTER, of New York, N. Y.—*Improvement in Machines for Cutting Fat.*—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, slicing the fat by the cutter G, which is rotated and moved vertically at the same time, as set forth.

Second. In combination with the rack K, and pinion J, or their equivalents, operating G by the ratchet and pawl G¹ T, or their equivalents, so as to act with a positive motion during the entire descent, and to release G during the ascent, as described, to avoid losing time and power in overcoming the momentum of the cutting disk, and for the purpose of clearing off the material without increasing the labor of operating.

Third. The adjustable frame E, as described, in combination with the pinion J, and fixed rack K, or their equivalents, for lowering the shaft g, as the disk becomes smaller, without affecting any of the other portions of the machine.

Fourth. The flaring of the trough B, as described, for the purposes set forth.

Fifth. Operating the cutting disk by the combination of a heart cam motion, with a rack and pinion motion, substantially as and for the purposes set forth.

Sixth. Sharpening and trueing the cutting disk, while in operation, by means of the adjustable surfaces N and N¹, arranged substantially as set forth.

No. 28,180.—C. L. INGRAHAM and EMERY ROUNDS, of Berlin, Wis.—*Improved Washing Machine.*—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

Claim.—What we claim is not the pump on the wheel separately, but the combination of the pump as arranged with the wheel or cylinder, which has a slatted or open periphery, the two being so arranged and connected that the water will be raised from the box by the pump, and injected upon and among the clothes through the open periphery of the cylinder as it revolves, substantially as specified.

No. 28,181.—ELIAS T. INGALLS, of Haverhill, Mass.—*Improved Machine for Burnishing the Edges of Boot and Shoe Soles.*—Patent dated May 8, 1860.—The claim and engravings explain the nature this invention.

The inventor says: I *claim*, first, subjecting the edge of the sole and heel of the boot or shoe, caused to travel and guided in a fixed path, either by machinery or by hand, to the action of a burnishing tool, either held stationary or having a vibrating or other proper motion communicated to it by any suitable arrangement of mechanical devices, as set forth.

Second. Producing an elastic yielding motion to the burnishing tool, both in a vertical and lateral direction, by means substantially as described.

Third. So arranging the tool stock that the tool can be set at any desired angle, so as to conform to any shape and bevel of the edge of the sole and heel, as described.

Fourth. So hanging the tool stock that it can turn in its bearings, whereby the tool will conform to the curves and elevations and depressions of the different portions of the sole and heel, and therefore prevent its cutting into and defacing the same as would otherwise be the case.

No. 28,182.—JOHN LOUIS JULLION, of Aberdeen, Great Britain.—*Improvement in the Preparation of Paper.*—Patent dated May 8, 1860; patented in England, November 9, 1858.—The claim explains the nature of this invention.

The inventor says: I *claim*, first, the use of compounds, prepared by precipitation, from watery or other solution of the earths and acids before mentioned, to consolidate and harden paper.

Second. The use of chloride or oxy-chloride of zinc with glutinous matter, as a size for paper.

Third. The use of any of the before-mentioned prepared inorganic bodies, mixed with the sizing agent, to facilitate the absorption of writing and printing ink.

No. 28,183.—CHARLES KINZLER and WILLIAM ROSEBROCK, of New York, N. Y.—*Improved Apparatus for Cutting or Dividing Loaf Sugar.*—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the combination and arrangement, with circular saws, of the revolving frame B, provided with arms n and m , operating in such a manner as to take hold of a loaf of sugar, carry the same through the saws, and deposit the cut slabs upon a suitable table, substantially as specified.

Second. We claim the arrangement of attaching the eccentric grove E, to a movable lever, operating in the manner described and for the purpose set forth.

Third. We claim the manner of working the revolving finger frame B, by means of the clutch K, acted upon by the lever L, in the manner and for the purpose substantially as described and specified.

No. 28,184.—HENRY KNIGHT, of Jersey City, N. J.—*Improvement in Moulds for Moulding Cement Pipes*.—Patent dated May 8, 1860.—F is a metallic mould made of little less diameter than rim b, so as to fit snugly within the same. This mould is made in two semi-cylindrical sections, having flanches S S, by which they are locked together through the aid of the straps t t, and the wedge staples n n. G is a removable collar of the core. This collar is placed over the top of the core during a certain stage of the operation of moulding the pipe, it is made removable to allow the ready introduction and the running down of the cement in the mould.

The inventor says: I claim, first, the combination of the stationary core B, mould F, with base E b, and hinged table C, constructed and arranged for joint operation in the manner and for the purpose described.

Second. The stationary core B, and mould F, having the enlarged top d e f, and base F b, in combination with hinged table C, and detachable collar G, in the manner and for the purpose substantially as specified.

No. 28,185.—MARTIN R. LEMMAN, of Columbus, Miss.—*Improvement in Machinery for Felting Hat Bodies*.—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The placing of the rollers C C C¹ C¹ eccentrically on their axis a, substantially as shown and described, so that said rollers will act or press alternately in pairs on the article between them, for the purpose set forth.

No. 28,186.—JOHN LIGHTFOOT, of Cold Spring, Ky.—*Improved Door Fastener*.—Patent dated May 8, 1860.—The fastener is placed against the door post in such a position that the fangs a a may face the post, and the end of the bolt C that passes through the plate A, may come in contact with the post.

Claim.—The combination of the plates A and B, hinged bolt C c, and spring d; the whole being constructed, arranged, and operating substantially as and for the purposes set forth.

No. 28,187.—WILLIAM S. LOUGHBOROUGH, of Rochester, N. Y.—*Improvement in Iron Ties for Cotton Bales*.—Patent dated May 8, 1860.—This invention consists in providing iron ties with a ball, operating against an inclined plane, so as to allow the hoop or band to be taken up when necessary, without requiring any readjustment of the tie.

Claim.—The construction of iron ties, substantially as and for the purposes specified.

No. 28,188.—GEORGE T. LUFBERY, of New York, N. Y.—*Improved Machine for Making Paper Bags*.—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, the cylinder D, constructed with bands and fillets D¹ D² D³, and furnished with grippers, substantially as described, to perform the several operations of taking the blank from a pile and conveying it toward the lap-folding apparatus, and of pasting the laps and printing it while on its way to such apparatus.

Second. The grippers i i, applied and operated by stationary arched plates H H, in combination with springs k k, substantially as described.

Third. The pronged fly Q, applied and operating in combination with cylinder D, to strip the pasted blank from the paste fillets of said cylinder, substantially as described.

Fourth. The arrangement of the folding table S, and lap folders T T, the fly Q, and the pasting and printing cylinder D, substantially as described.

Fifth. The fly W, applied in combination with the folding bed S, in the manner and for the purpose specified.

Sixth. The stationary curved needle, applied and operating in combination with a hole in the fly W, or its equivalent, by which the bags are thrown out of the folding apparatus, substantially as and for the purpose specified.

No. 28,189.—ALFRED WILLIAM JOHN MASON, of New Orleans, La.—*Improved Machine for Drying Sugar*.—Patent dated May 8, 1860.—This invention consists in combining a spout, drum, and slides, with a revolving fan or beater, and automatic ventilating valves, for the purpose of drying sugar or other similar substances.

Claim.—Combining a spout B, drum C, and slides F G E, with a revolving fan or beater D, and automatic ventilating valves H H, substantially as and for the purposes set forth.

No. 28,190.—C. A. McEvoy, of Richmond, Va.—*Improved Bolt for Car Seats*.—Patent dated May 8, 1860.—This invention consists in a portable self-fastening bolt, in combination with a detached pin, to use in connection with car seats, or other objects to which it may be applicable.

Claim.—A portable self-fastening bolt, constructed as described, in combination with a detachable pin, as and for the purposes set forth.

No. 28,191.—JOHN NEFF, JR., of Pultney, Vt.—*Improvement in Cultivators*.—Patent dated May 8, 1860.—P P are adjustable and supporting screws, put through the ends of the cross piece M, and resting upon the frame; they are used to support and change the position of the supports L L, and prevent too great stress upon the lever N.

Claim.—The arrangement of the crank shaft H, the handles I, couplings K, springs J, supports L, cross piece M, and screws P, constructed and operating as described, for the purpose set forth.

No. 28,192.—REUBEN NICKERSON and ALBERT B. COLTON, of Athens, Ga.—*Improvement in Valve Cocks*.—Patent dated May 8, 1860.—This invention consists of a new mode of applying the nut in which the screw thread on the valve stem works.

Claim.—The flanged nut F, fitted and applied to the socket c c, and secured by the screwed cap E, substantially as described.

No. 28,193.—WALTER PECK, of Rockford, Ill.—*Improvement in Pumps*.—Patent dated May 8, 1860.—This invention consists in certain improvements of construction in double-acting pumps.

The inventor says: I *claim*, first, coupling the lower end of the pump to a fixed stand P, or its equivalent, by means of a universal joint, substantially as described, for the purpose set forth.

Second. In combination with the moving rod or pipe a, the stationary collar e, and sliding collar f; the whole arranged and operating substantially as described, for the purpose set forth.

No. 28,194.—T. W. PORTER, of Bangor, Me.—*Improved Shoe Plate*.—Patent dated May 8, 1860.—This invention consists of an improved metallic concave plate or cork, to be applied to the bottoms of boots and shoes, to protect them from wear, and to protect the feet from slipping.

Claim.—The concave plate or cork, as described.

No. 28,195.—WILLIAM S. PRATT, of Williamsburg, N. Y.—*Improvement in Anti-Friction Journal Boxes*.—Patent dated May 8, 1860.—This invention is an improvement upon such journal boxes as make use of friction rollers, interposed between the axle and the outer bed or plate of such journal boxes, and has more particular reference to the internal arrangement of such rollers, so as to avoid all sliding friction by the motion of such rollers about the pin or axis passing through them.

Claim.—The use and application of the rollars a a a, placed within the rollers A A, and revolving around the fixed axis E, substantially as and for the purposes set forth.

No. 28,196.—FRANCIS B. RICHARDSON and BYRON L. RICHARDSON, of Boston, Mass.—*Improvement in Enema Syringes*.—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Our improved manufacture of elastic bulb enema syringes, as made by combining an elastic bulb A, two long flexible induction and eduction pipes B C, and two separate valve chambers K F, with a three-fold separate connector I, for connecting the elastic bulb and flexible pipes.

No. 28,197.—ELIJAH ROBERTSON, of Hartford, Conn.—*Improvement in Potato Diggers*.—Patent dated May 8, 1860.—This invention consists in the application and arrangement of a vertical side wheel, actuating a pinion and rotating crag wheel or shaft with a series of tongs or fingers to separate the soil and loosen the potatoes from the same after they are ploughed up.

Claim.—The application and arrangement of the inclined crag or finger wheel D, for the purpose specified, in the combination with the share B, the serrated mould board A, the vertical side driving wheel E, and pinion G, in the manner and for the purpose substantially as set forth and described.

No. 28,198.—DAVID B. ROGERS, of Pittsburgh, Pa.—*Improvement in Cultivator Teeth*.—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Attaching the bolt by which the tooth is secured to the beam to the shank of the tooth, by wrapping the shank around it, and passing a portion of the shank, together with the bolt, into the beam, in combination with the shoulder and stay point, formed out of the upper end of the shank, substantially in the manner described, for the purpose of attaching the tooth to the beam of a cultivator.

No. 28,199.—OCTAVE SAULAY, of New Orleans, La.—*Improvement in Lamps.*—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the dome H, constructed with spiral chambers L L L, through which the air is circulated and heated, with a lamp, arranged and described, for illuminating the apartment; the lamp and its mountings being used to illuminate, warm, and ventilate, substantially as set forth.

No. 28,200.—ADDISON M. SAWYER, of Athol, Mass.—*Improved Mode of Applying Steam Power to Propellers.*—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A propeller, having passages and orifices for the passage of steam, for the purpose of causing the same to revolve under water, as described.

No. 28,201.—SAMUEL J. SEELY, of Albany, N. Y.—*Improvement in Gates for Canal Locks.*—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the use of corrugated metal plates, to form the body of the lock gate, for the purpose of giving to the gate increased strength, without unduly increasing its weight, as described.

Second. Forming, of the corrugated spaces of the lock gate, air chambers, as set forth, to give buoyancy to the gate to allow it to be operated with a small amount of power, as described.

No. 28,202.—BEZALEEL SEXTON, of East Windsor, Conn.—*Improvement in Machinery for Drying Cloth.*—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the perforated segment plate connected with the blowing apparatus, in combination with the wheel armed with tenter hooks, or their equivalents, and the rollers, or their equivalents, for introducing the cloth, to make part of a hollow cylinder and for drawing off the cloth when dry, substantially as described.

No. 28,203.—SAMUEL SHADBOLT, of Scottsville, N. Y.—*Improvement in Stoves.*—Patent dated May 8, 1860.—This invention consists of a fire pot of particular construction, and in the peculiar arrangement of smoke flues and air pipes.

Claim.—The particular arrangement or combination of the fire pot described, with the smoke flues *d d* and air tubes *e e*, as set forth and described.

No. 28,204.—M. A. SHEPARD, of Parkersburg, Ill.—*Improvement in Floating Sluices for Mill Races.*—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* a sluice or race B, supported on a running stream by means of suitable floats or boats C, and fitted between upright guides E, substantially as and for the purpose set forth.

I also claim, in connection with the sluice or race B, a vertical shaft G, connected either directly or indirectly with the water wheel, and made to pass loosely through the power pulley H, to admit of the rising and falling of the shaft G with the wheel and race without affecting pulley H.

No. 28,205.—SAMUEL H. SILL, of Geneva, N. Y.—*Improvement in Gates.*—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the levers L and L¹ with the cam C, formed and arranged with reference to the gate, substantially as described, whereby the gate is elevated, disengaged from the cam stop and fastenings, partially revolved and disengaged from the lever, substantially as set forth.

Second. The arrangement with the above of the cam C¹ and the standards S, substantially in the manner and for the purpose set forth.

No. 28,206.—GEORGE W. SLOUGH, of Canton, Ohio, assignor to E. BALL & Co., of said Canton.—*Improvement in Making Guard Fingers for Harvesters.*—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Forming the blank guard, as shown in Figs. 11, 13 and 15, from a section of a

bar or piece of wrought iron, as shown in Figs. 4, 6, and 8, by the mode or process substantially as described, whereby the shank *g*, shoulder *f*, surface *k*, and lip *j* of each guard are formed with precision and celerity, while a sufficient amount of metal is reserved at the point *h* to form the point of the guard

No. 28,207.—ALFRED E. SMITH, of Bronxville, N. Y.—*Improvement in Making Axle Boxes*.—Patent dated May 8, 1860.—This invention consists in an improved manufacture of malleable iron axle boxes for wagons, &c., making the external and internal surfaces of the box of fine steel-like hardness, and yet leave the body of the metal to retain its toughness or malleability to resist sudden fracture like ordinary chilled cast iron boxes.

Claim.—A new and useful improvement in the manufacture of malleable iron axle boxes, by means of the operations described, and for the purpose of producing an article cheaper, more expeditiously, and of a better and more useful kind than heretofore known.

No. 28,208.—DAVID SNEDEKER, of New York, N. Y.—*Improvement in Tools for Opening Barrels*.—Patent dated May 8, 1860.—This invention consists in applying to a hammer handle a slotted and jointed rack bar, with an adjustable claw, to be used for the purpose of drawing hoops off of barrels and casks, drawing nails, and opening the heads of barrels.

The inventor says: I *claim* the combination of pivotted rack plate *D*, with the sliding adjustable claw plate *B*¹ and lever *B*, substantially as and for the purpose set forth.

I also claim making a slot in the end of the rack plate *D* and in the use of the spring *g*, arranged between jaws *b b*, as set forth, and the novel construction of the parts whereby they may be locked closely to the handle, as described and represented.

No. 28,209.—GEORGE A. STANLEY, of Cleveland, Ohio.—*Improvement in Candle Moulding Apparatus*.—Patent dated May 8, 1860.—This invention relates to a clamp, arranged with a top and bottom piece so connected together as to allow a slide to move between them longitudinally by means of a lever or its equivalent.

Claim.—The special arrangement of the slide *C* and upper and lower pieces *H H*¹ and lever *D*, when operating conjointly in the manner and for the purpose specified.

No. 28,210.—GEORGE A. STANLEY, of Cleveland, Ohio.—*Improvement in Candle Mould Boxes*.—Patent dated May 8, 1860.—This invention consists in constructing a mould box *D* of such a form as to cool the sprues of the candles as rapidly as any other part.

Claim.—The special arrangement of the upper section *B* with the candle moulds when operating conjointly, and in the manner specified.

No. 28,211.—GEORGE STEVENSON, of Zionsville, Ind.—*Improvement in Apparatus for Evaporating Liquids*.—Patent dated May 8, 1860.—*A* is an endless ring of metal, to which one end of the graduated arm *B* is rigidly secured, while the other end of it passes freely through the slot *a* in *A*. The bar *B* is graduated from zero (0) either way.

Claim.—The rotating shaft *D*, the adjustable perforated blades or skimmers *F*, and the springs *b*, constructed and operating in combination with the partitioned pan *B*, substantially as described.

No. 28,212.—OSCAR C. SQUYER, of West Dresden, N. Y.—*Improvement in Compensating Spring Balances*.—Patent dated May 8, 1860.—This invention consists in the peculiar arrangement and application of the two sides or wings, and the curved pins attached to the same, and the recovery spring relatively to a shaft or central axis.

Claim.—The metallic spring endless ring *A*, in a circular or oval form, with the graduated arm or bar *B*, hooks *C C*¹, and rings *D D*¹, constructed and operated as substantially set forth.

No. 28,213.—JOSEPH W. STRANGE, of Bangor, Me.—*Improved Self-Fastening Dress Hook*.—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* my self-fastening dress hook, as described, with the axle or shaft *c c*, the wings *W W*, the recovery spring *S*, the curved pins or hooks *h h*, and the perforated flanges severally marked "*i*," and upon the wings *W W*, or if said dress hook be formed in any manner substantially the same

No. 28,214.—ROBERT R. TAYLOR, of Reading, Penn., assignor to the BORDENTOWN MACHINE COMPANY.—*Improvement in Furnaces*.—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the foundation plates *G* and *G*¹, with their retaining ribs, the side plates of the furnace with the vertical ribs, and the bars *H*, with their vertical recesses; the whole being arranged and adapted to each other and applied to the brickwork of a furnace, substantially as and for the purpose set forth

Second. I claim the detachable plates *n*, adapted to the lugs *x x* on the side plates, and arranged, in respect to the openings on the same, in the manner and for the purpose specified.

Third. The box *K*, carrying the ash pit door, and connected to the foundation plates *G* and *G*¹ by bolts *q q*; the whole being arranged as set forth, for the purposes specified.

No. 28,215.—EARL D. THOMAS, of Rochester, N. Y.—*Improved Washing Machine*.—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the pinion upon the power shaft, the double toothed or ratchet bar, the levers, and the spring for giving the traverse to the box, as described, and in connection therewith—

Second. I claim the arrangement of the pounders having the spring yoke connection set forth, and attached to the main shaft by the cranks placed at the right angles to each other, as described.

No. 28,216.—GEORGE W. TOLHURST and DANIEL C. SARTWELL, of Liverpool, Ohio.—*Improvement in Dumping Wagons*.—Patent dated May 8, 1860.—Upon the ends of the cross pieces at *G* are placed leaders or connections *H*; said connections extend along the dumper from each cross piece to the forward part of the foot board marked *G*, and are held in a convenient position by the cleat *J*. *K* is the driver's seat, and *L* are partitions, formed of two sections.

Claim.—The combination of the adjustable partitions *L L L L*, sliding cross-piece *D D D D*, and side leaders or connections *H H H H*, the whole being arranged and combined for operation as described and set forth, not confining ourselves to the number or size of the compartments which contain the manure.

No. 28,217.—J. B. TURNER, of Jacksonville, Ill.—*Improvement in Seeding Machines*.—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of a rotary, corrugated, seed distributing shaft *f*, swinging or regulating plate *h*, and a gauge plate or cut-off *G* placed within a seed box *A*, and arranged to operate as and for the purpose set forth.

Second. The combination of two seed distributing devices, as above, when placed in a seed box *A* divided into two compartments by a partition *g* and placed on a plough or cultivator frame, the whole being arranged, substantially as described, to admit of the sowing of seed or grain broadcast or in drills alternately from one mode to the other, as may be required, while the machine is in operation, for the purpose specified.

Third. The general arrangement of the seed box *A*, beam *B*, handles *C C*, and wheel *D*, as shown and described, whereby the wheel and seed box are allowed to rise and fall independently of the beam, and the working parts prevented from being disarranged or injured by any irregular movement of the plough, and the flow or discharge of the seed or grain rendered more uniform than it otherwise would be

No. 28,218.—ALEXANDER VAN VALKENBURGH, of Griffin's Corners, N. Y.—*Improvement in Ox Shoes*.—Patent dated May 8, 1860.—This invention consists in providing for each part of the hoof a sole plate with an inclined heel flange, and fitted with a strap extending over the fore part of the hoof, so as, in combination with the inclined heel flange and a slight suspending link secured thereon, to firmly bind it when the suspending heel link is secured, and allow its ready removal by a proper force when the link is released.

The inventor says: I *claim*, first, the strapped shell *M N*, with its inclined heel flange *B*, and a supporting heel link, combined and arranged to form an ox shoe possessing the qualities described.

Second. Uniting and sustaining the two strapped shells *M N M N* by the double link *E* and strap and buckle *G H*, or their equivalents, substantially in the manner set forth.

No. 28,219.—GEORGE H. VAN VLECK, of Buffalo, N. Y.—*Improved Churn*.—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the churn box, the dashers and staff, and the adjustable hinged board *C*, the bottom of the box being provided with pins for adjusting the board, and said board being provided with openings the edges of which present different angles to the cream, as the position of the board is changed with reference to the sides of the box, substantially as and for the purpose specified.

No. 28,220.—EDMUND VICTORY, of Watertown, Mass.—*Improvement in Machinery for Spinning Yarns*.—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the mechanism described, or its substantial equivalent,

for regulating the draft and of adjusting the hold of the draw and feed rollers on the fibre for the purposes set forth, whereby the distance between the draw and feed rollers is rendered adjustable and controllable, whether while the machine is in motion or not, and without discontinuing the roving, substantially as specified.

Second. The general construction and arrangement of parts of a draw head as combined with its discoidal shield, substantially in the manner and for the purposes set forth.

Third. Constructing the circular stationary rack in two parts and attaching the one of said parts to the cap of the draw head standard, to facilitate the removal of the draw head, substantially as specified.

No. 28,221.—SYLVESTER W. WARREN, of Brooklyn, N. Y.—*Improvement in Hose Coupling*. Patent dated May 8, 1860.—This invention consists of a pipe or hollow seat for a key, which key passes across through one pipe and acts against the edges of mortises in a surrounding pipe, to force the ends of said pipes or couplings towards each other and make a perfectly tight connection.

Claim.—The hollow key seat 4 across the coupling *b* receiving the key *c* that connects the parts *b* and *a*, in the manner substantially as specified.

No. 28,222.—MORRIS WELLS, of Brooklyn, N. Y.—*Improvement in Making Kettle Ears*. Patent dated May 8, 1860.—This invention has for its object the manufacturing of kettle or bucket ears in a more neat and handsome style, with little trouble, and of refuse scraps of tin, such as are usually thrown away.

Claim.—The kettle ears, constructed in the manner set forth, forming a new article of manufacture.

No. 28,223.—CHARLES WESTON, of Salem, Mass.—*Improved Method of Hanging Reciprocating Saws*.—Patent dated May 8, 1860.—This invention consists in the employment of two reciprocating saw gates, placed one behind the other, between suitable guides, and operated by a pitman from reverse cranks on a driving shaft.

Claim.—The employment or use of two gates *B B*, placed one in front of the other and connected by suitable pitmen *C C* to cranks *D D* having reversed positions relatively with each other and formed on the same driving shaft *E*, substantially as and for the purposes set forth.

No. 28,224.—ALOYS WHITE, of New Haven, Conn.—*Improved Musical Instrument*.—Patent dated May 8, 1860.—This invention consists of a musical instrument composed of a series of metal springs, such as are used to produce the musical sounds in what are known as musical boxes, attached to a sound board, and a series of finger keys, and suitable mechanism in connection therewith, for playing upon said springs.

The inventor says: I *claim* a musical instrument composed of a series of springs *b* attached to a sound board, and a series of keys, and suitable mechanism in combination therewith, for playing upon the said springs.

I also claim the fly lever *D*, fly *E*, and let-off lever *F*, applied in combination with each other and with the key *C* and stationary ledge *g*, to operate substantially as described.

And I further claim the arrangement of the damper in combination with the spring *b* and the fly lever *D*, substantially as described.

No. 28,225.—E. H. WHEELER, of New Orleans, La.—*Improvement in Apparatus for Defecating Cane Juice*.—Patent dated May 8, 1860.—This invention consists of a cistern *A* of convenient size. In the centre of this cistern is placed a vertical tube *B* communicating with and attached to a centrifugal drum or wheel *C*, which drum or wheel has openings on its periphery *L*; on the top of the tube *B* is an oil joint *D*, for the purpose of connecting the pipe *E* which communicates with the retort *G*; at a short distance above the cover of the cistern is a driving pulley *F* to give motion to the vertical tube *B*.

The inventor says: I *claim* combining the several agents by which I produce a thorough and complete dissemination of the sulphurous gas or sulphurous acid gas in the cane juice.

No. 28,226.—JAMES P. WIGAL, of Henderson, Ky.—*Improved Apparatus for Feeding Saw Dust to Furnaces*.—Patent dated May 8, 1860.—This invention consists of a box that extends over the whole of the furnace, communicating with the same on either end by two flaps or doors, in combination with a sliding piston and counterweights, in such a manner that saw dust fed to the box is alternately discharged through one and through the other of the openings at the end of the box, said flap doors being opened as the piston advances towards the same, and closed when the piston recedes.

Claim.—The arrangement of the automatically closing flap doors *E E* in combination with

the reciprocating piston G and box C, constructed and operating substantially as and for the purpose described.

No. 28,227.—JOHN S. WILLSON, of Waynesboro', Ga.—*Improvement in Ploughs*.—Patent dated May 8, 1860.—This plough is made without any welding or upsetting of the metal, and the invention consists in the manner in which the plough is made, and the plough, the standards and their several connections, are united.

Claim.—In combination with the plough the beam and the false coulter, the standard made and connected therewith, substantially as described.

No. 28,228.—WILLIAM H. WILSON, of Denton, Md.—*Improvement in Automatic Raking Apparatus for Harvesters*.—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Combining, with a revolving post and a stationary cam, a mechanism substantially such as described, whereby a rake connected to said post shall have a revolving, reaching, and tipping motion, as set forth, to adapt it to the sweeping of the platform of the cut grain, and delivering it in a compact gavel on the ground, as described and represented.

No. 28,229.—DANIEL A. WOODBURY, of Rochester, N. Y.—*Improvement in Air Pumps for Steam Engines*.—Patent dated May 8, 1860.—This invention consists in the employment in an air pump of a piston elongated at one or both ends, whereby both water and air are caused to be discharged simultaneously from the commencement of the stroke, and sufficient air is retained to serve as a cushion to the piston to the end of the stroke. It also consists in a certain arrangement of the passages and valves, whereby the simultaneous discharge of water and air is provided for.

The inventor says: I *claim*, first, the elongation of the piston of the air pump at one or both ends, substantially as herein specified, to produce the result set forth.

Second. The arrangement of the three valve chambers, the valves, valve ports, and passages, substantially as and for the purpose set forth.

No. 28,230.—GEORGE WOODS, of Boston, Mass.—*Improvement in Reed Musical Instruments*.—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the application of a pressure escapement, substantially as described, to the reed and key, in order that on depression of the key the reed may be simply pressed upon or actuated without any percussive force, and afterward set free and suffered to freely vibrate, as specified.

I claim the combination constituting the pressure escapement, and as arranged and applied to the key and the reed, substantially as specified, such combination consisting of the above described spring slider *e*, the fly or grasshopper *g*, the weighted lever *h*, and the lifting devices *n o* thereof, or their equivalent.

No. 28,231.—HENRY A. ALDEN, of Matteawan, N. Y., assignor to the NEW YORK RUBBER COMPANY.—*Improvement in Hose Tubing*.—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

Claim.—As a new and useful improvement in a hose or flexible pipe or tube formed of woven fabric C, with a water proof lining, substantially as specified, covering the inner edge of the tube at its longitudinal lap or joint with a water proof lapping strip, essentially as and for the purposes set forth.

No. 28,232.—JOHN BAWDEN, of Freehold, N. J., assignor to GILBERT COOMBS, of said Freehold.—*Improvement in Potato Diggers*.—Patent dated May 8, 1860.—This invention consists in the use of two double mould board ploughs, provided with teeth at their back ends, and attached to one and the same foot or standard in such a way as to act consecutively, or one after the other, the front plough, as the implement moves along, opening the hills or drills and partially elevating the potatoes, and the back plough fully elevating the same and leaving them on the surface of the earth behind the implement.

Claim.—The employment or use of the two ploughs D E provided with the teeth or springs *d f*, and applied to the foot or standard C of the beam A, substantially as and for the purpose set forth.

No. 28,233.—LEVI W. BUXTON, of Nashua, N. H., assignor to himself and MARK STARRETT, of said Nashua.—*Improved Bed Bottom*.—Patent dated May 8, 1860.—This invention consists of a bed bottom made of an upper and lower series of slats, with spiral springs interposed between them, the lower series being held in place and kept at a proper distance apart

by a cross rail at each end, into suitable mortises in which the ends of the slats enter, these cross rails being made removable for the convenience of folding up the bed bottom.

Claim.—The removable rail D, operating substantially as described, for the purpose specified.

No. 28,234.—ELISHA CLARK, of New York, N. Y., assignor to himself and J. W. PADDON, of said New York.—*Improved Paper File.*—Patent dated May 8, 1860.—This invention consists in the combination of the main bar with a bar recessed into it and held up by springs against a fold which is joined to the main bar, and may be folded down upon it in such a manner as to form together a neat and simple file for news and other papers.

Claim.—The paper file described, made by arranging the grooved bar 1, bar 3, springs 4 4, and bar 7, in combination with each other, in the manner described and shown, the parts being constructed substantially as and for the purpose set forth.

No. 28,235.—R. B. FITTS, of Philadelphia, Pa., assignor to himself and W. L. GILROY, of said Philadelphia.—*Improved Ink Reservoir for Pens.*—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Making the said reservoir substantially in the manner described, of sheet metal perforated with numerous minute holes, as set forth, and for the purpose specified.

No. 28,236.—CHARLES H. HUNTER, of Indianapolis, Ind., assignor to himself and WILLIAM THORNBERRY, of said Indianapolis.—*Improvement in Grain Scales.*—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the peculiar shaped balancing lever or beam *i*, when constructed with the bifurcated curved ends in which the point of suspension for the weighing hopper is made, as and for the purpose shown.

Second. The combination of the trip lever 5 with the cut-off 6 and 7, when said lever is used for the purpose described.

Third. The horizontal balancing lever 9, when constructed with poising and adjustable weight *a* at one end, and used for the objects expressed.

Fourth. The perforated ratchet register wheel *e*, with pin *g* and with slide and pawl *f*, when the several parts are used in conjunction, as shown in the preceding specification, and for the purposes therein expressed.

No. 28,237.—WILLIAM KINGSLEY, of New York, N. Y., assignor to himself and J. J. FIELDS, of Brooklyn, N. Y.—*Improvement in Car Springs.*—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the toggle arms A A, arranged as specified to compress a spring between the ends of said toggle arms and give a yielding motion between the respective parts, as set forth.

I claim the arrangement of the toggle arms A A and bearing fork C, combined with the rubber or elastic block E, taking the plate D when under heavy compression, as set forth.

No. 28,238.—SAMUEL J. LADD, of Providence, R. I., assignor to H. L. WEBSTER & Co., of said Providence.—*Improved Metallic Cup and Stand.*—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A new and improved metallic cup and stand, as a new and improved article of manufacture, the part composing the stand being the base of a truncated cone, the sides being regular or irregular, according to the taste of the workman; the whole made of a single piece of metal by the operation of spinning.

No. 28,239.—WILLIAM J. McCLELLAND, of New York, N. Y., assignor to ERNEST GREENFIELD, of said New York.—*Improvement in Machines for Cutting Lozenges.*—Patent dated May 8, 1860.—The claim and engravings show the nature of this improvement.

The inventor says: I *claim*, first, the combination of rollers B B¹ and plate E with the reciprocating cutters *a a a* and plungers *c c c*, arranged in a suitable relation to each other, and operating substantially as and for the purposes set forth.

Second. The perforated plate P interposed between the plate E and cutters *a a a*, for cleaning the scraps from the cutters, substantially as set forth.

No. 28,240.—JOHN W. MURPHY, of Philadelphia, Pa., assignor to A. ROBERTS and P. ROBERTS, of said Philadelphia.—*Improvement in Iron Truss Girders.*—Patent dated May 8, 1860.—This invention consists in the employment of packing pieces so arranged, in respect to the posts and angle iron chords, that the posts and packing pieces shall serve to retain the vertical flanges of the angle iron chords in their proper position free from all liability to warp; the posts at the same time serving as bearings for the horizontal flanges of the angle

iron, while the packing pieces, which may be varied in thickness throughout the length of the girder, serve to impart a graduated rigidity to the same.

Claim.—The combination of the within described angle iron chords, packing pieces, and posts or verticals, when applied and arranged in respect to each other, as and for the purpose set forth.

No. 28,241.—C. B. RICHARDS, of Brooklyn, N. Y., assignor to SAMUEL J. SEELY, of New York, N. Y.—*Improved Hook Catch for Doors.*—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the hook H, with the locking catch S, constructed, applied, and operating substantially as described, whereby the said catch can be operated to simply latch the hook in place, or to securely lock the same, as set forth.

No. 28,242.—JOHN RANDALL, of Elmira, N. Y., assignor to himself and REUBEN R. SMALLEY, of Troy, N. Y.—*Improvement in Steam Engines.*—Patent dated May 8, 1860.—The steam cylinder A is constructed with a dividing plate b in the centre, thus forming two distinct working cylinders with a piston c in each, which are connected by the piston rods d and the pitmen e with the cranks f f¹, on the axis of the pulleys g g¹, arranged parallel to each other, and supported in suitable bearings h and i.

The inventor says: I claim, first, the double cylinder engine constructed, arranged, and operating substantially as set forth.

Second. I combination therewith, I claim the method described of gearing the said engine to the main or driving shaft, so as to dispense with the ordinary balance wheel.

No. 28,243.—WILLIAM L. WILLIAMS, of New York, N. Y., assignor to himself and THOMAS J. O'CONNER, of said New York.—*Improvement in Machines for Bundling Wood.*—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, a series of clamps k, acting on the ends of the split kindling wood, contiguous to the place from which the bundle is removed, for holding up the mass of wood, as set forth.

Second. The sliding follower b, in the trough a, for moving the wood along in said trough and conveying it into the bundling apparatus, as specified.

Third. The yielding semi-circular supporting slide f, taking the sides of the pieces of kindling wood as they stand in the trough a, and assisting in gathering them in a bundle, and at the same time preventing them from falling down as pressed along in the trough, as set forth.

Fourth. I claim the revolving jaw 4, and sliding blocking piece 6, for receiving, holding, and twisting the wire, as set forth.

Fifth. The jaw or jaws r, between the bundle of kindling wood and the apparatus for twisting the wire, the same acting to confine the wire near the bundle while being twisted, as and for the purpose set forth.

Sixth. One or more expansive ring bands or wires applied to compress the wood into a compact bundle by drawing upon and tightening the said band or wire, for the purposes and as set forth.

No. 28,244.—GEORGE B. ARNOLD, of New York, N. Y.—*Improvement in the Manufacture of Ruffles.*—Patent dated May 8, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The ruffle described, as a new article of manufacture, the gathered cloth A being secured to the binding B by the single series of stitches C, which perform the double duty of confining the gathers and of securing the gathered cloth to the binding, substantially as set forth.

No. 28,245.—W. CLARE ANDERSON, of St. Louis, Mo.—*Improvement in Lifting Jacks.*—Patent dated May 15, 1860.—This invention consists in the use of a hollow stand or upright provided with a base and a pawl at its upper end, and having a rack bar fitted within it, to the upper part of which a slotted lever is attached in such a manner as to raise the article to which it is applied, and to remain permanent after raising the article by the weight of said article alone, no other adjustment of the lever being required.

The inventor says: I claim the rack bar B, and the lever C, the latter being provided with an oblong slot e, through which and the upper part of the bar B, the fulcrum pin D passes, the rack bar being fitted in a stand A, or equivalent device, to operate as and for the purpose set forth.

I further claim, in connection with the lever C, and rack bar B, arranged as shown, the lugs or projections g, attached to the lever, and at such a distance from the bar B, to operate as specified.

No. 28,246.—LUTHER ATWOOD, of New York, N. Y.—*Improvement in the Construction of Apparatus for Redistillation of Coal Oils*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A separating chamber, constructed substantially as described, when arranged and combined with a volatile oil still and condenser, in such manner as to gradually separate and condense the heavier parts of the oleaginous vapors formed, and continuously return them to the still, for a further action of the heat, and at the same time preserve the lighter vapors, and pass them over to the condenser, substantially as described, and substantially for the purposes set forth.

No. 28,247.—ISAAC A. BENEDICT, of West Springfield, Pa., and G. W. CUMMINGS, of Conneaut, Ohio.—*Improvement in Ditching Machines*.—Patent dated May 15, 1860.—The guide O being brought forward towards the buckets, and the guide O¹ at the same time pushed back from and out, the arms on their ascending come in contact with the guide O, and having a lateral movement, are thereby easily turned to one side of the machine, and the buckets are made to discharge their contents on the opposite side of the machine, upon which the guide rods are brought to act.

The inventors say: We *claim*, first, the arrangement of the sleeve G, sliding shaft F, in combination with adjusting arms and segment gear and pinions, in the manner and for the purpose described.

Second. We claim the adjusting guides O O¹, and guides P P¹, in combination with the movable buckets M, when arranged and operating conjointly, in the manner and for the purpose set forth.

Third. We claim the springs and levers, in combination with the revolving hinged buckets M, in the manner and for the purpose specified.

No. 28,248.—DANA BICKFORD, of Westerly, R. I.—*Improved Compressed Air Engine*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

Claim.—One or more reservoirs for compressed air, with movable air-tight head, to be operated with either weight, screw, lever, spring, or any similar power, for the purpose of keeping up a uniform pressure upon the contained air, combined with an engine, of any form, for the purpose of propelling vehicles or machinery, the whole constructed, arranged, and operating substantially as set forth.

No. 28,249.—JAMES S. BLACK, of Bloomfield, Ky.—*Improvement in Bee Hives*.—Patent dated May 15, 1860.—The trap is designed for catching the moth or other enemies of the bee, which are caused to fall from the upper part of the palace when attacked by the bees, or from any other cause. It consists of a perforated chamber *m*, a perforated removable sliding bottom *n*, and a funnel shaped conductor *o*, said conductor partly overhanging the chamber *m*, and leading to the same.

Claim.—The combination and arrangement of the bee palace, constructed as described, with the moth trap constructed as described, for the purpose set forth.

No. 28,250.—WILLIAM N. BROWN, of Camden, N. J.—*Improvement in Vapor Burners*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of a heat conductor with a non-conductor in hydro-carbon vapor burners, for the purpose of securing to the heat conductor the greatest possible heat-conducting power, by employing a metallic heat conductor, encased in a non-conducting or partially non-conducting material, as described, and for the purpose set forth in the above given description of my invention and in the drawings hereunto annexed, or any other mode substantially the same, and which will produce the intended effect.

No. 28,251.—ANDREW BUCHANAN, of Jersey City, N. J.—*Improved Arrangement for Balancing Slide Valves of Steam Engines*.—Patent dated May 15, 1860.—The object of this invention is to regulate the pressure of steam on the upper and on the under side of a slide valve, according to the difference between that portion of the under surface of said slide valve which is exposed to the pressure of the steam and the entire upper surface of the valve; this device being more particularly applicable to that class of slide valves in which the steam from the boiler acts on the under side, thereby producing a tendency to lift up the valve and cause an escape of the steam.

The inventor says: I *claim*, first, the combination, with a slide valve, to which the steam is admitted from the under side, of a valve A, arranged with a stem D, and enclosed in steam-tight chamber C, substantially as and for the purpose specified.

Second. The arrangement of the cap F, with legs *e*, and fitting on a seat *c*, around the hollow stem D, in combination with the valve A, constructed and operating substantially as and for the purpose described.

Third. The arrangement and combination of the valve A, movable seat B, cap F, and regulating pins *f*, constructed and operating substantially as and for the purpose set forth.

Fourth. The arrangement of the pipe G, communicating with the steam chest through the chamber C, substantially in the manner and for the purpose described.

No. 28,252.—ASA L. CARRIER, of Washington, D. C.—*Improved Saw Set*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the construction and arrangement of a series of rotating punches and their corresponding matrices working together, to set the teeth of saws alternately to the right and left at the same time, thereby completing the operation, by passing it once through the machine.

Second. I claim the upright guides, the adjustable slide B, to regulate the degree of set in saws, in combination with the rotating punches, as described, for the purposes specified.

No. 28,253.—H. L. CASTILE, of Memphis, Tenn.—*Improvement in Axle Boxes*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment of the cone-sided block G, having the base resting upon the journal B, in combination with the inclined sided seat A, as shown and described, so that a space J will be left between the upper part of the block G, and the seat A, and the fibres of the block will be laterally compressed, all as set forth.

No. 28,254.—A. W. CHASE, of Ann Arbor, Mich.—*Improvement in Invalid Bedsteads*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The peculiar shape or construction of the bed posts adapting them to the open or false mortises, with the head and foot boards constructed to correspond thereto, in combination with the spring bolts to keep them in position, or allow any desired change, substantially as and for the purposes set forth.

No. 28,255.—JOHN CHANTRELL, of Bristol, Conn.—*Improvement in Knitting Machines*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, so applying and operating the frame needles, the rib needles and the sinkers of a ribbed knitting machine, in combination with each other, that after the sinkers have given the loops to the frame needles, the rib needles take their loops directly from the sinkers at the back of the frame needles, substantially as specified.

Second. Constructing the sinkers with recesses, in which the ribbed needles are arranged to operate, and across which the loops are extended, in the manner and for the purpose specified.

Third. The pressers J J applied, operated, and operating substantially as set forth.

Fourth. I claim applying the selvage fingers, and operating them by means of an arm attached to a slider which operates the needles, substantially in the manner specified.

Fifth. I claim combining the bar which carries the yarn guide with a slider which operates the needles by means of grooved blocks Q Q¹ and spring catches R R¹, acted upon by stationary wedges y y¹, substantially as described.

No. 28,256.—JOHN L. CHENEY, of Lowell, Mass.—*Improvement in Machinery for Winding Laps*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The method of winding a lap lightly upon a small wood roller, disconnected from any weight or motion otherwise than that given to it by the rollers between which it revolves, by the combination of the three rollers, or their equivalent, arranged substantially as and for the purpose described.

No. 28,257.—ORVILLE CHOATE, of Morrisville, Vt.—*Improved Mop Wringer*.—Patent dated May 15, 1860.—By pressing the treadle down the rollers C C¹ will be forcibly brought together, and by placing a mop between the rollers and then bringing them together and drawing a mop between them the water in the mop may be squeezed out; the mop will afterwards serve the purpose of drying the washed parts.

Claim.—The arrangement of the toggle levers a a b b within the uprights or frame B B¹ in combination with the pressing rollers C C¹ and treadle arms D, as and for the purpose shown and described.

No. 28,258.—T. G. CLAYTON, of Washington, D. C.—*Improvement in Vapor Lamps*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the converting of the fluid into gas or vapor below the illuminating flame by means of the combined generator and burner B and the jets of burning vapor below said burner and generator, the whole operating as described and for the purposes set forth.

Second. The burner and generator B having the gas chamber C below it, constructed and operating substantially as set forth.

Third. The use of jets of gas from chamber C or burner B for making an oxy-hydrogen flame for heating below the combined generator and burner, as set forth.

No. 28,259.—JOHN B. CORNELL and WILLIAM W. CORNELL, of New York, N. Y.—*Improvement in Metallic Rolling Shutters*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* preventing the longitudinal slitting of the individual slats of a rolling metallic shutter, by combining a series of bosses with the face of said shutter, substantially as set forth.

We also claim giving the metallic bosses upon the face of our improved rolling shutter such a shape that they will prevent the edges of the slats of said shutter from being forcibly separated from each other, substantially as set forth.

No. 28,260.—JOHN DOUGHERTY, of Cold Spring, N. Y.—*Improvement in Moulding*.—Patent dated May 15, 1860.—This invention consists in a novel arrangement of gearing combined with the central spindle carrying the templet, for giving said templet, or templets of any description, according to the kind of work, a vertical reciprocating motion, or a vertical motion combined with a circular motion.

Claim.—The temple block M combined with a hollow shaft B and screw shaft G, and operated substantially in the manner and for the purposes set forth.

No. 28,261.—WILLIAM DOYLE, of Albany, N. Y.—*Improvement in Moulding Iron Pipes*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the core bar K, made in sections or with joints S, in combination with a sand mould, when the sections of said bar are constructed with flanches *t t* for supporting the sand, substantially as described.

Second. The arrangement of the bars *pp* of the flask with rings *q q*, and the points L M P, substantially as shown, to admit of the ready adjustment of the same, as set forth.

Third. The employment or use of the stationary screw N and cylinder O, the latter being provided with an internal screw thread and fitted on the former, to operate as and for the purpose set forth.

Fourth. The employment or use, for the purpose specified, of the hollow screw S formed of two longitudinal parts, in connection with the bar Q provided with the annular plate R having an internal screw thread to receive the screw S.

Fifth. The cutter H attached to a cylinder G or other shaped tube corresponding, as well as the cutter H, to the shape of the pipes to be cast, and used in connection with the screw and gearing, or other proper mechanism, for the purpose of forcing the cutter down through the flask concentrically with the core bar K.

Sixth. The guide rod I fitted with the screw D and cylinder or tube G, and provided with a socket *a*, substantially as shown, for the purpose set forth.

No. 28,262.—LOVETT EAMES, of Kalamazoo, Mich.—*Improvement in Automatic Grain Weighing Machines*.—Patent dated May 15, 1860.—A is a standard or frame work for supporting the several parts to effect the automatic weighing and registering of the grain, to the top of which is attached the hopper or garner B, consisting of a box of any suitable capacity, having a double discharging bottom terminating in two side orifices *a a'* through which the grain flows from the bottom of the hopper.

The inventor says: I *claim* the combination of the weighted pendulum lever E with the scale beam F and weighing box D, in the manner and for the purpose substantially as shown and described.

I also claim the combination, in the manner shown and described, of the gate C C with the double discharging bottomed hopper B and oscillating weighing box D, for the purpose set forth.

No. 28,263.—LOUIS ENGLER and ERNEST FREDERIC KRAUSS, of Paris, France.—*Improved Insulator for Electrodes*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The insulator, consisting of an enamelled iron ring, having a lining of glass permanently cemented within it and a V-shaped opening *a*, the sides *c c* of whose throat project inwardly beyond the interior of the lining, substantially as described.

No. 28,264.—J. W. EVANS, of Forsyth, Ga.—*Improved Combination of Shovel and Tongs*.—Patent dated May 15, 1860.—When in use as fire tongs the implement is folded up, and when it is desired to bring the shovel into requisition the leg *b* is extended; the latch *g* is turned to one side; the shovel is then free to turn on its pivot *s* and is adjusted into the groove *e*; the leg *b* is then brought down in place; and the groove *e'* fitting the shank, like its fellow, com-

pletely closes it, and the hand of the operator easily and firmly keeps it in place, so that the whole now forms a complete shovel.

Claim—The combination and arrangement of the shank of the shovel *c* with the axis of the leg *a*, the latch *g*, and spring *h*, and the groove *f*, substantially as set forth.

No. 28,265.—EUNICE N. FOOT, of Saratoga Springs, N. Y.—*Improved Filling for Soles of Boots and Shoes*.—Patent dated May 15, 1860.—This improvement relates to the filling of boots and shoes, made in one piece of vulcanized India rubber, pressed by dies or rollers into its proper shape for both the shank and the fore part. It is attached to the sole by rubber cement, and then the bottom is put over it and secured or pegged in the usual manner.

Claim.—The filling of boots and shoes, made and inserted substantially as I have described, and for the purposes set forth.

No. 28,266.—J. FRASER, of Rochester, N. Y.—*Improved Clothes Frame*.—Patent dated May 15, 1860.—The bars *e*, when in an extended position, are capable of moving half a revolution around the standard *A*, by turning on the short arm of the crank pivots *g*, without moving the same in the standard; by placing them in the positions indicated by the dotted lines *jj*, on the plane of the square *c*, they are also capable of a vertical motion, which elevates them to the sides of the central standard.

Claim.—The combination and arrangement of the arms *D* with the standard *A*, by means of the crank pivot *g* or its equivalent, substantially in the manner and for the purposes shown and described.

No. 28,267.—THOMAS FRY, of Brooklyn, N. Y.—*Improvement in Hanging Window Sashes*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, arranging that character of window sashes which can be swung into a horizontal or oblique position, in such a manner that the sash, while it turns, is tightened laterally, so as to remain in a horizontal or oblique position, substantially as set forth.

Second. Providing the sash frame, in the manner described, with a spring strip, which has a recess for the reception of the sash when in an oblique position, said strip answering the double purpose of stop and weather strip, substantially as set forth.

No. 28,268.—F. H. FURNISS, of Cleveland, Ohio.—*Improvement in Railroad Jacks*.—Patent dated May 15, 1860.—This invention consists in the construction of a jack, in which the main or lifting screw can be carried sidewise for the purpose of easily replacing a car that has jumped off the track back again upon the rail. In connection therewith is the arrangement of a sleeve, on the outside of the standard and lifting screw, which has an arm at the lower end placed underneath the cars, lying flat on the ground for the purpose of elevating them high enough to place the head of the lifting screw under them.

Claim.—The arrangement of the sleeve *F* with the arm *E* and screw *B* and standard *A*, in combination with the sliding jack frame, when operating conjointly in the manner and for the purpose specified.

No. 28,269.—EMERSON GAYLORD, of Chicopee, Mass.—*Improvement in the Manufacture of Bayonet Scabbards*.—Patent dated May 15, 1860.—The claim explains the nature of this invention.

Claim.—A bayonet scabbard, shaped and finished by the application of moisture, heat, saturation, and pressure, as stated, for the purpose of giving it form, rigidity, and a highly polished surface, and making it impervious to water, as set forth.

No. 28,270.—JAMES GREENHALGH, SR., of Pascoag, R. I.—*Improvement in Harness Frames for Looms*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the hollow heddle bars *A A'* and the rods *d d*, inserted within the said bars to secure the loops at the ends of the heddles, substantially as described.

No. 28,271.—JOHN H. HASKELL, of Baltimore, Md.—*Improved Machine for Stretching Leather*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, making each of the gripping devices of two or more separate cams *l*, substantially as and for the purposes set forth.

Second. Arranging the cams *l* upon an adjustable bar *m* in such a manner that not only the whole gripping surface can be adjusted for pieces of leather of various thicknesses, but

that each cam *l* can also adjust itself to the varying thickness of one piece of leather, substantially as set forth.

Third. Combining a gripping cam, constructed of separate cams *l*, and of an adjustable bar *m*, with a lever *a* pivotted to the main frame of the machine at *d*, substantially as and for the purposes set forth.

Fourth. The combination of a flanged pawl *v* and a sliding cam *x*, substantially as and for the purpose set forth.

No. 28,272.—CHARLES F. HITCHINGS, of New York, N. Y.—*Improved Boiler for Heating Buildings*.—Patent dated May 15, 1860.—This invention consists in providing an annular water jacketed chamber, connected with water passages to, and enclosing the upper part of, the boiler, forming an annular flue or passage between the outer shell of the boiler and the inner shell of the chamber, through which the flame and heated gases are forced to pass in their escape from the fire chamber to the chimney, by which means, without altering the size or shape of the chamber, nearly double the amount of heating surface is exposed.

The inventor says: I *claim*, first, the water jacketed chamber *B*, in combination with a vertical, cylindrical, or conical boiler, enclosing the flue *D* between the inner shell *f f* of the chamber *B*, and the outer shell *d d* of the boiler *A*, for the purpose and in the manner substantially as set forth.

Second. The diaphragm *C C*, formed by an indentation in the inner shell *f f* of the chamber *B*, or its equivalent, for the purpose set forth.

No. 28,273.—ISAAC H. HOBBS, of Philadelphia, Pa.—*Improvement in Machines for Hoisting Persons, &c., from one Story to Another*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The application to a building of any suitable kind of either a single reciprocating frame *A* or *A¹*, or of a pair of such frames, arranged together, substantially as described, the same being actuated by any suitable machinery and motive power, so that the respective platforms *p p* of the said frame or frames may operate in combination with the several respective floors or landings of a building, substantially as described, and for the purpose of conveying persons from any one floor to its next, or successively to any other floors of the said building, substantially in the manner set forth and described.

No. 28,274.—ALFRED G. HOLCOMB, of New York, N. Y.—*Improvement in Telegraphic Instruments*.—Patent dated May 15, 1860.—The object of this invention is to increase the movement of the armature lever by allaying the residual magnetism in the relay magnet after breaking the circuit of the main battery; it also consists in an arrangement for increasing the relative capacity of the electro-magnet.

The inventor says: I *claim*, first, producing an additional movement of the armature lever by reversing the electrical current in the coils of the magnet, substantially as set forth.

Second. The arrangement of the steel cores *i¹* and iron bush cores *l*, in combination with the coils of the electro-magnet.

No. 28,275.—JAMES HOLLAND, of Conshohocken, Pa.—*Improved Post Butt*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

Claim.—An earthenware post butt, made substantially as described, so as to receive the bottom of the post entirely within it, as also to a luting of pitch, or its equivalent, between them, and having also a bottom support and protection, as described and represented, and for the purpose specified.

No. 28,276.—RICHARD HUBBARD, of Milton, Ind.—*Improvement in Bedstead Fastenings*.—Patent dated May 15, 1860.—The subject of this improvement is a combination of dovetail mortises and tenons, with metallic bearings and castings of peculiar construction.

Claim.—The described combination of the dovetail mortise *a*, dovetail tenon *b*, metallic lining *C*, and metallic casing *D*, formed with cylindrical ends *d*; the whole being constructed and arranged and operating in the manner and for the purposes explained.

No. 28,277.—DAVID HEUSTIS, of Cold Spring, N. Y.—*Improvement in Moulding Shot and Shells*.—Patent dated May 15, 1860.—This invention consists in the employment, for adjusting the pattern, of a mould board with a central aperture to receive a circular projection on the underside of the pattern, and with a circular flange on one side and a rim on the other, to fit on one side over a rim turned to the end of one of the semi-flasks, and on the other into a flange projecting from the end of the other semi-flask, said rim and flange on the semi-flasks being at the same time so arranged that they serve as guides for the flasks when the same are connected; and it also consists in combining with the flanged end of the lower semi-flask a cross shaped gauge with a half circular recess for the purpose of adjusting the core.

The inventor says: I *claim*, first, the employment, for adjusting the pattern, of a mould board

C, with a central aperture *c*, flange *d*, and rim *d*¹, in combination with the semi-flasks A A¹, constructed and operating substantially in the manner and for the purpose described.

Second. The combination, with the flanged end of the semi-flask A¹, of a cross shaped gauge H, with notches *h*, constructed and operating substantially in the manner and for the purpose specified.

No. 28,278.—CHARLES S. IRWIN, of Madison, Ind.—*Improvement in the Construction of Machinery for Cleaning Starch*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The rotating disk brush C, placed on the box or receiver A, in connection with the bed or platform D, also placed on the box or receiver, all being arranged as and for the purpose set forth.

No. 28,279.—ZALMON L. JACOBS, of Hebron, Conn.—*Improvement in Screw Plates*.—Patent dated May 15, 1860.—In using this invention the dies are arranged with any desired pair of their cutting parts facing each other and in line with the screws A A; the plate Q is made to secure said dies in their places, and the screws are turned outward sufficiently to allow the dies to be opened so as to receive the bolt or rod to be operated upon. The screws are then pressed inward so as to press the edges of the bolt, and the plate is made to revolve around the bolt to form the thread thereon.

Claim.—As an improved article of manufacture, a screw plate provided with changeable pivotted dies E, screws A, stock C, pins N, and plate Q, substantially as shown and described.

No. 28,280.—POMEROY JOHNSON, of Whitney's Point, N. Y.—*Improvement in Felling Trees*.—Patent dated May 15, 1860.—This invention consists in the employment of a pole provided with a metal point and having a rope attached which passes through a fixed pulley block, the parts being arranged so that with the aid of a team, or other power, the desired end is attained.

Claim.—The combination of the pole or scantling B, provided with a steel or proper metal point *a*, the fixed pulley block or shieve D and rope C, with animal or other power attached, all being arranged and applied substantially as and for the purpose set forth.

No. 28,281.—M. M. JONES, of Morrisville, N. Y.—*Improvement in Cotton Presses*.—Patent dated May 15, 1860.—In this improvement by the application of power to the lever M the follower will descend with double the velocity that it would with a single thread.

Claim.—The particular arrangement and combination of mechanism described, the same consisting of rods H, rotating nuts C, follower B, bed piece E, lever M, pawl N, springs *o o*, pivot P, stationary roller *i*, the several parts being constructed and arranged relatively as described and for the purposes set forth.

No. 28,282.—WILLIAM KENNISH, of London, England.—*Improved Hydraulic Motor*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A diaphragmed snail or other suitably shaped piston C, which has an opening in its face and another one in its back, in combination with a diaphragmed hollow shaft D, which has corresponding openings with those of the piston, substantially as and for the purposes set forth.

No. 28,283.—RICHARD KETCHUM, of South Dansville, N. Y.—*Improvement in Mowing and Reaping Machines*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the cross bar K, having supporting rollers *m m*, and vibrating bar or beam C, furnished with rollers *d d*, for operation by the corrugated driving wheel B, all arranged upon the axle A, for actuating the cutter, substantially in the manner and for the purposes set forth.

No. 28,284.—WILLIAM A. KIRBY, of Buffalo, N. Y.—*Improvement in Harvesters*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

Claim.—In combination with the rod and lifting wheel, the lever and rod *x*, with their attachments, substantially as described, for the purpose of raising, lowering, and holding the cutters at different heights, as set forth.

No. 28,285.—F. L. LANGLEY, of Troy, N. Y.—*Improved Shoemakers' Float*.—Patent dated May 15, 1860.—This improvement relates to machines for rasping or cleaning pegs from the inside of boots and shoes.

Claim.—Constructing and arranging the several parts of the machine substantially as described, whereby the rasp may remain movable upon its axis, or rigidly fixed thereon, as may be required, for the purposes set forth.

No. 28,286.—JOHN P. LEDY and WILLIAM BOYERS, of Mount Carroll, Ill.—*Improved Apparatus for Breachy Cattle.*—Patent dated May 15, 1860.—This invention consists in providing a metallic sheath A, constructed with suitable hinges B b, so that it can be opened and closed conveniently in order to apply it readily to the knee joints of the fore legs of cattle and horses.

Claim.—The metallic sheath A, in combination with the pad C and clasp D, constructed in the manner and for the purpose specified.

No. 28,287.—GEORGE LITTLE, of New York, N. Y.—*Improvement in Sewing Machines.*—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The adaptation of a cylinder, piston, rod, and valves to, and constituting a part of, a sewing machine, the whole combined, constructed, arranged and operating substantially as set forth.

No. 28,288.—THOMAS J. MAYALL, of Roxbury, Mass.—*Improvement in Machines for Making Rubber Hose.*—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, an organized machine for the formation of spiral rubber or gutta percha hose or tubing, the same consisting essentially of a travelling carriage carrying the fabric of which the hose or tubing is to be formed, and a reversible guide, to which such automatic motions are given as to wind the said fabric in spiral layers upon a suitable mandrel, substantially as set forth.

Second. I claim the combination of the travelling carriage carrying the fabric of which the hose is to be formed, and made to receive a reciprocating rectilinear motion, in any proper manner, with the reversible guide, the two so operating together that the said guide shall be reversed in position as soon as the fabric is wound spirally in one direction upon the mandrel whereby the fabric is fed along, and guided in two opposite directions upon the mandrel, so as to form spiral layers crossing each other, as set forth.

Third. I claim the combination of the travelling carriage carrying the supplying reel and the mandrel upon which the hose is to be wound, as set forth.

No. 28,289.—JOHN MCKELLAR, of Thomaston, Maine.—*Improvement in Beer Powder.*—Patent dated May 15, 1860.—The constituents and proportions of this beer powder are as follows: One pound of hops; eight pounds of wheat flour; one pound of powdered sugar; one pound of rasped or powdered lignum vitæ; three fourths of a pound of tartaric acid; and seven and one half ounces of essence composed of one part of some essential oil, such as that of spruce, and four parts of common alcohol.

Claim.—The said composition or beer powder, made substantially as described.

No. 28,290.—WILLIAM H. McNARY, of Brooklyn, N. Y.—*Improvement in Knitting Machines.*—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the threaded wheel D, with its movable switch D¹ H, applied substantially as described, in combination with the needle ring, or other equivalent device, carrying the needles, to produce the rotary or traverse movement of the needles in either direction, as may be necessary.

Second. The revolving and longitudinally moving studded cylinder, applied and combined with the movable switch wheel by means of a forked lever G, and revolving buttons h h¹, or their equivalents, and operating substantially as described, for the purpose of shifting the switch as often as it is desired to reverse the rotary or traverse movement of the needles.

Third. I claim the regulating wheel with its adjustable arms M M¹, applied and operating substantially as described, in combination with the needle ring and with suitable apparatus for throwing the studded cylinder into gear with the main shaft, for the purpose of regulating the length of the complete circular portions of the work.

Fourth. I claim combining the studded cylinder H with the disengaging apparatus, by which it is made to throw itself out of gear with the main shaft when knitting all round the whole series of the needles is required to be resumed after knitting round a portion of the series only.

Fifth. I claim combining the stitch hook bar S², with the main shaft, or other rotary shaft, of the knitting machine, by means of one or more cranks Z Z, and controlling the movement produced by such crank or cranks by means of a slotted arm S¹, working on a fixed guide pin 24, substantially as described, to produce the movement of the stitch hooks to take off the loops from the needles.

Sixth. I claim giving the stitch hook bar the necessary lateral movement to complete the

throwing off of the loops from the needles and to enable them to pass the needles as they descend to take another loop by means of the cams $Z^1 Z^1$, at the sides of the wrists of its driving cranks, substantially as described.

Seventh. I claim combining the rockshaft which carries the thread guides with the switch wheel D, by means of a fork U^4 , or its equivalent, substantially as and for the purpose described.

No. 28,291.—GEORGE MILLARD, of Waterbury, Conn.—*Improved Chimney Cowl*.—Patent dated May 15, 1860.—J J J are three friction rollers, which turn on short shafts fixed to the inside of the vertical portion C^1 of the cowl. These are placed at equal distances apart, and support the cowl on the edge of the flange B. They also allow the cowl to revolve freely, as the vane D is acted upon by the wind. They are protected from the weather by the cowl.

Claim.—The arrangement of the friction rollers J, to run upon the edge of flange B, in combination with the cowl $C C^1$, as and for the purposes shown and described.

No. 28,292.—HARRIS MORSE, of Columbia, Cal.—*Improvement in the Treatment of Snow or Ice to Convert it into Large Blocks*.—Patent dated May 15, 1860.—The inventor says: In carrying out my invention I take snow in its natural state, or ice in small lumps, and put the same in a suitable vessel or receiver, and while therein extract the air from said snow or ice, either by a powerful pressure equal to about seven hundred pounds the square inch exerted upon a piston playing into said vessel, or by an air pump, or suitable mechanical means for exhausting air from the vessel, subsequently producing the requisite compactness or condensation of the mass by a due amount of pressure.

Claim.—The said process of treating snow or small pieces of ice, in order to convert the same into large blocks or masses fit for preservation and use, as described.

No. 28,293.—SAMUEL D. NELSON, of Pittsburgh, Pa.—*Improvement in the Manufacture of Shovels*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The shovel, as a new article of manufacture, having the back strap imbedded in the back of the shovel blade, arranged and constructed as described, and for the purpose set forth.

No. 28,294.—DAVID NIVEN, of Rochester, N. Y.—*Improvement in Potato Diggers*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim suspending the grate, share, and clearing wheel together upon the axle by the supporting wheels, by means of the bails $h h$, yoke k , and axis of said clearing wheel, as described, or their equivalents, in combination with a lever E, so that the said grate, share, and clearing wheel may be continually graduated by the attendant to any depth, and adjusted to the undulations of the ground or raised therefrom, independently of the movements of the other parts of the machine, as specified.

I also claim forming the upper surface of the circular concentric grate bars l , with serrated edges $m m$, in combination with the intervening teeth $n n$ of the clearing wheel, for the more effectual separation of the tubers from the earth, substantially as set forth.

No. 28,295.—ROBERT F. O'BRIEN, of Boonville, Mo.—*Improvement in the Construction of Flues*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The metal base B, formed of the bottom plate a , sides $b b$, and flanches $c c$, applied to the timbers A A, as shown, and perforated at its bottom, or corrugated to receive and hold the plaster or mortar, substantially as and for the purpose set forth.

No. 28,296.—ALANSON ORDWAY, of Stratham, N. H.—*Improved Tuyere*.—Patent dated May 15, 1860.—The blast from the bellows passes into the box A, and is admitted to the fire in a greater or less volume by adjusting the lower grate E, which is done through the medium of the lever F, the two grates C E forming a register, the bars of one grate coinciding more or less with the other, according as the lower grate is adjusted.

Claim.—The combination of the rotating circular grate C, with the horizontal sliding grate E, and levers D F, as and for the purpose described.

No. 28,297.—SIDNEY W. PALMER and JOSIAH F. PALMER, of Auburn, N. Y.—*Improvement in Silk or Thread Reels*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Securing the slotted arms of a silk reel to the spindle on which they turn in such a manner that they can be extended and contracted at pleasure, and folded up parallel to each other, and so that they can be rigidly secured to each other and to the spindle in any

desired position, by means of a thumb screw, without preventing the spindle from freely turning in its bearings, substantially in the manner and for the purpose described.

No. 28,298.—JOHN G. PERRY, of South Kingston, R. I.—*Improved Sausage Machine*.—Patent dated May 15, 1860.—In operating this machine the tube F being placed in the aperture R, and the cases placed upon it, motion is given to the cylinder by one hand, and the meat is fed into the machine through the hopper by the other, and being prevented from going round with the cylinder by the proximity of the case upon one side, it is pushed towards the end where it is to be discharged through the tube or nozzle F into the cases placed upon them.

Claim.—The combination of the sliding knives D with the cylinder C, substantially as herein described, and for the purpose set forth.

No. 28,299.—IRA W. PETTIBONE, of Norfolk, Conn.—*Improvement in Vapor Lamps*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of the vapor valve at the mixing chamber with the supplementary valve, the two being constructed and operating substantially as set forth.

I also claim the combination of the mixing chamber, with an air tube or tubes, to deaden the whistling noise which generally accompanies such burners.

I also claim arranging the air tube in such a manner, with reference to the mixing chamber of the vapor burner, that it can be removed therefrom to permit cleaning, substantially as herein set forth.

No. 28,300.—GEORGE B. PHILLIPS, of Newark, N. J.—*Improved Wrench*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A curved bar provided with a rack of teeth, in combination with a scroll nut for traversing and holding the sliding jaw, as described for the purpose specified.

No. 28,301.—W. C. PITTS, of Austin, Texas.—*Improvement in Seed Planters*.—Patent dated May 15, 1860.—The guano, or other fertilizer, sown with the seed, is placed in the front hopper *e*, and as the distance is less from this hopper to the planting point, and more direct than that from the other or seed hopper *f*, the fertilizer reaches the furrow first, and hence the seed is dropped upon the fertilizer.

Claim.—The arrangement of the double hoppers *e f*, double tubes or ducts B C, and single seed slide *d*, operating together in the manner and for the purpose set forth and described.

No. 28,302.—JOSIAH S. POND, of Cleveland, Ohio.—*Improved Washing Machine*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the construction and arrangement of a compound rubbing board, having a series of alternate ridges and rollers, to compress and rub at the same time, as described, for the purposes specified.

Second. The compound rubbing board in combination with a fluted roller, or its equivalent, as set forth.

No. 28,303.—J. T. PRICE, of Rockville, Ind.—*Improved Sediment Collector for Steam Boilers*.—Patent dated May 15, 1860.—This invention consists in a novel system of pipes applied to a boiler, in connection with a water heater arranged as a bridge in rear of the fire grate, for the purpose of collecting the mineral or other sedimentary matter from the water, and preventing its deposit in the boiler.

Claim.—The system of pipes F G I, applied to a boiler in connection with a heater D—the whole arranged substantially as described, for the purpose set forth.

No. 28,304.—THOMAS J. PRICE, of Industry, Ill.—*Improvement in the Construction of Evaporating Apparatus*.—Patent dated May 15, 1860.—This invention consists in constructing evaporating pans so that a series of dampers may be inserted between the cross partitions; these dampers can be lowered to obstruct the heat, so that the syrup may be boiled to the proper degree for syrup or granulation without any possible chance of scorching or burning.

Claim.—Constructing evaporating pans with a series of dampers D D D D, inserted between the cross partitions B B B B, and operated with a series of levers *i i i i*, substantially as shown, for the purpose specified.

No. 28,305.—A. F. REEDER, of Bloomington, Ill.—*Improvement in Rotary Engines*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The engine constructed with a cylinder of the form described, with a partition I, with the induction ports in its abutments, and with a cavity *a* and series of projecting surfaces *t u v v* in and upon its rotating piston head D, substantially as herein described.

No. 28,306.—J. H. ROLLINS, of Wapello, Iowa.—*Improved Vapor Lamp*.—Patent dated May 15, 1860.—The bottom *a* of the chamber E is provided with a flanch *c*, which, when the bottom is screwed into the chamber, projects beyond the latter so that the chains *d* may be attached thereto, the lower ends of the chains being attached to a metallic band H provided with a suitable clasp that will admit of the band being increased or diminished in diameter, and secured at the proper point. This band encompasses a flanch *e* at the upper part of the glass globe I, within which is the burner G.

Claim.—The combination, with the vaporizing chamber E, of the removable flanch screw bottom *a* and globe I, so that the globe will be supported or hung from said bottom, all as and for the purpose shown and described.

No. 28,307.—W. J. SANDERSON and SIDNEY STANTON, of Syracuse, N. Y.—*Improvement in Steam Boiler Feeders*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of a discharging valve constructed in the manner stated and connected with the water pump of steam boilers A, solid float B, within the boiler, balanced by a weight without, and the steam whistle G connected with the balancing beam E, as described, when the valve J operates as set forth, to regulate the amount of water in the boiler, and the whole constructed, arranged, and operated in combination, substantially as described.

No. 28,308.—JOHN M. SCRIBNER, of Middleburg, N. Y.—*Improvement in Lathes*.—Patent dated May 15, 1860.—This invention consists in the arrangement and construction of devices to rotate the piano leg, newel post, or article being fluted, and at the same time traverse it towards and from the cutters, so as to cut the flutes.

Claim.—The arrangement of devices, as described, for traversing the leg or article cut to and from the cutter, and rotating it at the same time by the mechanism described, or its equivalent, so as to cut or form curves on the article so turned and traversed, substantially as described.

No. 28,309.—PHILANDER SHAW, of Boston, Mass.—*Improvement in the Method of Preparing and Moulding Wood into Different Forms*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the method or process of treating wood, consisting in compressing it within moulds and afterwards heating it while thus continued under pressure.

Also, the process of treating wood by impregnating it with steam and resinous, oily, or other water proof matter, and mineral or metallic salts and preservative chemicals and dyes, or any of these or their substantial equivalents, prior to and in combination with the process above claimed.

No. 28,310.—MARVIN SMITH, of New Haven, Conn.—*Improved Peach Parer*.—Patent dated May 15, 1860.—The two forks D and F have each two diverging prongs, the inner edges of which are made sharp, and designed to indent or cut the ends of the peach stone, to prevent the peach stone from slipping from between the forks while it is pared.

Claim.—The combination, with the stationary hollow concave rail B, standard *a*, and fork D, of the sliding hollow concave rail E, standard *d*, fork F, and spring *o*, as and for the purpose shown and described.

No. 28,311.—SAMUEL J. SMITH, of New York, N. Y.—*Improved Nut Cracker*.—Patent dated May 15, 1860.—This invention consists in the employment of a cam lever that is actuated upon by a coiled spring, arranged in such a relation to a curved fixed jaw, and operated by a lever having an eccentric motion, that two jaws will be obtained, one a curved and the other a straight one.

Claim.—The combination of the fixed and curved portion *a*, lever B, constructed as set forth, with its spring D and the eccentric hand lever C, all relatively arranged and combined as and for the purposes described and represented.

No. 28,312.—LYDIA W. STILES, of Brooklyn, Ohio.—*Improved Butter Worker*.—Patent dated May 15, 1860.—This improvement relates to a special arrangement of a bowl and workers, which are jointed or hinged to a movable standard, so as to allow these workers to be moved in any desired direction in the bowl, by means of which dough may be kneaded or butter worked.

Claim.—The special arrangement of the workers B B¹, hinged to the adjustable post E, in combination with the revolving bowl, when operating conjointly in the manner and for the purpose set forth.

No. 28,313.—ABRAHAM STOLER and SAMUEL A. SISSON, of Bristol, Pa.—*Improvement in Harvesters*.—Patent dated May 15, 1860.—In depressing the long arm of the lever K, the upright

lever L is thrown backward and the rod M made to draw up the point of the shoe, thereby raising the point of the guards, rendering them less liable to catch in grass or other occurring obstruction.

The inventors say: We *claim* the arrangement of the castor wheel H, with its frame G, connected to the main axle, in combination with the levers K and L, fulcrum I, rod M, and shoe S, applied in the manner and for the purpose substantially as described.

We also claim the combination and arrangement of the rod M and levers interposed between the castor wheel frame and pivotted shoe S, for adjusting the cutting apparatus, substantially as described.

No. 28,314.—A. M. SWAIN, of Lowell, Mass.—*Improvement in Water Wheels*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the annular chamber I, arranged substantially as shown, and provided with slots to receive the guides *e*, when the latter are attached to the cylinder J, for the purpose set forth.

Second. The arrangement of the guides *e* and cylinder J, attached to curb B, and chamber I, forming the gate, when said parts are arranged in relation to the wheel G, substantially as and for the purposes specified.

Third. The adjusting of the block E by means of the bar *b* and set screws *c*, for the purpose of adjusting the wheel to compensate for the wear of the step.

No. 28,315.—RICHARD A. TILGHMAN, of Philadelphia, Pa.—*Improvement in the Method of Decomposing Fats into Fatty Acids*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the process of decomposing fats into fatty acids and glycerine, by means of water at a high temperature and pressure, either with or without the presence of an alkali.

1. Applying the water in several successive portions, and removing those portions when partly saturated with glycerine.

2. Arranging the fat and water in shallow layers, so as to give an increased surface of permanent contact between them.

3. Causing the fat and water arranged in shallow layers to flow in opposite directions, so as to bring fresh water in contact with the partly decomposed fat.

No. 28,316.—JEREMIAH TILTON, of Northfield, and EDWIN RITSON, of Sanbornton, N. H.—*Improvement in Machinery for Cutting Flock*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment or use in a flock cutting machine of two cutters H J, arranged substantially as shown, so that one cutter H will have a rotary motion and a vertical adjusting movement, and the other cutter J an universal self-adjusting movement, for the purposes set forth.

No. 28,317.—MAURICE VERGNES, of New York, N. Y.—*Improvement in the Construction of Voltaic Gas Burners*.—Patent dated May 15, 1860.—This invention is an improvement on the Bunsen and Grove galvanic batteries, and consists of a novel arrangement of the parts and a new mode of building up or composing the battery, which has three cells and three decomposing and decomposable departments.

The inventor says: I *claim* the use, in gas batteries or combined acid and gas batteries, of porous platinized coke, substantially as and for the purposes set forth.

I also claim the general arrangement of the whole battery or apparatus, substantially as described.

No. 28,318.—JOHN H. WAIT, of Portsmouth, Ohio.—*Improvement in Mechanical Movement*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Constructing a crank with an elongated wrist pin set obliquely to its axis of rotation, so that a pitman connected thereto can be made to give any desired length of stroke or throw within the capacity of the crank, without retarding the motion thereof, in the manner substantially as described.

No. 28,319.—C. P. S. WARDWELL, of Lake Village, N. H.—*Improved Swift*.—Patent dated May 15, 1860; antedated April 25, 1860.—This invention consists in constructing swifts with a jaw and a compensating spring in such a manner that they can be readily attached to the edge of a table, or other suitable place, and held firmly in place regardless of the thickness of the table, and readily adjusted for skeins of various lengths.

Claim.—The spring D, in combination with the jaw formed by lips B B, substantially as set forth and represented.

No. 28,320.—C. O. WEST, J. R. SMITH, JOHN CAREY, GEORGE JANNEY, R. HUNT, AMOS HOCKETT, D. WEST, ELIEL WEST, and J. GARNER, of Martinsville, Ohio.—*Improvement in Ditching Machines*.—Patent dated May 15, 1860.—This machine is intended for forming ditches of any width or depth, having either vertical or inclined sides. The machine can be used for digging ditches around farms, for draining water, irrigating land, forming roads, &c.

The inventors say: We *claim*, first, the employment of the fin M, in combination with the inclined bottom L, as and for the purpose shown and described.

Second. The combination of the rib e^1 , with the inclined bottom B, as and for the purpose set forth.

Third. The employment of a hinged triangular beam A, and adjustable sled F, in combination with the plough, as and for the purpose shown and described.

Fourth. The combination with the plough, the beam A, and sled F, of the adjustable pivotted brace rod K, standard I, and front brace rod J, as and for the purposes shown and described.

No. 28,321.—J. W. WETMORE, of Erie, Pa.—*Improvement in Railroad Chairs*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the lip chair E, formed for a longitudinal wedge under the rails and fitting them exactly, because of the trimming of the web $u u$, the upper surface of the base of the chair being bevelled at each end $w v w v$.

Second. The wedge G, passing between all the spikes except one I, and held in place under the joint by notches h , catching the spike R.

No. 28,322.—JOSIAH M. WHITNEY, of Astoria, N. Y.—*Improved Sash Fastener*.—Patent dated May 15, 1860.—The inventor says: The dog E can be turned up and down under all circumstances and at all times with equal facility; it secures the brace C in such a manner that the window cannot be opened from the outside without breaking some portion of the same.

Claim.—As an improved article of manufacture, a window sash fastener composed of a plate a , hinged noose strut C, and a hinged dog E, arranged as shown.

No. 26,323.—DUDLEY WOOD and ALBERT BYINGTON, of Byron, Ill.—*Improvement in Ploughs*.—Patent dated May 15, 1860.—This invention consists in the arrangement of the devices named in the claim and shown in the engravings.

Claim.—The arrangement of the tubular beam A, tubular standard B, secondary joint b , and inside coupling bolts $a a$, substantially as described.

No. 28,324.—CHARLES W. BROWN and GEORGE W. BANKER, of Boston, Mass., assignors to GEORGE W. BANKER and GEORGE O. CARPENTER, of South Reading, Mass.—*Improvement in Machines for Mixing Paint*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The method of constructing and arranging the mixing apparatus in such way that the fixed arms in the tub shall be set so as to describe scrolls from the central tube, or centre of the tub, and arranged in such a relation to the parallel revolving arms that they will pass each other only in pairs, at nearly equal distances from the axis of the spindle, in the manner described and represented, for the purpose set forth.

No. 28,325.—PATRICK MIHAN, of Boston, Mass., assignor to himself and MAJOR A. LANE, of Charlestown, Mass.—*Improvement in the Construction of Condensers of Stills*.—Patent dated May 15, 1860.—This invention consists in combining an annular steam chamber surrounding a vessel that contains cold water, and the elevated conical bottom of said vessel, with a conical receiving chamber in such a manner that if said vessel is placed on a kettle containing boiling water, the steam arising from the latter by coming in contact with the conical bottom and with the cold walls of the steam chamber, condenses and collects in the conical receiving chamber, from which it is drawn by a suitable faucet.

Claim.—The combination of a conical mouth piece F of the supply pipe E, with the conical bottom b of the reservoir C, substantially as and for the purpose specified.

No. 28,326.—PURCHIS MILES, of New Haven, Conn., assignor to A. P. PLANT, of Plantsville, Conn.—*Improved Bedstead Fastening*.—Patent dated May 15, 1860.—This invention consists in the use of a shaft provided with an eccentric, on the prominent part of which a spiral flanch is formed, in connection with a dovetail tenon and mortise, arranged to effect the desired end.

Claim.—The arrangement of the shaft c , provided with eccentric a^1 , spiral flanches b^1 , the dovetail mortise a , tenon b , and female screw thread d^1 , with the bracket bearing C, substantially as and for the purpose set forth.

No. 28,327.—JAMES H. PARKER, of Boston, Mass., assignor to E. H. ASHCROFT, of said Boston.—*Improved Hand Drill*.—Patent dated May 15, 1860.—The inventor says: By arranging the clutch with respect to the drill carrier A and lever C, and covering the clutch, the screw G, and the shank I, by the tubular sleeve or cap L, I am enabled to protect from dust, chips, &c., the working surfaces of the clutch, the screws, and all parts to which it is necessary to apply oil, and the teeth of the clutch are covered so as to be protected from injury.

Claim.—The arrangement of the spring clutch with the drill carrier and its lever, and within, so as to be protected by, the sleeve or cap L, substantially as specified.

No. 28,328.—JAMES H. PARKER, of Boston, Mass., assignor to E. H. ASHCROFT, of said Boston.—*Improved Hand Drill*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* my improved hand drill, as constructed, not only with the application of a male screw G, and a concentric oil holder or tubular cap L, directly to, and so as to project from the drill carrier A, but with the tubular shank of the female screw extended directly from the pivot F, or a handle K, intervening between the two, as described.

I also claim connecting the chambers M N, by one or more passages *b*, separate from the female screw, that the oil may pass from one chamber into the other, under circumstances and for the purpose set forth.

No. 28,329.—WILLIAM C. PITTS, of Austin, Texas, assignor to WILLIAM A. PITTS, of said Austin.—*Improvement in Ploughs*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the construction of the plough with double points with the hole in the centre, so that either end may be turned to the ground and fastened to the stock or "helve" of the same, by the bolt through the hole in the centre, so that when one point wears out or breaks off, the other can be turned down; also, the separate bar, so constructed as to fit and sustain the plough, as specified.

And I hereby disclaim the invention of the stock of said plough, and claim only the invention of the share and bar, as specified.

No. 28,330.—EPHRAIM RUSSELL, of Coatsville, Pa., assignor to himself and JAMES S. WILEY, of Sadsbury, Pa.—*Improvement in Seed Planters*.—Patent dated May 15, 1860.—

This invention consists in the use of an equal armed horizontally vibrating lever, or its equivalent, connected to slides and operated by an armed cylinder on the axle of the machine; and also in the use in the machine of double dovetail keys in lieu of the screw bolts and nuts heretofore used for the purpose of holding certain parts of the machine together.

Claim.—The arrangement of the slides $D^1 D^2$, the equivalent lever, the armed cylinder F, screw stems $m m^1$, slotted plates or loops $n n$, and the double dovetail keys $G G G^1 G^1 G^2$, operating in the manner described and for the purpose specified.

No. 28,331.—EDWARD SAVAGE, of Cromwell, and HENRY SAVAGE NORTH, of Middletown, Conn., assignors to the SAVAGE REVOLVING FIRE ARMS COMPANY, of said Middletown.—*Improvement in Revolving Fire Arms*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, placing the coiled spring which forces back the rotating cylinder away from the muzzles of the charge chamber, and covering it with the shoulder *b*, of the cylinder axis pin, so that its action cannot be clogged by the accumulation of smoke, burned powder, or dust from the muzzles when fired; and also increasing the facility with which the rammer can be put in and taken out, all as shown and described.

Second. The employment, in combination with the regulating screw G, of a thimble or bushing E, applied to the recoil shield, to serve, at the same time, as a bearing for the rear end of the cylinder axis pin D, and a bearing for a set screw *f*, by which to secure the regulating screw, substantially as described.

Third. The set screw *f*, applied in combination with the thimble or bushing E, of the recoil shield, and with the regulating screw G, substantially as and for the purpose described.

Fourth. The combination, with the plunger I, fitted to a guide in the head of the cylinder axis pin D, as described, of the lever J, fitted to the slots *i* and *j* of the said head, and to a slot *m*, in the plunger, and connected with the said head by a fulcrum pin *k*, and with the plunger by a cam-like slot *b*, and pin *p*, substantially as specified.

No. 28,332.—WILLIAM SHIELDS, of Manchester, England, assignor to JOSEPH LOCKETT and ROBERT LEAKE, of said Manchester.—*Improvement in Machines for Engraving Rollers, &c.*—Patent dated May 15, 1860; patented in England, October 30, 1857.—This invention refers to those machines in which a tracer is used to be placed over the design to be copied

and transferred upon a roller, or cylinder, the motions of the tracer being followed by the cylinder and an etching instrument, or series of etching instruments.

The inventor says: I *claim* the combination and arrangement of the mechanism described, by which the movements of a tracer can be modified in extent and changed in direction and transmitted to etching instruments, and the roller or cylinder to be operated upon; and I particularly claim for these purposes the use of the levers or bars e^9 and h^4 , and the bars or carriages $e^1 f$ and g^6 .

No. 28,333.—EMIL TRITTIN, of Philadelphia, Pa., assignor to himself and J. A. CUMMINGS, of said Philadelphia.—*Improvement in Burners for Vapor Lamps*.—Patent dated May 15, 1860.—This invention consists of a device for increasing or diminishing the extent of the flame at pleasure.

The inventor says: I *claim*, first, the tube A, with its chamber C, and slotted top a , in combination with the stem D, and the attachment E, or its equivalent; the whole being arranged substantially as and for the purpose set forth.

Second. The cap d , with its openings, having inclined sides v , in combination with the slotted top a of the burner; the whole being arranged and operating substantially as specified.

No. 28,334.—JEDEDIAH WEISS, of Bethlehem, Pa., assignor to himself and CHARLES BRODHEAD, of said Bethlehem.—*Improvement in Telegraphic Machines*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The application of clock work to the drawing out and letting back of the spiral spring, circular spring, or elastic substance, commonly used for adjusting the telegraphic circuit, by combining with the clock work the eccentric C C C, the lever A A, and roller L, the movable axis to the wheel S, the sliding wedge shaped knob K, and the lever O O, in the manner and with the effect set forth particularly in the foregoing specification and the annexed drawings.

No. 28,335.—DAVID H. WILLIAMS, of Allegheny, Pa., assignor to himself and R. B. FITTS, of Philadelphia, Pa.—*Improved Apparatus for the Combustion of Smoke in Steam Boiler Furnaces*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The use of steam under pressure, for the purpose of forcing air, through suitably arranged, conically-shaped tubes or other openings, by means of the steam pipe apparatus, operating substantially as described, into steam boiler furnaces, their hot air chambers, or the flues or tubes of the boiler, the steam jets H, with their openings K, or their equivalents, being in combination whether with or without the deflecting or heat receiving wall E.

No. 28,336.—THOMAS T. WOODWARD, of South Reading, Mass., assignor to himself and WHITON, BROWNE, and WHEELWRIGHT, of Boston, Mass.—*Improved Signal Apparatus*.—Patent dated May 15, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a portable revolving signal apparatus, containing a series of pyrotechnic charges, such as blue lights or rockets, &c., and operated so as to receive an intermittent rotary motion, and to successfully ignite the several charges by any suitable arrangement of mechanical devices.

Second. The arrangement of devices for rotating the apparatus and igniting the charges at the same time; the same consisting of the spring hammer and cam grooved cylinder c , both actuated, as described, by the rod.

No. 28,337.—CALVIN ADAMS, of Pittsburgh, Pa.—*Improved Clevis for Ploughs*.—Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, constructing the loose end piece of the clevis with hooked ends, fitting into suitable slots in the shanks, for the purpose of forming a connection between the outer extremities of the shanks, and at the same time sustaining the end piece in its proper position, without any bolt or other fastening for that purpose.

Second. Combining with a plough clevis, constructed as described, a projection, or lug on one of the shanks, in the manner and for the purpose set forth.

No. 28,338.—DANIEL W. AYRES, of Middleport, Ill.—*Improvement in Grain Binding Machines*.—Patent dated May 22, 1860.—This invention consists in the employment of a rotating arm, stationary gavel receiving box, twisting device, cutter and holder, and fingers or teeth; all arranged in such a manner that the gavels may be bound and the binding wire twisted and cut and secured in proper position for a succeeding operation, all the parts working automatically by the turning of a shaft, and a gavel bound at each revolution of the shaft.

Claim.—The employment or use of the rotating arm D, with the toothed segment E, and rod or bar F attached, in connection with the stationary box G, and twister formed of the

stationary and movable heads *k l*, and the holder and cutter, formed of the lever *K*, provided with cutting and holding teeth *p* and *q*, all being arranged for joint operation, substantially as and for the purpose set forth.

No. 28,339.—GILBERT L. BAILEY, of Portland, Me.—*Improved Ballot Box*.—Patent dated May 22, 1860.—This invention consists in providing a box with a suitable mechanism, which being operated by the hand of the voter, or of the person holding the same, causes the number of votes, "Yes" or "No" to be plainly indicated to the person carrying or holding the box.

The inventor says: I *claim*, first, the employment of dials *O* and *P*, with their numerals and blank space, operating in conjunction, substantially as and for the purpose set forth.

Second. The employment of dials *O* and *P*, as and for the purpose set forth, in combination with the ratchet wheel *L*, pawl *A*, and pull *E*, or their equivalents.

Third. The combination and use of the above claimed dials, ratchet wheel, pawl, and pull, operating as described, with alarm bell *c*, for the purpose set forth.

Fourth. The combination and use of the above claimed dials, ratchet wheel, pawl, and pull, whether with or without alarm bell *c*, with any suitable box, substantially as described.

Fifth. The combination and use of an alarm bell, with a self registering ballot box.

Sixth. The combination and use of two sets of registering mechanism, with one ballot box, operating substantially as and for the purpose set forth.

No. 28,340.—HENRY O. BAKER and JAMES MCGILL, of New York, N. Y.—*Improved Fire Escape*.—Patent dated May 22, 1860.—This invention consists in providing a series of adjustable or stationary stairs, steps, or ladders, with or without single or double folding guards or balusters, in connection with balconies upon the outside of the buildings, to be used as a means of egress or escape from buildings when on fire.

Claim.—The stairs or ladders, the folding guard or their equivalent, in connection with balconies upon the outside of a building, substantially as described, for the purpose specified.

No. 28,341.—JOHN F. BENNETT, of Pittsburgh, Pa.—*Improvement in Apparatus for Condensing Coal Oils*.—Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Subjecting the volatile products of the distillation of coal, composed of a mixture of various substances in the form of vapor, directly as it passes from the retort or prime generator, to gradually diminishing degrees of heat in a succession of condensers for the purpose of separating by one operation, each of these several different substances from the other substances with which it is mixed, when in the form of vapor, at the particular degree of temperature at which it assumes the liquid form as distinguished from the fluid or gaseous form, by means of an apparatus such as described, when combined with a coal oil retort.

No. 28,342.—G. W. BILLINGS and W. M. HUTTON, of Cleveland, Ohio.—*Improved Apparatus for Elevating Water from Wells*.—Patent dated May 22, 1860.—This invention relates to a certain arrangement of devices by which the cord or chain used in raising the bucket will be firmly held from slipping between two revolving disks, which disks are caused to hold the rope by a circular revolving wedge.

The inventors say: We *claim* the arrangement of the disks *F F*¹, with the radial slots *G*, and revolving wedge *E*, in combination with the radial arms or lugs *H*, shaft *B*, and rope *D*, the whole being constructed, substantially as set forth, for the purpose described.

We also claim the sliding draws *P P*¹, hooks *N N*¹, and loops *M M*¹, when specially arranged as described, and operating conjointly in combination with a windlass and buckets, in the manner and for the purpose set forth.

No. 28,343.—J. H. BONHAM, of Elizabethtown, Ohio.—*Improvement in Corn Planters*.—Patent dated May 22, 1860.—*E* is a pulley attached to the axle for the purpose of rotating the seed reservoir *C*, with its rings and caps by the cord *G*; *n* is a drop hammer which falls on the cavities to loosen any grain that may be held fast; *m* is a flange with holes in it, attached to the side of the hopper *B*.

The inventor says: I *claim* the seed reservoir *C*, in combination with the hooper *B*, operated by the driving wheel *E*, in the manner and for the purpose set forth.

I also claim the combination of the pivotted hopper *B*, perforated flange *m*, hook *r*, brush *h*, and ring *k*, constructed, arranged, and operating substantially as and for the purpose set forth.

No. 28,344.—JOHN BROUGHTON, of New York, N. Y.—*Improvement in Dress for Mill Stones*.—Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment or use of the peculiar zigzag form of teeth, so cut or constructed on the grinding surfaces that while the working edges or meal producing line shall present an obstruction to the discharge of unground portions of the substances passing through the mill, the furrows shall be clear and unobstructed, for the free passage of air and the proper ventilation of the grinding surfaces, substantially as set forth.

No. 28,345.—CHARLES W. BROWN, of Boston, Mass.—*Improvement in Rotary Cutting Shears.*—Patent dated May 22, 1860.—This invention has for its object the cutting or shearing of India rubber cloth into narrow strips by a new and improved system of rotary shears, which are constructed and arranged upon suitable shafts in such a manner that they will be brought in contact only at their cutting edges, or so that the points of contact of the shears will be the cutting points.

Claim.—The annular shear plates, when formed and arranged essentially as and for the purposes described, so that their cutting edges will always be kept in perfect contact, and so as by their elasticity to correct any variations in their thickness, resulting from imperfect workmanship or other causes.

No. 28,346.—WILLIAM R. CARNES, of Roxbury, Mass.—*Improved Flush Bolt.*—Patent dated May 22, 1860.—This invention consists of a door fastening in which a single spring catch or bolt is employed to secure the door when closed, which bolt, of itself, forms the face of the fastening, and is so shaped at its end that it may spring in and out of the striker when one door is opened or closed, and so arranged that when the other door is closed its edge shall rest against the bolt and prevent it from being withdrawn from the striker.

Claim.—The above described flush bolt or door fastening, consisting of a single spring bolt flush with the edge of the door or jamb which is locked by the edge of the other door, as set forth.

No. 28,347.—ALFRED CARSON, of New York, N. Y.—*Improved Fireplace.*—Patent dated May 22, 1860.—The object of this invention is to obviate the difficulty hitherto attending open grates or fireplaces for heating apartments, to wit: the escape of a large amount of heat up the chimney or flue, the result being due to the encompassing of the back and sides of the fireplace or grate by the masonry of the chimney and the consequently small area of heat radiating surface exposed, together with the very direct communication of the fire with the chimney or flue.

Claim.—The arrangement of the inclined grate I, fireplace C, feeder G, hearth plate H, and cold air passage j, with or without the air heating passage E, substantially as and for the purpose set forth.

No. 28,348.—F. Y. CLARK, of Savannah, Ga.—*Improvement in Moulds for Metal Dies used by Dentists.*—Patent dated May 22, 1860.—This invention consists in an improved construction of the impression cup, and in a new system of flasks employed in combination with the impression cup, and the impression taken directly from the mouth, the whole constituting a complete mould possessing the requisite qualities.

The inventor says: I *claim*, first, the impression cup, perforated, substantially as described, for the purposes specified.

Second. The combination of the perforated cup C, the impression obtained directly from the mouth, and the two flasks A and B B, constructed substantially as described, the whole constituting a mould for casting the die, of which the impression taken directly from the mouth forms a part, as specified.

No. 28,349.—A. C. CLEMENS, of Crain Township, Ohio.—*Improvement in Apparatus for Evaporating Saccharine Juices.*—Patent dated May 22, 1860.—This invention consists in an improved construction and arrangement of the fire box and smoke pipes, in connection with a peculiar arrangement of the division of the pan.

Claim.—The construction and arrangement of the several fire chambers and the two smoke pipes with the damper I, in combination with the peculiar arrangement of the pan in different divisions, at variable heights, substantially as set forth, for the purposes described.

No. 28,350.—JOSEPH H. CLIFTON, of New Castle, Pa.—*Improvement in Bands for Machinery.*—Patent dated May 22, 1860.—The claim explains the nature of this invention.

Claim.—A band, the warps of which are of animal fibre, and the wefts, of either animal or vegetable fibre, impregnated or coated with pliable cement.

No. 28,351.—L. O. COLVIN, of Cincinnati, Ohio.—*Improvement in Cow Milkers.*—Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the adjustable elastic tube D between the tubes E C, as and for the purpose shown and described.

Second. The attaching of the tubes C of the teat tubes to the pump cylinder b, by means of the balls q, sockets p, and elastic tubes r, for the purpose set forth.

Third. The employment, in combination with the milk pail, of a pump provided with double pistons and double brakes, or lever, that move in opposite directions, so that the force required to move one of the brakes and pistons in one direction will be counterbalanced or equalized by the force applied to move the opposite piston and brake, thus preventing the pail and apparatus from being capsized or displaced by the act of pumping, and also producing a quick vacuum within the pump, all as shown and described.

No. 28,352.—WILLIAM COMPTON, of New York, N. Y.—*Improved Pianoforte Action*.—Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the repeating finger k, when placed diagonally to the fly of the jack and taking the butt g of the hammer beneath the centre on which said hammer moves, for the purposes and as specified.

Second. I claim the twining pin 8, combined with the spring in the jack of a piano, for regulating the power of such spring, as specified.

Third. I claim the regulating top screw 5, to adjust the elastic material that takes the side of the fly jack c, for the purposes set forth.

Fourth. I claim the regulating button 4 only when formed on and adjusted by a screw that passes through the base of the jack fly c, whereby the said button is drawn out with the key and is not in the way of the check l in removing the key, as specified.

Fifth. I claim controlling the action of the repeating parts of pianoforte actions by means of the hammer rail e that takes said parts and determines their position relatively with the hammer itself, as set forth.

No. 28,353.—G. W. DAVIS, of Brooklyn, N. Y.—*Improved Arrangement of Counter Shaft*.—Patent dated May 22, 1860.—This invention relates to an arrangement of counter shaft, or intermediate shaft and pulley, or pulleys, between a driving shaft and a shaft to be driven by it, whereby the belts running from the driving shaft to the intermediate shaft and to the shaft to be driven are both kept at a uniform tension, notwithstanding any expansion and contraction of the belts or any untrue wear or settling of the driving shaft or machinery, and whereby provision is afforded for regulating the tension of the said belts according to the amount of power required to be transmitted, and for letting them slack when the transmission of power is desired to be suspended.

The inventor says: I *claim*, first, the yielding counter shaft or intermediate shaft D suspended upon and attached to the carriage, as described, and in relation to the shafts B and C, as set forth.

Second. The lever S in combination with the gate F and the weight P, substantially as and for the purpose specified.

No. 28,354.—G. W. DAVIS, of New Orleans, La.—*Improvement in Ice Cream Freezers*.—Patent dated May 22, 1860.—In the interior of the cylinder b is the frame K which agitates the cream as the cylinder revolves; this frame has a pintle at its base for its centre in the cylinder, and is joined to the pipe S at its upper end, which has a cap r, made conical, over which the cream flows, and is discharged near the circumference or body of the cylinder, to be in proximity to the ice.

Claim.—The vessel P, pump V, pipes X and S, in combination with cylinder b, when arranged and operated as, or substantially as, and for the purpose set forth.

No. 28,355.—A. E. DORY, of North Henderson, Ill.—*Improvement in Seeding Machines*.—Patent dated May 22, 1860.—To the under side of the machine, below each seed box D, there are attached plates H, one under each hopper; the front parts of these plates are straight, but the back parts are curved inwards, or towards the seat G; these parts are secured at their inner sides of the discharge openings h, which are in the boards i below the lower parts b of the slide bar E; the plates H have an edgewise position, and their front parts are curved, serving as cutters or coulters, while their curved back ends form the furrows.

Claim.—The arrangement of the double-acting plates H, openings h, boards i, slide bars E, boxes D, levers F, rollers B, and scrapers I, all as and for the purpose shown and described.

No. 28,356.—CAROLUS DUNHAM, of New Haven, Conn.—*Improvement in Potato Diggers*.—Patent dated May 22, 1860.—This invention consists in so constructing the machine by the combination of cog wheels, cranks, spring planes, inclined planes, and levers, attached to a two wheel vehicle, with a shoe or shovel beam plough and a common rake, as to raise the

potatoes, or other circular vegetable, upon an apron with slats or rods attached, by the motion of the rake to clear the vegetables from the earth, leaving them on the surface.

Claim.—The rake 6, operated as described, the plane 13, spring inclined plane 14, in combination with the plough and plough box having closed sides and open bottom, substantially as described and for the purpose set forth above.

No. 28,357.—DAVID ELDRED, of Monmouth, Ill.—*Improvement in Seeding Machines.*—Patent dated May 22, 1860.—This invention consists in the use of an adjustable scattering board attached to the seed box, and so arranged relatively therewith that the distribution of the seed may be stopped whenever desired, without throwing the working parts of the distributing device out of gear with the driving wheel. It further consists in a means employed for retaining the seed in proper position within the seed box, so that the distribution of the seed will not be affected by the inclination of the machine in moving over inclined ground.

The inventor says: I *claim* the employment or use of the tubes or seed receptacles *a*, when attached to the peripheries of the wheels E, and provided with adjustable yielding or elastic stoppers *b*, arranged as and for the purposes set forth.

I also claim the adjustable or hinged scattering board F, attached to the seed box C, as and for the purpose specified.

I further claim the double inclined partitions *c c*, in the seed box C, arranged relatively with the seed distributing wheels E, for the purpose set forth.

No. 28,358.—WALTER FITZGERALD, of Boston, Mass.—*Improved Pegging Machine Jack.*—Patent dated May 22, 1860.—This invention is an improvement upon the means shown in United States patent No. 18,879, for feeding the shoe to the action of the pegging mechanism. Its object is to simplify and cheapen the means now in use for feeding the boot, or shoe, so as to present at regular spaces new portions of the sole to the action of the awl and peg driver.

Claim.—The combination and arrangement, in a pegging machine, of the friction feed rolls *j* and *d*, with the plate *o*, which carries the shoe, and the guide gauge *q*; all operating together, substantially as set forth.

No. 28,359.—ANDREW A. GARVER, of Mechanicsburg, Pa.—*Improvement in Digging Machines.*—Patent dated May 22, 1860.—This invention consists in the combination, with a cylinder, or roller, of spades so hung in said cylinder as to be capable of being vibrated as the roller revolves to relieve them in their operation; also in the combination with a cylinder having vibrating spades of a detachable connection, which connects the cylinder and the traction wheels by which the machine is made capable of acting as a pulverizer at the same time by its action scattering the earth in various directions.

The inventor says: I *claim*, first, the combination, with the cylinder 5, of the spades 6, so arranged, in connection with the other parts as to have a torsional vibration, as described, for the purposes set forth.

Second. The combination of the cylinder 5, and the torsionally vibrating spades 6, with the traction wheels 11 and 12, or one of them, by means of detachable gearing, substantially as and for the purposes stated.

No. 28,360.—GEORGE W. GERAU, of Brooklyn, N. Y.—*Improvement in Mainsails of Fore-and-Aft Vessels.*—Patent dated May 22, 1860.—The object of this invention is to simplify and lighten the fore and aft rig still further than by United States patent No. 15,420, and at the same time obviate the necessity of furling aloft.

Claim.—The combination, with the lower mast and topmast, of the sail A, and halyards E F, as and for the purpose shown and described.

No. 28,361.—JOHN GILMORE, of New Orleans, La.—*Improvement in Machines for Cleaning Cotton.*—Patent dated May 22, 1860.—Immediately below the perforated part *g* of the shell, a slide G is placed, said slide forming the bottom of a box H. The slide G is inclined corresponding to the inclination of the lower part *g*. The slide is within the compartment *b*, and this compartment is provided with a door.

The inventor says: I *claim* the arrangement and combination of the feed box H, and slide G, between the picker B and the compartment *b*, as and for the purpose shown and described.

I also claim the combination of the chute *m*, with the slotted bottomed spout I, as and for the purpose shown and described.

No. 28,362.—J. H. GLOVER, of Glasgow, Ky.—*Improvement in Hanging Mill Stones.*—Patent dated May 22, 1860.—A is an upper mill stone, or runner; B the lower, or bed stone, which is stationary; C is the spindle, the collar *a* of which is fitted in the bush D at the centre of the bed stone B; E is a conical shell which has a cylindrical apex, or head *d*, in the under side of which a square opening *e* is made to receive the upper part *f* of the spindle C, which is also square and smaller in diameter than the opening.

Claim.—The employment of the adjustable conical shell E, when arranged and constructed as shown, in combination with the stones A B, as and for the purposes set forth and described.

No. 28,363.—JOSEPH F. HALL, of Bangor, Maine.—*Improved Curtain Fixture.*—Patent dated May 22, 1860.—This invention consists in the combination of the bracket and spring in one piece of mechanism; the bracket, while sustaining one end of the curtain roller, at the same time acts as a spring pressing the roller against the bracket at the opposite end of the roller, thus creating a friction bearing, whereby the curtain is sustained in any desired position.

Claim.—The spring bracket E, substantially as described, for the purposes set forth.

No. 28,364.—SAMUEL HALL, of Boston, Mass.—*Improved Attachment of Yards to Topmasts.*—Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Attaching the yard to the topmast by means of the swiveling shaft *b*, the axis of which passes through the yard, and both the standard *e* and brace *g* of the swinging crane, in the position and manner substantially as described.

No. 28,365.—ASA HAPGOOD, of Worcester, Mass.—*Improved Ventilator for Railroad Cars.*—Patent dated May 22, 1860.—The object of this invention is to produce a simple and efficient ventilator for introducing fresh air into railroad cars, and for separating the dust from the air before the air is admitted into the car.

Claim.—The described ventilator, consisting of the box A, hood B, wheel D, and water box C, arranged and operating in the manner described, for the purpose specified.

No. 28,366.—WILLIAM H. HARN, of Carlisle, Pa.—*Improvement in Preserve Cans.*—Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention.

Claim.—In disks for closing the openings in preserve jars or cans, or other vessels, making the inside disk in two parts or pieces, substantially as described, so that it may be readily passed into or through the opening to be closed.

No. 28,367.—ABIEL HAYES and JAMES VANCUREN, of Chenoa, Ill.—*Improvement in Corn Planters.*—Patent dated May 22, 1860.—This invention consists in constructing and arranging the parts of the machine named in the claim.

Claim.—The arrangement of the slides D D, provided with cutters *a a*, with seed openings *d* in their rear, and with coverers H H, when the same are used in connection with the frame A, seed boxes J J, seed slide *e*, treadle F, and lever I, substantially in the manner and for the purpose specified.

No. 28,368.—ELIJAH HARRIS, of Princeton, Ill.—*Improvement in Spade Ploughs.*—Patent dated May 22, 1860.—This invention consists in making a spade plough supported and driven by driving wheels, causing the cylinder furnished with spades in spiral rows to revolve with sufficient velocity to thoroughly cut and turn over the soil at any reasonable depth.

Claim.—The arrangement of the cylinder J, in combination with spades K¹ K¹, pivots L L, pinions M M, master or driving wheels D D, arms G G, slotted guide N, scrapers O O, and rod P, with a cord attached to it, substantially as shown and described.

No. 28,369.—WILLIAM H. HENDERSON, of Franklin, Ind.—*Improved Machine for Making Rain Troughs.*—Patent dated May 22, 1860.—This invention consists in constructing and arranging the different parts of the machine.

The inventor says: I *claim*, first, the employment of the box A and the curved metallic braces and supporters B B, when the same are used substantially as and for the purpose specified.

Second. In connection with the box A, the employment of the levers C C C, screws *d d d*, and nuts E E E, when the same are used for holding the gutter in proper position for soldering the joints and braces in the gutter, substantially as set forth.

No. 28,370.—MARTIN A. HOWELL, JR., of Ottawa, Ill.—*Improved Safety Paper.*—Patent dated May 22, 1860.—The claim explains the nature of this invention.

Claim.—The application of metal, in foil or in powder, between the laminæ of thin paper, to designate the character or denomination of each particular bank note or other money security for which my improvement may be applied, substantially as described.

No. 28,371.—SAMUEL HUFFMAN, of Richmond, Va.—*Improvement in Sewing Machines.*—Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention

The inventor says: I *claim*, first, the reciprocating shuttle N, when so constructed that its bobbin shall revolve upon an axis perpendicular to the plane of its motion, and when one side is closed, in combination with an adjustable yielding pressure upon the thread after it has passed from the bobbin, as specified.

Second. Making the shuttle race adjustable in its depth, substantially in the manner and for the purpose set forth.

No. 28,372.—JOHN S. HUGGINS, of Timmons ville, S. C.—*Improvement in Ploughs*.—Patent dated May 22, 1860.—A is the beam; B B are the handles; D is the standard; and *d* the cross wrung of the plough; *a* is the helve, *b* the share, *g* the sword; *m* and *n* are bolts by which share *b* and sword *g* are secured to the helve *a*. H is the clevis, and *h* is a link to which it is coupled by a pin *i*, said link being pivotted to the beam.

The inventor says: I *claim*, first, the adjustable helve *a*, in combination with the slotted beam A, and the removable shares, the whole constructed and operating as specified, for the purpose set forth.

Second. I claim the removable sword *g*, in combination with the adjustable helve *a* and removable shares, the whole arranged and operating as specified, for the purpose set forth.

No. 28,373.—STEPHEN HULL, of Poughkeepsie, N. Y.—*Improvement in Supporting the Grinding Plates in Mills*.—Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* attaching a cylinder, having a rough or grating surface, to the frame of grinding mills, with spring hoppers, when the cylinder is made to run in an upright position or nearly so, in combination with portable grinding mills, substantially as and for the purposes set forth.

I also claim the cylinder with the diamond points in spiral rows, in combination with spring hoppers, when the cylinder is made to run in an upright position or nearly so, substantially as set forth and for the purposes described.

No. 28,374.—G. HENRY HULSKAMP, of Troy, N. Y.—*Improved Pianoforte Action*.—Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement and construction of the action for pianofortes, substantially as set forth.

Second. I claim the regulating screw L, secured to the key, and also the spring M, to hold the hammer lifter in its proper place, substantially as set forth, or its equivalent.

Third. I claim the improved back check, with spring fastened to the key, for the purpose set forth, substantially as described.

Fourth. I claim the lever D D, jointed and connected with the hinge butt and hammer butt, to lift the hammer or its equivalent.

Fifth. I claim securing the hinge butt to its bar, in the manner and for the purpose set forth, or its equivalent, and the same device in other parts in the action.

No. 28,375.—JOHN R. INGERSOLL, of New York, N. Y.—*Improved Hair Brush*.—Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A brush provided with an elastic reservoir, so that by compression of some part thereof the liquid will be injected into the brush, as shown and described.

No. 28,376.—DANIEL C. JORDON, of Centre Port, N. Y.—*Improvement in Hand Cultivators*.—Patent dated May 22, 1860.—The object of this invention is to obtain a cheap and portable hand cultivator, for eradicating weeds and loosening the soil in drill husbandry, and in passing where the plough would be too cumbrous.

Claim.—The combination of the several parts described, whereby is obtained adjustability and portability, when the same are arranged in the relation set forth, for the purposes specified, it being understood that I do not claim each part separately or irrespective of its substantial arrangement.

No. 28,377.—JOSEPH W. KERR, of Pittsburgh, Pa.—*Improvement in Gasaliers*.—Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Combining with a gasalier, consisting of a cluster of gas burners, placed in or near the mouth of a flaming pipe or tube, a ventilating pipe D and screw B, constructed and arranged substantially as described, for the purposes of ventilation and increasing the brilliancy of the light.

No. 28,378.—LEONARD KING, of Bridgeport, Conn.—*Improved Fire Escape*.—Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment of the ladder D, in place of the perch, for connecting the fore wheels A and the hind wheels, substantially in the manner described.

Second. The combination of the hinged legs F and brake, substantially as described, for the purpose of securing the hind wheels with the frame C in the desired place and position.

Third. The arrangement and combination, with the ladders D, of the sliding head *e*, operated by a screw *e*¹, substantially as and for the purpose specified.

Fourth. The arrangement of the sockets *k*, in the ends of the axle *d* of the hind wheels, in combination with the braces J, constructed and operating substantially as and for the purpose set forth.

Fifth. The arrangement and combination of the fore wheels A, catch E, ladders D, hind wheels B, and frame C, substantially as and for the purpose described.

No. 28,379.—A. KIRLIN, of New Boston, Ill.—*Improvement in Seeding Machines*.—Patent dated May 22, 1860.—This invention consists in the arrangement of rotary cylinders in the bottoms of two hoppers, for planting in two rows at one time, having suitable cups punched in them for receiving and dropping seed into a vertical seed tube as they are rotated, and having on each of their sides a number of suitable cams for operating valves placed in the bottoms of the seed tubes, so that the dropping of seed from the hoppers into the bottom of the tube and the dropping of said seed from the seed tubes will take place alternately, thereby enabling the operator to bring the bottom of the seed tubes near the surface of the ground and drop the seed instantly from them into the hills, regularly, without scattering the seed.

Claim.—The drums G G, with their side cams and cups, arranged as set forth and operated by the marker wheels E E, in combination with the yoke rods K and valve bottoms J, as and for the purposes set forth.

No. 28,380.—LOUIS KNOCKE, of Davenport, Iowa.—*Improved Fire Escape*.—Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination and arrangement of a movable platform *a* with hinged sides *c f d e*, a hinged and jointed mast *p q*, carriage *c*¹ *k*¹, staples *y*, and anchor bars *x*, substantially as and for the purposes set forth.

Second. Combining a movable platform with hinged sides, which consist of hinged railings *d e*, a hinged bottom *f*, and a ladder *c*, substantially as and for the purposes set forth.

Third. Combining the carriage *c*¹ *k*¹ with tapering cross beams *n*¹, staples *y*, and anchor beams *x*, substantially as and for the purposes set forth.

No. 28,381.—GOTTFRIED KOBER, of New York, N. Y.—*Improvement in Machines for Making Lozenges*.—Patent dated May 22, 1860.—The object of this invention is to produce a simple and efficient mechanism for cutting out lozenges, giving to them the desired color and impressing them with suitable letters or inscriptions.

The inventor says: I *claim*, first, the arrangement and combination of the vibrating arms D, the spring F, cutters *h*, scrapers *e* and *f*, and pistons *l*, constructed and operating substantially as and for the purpose specified.

Second. I *claim*, in combination with the pistons *l* and cutters *h*, the coloring roller P, when the same is operated by vibrating arms Q, or their equivalents, so as to sweep over the faces of the pistons, substantially in the manner and for the purpose described.

No. 28,382.—THOMAS B. LAMB, of Summitt, Mich.—*Improved Vise*.—Patent dated May 22, 1860.—At the back of the stationary bar A is a socket I, in which there are placed two grippers J J, one at each end of the bar F. These grippers are simply metal blocks having their inner sides serrated, corresponding to the racks *e e*. The grippers are allowed to slide laterally in the socket I, and both grippers are encompassed by a metal strap K, in one end of which the axis of an eccentric L bears against one gripper; to the upper end of the axis of the eccentric L a crank *f* is attached.

Claim.—The combination of the grippers J J, pressure eccentric L, and serrated bar F, with the socket I and jaws B D, as and for the purpose shown and described.

No. 28,383.—JOEL LEE, of Galesburgh, Ill.—*Improvement in Corn Planters*.—Patent dated May 22, 1860.—This invention relates to improvements in several parts of seed planters, and is designed to render such planters more accurate.

The inventor says: I *claim*, first, the feet, formed and constructed as described, the plunger, the friction rollers, the cam, and the oscillating arm, to save the friction of the plunger, when the same are arranged and used in the manner and for the purpose specified.

Second. The arrangement of the seed chamber in the foot, with the cut-off valve, the oscillating arm and the groove in the top of the dropper, when used as and for the purpose specified.

No. 28,384.—WILLIAM N. LOCKWOOD, of New Britain, Conn.—*Improvement in Ox Yoke Fastenings*.—Patent dated May 22, 1860.—A is a yoke, or part of one, having a hole for

inserting the bow B; C is the pin which passes through the bow; D is a hinged bar or horn which fastens and secures the pin to the bow.

Claim.—The pin C and horn D attached to the same stock, as described, and operating in combination with the ox bow B as a fastening for ox yokes, substantially as set forth.

No. 28,385.—PAUL MARCELIN and ERNEST EUDE, of New Orleans, La.—*Improvement in Apparatus for Clarifying Cane Juice.*—Patent dated May 22, 1860.—This invention consists of an improved apparatus for the manufacture of sulphurous acid or bi-sulphate of lime, and for using the same in the production of sugar.

The inventors say: We *claim* the combination of the furnace, washer, pumps, gasometer, tester, receivers, water column, and alembic, the whole being constructed, arranged, and operated substantially as set forth, for the purposes described.

Second. We also claim the use of the gasometer K and gas tester Y in combination with either the pumps H and furnace A, or with the alembic I, substantially in the manner and for the purposes specified.

No. 28,386.—JOHN W. MASTEN, of Utica, N. Y.—*Improvement in Seed Planters.*—Patent dated May 22, 1860.—A is the seed hopper; it is supported on a frame *a* resting on the axle B, said axle having driving wheels H. C is a jointed frame connected to the under side of the axle, having its bottom sections hinged, as shown at *b*; to the forward end of these hinged sections are secured the furrow shares D immediately behind which an opening or hole is made in the hinged section, to allow the seed conducting tube E to pass through, said tube being placed immediately under and in communication with an opening in the bottom of the hopper A and serving to conduct the seed into the furrow prepared by the shares D; a concave seed roller F is suspended from the frame C just behind the tube.

The inventor says: I *claim*, first, the adjustable hinged projection I on the seed slide G, in combination with the cams *e e* on wheel H¹, substantially as and for the purposes set forth.

Second. The arrangement of the partitioned hopper A, distributing seed slide G, spring cut-offs *g*, adjustable hinged projection I, wheel H¹ with cams *e e*, main frame *a*, and jointed frame C, in the manner and for the purposes set forth.

No. 28,387.—JOHN MASTERS, of Waukegan, Ill.—*Improvement in Ditching Machines.*—Patent dated May 22, 1860.—The object of this invention is to obtain a machine that will form a ditch and elevate and discharge the excavated earth upon one side of the ditch however deep it is found desirable to dig down.

The inventor says: I *claim*, first, the combination, with the trough and elevators, of the adjustable standards M M, adjustable cross brace N, chain P, and windlass P¹, arranged and operating substantially as set forth.

Second. I claim, in combination with the adjustable castor wheel and standard D, the two adjustable inclined slotted coulters S S, arranged as and for the purposes set forth.

No. 28,388.—THOMAS J. MAYALL, of Roxbury, Mass.—*Improvement in the Manufacture of Rubber Hose.*—Patent dated May 22, 1860.—The inventor says: I take a metal pipe of the intended size of the bore of the hose or tube and fold around it strips of cloth covered with a vulcanized compound of rubber or gutta percha, or strips of the same compounds prepared with fibrous materials, for the purpose of giving it additional strength; after the hose is thus prepared I wrap it tightly in sheets of flexible metal; the hose is then vulcanized; I take great pains, in vulcanizing the hose, to wrap it tightly in the sheets of flexible metal.

Claim.—The mode of vulcanizing India rubber or gutta percha hose or tubing, by heating the same in sheets of flexible metal, thereby gaining greater strength and a smooth surface to the hose or tubing.

No. 28,389.—THOMAS J. MAYALL, of Roxbury, Mass.—*Improvement in Rubber Hose Tubing.*—Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, filling or partially filling a woven tube, composed of cotton, flax, or other fibrous materials, with any proper rubber cement, and then driving the said cement into the inner surface of the woven tube, so as to form a water proof lining therein by means of rolls or other devices for accomplishing the desired result applied to the outside of the woven tube.

Second. I claim inserting within the woven tube, coated on its interior surface with an adhesive cement, as described, an inner tube of rubber or gutta percha, so that the woven tube and inner tube can be united by vulcanizing, as set forth, and for the purpose of forming a smooth bore to the hose or tubing.

Third. I claim sprinkling or dusting the outer surface of the rubber or gutta percha tube, that is, to form the lining of the hose, with such a non-adhesive material as shall incorporate

with the adhesive cement on the inner surface of the woven tube when heated or cured, as set forth

No. 28,390.—WILLIAM T. McMILLEN, of St. Louis, Mo.—*Improved Coal Grate*.—Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement and location of the hot air chambers H I I¹ J, with their communicating passages and with regard to the fire box and the driving and ascending flues L M, whereby I economize heating and radiating surface without impeding the draft, as set forth

No. 28,391.—MONTGOMERY C. MEIGS, of Washington, D. C.—*Improvement in Valves for Hydrants, &c.*—Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of a barrel or slide having the contrivance for regulating the flow of water through the barrel or slide by means of serrations, or notches, or perforations of proper form, and extending to and terminating at different depths or heights above the seat of the poppet valve, forming a slide poppet valve.

Second. The combination of the conical plug or many-way valve, used as a stopcock for governing the distribution and flow of water at the intersection of two or more water mains or distributing pipes, with the serrated or perforated slide poppet valve for a hydrant, the valves thus combined into one being lifted and depressed by a single screw.

Third. The combination and arrangement of the various parts into a many-way stopcock and hydrant or fire plug, substantially as described and set forth.

No. 28,392.—AYRES P. MERRILL, JR., of Natchez, Miss.—*Improvement in Locks for Cotton Bales*.—Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the rounded out notches in the end of the strap, band, or hoop, and the pyramidal shaped opening in the buckle, for the purpose of forming a lock or fastening to the hoops of cotton and other bales, and when constructed to operate together, substantially as described.

No. 28,393.—PURCHES MILES, of New Haven, Conn.—*Improved Meat Cutter*.—Patent dated May 22, 1860.—The operation of this machine is as follows: The crank L is turned with the right hand, and the cylinder J is filled with meat in pieces of suitable size; as the cap H rotates the flanch *f* forces the meat down between the flanches *b*, and the pendants *g* force the meat past the cutters B. The flanches *b*, in connection with the rotating flanch *f*, have a tendency to feed or press the meat towards the periphery of the case or shell, and as the meat becomes minced, or cut sufficiently fine to pass between the pendants *h*, it is discharged through the spout C, by the pendants *h*¹, the latter clearing the space between the pendants *h* and the periphery of the case or shell. The operator presses his left hand on the plunger K. The sausage cases are connected to the spout C.

The inventor says: I *claim*, first, the combination with the cap H, of the screen *h h*¹, in the manner shown and described, so that the meat cannot be discharged until properly cut, all as specified.

Second. The employment of the plunger K, in combination with the screen *h h*¹, as and for the purposes set forth.

Third. The employment of taper formed pendants *g*, in combination with the eccentrically arranged cutters B, as and for the purposes shown and described.

Fourth. The employment of the spring G, and stop D, in combination with the screen *h h*¹, as and for the purposes set forth.

No. 28,394.—JOSEPH S. MILLER and S. LLOYD WIEGAND, of Philadelphia, Pa.—*Improved Machine for Printing Butter*.—Patent dated May 22, 1860.—This invention consists in moving the mould during the act of printing, and in leaving the printed butter in a state of rest at the time of drawing the mould, and also in the particular arrangement of mechanism for effecting this result.

The inventors say: We *claim*, first, the mould A, and follower or piston M, and the lug O, used in the manner and for the purposes described.

Second. The treadle F, link G, lever E, and links D and D¹, operating the mould A, and piston M, substantially in the manner and for the purposes described.

No. 28,395.—GEORGE A. MITCHELL, of Turner, Me.—*Improved Jointed Tip for Boots and Shoes*.—Patent dated May 22, 1860.—This invention consists in providing the upper and toe portions of boots and shoes with a tip, which is extended back the desired distance towards the heel, and made in sections. The ends or edges overlapping each other where it protects the upper, and not coming in contact where it is confined between the soles, in order

to effectually protect the upper, and at the same time not render the soles rigid or prevent their elasticity.

Claim.—The construction and application of the described tip, made jointed or in sections, substantially in the manner and for the purposes fully set forth.

No. 28,396.—DANIEL MONTAGUE, of New Bedford, Mass., and JAMES TOWNSEND, of Gardiner, Me.—*Improved Glass Door Plate.*—Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the combination of a hollow glass door or name plate A, spring fastening strip or bar B, and elastic mat or cushion D, substantially in the manner and for the purpose described.

Second. The spring fastening strip, provided with screw bolts, arranged within the hollow glass door or name plate A, and having its ends confined in grooves *a a* of the glass plate A, substantially as and for the purpose set forth.

No. 28,397.—ORRIN NEWTON, of Pittsburgh, Pa.—*Improvement in Making Sheet Metal Caps, &c.*—Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The use of a die, or succession of dies, each having a smaller cavity than the preceding one, the mouth of each die being of the diameter of the blank or unfinished cap to be operated upon, and the diameter of the cavity rapidly diminishing through part of its depth and thence to the bottom, having the same angle to the axis of the die as the sides of the finished cap are designed to present to its axis, with a plunger or plungers fitting into said die of the same shape as the lower part of the dies, and of such diameter as, together with the metal of the disk or cap, to fill up the entire diameter of the dies, for the purpose of drawing out radially and contracting circumferentially the edge of metallic disks so as to form seamless caps or boxes, substantially in the manner described.

No. 28,398.—HENRY L. NICHOLS, of New York, N. Y.—*Improved Carpet Cleaner.*—Patent dated May 22, 1860.—The object of this invention is to combine in a novel manner with vibrating beating or whipping arms, stiff or elastic, a brush or broom cylinder, and fans, for beating, brushing, and blowing off the dust from carpets all at one and the same operation, and for brushing both sides of the carpet as it passes through the machine.

Claim.—The rotary brush and blast boards *a*, in combination with vibrating beating arms *m m*, arranged substantially as and for the purposes set forth.

No. 28,399.—JAMES NUTE, of East Boston, Mass.—*Improvement in Hanging Top Sail Yards.*—Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Supporting the yard E, independently of the top mast, substantially as shown and described, so that, in case the top mast is carried away, the yard will still remain supported, all as set forth.

No. 28,400.—G. M. NYE and A. T. HAVILAND, of Elmira, N. Y.—*Improved Hollow Auger.*—Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the combination and arrangement of the cutting lips or edges *e f*, having their inclinations alternately reversed, so that one cuts in a direction which crosses that of the preceding one; said cutters being formed with a series of planes and grooves *i i*, upon their faces, substantially in the manner and for the purposes specified.

Second. I claim the vertical spurs *g g*, in combination with the alternate cutters.

No. 28,401.—CHARLES OYSTON, of Little Falls, N. Y.—*Improvement in Power Press.*—Patent dated May 22, 1860.—In using this press the power is applied to the pinion shaft F, by a lever J, one end of which is attached loosely to the shaft, and from the other may be hung a suitable weight. To this lever is applied a weighted pawl K, which engages with the teeth of a ratchet wheel M, keyed securely to the shaft F. By raising or depressing the lever J, the shaft will be turned in the direction indicated by the arrow, and the follower will be forced down.

Claim.—The combination of the internally geared sector C, formed as shown, with the sector D, pinion E, follower B, rods G H, lever J, crank N, and pawls K P, the said parts being constructed and arranged to operate, as and for the purpose shown and described.

No. 28,402.—CHARLES W. PACKER, of Philadelphia, Pa.—*Improvement in Ice Cream Freezers.*—Patent dated May 22, 1860.—This invention consists in the combination of the inner revolving vessel of an ice cream freezer, with certain stationary blades and stationary

deflectors, arranged and operating so as to cause, in the inner vessel, continuous eddies of the cream, and a continuous removal of the frozen portions of the latter from the sides of the vessel, and a continuous flow of the unfrozen portion towards the sides of the same.

Claim.—The revolving vessel C, in combination with stationary inclined blades K and K¹, and inclined deflectors x and x^1 , the whole being arranged and operating as and for the purpose set forth.

No. 28,403.—LOUIS PLANER, of New York, N. Y.—*Improvement in Converting Reciprocating Rectilinear into Intermittent Rotary Motion.*—Patent dated May 22, 1860.—The claim and engravings explain the nature of this improvement.

The inventor says: I *claim*, first, the employment of the hinged cam E, in combination with the dogs C D and grooved wheel A, constructed and operating as and for the purpose described.

Second. Arranging the dogs C D, with V-shaped edges lm , to fit into a corresponding V-shaped groove or recess B, in the wheel A, substantially in the manner and for the purpose specified.

Third. Giving to the advancing corners $c^1 d^1$ of the dogs C D, the shape of knife edges, substantially as and for the purpose set forth.

Fourth. Arranging the surface of the dog C in such a manner that its rear edge projects above the upper edge of the recess B, and that all the dirt scraped off by the advancing corner c^1 is caused to discharge over the wheel A, substantially as described.

No. 28,404.—JOSEPH F. POND, of Cleveland, Ohio.—*Improved Washing Machine.*—Patent dated May 22, 1860.—This invention consists in combining with a fluted roller, in fixed bearings, a spring bed beneath said roller, grooved obliquely to the axis of the roller, so that the clothing will be subjected to a continued pressure while passing between the bed and roller.

Claim.—The obliquely fluted spring bed C, substantially as described, in combination with the fluted roller R, arranged and operating substantially as and for the purpose specified.

No. 27,405.—WASHBURN RACE, of Seneca Falls, N. Y.—*Improvement in Pumps.*—Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* suspending the spout piece H and its dependent parts, in the hollow standard A, by a conical bearing, or its equivalent, the parts suspended being free from any connection or support except the said suspension bearing, substantially as and for the purposes specified.

In combination with the above suspension of the parts in the standard A, I also claim the arrangement of the spout piece H and standard A, so that the spout may be turned at any moment, either to the right or left position, in relation to the working lever, as described.

I also claim the arrangement of the grooves or flutes $b b$, in the conical bearing of the spout piece, or correspondently in the standard, as specified, so as to apply the means of ventilating the well to the additional purpose of preventing the freezing of the water within the spout piece, substantially as set forth.

No. 28,406.—ANDREW RANKIN, of Philadelphia, Pa.—*Improved Lock.*—Patent dated May 22, 1860.—This invention consists in a supplementary tumbler, having a spring, certain projections, and a shoulder, in combination with a spring and stop, connected in the case of the lock, the whole, with the bolt, being arranged for joint action, thereby enabling the occupant of the room to lock himself in, free from the intrusion of those desiring to gain access from the outside, and at the same time enabling the possessor of the key to lock and unlock the door from the outside so long as it remains unlocked from the inside.

Claim.—The supplementary tumbler, its spring r , its projections t and u , and shoulder q , all of the form described, in combination with the spring p and stop s , the whole, with the bolt, being arranged for joint action, as and for the purpose set forth.

No. 28,407.—ISAAC N. RANKIN, of Middletown, Iowa.—*Improvement in Ploughs.*—Patent dated May 22, 1860.—The back mould board and landside are somewhat below the front ones, and the latter, as the implement is drawn along, remove all weeds and trash, and prepare the way for the back plough, which throws up the sub-soil; the front plough turns down the stubble, the weeds, and manure, while the back plough completely covers the same with the sub-soil, and favors their decomposition to nourish the crop to be grown.

Claim.—The arrangement of the double curved standards C C, braces F F, bars E, landsides D D, shoes C¹ C¹, handles B B, and beam A, as and for the purpose shown and described.

No. 28,408.—M. G. RHODES and J. M. SCAGGS, of Talladega, Ala.—*Improvement in Ploughs.*—Patent dated May 22, 1860.—This invention consists in a peculiar construction

of the plough stock, making the same entirely of iron rods, fastened together by means of screws in such a manner that both the beam and the handles can be adjusted, and that a light and strong stock is produced.

Claim—The combination of the standard A, rods $a\ b\ c\ a^1\ b^1\ c^1$ and $d\ d^1\ f$, substantially as described, for the purpose of producing a new and improved plough stock.

No. 28,409.—CLARK ROBERTS, of Winchester, Ill.—*Improved Washing Machine*.—Patent dated May 22, 1860.—This invention consists of a peculiar arrangement of levers, to which are attached beaters or pressers, with turners, shovers, and stirrers, in a tub of ordinary construction.

The inventor says: I *claim*, first, the peculiar construction and arrangement of the levers, in combination with the turners or stirrers, substantially as described and for the purposes set forth.

Second. A hinged or opening shaft bearing, fastened and secured by a swinging cap g , substantially as described.

No. 28,410.—THOMAS N. READ, of Aspen Wall, Va.—*Improvement in Tobacco Presses*.—Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention.

Claim.—In combination, with a hinged presser beam carrying at its free end the gearing and the person or persons who operate the press, a hinged rack, which is held up to the gearing by a presser roll, or its equivalent, substantially in the manner and for the purpose set forth and explained.

No. 28,411.—MARSHALL S. ROOT, of Medina, Ohio.—*Improvement in Seeding Harrows*.—Patent dated May 22, 1860.—The inventor says: The advantage gained by this improvement is in the construction of the frame B B, so that the harrow wheels may be made to follow each other in as direct a line as the operator may desire.

Claim.—The special arrangement of adjustable jointed frame B, harrows Fig. 1, and seeding machine Figs. 2, and 3, when combined and operating in the manner and for the purposes described.

No. 28,412.—SAMUEL T. SANFORD, of Fall River, Mass.—*Improved Vegetable Slicer*.—Patent dated May 22, 1860.—The operation of this machine is as follows: The vegetables to be cut are placed in the box or hopper B; the lever H is then forced down, and the follower or plunger F drives the vegetables down between the cutters, the latter slicing the vegetables into pieces corresponding in thickness to the spaces between them.

Claim.—As an improved article of manufacture, a vegetable cutter, composed of a table A, hopper B, knives D, uprights $D^1\ D^1$, followers F, toggle rod G, lever H, when arranged and constructed as shown and described.

No. 28,413.—THEODORE SELLERS, of East Birmingham, Pa.—*Improvement in Preserve Cans*.—Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The use of a cylindrical ring of India rubber, or other elastic material, in combination with and interposed between the neck of a bottle or jar and its cap or cover, each having a corresponding groove or recess for the reception of the ring, constructed and arranged substantially as described.

No. 28,414.—AMOS SHEPARD, of Southington, Conn.—*Improved Sausage Filler*.—Patent dated May 22, 1860.—This invention consists in arranging a revolving cam, which is a cone, or a section of a cone, on a shaft in combination with a cut-off, in such a manner that the face of the cam fits the cut-off and drives the cut-off in a circle whose centre is found in the axis of motion of the shaft on which is the cam.

Claim.—Arranging the cam or cams C C, in combination with the cut-off E, and the valve G, as and for the purposes described.

No. 28,415.—ISAAC SHERMAN, of Cleveland, Ohio.—*Improvement in Evaporating Apparatus*.—Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Making a sugar pan, as described, having one or more perforated tin strainers across the pan, near the outside of the fire surface, and gates placed transversely outside of the fire surface, so as to keep any sediment or other impurity from passing into the boiling part of the pan; and further, to allow the scum that rises from the boiling mass to flow over the strainer and settle there, so that it can be removed at the will of the operator

No. 28,416.—C. J. SHIVER, of Camden, S. C.—*Improvement in Ploughs*.—Patent dated May 22, 1860.—The share D is attached to the front bar *d* of the frame C, the front bar *d* serving as its foot or standard. The share is attached to the upright by having a pin, or projection *k*, at its back, fitted in a hole in the bar *d*, and having a collar or keeper *l*, which is on the upright, fitted over a lip *m*, at the upper end of the share. By this means the share is not only firmly secured to the front bar *d*, but readily attached to it and detached therefrom.

Claim.—The arrangement of the double curved frame C, horizontal bar *e*, bars *d d*, eyes *f f*, beam A, and share D, as and for the purposes shown and described.

No. 28,417.—JAMES M. STEPHENSON, of Anderson, Ind.—*Improvement in Pumps*.—Patent dated May 22, 1860.—In this invention, when the piston B¹ is turned in either direction, the water rushes in behind it, while it drives the water before it through one or the other of the pipes *d*, and the sand and other matter drawn into the cylinder will by virtue of its greater specific gravity fall down through the slot, or opening in the cylinder, into the air tight chamber F, and the cylinder will thus be kept free of grit and sand and the piston in working order.

Claim.—The arrangement and combination of the separate chamber F, with the pump cylinder A, inlet orifices *d d*, and the pipes J J, as and for the purpose shown and described.

No. 28,418.—B. T. STOWELL, of Quincy, Ill.—*Improvement in Corn Planters*.—Patent dated May 22, 1860.—This invention consists of a peculiar seed distributing device, constructed and arranged in such a manner as to obviate the objection to this class of machines, to wit: the unequal discharge of the seed and the derangement of the parts consequent upon a slight wear of the same.

Claim.—The arrangement and combination, with a hub G, composed of one piece, of the radial recesses *c*, to receive the spokes, the annular recess *e*, to receive the seeds, and the adjustable plates *f*, as and for the purpose shown and described.

No. 28,419.—WILLIAM H. TRISSLER, of Lima, Ind.—*Improved Fruit and Vegetable Cutter*.—Patent dated May 22, 1860.—This invention consists mainly of a rectangular box A, which has a sliding bottom D, transversely slitted and armed with cutting blades *e e*; at the same time the said box has a follower C working freely within the same, which is combined with a jointed hand lever B, in such a manner that while the operator with one hand can impart a reciprocating motion to the cutting bottom of said box, with the other hand he can bear down upon the lever B.

Claim.—The arrangement of the hopper box A, the sliding cutter bottom D, the follower C, the hand lever B, the pitman F, and the crank shaft G, with each other and with the supporting bench K, in the manner and for the purpose set forth.

No. 28,420.—JONATHAN T. TROTTER and ISAAC F. WILLIAMS, of New York, N. Y.—*Improvement in Finishing the Surface of India Rubber Goods*.—Patent dated May 22, 1860.—The claim explains the nature of this invention.

Claim.—The process or method of fixing or finishing the coating of flock, cork, or other fibrous material by the use of camphene, naphtha, bi-sulphide of carbon, or other solvents of any of the vulcanizable gums, when applied by means of the sizing roller or machine, as described, as a secondary or additional operation for fixing or finishing the surface of the previously flocked goods, substantially as set forth.

No. 28,421.—A. K. TUPPER, of Milford, Mich.—*Improvement in Apparatus for Generating Gas*.—Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The retort A, having on one side, below the feed pipe, a series of gutters, arranged with a descent from one to the other in opposite directions, alternately, and having a narrow space between the said gutters and the opposite side for the upward escape of the gas and vapors, substantially as described.

No. 28,422.—WILLIAM TUSCH, of Brooklyn, N. Y.—*Improvement in Brushes*.—Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention.

Claim.—As an improved article of manufacture, a brush, having its back provided with curved or angular plates which will cut into and hold the soap when the latter is pushed thereon, as shown and described.

No. 28,423.—WILLIAM I. TUSTIN, of Benicia, Cal.—*Improvement in Wind Mills*.—Patent dated May 22, 1860.—This invention consists in arranging on the shaft of the driving sails a series of regulating fans, which, or the arms of which, connect with the windward edge of the driving sails in such a manner that whenever the velocity of the wind wheel exceeds a

certain point the resistance of the regulating fans causes the driving sails to turn to the wind and to decrease their effective surface; it further consists in combining with the arms of the driving sails, and with those of the regulating fans an adjustable spring in such a manner that the velocity at which the regulating fans begin to act can be varied at pleasure.

Claim.—The arrangement of the regulating fans G on the shaft C, when the same are connected to the driving sails A by means of links e, together with a spring I, substantially as and for the purpose described.

No. 28,424.—A. T. TWING and EBENEZER WOOD, of Louisburgh, and WILLIAM ELDERHOST, of Troy, N. Y.—*Improvement in Preserve Cans.*—Patent dated May 22, 1860.—The object of this invention is to remove the air from the interior of a fruit can without heating the contents, and to seal the same up perfectly tight and with an easy manipulation without giving the air a chance to find its way back to the interior of the can.

The inventors say: We *claim*, first, the employment of the neck B of a preserve can A as a receiver for an air pump, applied to the same by means of a chamber D, substantially as and for the purposes specified.

Second. The arrangement of the chamber D with the channels c d and with a funnel E, when the same is used in combination with a fruit can A, substantially as and for the purposes set forth.

No. 28,425.—R. L. UNDERHILL, of Bath, N. Y.—*Improved Door Latch.*—Patent dated May 22, 1860.—This invention consists in having the knob arbor so arranged that it may slide longitudinally in the door and transversely therewith, said arbor being connected with a slide bolt through the medium of a lever, or an equivalent device, and in using in connection with the above a spring bolt fitted in the tile of the door frame and operating in relation thereto.

Claim.—The employment or use, in connection with a sliding knob arbor B, of bolts E H fitted respectively in the door A and stile F, and arranged, in relation with each other and the knob arbor, to operate as and for the purpose set forth.

No. 28,426.—ABRAHAM VOORHEES, of Grand Rapids, Mich.—*Improvement in Shortening Tire.*—Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the clamping bars C H, short clamping anvil block K, and detached lever or slide L working between guides F G, as set forth, for the purpose of clamping and upsetting or shortening wagon tires, as described and represented.

No. 28,427.—JEPHTHA A. WAGENER, of Pultney, N. Y.—*Improvement in Harvesting Machines.*—Patent dated May 22, 1860.—H H are teeth attached to the adjustable frame K, and prevent the straw from moving while the heads are severed by the spiral knives; I is a straight knife on the base of the teeth H which acts in concert with the spiral knives F and severs the heads from the straw; i² is a spring placed between the teeth H and straight knife I to cause a continuous and elastic shear to the edges of the knives F acting in concert with the edges of the knife I.

Claim.—The revolving canvas G acting in concert with cylinders E E, spiral knives F F, and straight knife I, adjusted on spring i² set on the base of teeth H, substantially as and for the purpose described and set forth.

No. 28,428.—SYLVESTER W. WARREN, of New York, N. Y.—*Improvement in Apparatus for Vulcanizing Caoutchouc.*—Patent dated May 22, 1860.—This invention consists of a portable apparatus designed especially for the use of dentists for vulcanizing the plates of artificial teeth and other articles.

Claim.—The portable vulcanizing apparatus, constructed substantially as set forth and for the purposes specified.

No. 28,429.—JAMES WEED, of Muscatine, Iowa.—*Improvement in Power Presses.*—Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment or use of toggles or toggle frames applied to the press or follower, substantially as described, so as to admit of repeated applications of their power during a single movement or stroke of the follower, or, in other words, during the compression of each bale, for the purpose specified.

No. 28,430.—JOHN W. WILLETT, of Wareham, Mass.—*Improved Camp Stool.*—Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The said improved portable folding chair, as made with its back posts and arm rests, or the latter hinged or connected to the crossed leg frames and the flexible seat and having struts applied to them, substantially as specified.

No. 28,431.—CHARLES WOOSTER, of New York, N. Y.—*Improvement in Gas Retorts*.—Patent dated May 22, 1860.—A is the body of the retort, cast with a central flue or chimney base *b b*; the external portion of the retort is of the form of an inverted frustrum of a cone; the flue or chimney base is represented as cylindrical, but may have an upward taper; to burn out the retort it is only necessary to raise the half C of the cover high enough to establish communication between the opening *j* and the retort, while the latter is kept hot by a good fire; the air then admitted under the edges of the cover serves to inflame the residuary carbon and the draft of the chimney causes the escape of the production of combustion through the opening *j* into the flue *b b*.

Claim.—The employment of the central flue *b b* in combination with the body or shell A, substantially as and for the purposes shown and described.

No. 28,432.—HENRY A. ALDEN, of Matteawan, N. Y., assignor to the NEW YORK RUBBER COMPANY.—*Improvement in Flexible Hose Tubing*.—Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention.

Claim.—As a new and useful article of manufacture, a compound flexible tubing or hose formed of close or woven and lapped tubes, with water proof coatings or linings, and combined as described.

No. 28,433.—CHARLES R. ALSOP, of Middletown, Conn., assignor to J. W. ALSOP, of New York, N. Y.—*Improvement in Gun Stocks*.—Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the construction of the stock of a fire-arm intended to be fired from the shoulder, with an opening B for the thumb to pass through, and for the reception of the ball of the thumb, and with the portion D, in front of the said opening, so nearly perpendicular to the barrel as to allow it to be grasped by the hand with the thumb through the said opening, substantially as described and represented in Fig. 1 of the drawing, whether the butt A is or is not capable of disconnection.

I also claim the attachment and securing of the two parts of the stock together by means of a round tenon or dowel *b*, and a dovetail tongue *c*, on the rear portion, a corresponding mortise and dovetail groove in the front portion, and a spring bolt E applied within the front portion, to lock the dovetail tongue therein, the whole applied and operating substantially as specified.

No. 28,434.—CHARLES BADGER, of Edgerton, Wis., assignor to MELVILLE BADGER, of said Edgerton.—*Improvement in Grist Mills*.—Patent dated May 22, 1860.—This invention consists in constructing a grinding mill, in which geared machinery is firmly attached to a movable frame that is placed inside of the principal frame that supports the bed or stationary stone and hopper, and which movable frame sustains at the upper end of the vertical shaft the runner or upper stone, and which interior frame, gearing attached thereto, vertical shaft and runner, are elevated and lowered together, whereby the stones are separated or brought nearer together to grind coarse or fine, and whereby the different parts of the gearing retain their relative position undisturbed by such elevation or depression.

The inventor says: I *claim*, first, the framework 27, in which the gearing is located, in combination with the vertical shaft and runner, when arranged substantially as described, for the purposes set forth.

Second. The combination of the devices for driving the runner with the devices for driving the bolt, when constructed and operated substantially as described.

Third. The cog gears on each side of the pinion, in combination with the pinion and shaft in Fig. 27, substantially as described and for the purpose set forth.

No. 28,435.—JAMES P. ELLICOTT of Washington, D. C., assignor to PHELAN & COLLENDER, of New York, N. Y.—*Improved Chalk Holder for Billiard Tables*.—Patent dated May 22, 1860. A stationary jaw *b b* is fastened to a billiard table by means of a flange *a*; a movable jaw *c f* is hinged to the stationary jaw by means of a pivot *d*, placed between the forward and the rear end of the jaw *c f*. The rear part of *c f* is provided with a weight *g*, which has a tendency to close the front part *c* of the movable jaw against the stationary jaw, and will serve to hold or clamp a piece of chalk between the two jaws.

Claim.—The combination of the lower pivoted jaw *c g*, constructed as described, with the stationary jaw *b b*, for the purposes set forth.

No. 28,436.—STEPHEN W. BROWN, of Syracuse, N. Y., assignor to himself and JOEL McCOMBER, of Watertown, N. Y.—*Improved Printers' Composing Stick*.—Patent dated May 22, 1860.—This invention consists in the use of an eccentric and elastic plate, connected with the slide and applied to the side of the stick.

The inventor says: I *claim* the employment or use of the elastic plate E, placed at the outer side of the side piece C, provided with a tongue *d*, passing through the side piece and part

b of the slide, and having attached a lever *F*, provided with an eccentric *G*, arranged as shown, or in an equivalent way, for the purpose set forth.

I further claim, in connection with the plate *E*, slide *B*, lever *F*, and its eccentric, the bridge or brace *G*, attached to the slotted sidepiece *C*, substantially as and for the purpose set forth.

No. 28,437.—A. J. GIBSON, of Worcester, Mass., assignor to himself, JOHN BOYDEN, JOSEPH P. HALE, and SAMUEL FISK, of the same place.—*Improvement in Revolving Fire-Arms*. Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, combining the barrel with the breech frame or stock by means of a pivot *b*, two doubly notched check pieces *a a*, and a sliding bolt *E*; the whole arranged and operating substantially as and for the purpose specified.

Second. Combining the downwardly movable barrel with the trigger or lever *I*, or its equivalent, in such manner that the said barrel may lock the said trigger or lever, or its equivalent, when it (the said barrel) is in its downward position, to prevent the discharge, substantially as described.

No. 28,438.—ADOLPHUS LIEBENROTH, of New York, N. Y., assignor to himself and IWAN VON AUW, of said New York.—*Improved Paper File*.—Patent dated May 22, 1860.—This invention consists in the combination of elastic bands, with covers provided with a tuck, or or tongue, whereby the papers can be placed within said file, and the parts drawn around the papers, and the tuck entered so as to hold the file together and enclose and compress the sheets of paper or other fibrous substances.

Claim.—The combination of the elastic bands *c c e e*, covers *a d*, and tuck or attachment *f*, for the purposes and as specified.

No. 28,439.—GEORGE H. MILLS, of East Boston, Mass., assignor to NATHANIEL MCKAY, of said East Boston.—*Improvement in Pumps*.—Patent dated May 22, 1860.—The intermediate cylinder *H*, having a positive action relatively to the plunger, causes the opening and closing of the ports to take place at the right time and with precision, and as the several series of ports extend around their several cylinders, or the ports of the same series are arranged at opposite points in the circumference of their respective cylinder, the intermediate cylinder works without lateral pressure, or in equilibrio, and consequently with but little friction.

Claim.—The employment of the intermediate cylinder *H*, in combination with the two stationary cylinders *A C*, and piston *B*, as and for the purpose shown and described.

No. 28,440.—J. G. PUTNAM, of Tioga, Penn., assignor to himself and J. SCHIEFFLEIR, JR., of said Tioga.—*Improvement in Corn Shellers*.—Patent dated May 22, 1860.—After the ears of corn leave the feeder they are received between the shelling cylinder *D* and concave *E*, the surfaces of both of which are furnished with teeth, or ribs. The cobs, after the grain is removed, are discharged over a curved guard plate *J*; a number of curved guards *L* is arranged over the shelling cylinder, the lower ends of which press against the annular grooves in said cylinder; these prevent the cobs from being carried over the cylinder.

Claim.—The arrangement of the divided, yielding, perforated concave *E*, feeder *B*, prongs *b*, guard plate *J*, guard *L*, and shelling cylinder *D*, as and for the purpose shown and described.

No. 28,441.—ISAAC RECKHOW, of Brooklyn, N. Y., assignor to JOHN GRIFFITH, of said Brooklyn.—*Improvement in Curing Prunes*.—Patent dated May 22, 1860.—By this invention the prunes are spread in a box or other receptacle on wire screens or open shelves, and exposed to a current of steam.

Claim.—The within described method of curing prunes by exposing them to a current of steam, substantially in the manner specified.

No. 28,442.—MARK RICHARDSON, of Philadelphia, Pa., assignor to himself, THOMAS CORT, and H. ROWBOTHAM, of said Philadelphia.—*Improved Washing Machine*.—Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the revolving beaters, constructed substantially as described, in combination with the platforms *e f* and *h*, the whole arranged within the trough and operating on the folds of the fabric as specified.

Second. The revolving shaft *K*, with its elastic vanes, when arranged within the trough in respect to the roller *H* and the mouth of the inlet *y*, substantially as and for the purpose herein set forth.

No. 28,443.—DAVID M. SMITH, of Springfield, Vt., assignor to himself, H. H. MASON, and A. C. MASON, of said Springfield.—*Improvement in Hooks and Eyes*.—Patent dated May 22, 1860.—The claim and engravings explain the nature of this invention.

Claim.—As an improved article of manufacture, a hook A having one of its legs *e* extended and bent up within the bill *a*, so as to form a snap or spring guard, as shown and described.

No. 28,444.—JOSEPH J. VAUGHAN, of Alexandria, Va., assignor to himself and S. R. VAUGHAN, of said Alexandria.—*Improvement in Car Couplings.*—Patent dated May 22, 1860. The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the skeleton bumper H, which surrounds the box, with the box and with the tumbler, for the purpose of relieving the tumbler from sudden and violent concussions, substantially as specified.

No. 28,445.—SAMUEL WELLS, of Elmore, Ohio, assignor to ELIAB KARR and ERASTUS HOWLAND, of said Elmore, and EDWARD F. DICKINSON, of Fremont, Ohio.—*Improvement in Machines for Moving Buildings.*—Patent dated May 22, 1860.—On the drum B is wound a rope or cable *d*, to the loose end of which, the power that is to work the machine, is attached, whether a team, capstan, or any other power. The unwinding of the rope *d* or turning of the drum B applies the power to the drum E and through it to the block H, multiplying itself manifold by the difference of the diameters of the gearing and drums and the series of sheaves in the blocks, so that power is exerted on the block H.

Claim.—In combination with the carriage A and the drums B E, and their operating connections, the turning block F hinged to said frame and loose block H, and their rigging, the whole being arranged for the purpose of exerting great power in moving heavy bodies and easy transportation, substantially as described.

No. 28,446.—HENRY W. ADAMS, of Brooklyn, N. Y.—*Improvement in Apparatus for Distilling Coal Oils.*—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment, in the distillation of coal, shale, and other analagous substances, to obtain the oil and other liquid products therefrom, of a retort consisting of a pit dug or otherwise made in the earth, substantially as described.

Second. I claim the construction of the retort for distilling oil and other liquid products from coal, shale, or other analogous substances, in a horizontal or other slightly inclined form, with a draught through it in a horizontal direction or parallel with the floor, and without a separate furnace, so that the charge may burn away gradually toward the outlet, substantially as described.

Third. Though I do not claim the use of a separate pipe or conductor, to carry off the liquid products condensed in the retort, or the introduction of steam into the retort, I claim the steam pipe *j* in combination with the eduction pipe *b*, substantially as and for the purpose specified.

Fourth. Connecting the eduction pipe, by which the condensed liquid products leave the retort, with the main discharge pipe, by which the vapors leave the retort, substantially as described.

No. 28,447.—WILLIAM ADAMSON, of Philadelphia, Pa.—*Improvement in Machines for Picking Curled Hair.*—Patent dated May 29, 1860.—The inventor says: One or more brush feed cylinders may be used, as occasion may require; in many cases one brush cylinder with a fluted cylinder would answer, as one cylinder of brushes would allow the stock to pass between the cylinders without breaking; in other cases one brush cylinder with a smooth cylinder would answer equally well.

Claim.—The employment of a brush feed roller, made as shown and described, whether used in connection with another brush cylinder or feed roller, or in connection with plain or fluted rollers, for the purpose set forth.

No. 28,448.—LUTHER ATWOOD, of New York, N. Y.—*Improvement in the Manufacture of Oils obtained from Coal.*—Patent dated May 29, 1860.—This invention consists in a method of treating these heavy oils, paraffine fatty oils and acids, or the crude oils and natural oils from which the heavy oils are produced, so that the whole, or as much as may be desired, may be converted into thin oil suitable, when purified, to burn in lamps.

Claim.—The production of thin oils, suitable to be manufactured into illuminating oils, from the heavier parts of the crude and fixed oils and other substances within mentioned, by treating them in the manner substantially as described, during one or several continuous distillations.

No. 28,449.—GEORGE W. BROWN, of New York, N. Y.—*Improvement in Ice Cream Freezers.*—Patent dated May 29, 1860.—This invention consists of a conical can to contain the cream to be frozen, provided with a tapering dasher fitted to the can and arranged to turn freely in it.

Claim.—A conical can in combination with a tapering dasher made to correspond with the can, substantially as described, for the purposes set forth

No. 28,450.—JOHN D. BROWN, of Cincinnati, Ohio.—*Improvement in Lanterns.*—Patent dated May 29, 1860.—This improvement relates to the construction of lanterns adapted to contain a coal oil lamp, the draught passages being so protected, while preserving ample area, as to neutralize the effect of any local draught.

Claim.—The recessed floor B C formed with minute perforations over the entire surface of its upper portion B and the vertical sides c of the recess, in the described combination with the imperforate floor A, apertures E, and lamp D, the whole being constructed and arranged in the manner and for the purposes set forth.

No. 28,451.—CYRUS L. CARTER and ELEAZER JONES, of New York, N. Y.—*Improvement in Coffins.*—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

Claim.—As a new article of manufacture, the coffin above described, the slabs being connected and secured together by grooves, in combination with unconnected angle irons and with the second or under lid formed of a glass plate, in the manner set forth.

No. 28,452.—JOHN N. CHAMBERLIN, of Troy, N. Y.—*Improvement in Sewing Machines.*—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the construction, arrangement, and combination of the catch or latch with the needle bar *j* and the step bar *d*, as herein set forth.

I also claim the needle bar *j*, constructed with two channels or grooves *s* and *t* crosswise of the same, in connection with the catch or latch *a* or *b*, for the purpose of holding the said needle bar in a certain position for a correct and working adjustment of the needle *l*, as well as to hold the same upward and away from any interference of the materials to be worked, as described and set forth.

No. 28,453.—JOSEPH H. CLIFTON, of Newcastle, Pa.—*Improvement in Looms.*—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the jack hook lifter with an adjustable mechanism for imparting to it a reciprocating motion, arranged substantially as described, so that the range of motion of the heddle may be changed as required, to vary the opening of the shed.

Second. The combination of a rockshaft and cam plate with adjustable cams, so arranged that by varying their distance from the centre of the rockshaft the range of motion of the rockshaft is changed and the shuttle thrown a greater or less distance, as required.

Third. The combination of the lay with a vibrating shuttle carrier arranged substantially as described, so that the distance between the arms of the carrier may be varied to correspond with the distance the shuttle is thrown in passing through webs of different widths, substantially in the manner described.

Fourth. The combination of the lay with adjustable guide rods for the shuttle, so arranged that their distance apart may be varied as required, in weaving fabrics of different widths at the same time, and also that their height above the race board may be changed for fabrics varying in thickness, substantially as described.

Fifth. Arranging a cord or other material which is to be covered with a woven fabric, between the warps, and connecting it to an independent heddle which is so arranged and operated as to raise the cord with the upper leaf of the shed while the woof thread is passing between the warp covering the under side, and depress it with the lower leaf of the shed while the woof is passing between the warps covering the upper side of the cord, substantially as described.

No. 28,454.—HENRY A. CLUM, of Auburn, N. Y.—*Improvement in Barometers.*—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the movable slides D and E, with meteorological reading only, separate and detached from any graduations for vernier purposes, for summer and winter purposes, substantially as shown and described.

Second. The application of heights above sea level, of atmospheric pressure, &c., to the ordinary barometer face, as shown in Fig. 1, columns 1 and 2, on the bed pieces A and B.

Third. The cistern, as shown in Fig. 6, consisting of two or more chambers connected by stop cocks at points above the open end of the tube.

Fourth. The entire cistern adjustment, as shown at H, Fig. 1, and N M R R S, Fig. 2, consisting of the connection of the vernier I to the cistern, which allows it to move with the cistern and tube, and also the movable cistern as fully represented in the drawing.

Fifth. The combination of two meteorological slides D and E, for winter and summer purposes, to the ordinary parlor barometer, the cistern adjustment as described, with the

cistern and further bottom adjustment, as shown on face H, Fig. 1; all as fully and substantially set forth.

No. 28,455.—L. O. COLVIN, of Cincinnati, N. Y.—*Improvement in Cow Milkers*.—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the extension legs formed of the tubes or hollow legs *a*, containing the slides *b*, in connection with the pins *e*, attached to the springs *d*, which are secured to the tubes *a*, when the above parts thus arranged are applied to a bench A, of the milking device described, for the purposes set forth.

Second. The teat tubes G, when made of conical form or taper form longitudinally, and of an elliptical form in their transverse section, to operate as specified.

Third. The combination of the teat tubes G, levers F, and the pump, the latter being constructed of the conical chambers D, provided with valves *h*, and the semi-cylinder C fitted on the socket B; all being arranged as and for the purpose specified.

No. 28,456.—HORACE H. DAY, of New York, N. Y.—*Improvement in the Manufacture of Elastic Cloth*.—Patent dated May 29, 1860.—The claim explains the nature of this invention.

Claim.—The new elastic cloth described, consisting of the stockinet goods and elastic gum so combined that two sheets of stockinet goods are connected by elastic gum, and the outer face of the fabric presents a gum surface; the said elastic cloth being a new article of manufacture.

No. 28,457.—JAMES DEALLY, of Louisville, Ky.—*Improvement in Keys*.—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the slide D and spring F, with the stem B, in the manner shown and described, so that the key may be elongated when wanted for use, and closed up or shortened when not in use, all as set forth.

No. 28,458.—TRUMAN W. DETRAY, of Montpelier, Vt.—*Improvement in Ferules*.—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The ferule described, when closed at one end, and having an interior swell or projection combined with a wedge projecting inwardly from the closed end, in the manner and for the purpose set forth.

No. 28,459.—ASAHEL K. EATON, of Brooklyn, N. Y.—*Improvement in Rendering Safes Fire Proof*.—Patent dated May 29, 1860.—This invention consists in the use of pure alumina, or the sulphate of alumina, or the double sulphate of alumina and ammonia, as a material to be used for packing between the walls of safes, for the purpose of giving the requisite non-conducting quality.

Claim.—The use of pure alumina, or the substances from which it may be produced, as hereinbefore mentioned and described, in the manner mentioned.

No. 28,460.—WILLIAM H. ELLIOT, of Plattsburgh, N. Y.—*Improvement in Repeating Fire Arms*.—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment of a hammer arranged as specified in relation to the frame, in combination with chambers bored entirely through and left open at their rear end, and with a breech plate, as and for the purpose specified.

Second. The employment of a movable exploding point for distributing the force of the hammer among the charges, so as to fire them in a certain order, when said point is employed with, but detached from, a hammer, arranged as specified in relation to the frame.

Third. The arrangement of the head of the firing pin *r*, in the central line or axis of the disk *p*, so that a gliding blow from the face of the hammer upon the head of the firing pin shall have no tendency to revolve the disk, as specified.

Fourth. The employment, between the chamber *j* and the hammer *c*, of a firing pin, or its equivalent, when said pin is so arranged and employed with the hammer that, while it receives a gliding blow from the face of the hammer, it penetrates the cartridge in a direction perpendicular or nearly so to the surface of the shell, as and for the purpose specified.

Fifth. The employment of a stop seat *b*¹, in combination with main seat *b*, when these devices are employed with an exploding point which penetrates the surface of the cartridge, as specified.

Sixth. The employment of disk *p*, firing pin *r*, in combination with a series of stationary barrels arranged around a common centre, when these devices are so arranged that the longitudinal motion of the firing pin within the disk shall be parallel with the axis of the disk and with the bores of the barrels, or nearly so, at set forth.

No. 28,461.—WILLIAM H. ELLIOT, of Plattsburgh, N. Y.—*Improvement in Revolving Fire Arms*.—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment of a hammer, arranged as specified, in relation to the barrels, when used independent of a breach pin or nipple, and in combination with chambers bored through at their rear end, and with a breach plate, as specified.

Second. The arrangement of support *n*, in rear of all the barrels, and support *n*¹, in front of all the barrels, in combination with a series of revolving barrels, when said barrels are bored through at their rear end for the purpose of being charged at the breech, as set forth.

Third. The employment of a hammer, arranged and operating as set forth, in combination with a breach plate for resisting the recoil of the cartridge, so as to relieve the breach plate from the pressure of the cartridge shell, as and for the purposes specified.

Fourth. The combination of wedge or cam *j* with fly *f* for raising the hammer, as specified.

Fifth. The employment of lever *k*, in combination with fly *f*, as and for the purpose specified.

No. 28,462.—J. W. EVANS, of Forsyth, Ga.—*Improved Churn*.—Patent dated May 29, 1860.—This invention consists in providing a frame, with suitable gearing, to communicate a reciprocating motion, to which the dasher of an ordinary churn can be attached or detached with facility; the whole forming a churn which can be worked by a laborer by means of a crank.

Claim.—The combination of the above mechanical arrangement with the grated dasher, sash *f*, and set screw *i*, the whole of the devices arranged, as described, for the purposes set forth.

No. 28,463.—CHARLES W. FELT, of Salem, Mass.—*Improved Machine for Setting Type*.—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the general arrangement and organization of the apparatus described, and for the purposes specified.

Second. Imparting the automatic motions described to the T's, or their mechanical equivalents, by means of keys or indicators so arranged and operated that these automatic motions can be given at pleasure to one or more of the said T's, or their mechanical equivalents, as set forth.

Third. The combination of the sliding pieces L L, keys H H, and vibrating bar F, so operating together that the depression of the keys will actuate the T's as set forth.

Fourth. Holding the T's, or their mechanical equivalents, in the same position in which they were sent by the action of the keys, so as to economize their motion, and whereby the keys can be operated quickly, several times in succession, without delay, by the arrangement of devices described, or any other arrangement of devices that will successfully accomplish the desired result.

Fifth. The arrangement of the series of holding hooks *q q*, so operating as to engage with or be disengaged from the T's, and actuated for those purposes, substantially as described.

Sixth. The mode described of producing a registry or record of the T's or of the work performed, the same consisting in forming automatically, by the action of the machine itself, holes, perforations, or indentations in a strip of paper, or other proper material, corresponding to the movements of the keys by the operator.

Seventh. The combination of the T's, in the series of punches, operating in conjunction with each other, substantially as described, whereby the forward movements of the T will so actuate the punches as to produce holes, perforations, or indentations in a strip of paper or other proper material.

Eighth. The arrangement of a series of needles or feelers, so operated by and in conjunction with a register, consisting of a strip of paper or other material having holes, perforations, or indentations formed therein, and so operating upon the T's, or their equivalents, that the same movements can be given thereby to the T's, or their equivalents, as those previously imparted by the operator on the keys, for the purpose specified.

No. 28,464.—CHARLES W. FRICKE, of Mobile, Ala.—*Improved Cement*.—Patent dated May 29, 1860.—This invention consists in mixing, in proper proportions, clean, dry sand, hydraulic cement, and tar, so as to make a mortar suitable to lay brick or stone.

Claim.—The described water-proof composition or mortar cement, for laying brick, stone, &c., compounded substantially as described.

No. 28,465.—RICHARD J. GATTING, of Indianapolis, Ind.—*Improvement in Machines for Breaking and Pulverizing the Soil*.—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a rotary share frame, provided with shares capable of being adjusted to vary the depth of their cut, as well as to escape or pass over obstructions that may be in their path, substantially as shown and described.

Second. The employment of two sets of shares K, attached to a rotating frame at opposite points of its shaft, to admit of the adjustment of the shares free from the ground when they are not required for operation, and thereby allow the machine to be readily turned and transported from place to place.

No. 28,466.—E. L. GAYLORD, of Terrysville, Conn.—*Improvement in Attaching Bows to Keys*.—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Securing the bows B of keys to their arbors A by means of knobs or heads c, formed on the arbors, grooved longitudinally, and driven snugly into the socket f of the bows, the parts of the bows at the ends of the sockets being then upset to make the sockets snugly encase the knobs or heads, substantially as described.

No. 28,467.—ALBERTUS GEIGER, of Dayton, Ohio.—*Improvement in Vapor Lamps*.—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combined arrangement of the vaporizing tube B, as constructed, and the conducting or wick tube C, together constituting an efficient hydro-carbon gas generator, with the globe holder D, by which the globe holder is rigidly secured for use, as described.

No. 28,468.—W. A. GLIDDEN and A. STARKWEATHER, of Alvaretta, Wis.—*Improvement in Horse Powers*.—Patent dated May 29, 1860.—This invention relates to an improvement in horse power, whereby the draft will be equalized and adapted to the strength of different spans of horses, also the jarring jerking motion, occasioned by starting, will be prevented.

Claim.—The sweeps C E and D F, coupled in the centre, and the braces a b c d and pulleys Q R S T, when specially arranged and operating conjointly as described.

No. 28,469.—R. A. GOODENOUGH, of Brooklyn, N. Y.—*Improvement in Horse Shoes*.—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A shoe for horses and other hoofed animals, having upon its under side an indented ridge, as described, perforated for the insertion of nails at the rim of the shoe.

No. 28,470.—FREDERICK T. GRANT, of Gardiner, Me.—*Improvement in Sliver Machines*.—Patent dated May 29, 1860.—This invention consists in the peculiar construction of the machine, whereby the wood to be manufactured into slivers or fine shavings is firmly held and regularly moved up and brought in contact with the slitters and cutting knife in the sliding block a; also the form and an arrangement of slitters x, whereby the wood is cut or slit in fine and uniform widths, without liability to clogging; also the peculiar form of the lower end of the cap o o attached to the cutter knife c c, whereby the sliver or shaving is curled or twisted.

Claim.—The combination of the feed rolls G G, operated by worms H H, and cam L, or their equivalents, and pressure bars p p, for the purposes specified.

No. 28,471.—S. S. GREENE, of Rome, N. Y.—*Improvement in Shrinking Tire*.—Patent dated May 29, 1860.—The tire is upset or contracted with this machine as follows: The tire is heated to a proper degree at any desirable point, and the heated portion is placed on the buckets E E¹, when the arm C is thrown back. The tire is then clamped hard down by the vise arrangement G, and held in this state. The handle of the lever F is then brought slowly down until the jaws D D¹ clamp the tire firmly to both arms B C. The tire being thus held to the levers B C, and at an intermediate point between them, the handle of the lever F is brought slowly down in the direction of the arrow when the jaws D D¹ will be made to gripe the tire still more firmly, at the same time the end of the arm C will be drawn forward towards the opposite arm B, the jaws holding the tire more and more firmly as the pressure is increased.

Claim.—The arrangement, as shown and described, of the jointed arms B C, jaws D D¹, rod J, lever F, and vise G, for the purpose set forth.

No. 28,472.—OLIVER F. GROVER, of Middletown, N. Y., and HENRY L. PELOUZE, of New York, N. Y.—*Improved Tool for Mitreing Printers' Rules*.—Patent dated May 29, 1860.—This invention consists in the structure, arrangement, and combination of the parts of the mitreing machine by which a machine is produced that is easy to be operated.

Claim.—The attaching B to A, as shown at E E, so as to accommodate the motions of the lever and cutter in their performance, as set forth, the manner of adjusting C; also F, in combination with G, for the purposes set forth.

No. 28,473.—LOREN HALE, of Milford, Massachusetts.—*Improved Cushion for Horses' Feet*.—Patent dated May 29, 1860.—A is the hoof, B the shoe which is bevelled off at a from the point where the shoe is seated on the hoof to its inner edge. C is the hollow elastic pad of

cushion which is thicker in the middle, and is brought down to a thin edge at *b*, and turned up at *c* at the rear end where it presses against the back part of the frog at the foot.

Claim.—An elastic air cushion for protecting horses' feet, substantially as specified.

No. 28,474.—SAMUEL HALL, of New York, N. Y.—*Improvement in Coupling for Shafting.*—Patent dated May 29, 1860.—This invention consists in a ready and direct mode of coupling shafts, or portion of shafting and rods, by the employment of which the same are more compactly and securely held together than heretofore.

Claim.—The use or employment of the cross key *W*, in combination with the longitudinal keys *E E*, and slotted shafts *D D*, said shafts being coupled within the box or clutch coupling composed of the sections *A* and *B*; the whole being arranged and operated as set forth, and for the purpose specified.

No. 28,475.—I. F. HOLLOWAY, of Saline Mines, Ill.—*Improved Steam Traction Engine.*—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the putting of the boiler *C* within a driving wheel or drum *D*, when placed upon friction wheels or bearings within or upon said drum, substantially as described, so that the wheel or drum shall revolve around the boiler.

Second. The inner shell *B*¹ of the driving wheel or drum *B*, in combination with the stationary head *M*, for the purpose of forming a tank, heater, condenser, and jacket, substantially as described.

No. 28,476.—CHARLES L. HARDING, of Winooski Falls, Vt.—*Improvement in Facilitating the Removal of Burs from Wool.*—Patent dated May 29, 1860.—The claim explains the nature of this invention.

Claim.—Subjecting wool, prior to its being submitted to the picking, combing, and carding operations, or either of them, to a sufficient pressure between the loaded rollers, or by means of other contrivance, to destroy the fibrous character of the burs contained in it, substantially as and for the purpose described.

No. 28,477.—L. P. HARRIS, of Mansfield, Ohio.—*Improvement in Apparatus for Clarifying and Evaporating Saccharine Juices.*—Patent dated May 29, 1860.—This invention consists in the construction and application of transverse or oblique partitions to defecating and evaporating pans, said partitions having a series of perforations, or small openings in their lower edges, and being so arranged as to obstruct the onward motion of feculences, which rise to the surface during the process of heating and evaporating, while the liquid beneath it is allowed to pass freely on to the point of escape when drawn from the pan.

The inventor says: I *claim*, first, the double filter, when constructed substantially as described, and its combination with heating and evaporating pans, substantially as and for the purposes set forth.

Second. An apparatus which affords facilities for heating, skimming, filtering, and evaporating saccharine and other juices, substantially as described, and for the purpose set forth.

No. 28,478.—CHARLES H. HASKER, of Portsmouth, Va.—*Improvement in Suspending Boats.*—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the bolt *i*, eyes *j j*, ring *h*, as connected and arranged with the thimble *g* and the gripes *a a*, operated as and for the purposes set forth.

Second. The roving of the one lowering and stopping fall *q* into the bite *t* of the other fall, whereby the lowering of the boat is done by one fall, as described.

Third. The hook *z*, clamp *f*¹, check lines *h*¹, lever *i*¹, with its bars and pin, as arranged, for holding and liberating the falls block, as set forth.

No. 28,479.—S. I. HAYES, of Chicago, Ill.—*Improvement in Making Tubes.*—Patent dated May 29, 1860.—The object of this invention is to apply copper or other soft metal in making the joints between iron tubes and tube sheets in locomotive and other boilers, so as to obtain cheaply all the advantages to be derived from its use.

Claim.—The ferule of copper or other soft metal applied to the exterior of the iron tube, between it and the tube sheet, substantially as and for the purpose specified.

No. 28,480.—JOSEPH M. HEARD, of Aberdeen, Miss.—*Improvement in Pessaries.*—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The construction of the pessary, with its anterior side retreating upwardly to form a support to the bladder, and with its posterior side retreating upwardly to fit the hollow of the sacrum, substantially as described.

No. 28,481.—OTTO HEINIGKE and MORITZ LAEMMEL, of Bay Ridge, N. Y.—*Improved Mosaic Veneers*.—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the within described method of producing mosaic veneers from strips of any desired cross section, and of various colors; said strips being formed by pressing a suitable plastic material, which will harden after having gone through the whole process, through openings of required shape, substantially as and for the purpose described.

Second. Uniting the strips, formed, as described, into blocks G, a cross section of which represents the pattern to be represented by the mosaic veneer, or a portion of the same, substantially in the manner and for the purpose specified.

No. 28,482.—JOSEPH C. HENDERSON, of Albany, N. Y.—*Improvement in Stoves*.—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the air spaces *g*, for a descending draft between the fuel hopper and combustion chamber, said draft entering the combustion chamber at the lower end of said air space, as set forth, whereby the descending draft keeps the hopper cool and enters the combustion chamber in a heated state, as specified.

I claim the combination of a hopper for feeding the fuel, with a cone *l*, or contracted chamber, as seen at *q*, for detaining the products of combustion and retaining a sufficient heat for insuring perfect combustion, as set forth.

No. 28,483.—SOLOMON T. HOLLY, of Rockford, Ill.—*Improvement in Seeding Machines*.—Patent dated May 29, 1860.—This invention consists in the use of oblique supporting and driving wheels, arranged so that the same are made to cover the seed and press the earth thereon in different ways as the nature of the case may require to favor the speedy germination of the seed.

Claim.—The oblique supporting and driving wheels B, applied to the machine, and arranged to operate substantially as and for the purpose set forth.

No. 28,484.—NOBLE HILL, of Caton, N. Y.—*Improvement in the Manufacture of Pile Fabrics*.—Patent dated May 29, 1860.—The claim explains the nature of this invention.

Claim.—The new article of manufacture described, constituting a fabric of wool, hair, or other fibres, interwoven with a web of cloth, and treated with one or more coats of elastic varnish, with an exterior lining attached thereto, substantially in the manner and for the purposes shown and described.

No. 28,485.—I. MOORE HENDRICKS, of Philadelphia, Pa.—*Improvement in Rice Hullers*.—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the hulling, the scouring, the pearling, the polishing, and the separating apparatus in one frame, substantially as described, for the purpose set forth.

Second. The combination of a layer of cork wood with a layer of buffalo hide, with the hair on, for forming an elastic bed for an outer grinding covering of the hulling cylinder.

Third. I claim the combination of emery and metal filings cemented to duck, or equivalent material, for forming a grinding or rubbing surface.

Fourth. I claim combining with the grinding surface a narrow band wound spirally around the surface of the cylinder, when the ridge formed by the band is of less width than the space between the bands, and when the said ridge and depression are both covered with a material to form a grinding surface, for the purpose as set forth.

Fifth. In combination with a pliable grinding or rubbing surface, I claim an underlayer of buffalo hide with the hair on, for the purpose set forth.

Sixth. The combination of the two screws, revolving in opposite directions, and arranged substantially as described, for the purpose of pearling the rice.

Seventh. The combination of buffalo hide, with the hair outward, with an underlayer of curled hair, for the formation of a polishing pad or brush.

Eighth. In combination with the polishing pad or brush, constructed as described, I claim a narrow band of cloth, or other material, wound spirally around the brush from end to end, and arranged so as to form a depression or groove in the surface of the brush or pad, so as to act as a carrier and assist the brush in conveying the rice through the machine.

No. 28,486.—WILLIAM W. HUBBELL, of Philadelphia, Pa.—*Improvement in Breech Loading Ordnance*.—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the screw *c c f*, the parallel gate shaft *j*, and the gate *g*, operating together, as described, so that the gate is moved forward without impinging on the parallel shaft, by the cylindrical front face of the hollow screw, and back as it releases, from the facing of the chamber, when presented on the shaft to the screw.

Second. I claim the curved gate arm *q*, the gate shaft *j*, the gate *g*, and the gate arm *r*, together, in combination with the screw *c c f* and the bearing surfaces *l l* and *t t* of the recess and barrel, so as to conveniently raise a heavy gate of large guns by the leverage of the arm *r* on the shaft of the arm *q*, and regulate the position of the gate in the recess and with the barrel laterally and vertically, to receive the action of the screw *c c f* by means of the bearing surfaces *l l* and *t t*, in the operation of loading, as described.

Third. The circular raised face *h* on the back part of the gate, fitting into the central hollow *f* of the screw, so as to enable the screw to secure this gate so that it cannot be forced up, as described and shown.

No. 28,487.—ALLEN HUGHES, of Gratiot, Ohio.—*Improvement in Cultivating Ploughs*.—Patent dated May 29, 1860.—The object of this invention is to connect the shanks carrying the shovels to the frame or beams of the cultivator in such a manner that the shovels may be raised or depressed, and in fixing the shovels in the shanks and carrying them rigidly to the beams by sector bars having pins passing through them and through the beams.

Claim.—The shovel cultivator described, capable of both a lateral and a vertical adjustment, when made in the manner and by the combined arrangement described and represented

No. 28,488.—LIVERAS HULL, of Charlestown, Mass.—*Improved Ratan Machine*.—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, in combination with the splitting knife and the feeding mechanism, a mechanism for moving the feed rollers *F F*, laterally, relatively to the knife, such mechanism for so feeding the feed rollers consisting of the actuator cam *S* and the slider *I*, furnished with an adjustable arm *p*, the whole operating and being operated substantially as specified.

And, in combination therewith, I claim a mechanism consisting of the stop cam *v*, the lever catch *N*, and its spring *y*, or mechanical equivalent therefor, not only for stopping the operations of the lateral motion machinery immediately after the splitting of a ratan may have been accomplished, but for stopping and holding the actuator cam of such lateral motion mechanism in its proper position for the feeding and splitting machinery to commence action on another ratan.

I also claim applying the actuator cam and its stopping cam, or either, to the shaft *t*, substantially as described, so as to be capable of revolving thereon, and providing the same with devices for producing friction, so as to cause the shaft to revolve the cam when the latter is not held or stopped by the lever catch and stop cam, as described, such devices consisting of the cone *u* and the spring *w*, or mechanical equivalents therefor.

I also claim combining with the slider *I*, of the lateral motion mechanism, an arm *p* and its adjustable devices, arranged to operate substantially in the manner and for the purpose as stated.

I also claim the combination of levers *O P R* and the spring *c¹*, arranged and applied together to the slider *I*, and the shafts of the feed rollers *F F*, substantially as and to operate as stated.

I also claim the arrangement of the strip guides *m* and *n* relatively to the knife and the set of draught rollers *G G*.

No. 28,489.—J. BURROWS HYDE, of Newark, N. J.—*Improvement in the Machinery for Manufacturing Sheathing Felt*.—Patent dated May 29, 1860.—The fibrous material is picked and collected upon a perforated cylinder *C²* by an air exhausting apparatus, causing a current downward through the cylinder which draws the fibres upon the upper part of the cylinder, and which are thence carried through the rollers in the form of an endless bat.

Claim.—The apron *E*, the composition troughs *F* and *1 2* and *3*, the apron and troughs *G*, the rolls *H L* and the rolls *1*, and the sand apparatus *K*, arranged substantially in the manner and employed for the purpose set forth.

No. 28,490.—JOHN JOHNSON, of Naples, Ill.—*Improvement in Corn Planters*.—Patent dated May 29, 1860.—This invention consists in dividing the frame of the machine, arranging the seed device on one frame and the grooved pressing wheels on the other, and connecting the two frames together by a sliding coupling.

Claim.—The combination, with a divided frame *A B*, of the adjustable or extension bar *J* jointed to the front part of the machine and arranged in the manner and for the purposes set forth.

No. 28,491.—ROSS JOHNSON, of Frederick, Md.—*Improved Sash Fastener*.—Patent dated May 29, 1860.—When using this invention as a door fastener, the under portion of the plate *c* with the hook *h* is placed against the side of the door frame, the lower flange *d* being even with the inside front of the door frame; the door is then closed so as to press the hook *h* into the door frame, which fastens the door.

Claim.—The application of the described implement *c j i* as a permanent window sash fastener, in the manner set forth.

No. 28,492.—PERMIN KOPFER, of Fond du Lac, Wis.—*Improvement in Cooling and Setting Tire.*—Patent dated May 29, 1860.—This invention consists of a circular cistern provided with a series of inclined planes in connection with a revolving platform running upon rollers.

Claim.—The described cistern and revolving platform, the former being provided with a series of inclined planes and the latter with a corresponding series of rollers, the whole being constructed, arranged, and operated substantially as set forth, for the purposes specified.

No. 28,493.—LEWIS W. LEEDS and CALVERT VAUX, of New York, N. Y.—*Improved Steam Heating Apparatus.*—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The admission of steam at or near and over all parts of, or a great portion of, the bottom of a steam heater, in numerous thin jets or streams, or, in other words, in a divided state, by a perforated pipe, or its equivalent, substantially as described, whereby an equable diffusion, in any quantity, may be effected through the whole of the heater, for the purpose specified.

No. 28,494.—A. LEIGHTHEISER, of Reading, Pa.—*Improved Washing Machine.*—Patent dated May 29, 1860.—This invention consists in having an ordinary tub A, which is furnished with a brace B across the centre, and is secured into the lugs of the tub by means of small pins C C.

The inventor says: I *claim*, first, the use of two rubber disks with radially curved arms, constructed as described.

Second. I claim the centre piece J furnished with hinged semi-circular lids, turn latches M, radially curved rubbers E K, brace B, and hand cranks F H, the whole arranged and combined for the purposes as set forth.

No. 28,495.—JOHN LOVATT, of Newark, N. J.—*Improvement in Skates.*—Patent dated May 29, 1860.—The power to be obtained by the V-shaped slots in the blocks E E¹, to act directly on the clamping jaws, is great; it is a combination of screw and wedge, and as the blocks E E¹ are made to approach each other in screwing up the rod G, the clamps D D D¹ D¹ contract laterally until they securely gripe the sole of the boot, then the heel clamps begin to move and they gripe the heel with equal security, so as to require no other fastening to the skate.

Claim.—The combination of the movable V-slotted blocks E E¹ with the clamps D D D¹ D¹ and the screw rod G, when the same are arranged substantially in the manner and for the purposes set forth.

No. 28,496.—EDWIN MAY, of Indianapolis, Ind.—*Improvement in Window Grating for Prisons.*—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the platting of tubular iron, the tubes crossing each other at right angles, substantially as and for the purposes set forth.

Second. The bolting together of right angle tubes with the dovetail bolt H, when the same is done for the purposes set forth.

Third. I claim the filling of said tubes with molten iron, in combination with the dovetail rivet H, when all these parts and ingredients are used for the purposes described in the foregoing specification.

No. 28,497.—JOHN MILLS, JR., of Quincy, Ill.—*Improvement in Hemp Brakes.*—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The rotary cleaning and beating beater E¹ arranged over beater E, when the same has also imparted to it a vibratory motion, by the arrangement substantially as described, or by any other suitable machinery, whereby a beating, and, at the same time, a forward motion is given to the hemp, as set forth.

No. 28,498.—J. CAMPBELL MOORE, of Peoria, Ill.—*Improvement in Corn Planters.*—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the jointed bar with the operating cam and spring, arranged substantially as described, so that by bending the central joint, the bar is withdrawn from the cam, the discharge of the seed cut off and the movement of the slide to the seed box arrested.

No. 28,499.—WILLIAM P. PARROTT, of Boston, Mass.—*Improvement in Machines for Crushing Mineral Ores.*—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the described combination and arrangement of one or more sets of crushing rollers $B\ B^1\ C\ C^1$, a sifting or screening apparatus, consisting of a rotary screen S , and its case b^2 , an air blast or blower e^2 , and a discharging conduit k , provided with a separator h , so arranged that, by the conjoint action of gravity and a blast of air, the mineral matters may be separated from the refuse ore; the whole being for crushing ore and separating the metal therefrom, substantially as specified.

I also claim so combining the air blast or fan blower e^2 , and the conduit k , and its separator h , that the same conduit and separator may be adjusted at any desirable angle of inclination relatively to the horizon.

I also claim so combining the rotary screen case b^2 , with the fan blast or blower e^2 , and the conduit k , provided with a separator h , that the air blown through the conduit shall first be made to pass through the rotary sieve, substantially in manner and for the purpose as described.

I also claim combining a regulating air hole c^2 , and plug, or its equivalent, with the case b , of the rotary screen S , and with the fan blower e^2 , applied to operate therewith, and with a discharging conduit k , furnished with a separator h , as specified.

I also claim combining the inclined screen a^3 of the rotary sieve case with the rotary screen S , the regulating air inlet c^2 and the fan blast apparatus e^2 , its conduit k , and separator h .

No. 28,500.—O. J. PENNELL, of Williamsport, Pa.—*Improvement in Apparatus for Renovating Feathers*.—Patent dated May 29, 1860.—This invention consists in the use of a steam boiler, in connection with an air heating device applied to a hollow shaft, provided with radial arms, perforated at their ends, and placed within a cylinder or box, which has ventilating openings provided with flaps or doors.

Claim.—The arrangement and combination of a steam boiler and air heating device applied to the hollow rotating beater shaft H , of a feather receptacle H , substantially as and for the purpose described.

No. 28,501.—HENRY POWELSON, of New Brunswick, N. J.—*Improved Fire Escape*.—Patent dated May 29, 1860.—This invention consists in arranging on the top of a building, or in one of the upper stories, a sliding platform in combination with a rising and falling car, and with suitable chains or ropes in such a manner that by pulling one of the chains, the platform, together with the car, is brought to the edge of the building, and the rope which controls the motion of the car is dropped where it can be reached from any of the windows situated in the same vertical plane with the car or from either story of a building.

The inventor says: I *claim*, first, the arrangement, on the top or in one of the upper stories of a building, of the sliding platform A , in combination with the rising and falling car or basket E , constructed and operating substantially as and for the purposes described.

Second. The combination, with the platform A , and basket E , of the hinged flap G , substantially as specified, for the purpose of dropping the rope F , as the platform advances.

Third. The arrangement of the rope H , with its branches $S^1\ S^2$, &c., in combination with the sliding platform A , substantially as set forth, for the purpose of enabling the inmates of the house to control the apparatus from the several stories of the building.

No. 28,502.—GEORGE W. RAINS, of Newburgh, N. Y.—*Improvement in Governors for Steam Engines*.—Patent dated May 29, 1860.—The object of this invention is to apply the governor in connection with the throttle, or regulating valve, that necessary movement of the valve may be imparted to it by the rotary motion of the governor, and not directly by the act of the change of the planes of revolution thereof.

Claim.—The employment, in combination with a wheel L , having teeth on a portion only of its circumference, applied in connection with the regulating valve, substantially as described, of two teeth or sets of teeth ff and $f^1 f^1$, not forming continuous series on the governor sleeve, the whole arranged and operating substantially as specified.

No. 28,503.—THOMAS S. RAY and A. C. RAND, of Buffalo, N. Y.—*Improvement in Vapor Lamps*.—Patent dated May 29, 1860.—The inventors say: By this device we produce the gas which supplies the burner E , by means of a flame or heat, separate and independent of the light flame or burner E . We also dispense with generators, tubes, and all devices which are dependent upon the light flame for heat, and leave it entirely free and unobstructed.

Claim.—The generating cup F , in combination with the vaporizing tube D , and supply or aperture d^3 , the same being constructed, arranged, and operating substantially as set forth.

No. 28,504.—GEORGE W. RICHARDSON, of New York, N. Y.—*Improved Steam Heating Apparatus for Warming Buildings*.—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* an ascending steam pipe with syphons, constructed and ar-

ranged substantially as described, and with radiators, to which is connected a descending water pipe, the whole forming a continuous open circuit between the steam space and the water space of a boiler.

I also claim, in combination, first, coils, or their equivalent, for radiating heat into apartments; second, syphons, constructed and arranged substantially as described, and making connection between the ascending steam pipes and the coils; and third, ascending steam pipes and descending water pipes, each varying in area, substantially as specified.

No. 28,505.—DANIEL F. SAVAGE, of Boston, Mass.—*Improvement in Dumb Bells*.—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Making the balls of a dumb bell in hollow or solid sections, substantially as set forth, and thus rendering the same capable of being increased or diminished in weight.

No. 28,506.—WILLIAM SCARLETT, of Aurora, Ill.—*Improvement in Skates*.—Patent dated May 29, 1860.—When the plates A, a right and left hand one, are prepared, they are brought together and a stiff piece D, of thick metal, which has previously been cut into the required shape, is interposed between the vertical or runner portions *a* of the plates, and the whole skate is secured together by a suitable number of rivets *h h h*.

Claim.—Combining the central stiffening bar or plate D, with the two sheet metal halves A, in the manner and for the purpose shown and described.

No. 28,507.—HIRAM H. SCOVILLE, of Syracuse, N. Y.—*Improved Machine for Making Mould Boards for Ploughs*.—Patent dated May 29, 1860.—The frame work A is made of strong timbers or iron, the cylinder B is also made of iron having one end of larger diameter than the other, thus giving it a conical form. The cylinder is cut in two parts from end to end, the gudgeons C are attached to the centre of each end of one of the parts. The cylinder B is placed in the frame work so that the gudgeons C may revolve in boxes attached to the frame at D.

Claim.—The use of a conical forming block for shaping mould boards of ploughs when the same is so arranged with the pressure roller, constructed substantially as described, and frame work, as to operate in the manner set forth.

No. 28,508.—FREDERICK SHUTTEE, of Philadelphia, Pa.—*Improved Machine for Cutting Saw Teeth*.—Patent dated May 29, 1860.—This invention consists of two revolving dies, each die being formed of two disks, and both dies having permanent angular projections and recesses, the projections of one die being adapted and gearing into the recesses of the other die, so that a saw blade, submitted to the dies, may have teeth formed on its edge.

Claim.—The two revolving dies, composed of the disks *m* and *n*, and having permanent angular projections and recesses, the projections of one die being adapted to and gearing into the recesses of the other die, as and for the purpose set forth.

No. 28,509.—REUBEN SHALER, of Madison, Conn.—*Improvement in Wheel Skates*.—Patent dated May 29, 1860; antedated February 24, 1860.—This invention consists of a skate, which in the place of the ordinary runner is provided with rollers, the operating surfaces at the periphery of which is made elastic, by which they are made to take a better hold upon the floor or carpet.

Claim.—The skate described, which, in the place of the ordinary runner, is provided with rollers, the periphery of which is made elastic, substantially as and for the purposes set forth.

No. 28,510.—JOHN E. SHIELDS, of Washington, D. C.—*Improved Butt Hinge*.—Patent dated May 29, 1860.—This invention consists of a hinge formed as a tight butt, and having its parts connected by a pin which is capable of removal when the hinge is open and firmly connected with the leaves when closed, so as to prevent removal.

Claim.—The side projection C, on the connecting pin, in combination with the slotted ends of the segments *a a*, and cavities *i i*, in the leaves, arranged and operating substantially as and for the purposes set forth.

No. 28,511.—HENRY K. SMITH, of Philadelphia, Pa.—*Improved Sash Supporter for Car Windows*.—Patent dated May 29, 1860.—A shows the frame of the window, B the sash, C the weighted catch, D the hook into which the lower end of the catch C is received; *a* is the arm of the catch, and *b* the burr or pin of the hook D.

Claim.—The combination, with the window of a railroad car, of the catch C, and hook D, constructed and arranged for conjoint operation in the manner described and for the purpose set forth.

No. 28,512.—**SOLOMON P. SMITH**, of Troy, N. Y.—*Improvement in Car Wheels*.—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, making the inner side of the rim A, with a continuous mid-rib *d*, and a cylindrical or slightly flaring surface at each side of the rib, and the peripheries of the supporting disks F I, with shoulders *h h*, and flanges *j j*¹, as and for the purposes set forth, the said rim and disks being united together by means of compound band packing *k l k l*, in the manner described.

Second. I also claim inclosing the elastic packing *r*, when placed between the tightening device of the holding bolt and the body of the wheel, by means of a ring or recess *q*, follower S, and collar *t*, all constructed and arranged together as described, so that, while the packing is left free to be compressed to any required degree, no part of the packing can be squeezed or worked out of place, nor pressed in contact with the holding bolt.

No. 28,513.—**THOMAS SPENCER**, of Syracuse, N. Y.—*Improvement in the Manufacture of Common Salt*.—Patent dated May 29, 1860.—The claim explains the nature of this invention.

Claim.—Combining the carbonate or bi-carbonate of soda with common salt, substantially as and for the purposes set forth

No. 28,514.—**HENRY J. SPILLER**, of Cincinnati, Ohio.—*Improved Roller Box for Printers*. Patent dated May 29, 1860.—The claim and engravings show the nature of this invention.

Claim.—The ventilating roller box, as described, consisting essentially of roller chamber B, water chamber C, ventilators *d d e*, sliding doors G H, and vertical reels, consisting of stock E, stationary head D, and movable heads C, all constructed and arranged substantially as and for the purpose set forth.

No. 28,515.—Cancelled.

No. 28,516.—**LEMUEL STEPHENS**, of Philadelphia, Pa.—*Improvement in Fertilizers*.—Patent dated May 29, 1860.—The inventor says: My "phuine" consists of the following ingredients and proportions: Decomposed animal matter, 1,200 pounds; animal charcoal, 150 to 200 pounds; sombrero guano, 200 pounds; Peruvian guano, 175 pounds; sulphate of ammonia, 25 pounds; common salt, 100 pounds; solution of bone in muriatic acid, 500 gallons.

Claim.—The "Phuine," made substantially as set forth.

No. 28,517.—**LEE SWEARINGEN**, of Valley River Falls, Va.—*Improvement in Cars for Transporting Cattle, &c.*—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

Claim.—So hinging or connecting a series of partitions with a cattle car body, as that said partitions may be swung into a vertical position to form stalls or apartments to contain horses or cattle, or into a horizontal position for forming an upper and lower compartment for containing sheep or hogs, substantially in the manner and for the purpose set forth.

No. 28,518.—**WILLIAM TANSLEY**, of Salisbury Centre, N. Y.—*Improvement in Bark Mills*. Patent dated May 29, 1860.—The object of this invention is to obtain a grinding mill by which damp or wet bark may be ground with facility and in a perfect manner.

The inventor says: I *claim*, first, the forming of the conical head C, and rims D F of a bark mill, of eccentric sections, substantially as and for the purpose set forth.

Second. The grater E, when formed of a series of alternate concave and convex sections *b* c**, as described.

Third. The crushing teeth *f g*, formed respectively on the arms *a c*¹, when used in connection with the head C, rims D F, and grater E, and placed in the relation thereto, as and for the purpose set forth.

Fourth. The alternate long and short teeth or burrs, 1 2 and 3 4, respectively, on the rim D, and conical head C, as and for the purpose specified.

Fifth. The combination of the head C, rims D F, and grater E, arranged within a case A, for joint operation, substantially as and for the purpose set forth.

No. 28,519.—**JOSEPH R. THOMAS**, of Williamsburgh, N. Y.—*Improvement in the Mode of Securing Lids on Gas Retorts*.—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Providing one end of the bar D, with a double taper socket *d*, and pivoting said end upon a pintle *c*, so that said bar may be swung horizontally and also vertically upon the pintle, as and for the purpose shown and described.

No. 28,520.—JOHN THOMPSON, of East Boston, Mass.—*Improvement in Locomotive Boilers.*—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The improved smoke box, as so extended beyond the smoke current leading from the pipe stack to the chimney, that the sparks or cinders discharged through the pipe stack may pass out of and beyond the current of smoke, so as to be deposited in the box by the action of gravity and not be carried up the chimney.

No. 28,521.—THOMAS TOWNDROW, of New York, N. Y.—*Improvement in Book Binding.*—Patent dated May 29, 1860.—The object of this invention is to produce a binding of durable and convenient character, adapted to permit the book to be taken apart for the insertion or removal of leaves in any part, and particularly applicable to the binding of common place index and memoranda books, catalogues, sheet music, and the like.

Claim.—The combination of the plates A and A¹, tubes B, and pins C, constructed and arranged substantially as and for the purposes set forth.

No. 28,522.—JOHN G. TREADWELL, of Albany, N. Y.—*Improvement in Stoves.*—Patent dated May 29, 1860.—This invention consists in constructing and arranging the different parts of the stove.

Claim.—The employment of the corrugated or plain front plate D, perforated as described, the close fitting doors E E, and slide F, when used in connection with the double sides G G¹, and the perforated air chamber at the rear of the fire, substantially as and for the purpose specified.

No. 28,523.—R. P. VAN HORNE, of Gratiot, Ohio.—*Improvement in Cultivators.*—Patent dated May 29, 1860.—This invention consists in a novel arrangement of tooth bars attached to a plate, the latter being connected to a bar provided with adjustable wheels, whereby the desired end is attained.

The inventor says: I *claim* the arrangement of the plate A, draught bar B, tooth or share bars K, and truck or wheel bar D, substantially as and for the purpose set forth.

I further claim, in connection with the plate A, draught bar B, share bar K, and truck or wheel bar D, the transverse bar M, provided with teeth or shares N, substantially as and for purpose specified.

No. 28,524.—J. H. G. D. WAGNER, of Paris, France.—*Improved Filtering Apparatus.*—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, removable horizontal shelves p, the bottom and top surfaces of each of these shelves being provided with flanges on three sides, and the shelves being placed in relation to each other, as shown on plate 1, in combination with a steam tight box B, water reservoir A, and stop cock o, substantially as and for the purposes set forth.

Second. Disks m, provided with circular flanges on top and bottom with sockets m¹, and central holes, in combination with disks n, provided with sockets n¹, all the disks being placed in a steam tight box B, and in relation to each other, as represented on plate 2, substantially as and for the purposes set forth.

Third. Shelves, the top and bottom surfaces of each of which are provided with flanges on three sides, combined with a steam tight box B, and surrounding jacket C¹, as represented on plates 3 and 4, substantially as and for the purposes set forth.

No. 28,525.—ALVIN WARTH, of New York, N. Y.—*Improved Fire Escape.*—Patent dated May 29, 1860.—This invention consists in arranging a tube, combined with a pin passing through the same, in combination with a rope in such a manner that by straining the rope its friction in the inside of the tube is increased, and that weights attached to said tube can be let down from any height with a moderate speed; also in the arrangement of a number of loops and hooks attached to a curved tube furnished with a pin and working in combination with a rope, so that said tube affords the facility to attach to the same a number of persons, or articles to be saved at the same time.

The inventor says: I *claim*, first, the arrangement of a tube A or A¹, substantially as described, in combination with a rope a, in such a manner that, by straining the rope, its friction on the inside of the tube is increased, and that weights attached to said tubes can be let down with any desirable speed.

Second. Arranging the tubes A A¹, with a number of hooks c, and loops d, substantially in the manner and for the purpose specified.

Third. The combination, with the rope a, and tubes A A¹, of a derrick D, constructed of standards i, hooks j, lever k, and cross bar l, substantially as and for the purpose set forth.

No. 28,526.—MAXIMILIAN WAPPICH, of Sacramento, Cal.—*Improved Water Elevator*.—Patent dated May 29, 1860.—The nature of these improvements is explained by the claim and engravings.

The inventor says: I *claim*, first, sustaining and buoying the screw elevator by a water chamber exterior to the shell of the screw, either in connection with the air chamber or without it, substantially as described.

Second. Regulating the admission of the water by the lip j^1 , constructed and operated as described.

Third. The arrangement of means for suspending the upper end of the elevator set forth.

Fourth. The ring e^1 , and the means connected with it for packing and guiding the lower end of the cylinder, as described.

Fifth. The frame b^1 , as constructed and arranged, and for the purposes set forth.

No. 28,527.—JOHN B. WINSLOW, of Charlestown, Mass.—*Improved Machine for Cutting Mouldings*.—Patent dated May 29, 1860.—By the feed roll and the lower extremities of the stationary cams r , and the convex face of the back guide 8, serpentine forms of almost any intricacy when once entered, are guided through the machine either automatically, or with a very slight directing motion by the hand of the operator, and a moulding of any desired form is cut upon their upper exterior edge by the rotary cutters.

The inventor says: I *claim*, first, the combined action of the cams or guides r , and the self-adjusting feed roll h , or their equivalents, substantially as described.

Second. I claim the adjustable back guide 8, acting with the cams or guides r , and the feed roll h , or their equivalents, substantially as described.

Third. I claim the connecting rods or wires 15, or their equivalents, arranged in the machine substantially as described, whereby the action of the springs x , is changed from the feed roll h , to the compressure rolls 12, for the purposes set forth.

No. 28,528.—D. M. WOODIN, of Brandon, Wis.—*Improved Churn*.—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

Claim.—So arranging the two dasher shafts, which are provided with wings secured to them in a screw or spiral form, that by revolving one, the other will be revolved by it, the wings interlapping, pressing against each other and expressing the butter from the cream, as the bearings change from bottom to top, or vice versa, substantially as specified.

No. 28,529.—STEPHEN W. WOODWARD, of Buffalo, N. Y.—*Improved Washing Machine*.—Patent dated May 29, 1860.—A is a cylindrical tub forming the body of the machine into which the clothes are to be put to be washed; it is fluted or corrugated upon the inside at A^1 . B represents a vertical shaft which has a step, or bearing, in the bottom of the tub at c . H shows the spring flaps, or rubbers, which are connected to the fluted disk F by the journal pin h^1 , and to the plate G by the journal pin h^2 .

The inventor says: I *claim*, first, the combination of the stationary tub A, rotary shaft B, and rotary disk F, placed beneath and supporting the clothes; the whole being constructed, arranged, and operated in the manner and for the purpose set forth.

Second. The spring rubbers H, in combination with the revolving disk F, substantially as set forth.

No. 28,530.—WILLIAM C. ALLISON, of Philadelphia, Pa., assignor to ALLISON & MURPHY, of the same place.—*Improvement in City Railroad Cars*.—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A seat composed of a series of transverse truss frames, constructed and connected together as set forth, when the said seat is arranged on, and combined with, the arched roof of a railroad car, in the manner and the purposes specified.

No. 28,531.—WILLIAM A. BACON, of Campello, Mass., assignor to himself and MARCUS V. REYNOLDS, of said Campello.—*Improved Machine for Skiving Counters for Boots and Shoes*. Patent dated May 29, 1860.—In connection with the feed wheel, the frame and the standard E, a rocker, or lever knife F is employed; it is so applied to the block H as to enable the angle of its cutting edge f , with respect to the periphery of the feed wheel to be varied as circumstances may require. At the angular bend g of the knife a screw h passes down through the knife and is screwed into the block H, the head of the screw resting on the upper surface of the knife.

Claim.—The arrangement of the adjustable block H, with the feed wheel C, raised above the table, and with the knife F, provided with adjusting screws, and supported by such block, as described.

No. 28,532.—ALBERT BROUGHTON, of New York, N. Y., assignor to himself, ALEXANDER LINDSEY, and JOHN R. PLATT, of said New York.—*Improvement in Machinery for Grinding*

and Polishing Glass, &c.—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the rotary adjustable shaft I, revolving disk J, and independent pivoted disks K K K, with the horizontally reciprocating bed C, and mechanism for effecting the intermittent oscillating motion of gear shaft E, which reverses the movement of the travelling bed, arranged and operating in the manner and for the purpose shown and described

No. 28,533.—LEWIS S. CHICHESTER, of New York, N. Y., assignor to F. S. CABOT, of said New York.—*Improvement in Filters.*—Patent dated May 29, 1860.—Within the case A a concave perforated plate *h* is fitted. This plate is supported at a suitable height by the lugs *i*, which are attached to it and rest on the bottom plate *b*, and on the concave *h* a perforated convex plate *i* is placed. The plates *h i* are of equal diameter, and are somewhat less than the inner diameter of the body of the case in order to allow a space *j* between the edges of the plates and the inner side of the case.

Claim.—The combination, in the manner shown and described, of the plates *i h*, and the filtering materials, with the adjustable plates *a d*, when all the said parts are constructed substantially as set forth, so that by adjusting either of the plates *a d* filtered or unfiltered water may be obtained at pleasure, as specified.

No. 28,534.—G. P. DANCE, of Columbia, Texas, assignor to himself and J. H. DANCE and D. E. DANCE, of said Columbia.—*Improvement in Hanging Mill Stones.*—Patent dated May 29, 1860.—The claim and engravings explain the nature of this improvement.

Claim.—The driver D, provided with a taper, square opening *c*, at its centre, fitted in the runner A, and resting on a rocking key C, in the spindle, the latter passing through the taper opening of the driver, substantially as and for the purpose set forth.

No. 28,535.—THOMAS G. HAROLD, of Brooklyn, N. Y., assignor to himself and JAMES H. HAROLD, of said Brooklyn.—*Improvement in Guards for Key Holes.*—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The blocking piece *a*, fitted on the bar *b*, in combination with the sliding blocking piece *c*, that enters the key hole and prevents the piece *a* being turned, or picks entered into the keyhole, as set forth.

No. 28,536.—SAMUEL W. LOWE, of Philadelphia, Pa., assignor to himself, CHARLES WINGMAN and D. S. JOHNSON, of the same place.—*Improvement in Vapor Lamps.*—Patent dated May 29, 1860.—This invention consists in providing a fluid burning lamp with a woven wire bag, or case, packed with raw cotton or other equivalent fibrous material, in connection with the wick of the lamp, whereby the fluid being absorbed and held suspended within the wire gauze case all danger of scattering its contents is prevented.

Claim.—The woven wire bag or case B, the fibrous packing D, and the wick C, when the same are arranged and combined together in a lamp, substantially as and for the purposes set forth and described.

No. 28,537.—S. E. PETTE, of Philadelphia, Pa., assignor to the NORTH AMERICAN PAPER BAG AND ENVELOPE MANUFACTURING COMPANY, of said Philadelphia.—*Improvement in Sewing Machines.*—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, locating the rotating paster F^1 , so as to apply the paste directly to the edge of the paper in forming the tube, as set forth.

Second. Giving to the paster F^1 a velocity corresponding with that of the edge of the paper on which it applies the plate by means of the ratchet arrangement, operated as described, and for the purpose stated.

Third. The slide Q^2 , constructed and operating substantially as and for the purpose specified.

Fourth. Feeding the tube of paper to the knife by the alternating operation of the reciprocating clamps $V V^1$, as specified.

Fifth. The clamps $V V^1 V^2$, constructed as set forth, and operating them by darts and dogs, as described.

Sixth. Folder and paster H, constructed and operating substantially in the manner stated.

Seventh. In combination with the paper bag machinery, attaching the connecting rods which operate the slides and clamps to opposite crank centres, to secure a continuous feed of the tubing to the knife, as described and shown.

Eighth, and finally. I claim the general arrangement of the parts of the machine described, for performing the various operations of making the bags, in the order and manner set forth and shown.

No. 28,538.—HAMILTON RUDDICK, of Boston, Mass., assignor to himself and JONATHAN PEIRCE, of said Boston.—*Improvement in Sewing Machines*.—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Adjusting the length of the crank *e* by means of the slide, or its equivalent, in combination with the feed lever *b*, vibrating on the adjustable fulcrum *d*, in order to cause said feed lever to pass a greater or lesser distance above the surface of the table or cloth plate, substantially as and for the purpose specified.

No. 28,539.—THOMAS SHAW, of Philadelphia, Pa., assignor to himself and L. N. BROGNARD, of said Philadelphia.—*Improvement in Furnaces for Burning Coal Oil or other Hydro-Carbon Fluids under Steam Generators*.—Patent dated May 29, 1860.—This invention consists in using any ignitable fluid as a fuel for generating steam, by discharging it into the fire chamber of a steam boiler, and upon a body of ignited coal, or its equivalent, through a pipe surrounded by water contained in the boiler; also in a perforated tube, and a box communicating therewith.

The inventor says: I *claim* the conveying of ignitable fluids to the interior of the fire chamber, by means of a pipe surrounded by water within the boiler, substantially as and for the purpose set forth.

I claim saturating the air with vapors of a fluid, by means of the perforated tube *H*, and its box *h*, when arranged in respect to the fire chamber of the steam boiler, substantially as set forth.

I claim the bars *n* and *n*, arranged in respect to the grate bars and fire chamber, substantially as and for the purpose set forth.

No. 28,540.—GEORGE E. VANDERBURGH, of Mamaroneck, N. Y., assignor to the LIQUID QUARTZ COMPANY, of New York, N. Y.—*Improvement in the Preparation of Soluble Silicates*.—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Reducing silicious substance to a liquid state by first incorporating therewith a small proportion of some alkaline substance, and then subjecting the same to the direct action of super-heated steam whilst inclosed within a suitable vessel, substantially as set forth.

No. 28,541.—GEORGE E. VANDERBURGH, of Mamaroneck, N. Y., assignor to the LIQUID QUARTZ COMPANY, of New York, N. Y.—*Improvement in Silicated Cements*.—Patent dated May 29, 1860.—This cement is prepared from a liquid silicate that is produced by the method described in the preceding invention.

Claim.—A silicious cement prepared substantially in the manner set forth

No. 28,542.—ELBRIDGE WEBBER, of Gardiner, Me., assignor to himself, G. W. WAITT, of said Gardiner, and N. B. STARBUCK and G. H. STARBUCK, of Troy, N. Y.—*Improved Marine Propeller*.—Patent dated May 29, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The construction of propellers with the two blades *B B*¹, as described, and placed at about an angle of 45° with the axis of shaft on opposite sides of a plane through said axis, and altogether forward of the rear extremity of the hub, substantially as set forth.

No. 28,543.—GEORGE NOCK, of Pittsburgh, Pa., assignor to THOMAS G. NOCK, of Windsor Locks, Conn.—*Improvement in Desulphurizing Coke*.—Patent dated May 29, 1860.—The claim explains the nature of this invention.

The inventor says: I *claim* the use of a mixture of an oxydizing agent such as peroxide manganese, nitrate of potash, or other substance which yields oxygen at an elevated temperature in contact with carbon, with an aqueous solution of chloride of sodium, or other alkaline chloride, or chloride of alkaline earth, in the process of desulphurizing coke, as described. Also in a mixture of peroxide of manganese or other substance, which yields oxygen at an elevated temperature in contact with carbon and colophony (or rosin) or other easily combustible substance, with an aqueous solution of chloride of sodium (common salt) or other alkaline, chloride, or salt of an alkaline earth, for the purpose of desulphurizing coke, in the manner described.

No. 28,544.—P. W. ADAIRE, of Hay's Creek, Miss.—*Improvement in Ditching Machine*.—Patent dated June 5, 1860.—The setting of the wheel *B* into the earth causes the earth to enter and fill the boxes *C*, while the plough *I* separates the earth, and causes that portion of it which fills the boxes to pass up with the wheel in front of shield *B*, until it reaches the top of the wheel when the guide piece *e*¹ is elevated by the stationary cams *C C*¹ attached to the pieces *A*² *A*², whereby the false bottoms *c* are forced out even with the side cutters *a a*, thus shoving the earth into the spout *D* down, which it descends by its own gravity, until it lands on the endless conveyor *D*¹, by which it is carried up and off at the side of the machine.

Claim.—The combination of the frame *A*, and adjustable standards *E E*, with wheel *B*,

circular cutting plates *a a*, cross pieces *b b*, false bottoms *c*, guide pieces *e¹*, cams *C¹ C¹*, guide or shield *B¹*, plough *I*, and operators *H*, arranged and operating in relation to each other as and for the purposes set forth.

No. 28,545.—M. C. ANDREWS, of Lawrence, Mass.—*Improvement in Swinging Bolsters for Railroad Car Trucks*.—Patent dated June 5, 1860.—This invention consists in the combination of semi-circular friction blocks, with the truck frame, the bolster, and its pendulous links; also an improved mode of making the swinging bolster, viz: with an elastic step for the central pivot, and with the parts composing the bolster capable of springing together.

The inventor says: I *claim* the combination of the friction blocks with the truck frame, the swinging bolster, and its pendulous links, the same being for the purpose described.

I also claim the application of the elastic step to the bolster, in connection with so constructing the bolster that it may be capable of springing together, substantially in manner and for the purpose as described.

No. 28,546.—WILLIAM J. ANDREWS, of Columbia, Tenn.—*Improved Sad Iron Heater*.—Patent dated June 5, 1860.—This invention consists in constructing a rack of hollow metal tubes, of a suitable strength and arrangement, in such a manner that the tubes will serve to hang the rack to the top bar of an ordinary grate, and to conduct hot air through them from the fire, and give out heat to the iron or irons that are placed on the rack independently of the direct heat the bottoms of the irons receive from the fire; and in combining with such a rack a guard plate for protecting the irons from burning or being smoked.

Claim.—The described rack for sad iron heaters constructed and operating in the manner substantially as described.

No. 28,547.—JOHN ARMOUR, of Helena, Ark.—*Improvement in Sharpening Shears*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* forming a narrow slit from the bottom of the notch in the spreader and sharpener *B*, into the body of the same, and then bringing the sides of said slit into close contact with each other before tempering the said spreader and sharpener, substantially in the manner and for the purpose set forth.

I also claim combining the spreader and sharpener *B* with the hand block *A*, when the adjustable segment *C* is combined with said block, substantially in the manner and for the purpose set forth.

No. 28,548.—T. G. ARNOLD, of New York, N. Y.—*Improvement in Drop Light Joints*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the construction of the socket of a drop light joint of a single piece, substantially as described.

Second. The employment, in combination with the socket *A*, of a drop light joint for gas burners, made in one piece, and the elastic lining *d* of a screw ring *e*, fitted to a screw thread inside of the said socket, substantially as and for the purpose specified.

No. 28,549.—EDWARD H. ASHCROFT, of Boston, Mass.—*Improvement in Apparatus for Naphthalizing Gases*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of the gas-receiving and expanding chamber *F*, with the naphthalizing cistern, scroll, and float, as specified.

Also the above described arrangement and application of the float, scroll, and disk, whereby they are rendered capable of easy and proper adjustment, as explained.

Also the combination of one or more propelling wings, or the equivalent thereof, with the scroll and float, when applied and used within a cistern, substantially in manner and for the purpose as described—such propelling devices being to facilitate or effect the rotation of the said float and scroll while being buoyed within the liquid, as described.

Also the application and arrangement of the foraminous diaphragm with respect to the cistern and eduction pipe of the apparatus, as described.

No. 28,550.—CYRUS AVERY, of Tunkhannock, Pa.—*Improvement in Gearing for Horse Powers, &c.*—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, constructing the main wheel *C* in the form of a cone, and each section with a narrow periphery, the teeth on the lower intermediate wheels *A A A* running under a part of the main wheel *C*, which is smaller than the part which they take into, following the same arrangement up to any number desired, the upper series held down by the top or cover *D*, the whole constructed and working as specified.

Second. The peculiar construction, combination, and operation of the intermediate wheels *b b b*, the main wheel *c*, and the centre pinion, Fig. 7, both when at rest and in motion, substantially as specified above.

Third. The manner in which the main shaft is held in position, namely, by the intermediate wheels taking into the main wheel and into the centre pinion, thus enabling me to dispense with all bearings except the stepping.

Fourth. The manner of seating the driver, namely, putting a post through the cover and main shaft into the step, and a seat on top of this post that will revolve or stand stationary at the driver's pleasure.

Fifth. Giving the band wheel K an increased velocity of one revolution over and above the velocity imparted by the tumbling shaft M, by means of the cogged or milled stationary concave wheel or ring N, Fig. 8, one or more intermediate wheels, Fig. 8, revolving on their own axis and the centre pinion wheel L, Fig. 9.

Sixth. Having one end of the band wheel shaft in the end of the tumbling rod and revolving the same way.

Seventh. Having the whole machine shut up tight by the way it is constructed without boxing.

No. 28,551.—WILLIAM B. AVERY, of Cambridge, Mass.—*Improved Fire Escape*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination and arrangement with a grapple, constructed with pivotted holding dogs *o o*, of the reels E and I, when these latter are hung by a shaft *a*, in links *g*, adjustable in position as described, and provided with a crank chain *c* and brakes, all operating to regulate and control the position and descent of the car *d*, substantially as described.

No. 28,552.—LEOPOLD BENNETT, of Pittsburgh, Pa.—*Improved Steam Valve*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the construction of a valve, oscillating or working in the same manner as a cock, with the steam passage transversely through it, and the exhaust through it, in the direction of its length, as in the manner described by reference and drawings, my object being to relieve the steam valve as far as possible from unnecessary friction. The valve can be worked by any ordinary eccentric or cam, or any of the usual appliances for working slide or poppet valves.

No. 28,553.—JOEL BOWMAN, of Somerset, Ohio.—*Improvement in Machines for Dressing Millstones*.—Patent dated June 5, 1860.—This invention consists in combining with a dressing machine a device whereby the depth of cut can be instantaneously regulated by the operator during the running of the machine.

Claim.—The application to the lever G of the graduating device, consisting of rocking bar *n*, with arms *q*, connected with sliding frame *t x*, in combination with springs *p* and *v*, the arrangement and operation being substantially as set forth.

No. 28,554.—JOSEPH BRAKELEY, of New York, N. Y.—*Improvement in Machines for Separating the Qualities of Bark*.—Patent dated June 5, 1860.—This invention consists in the use of a cutter, pressure roller, and an adjustable bearing.

Claim.—The combination of a saw or cutter D, rotary or reciprocating, a pressure roller L, and adjustable bearing plate O, with or without rollers Q, all being arranged and applied to a bark mill, substantially as and for the purposes set forth.

No. 28,555.—HENRY BRANDT, of Columbia, Pa.—*Improvement in Bending Teeth for Horse Rakes*.—Patent dated June 5, 1860.—By taking hold of the lever handle K, affixed on its pivot F, the wire is speedily bent with ease and uniformity to any shape or curve desired by making the corresponding curves of the bender and lever of said curve.

Claim.—The bender A, with its flange B, raised end G, guides E D, pivot F, and braces C e e, in combination with the flanged and grooved curved lever K L M N, made substantially as set forth, for the purpose specified.

No. 28,556.—GEORGE C. BROWER, of New Orleans, La.—*Improvement in Gas Torches*.—Patent dated June 5, 1860.—This invention consists in making or placing a reservoir for alcohol at the outer end of a crook made to pass into the top of a gas shade.

Claim.—A gas torch, constructed substantially as described and represented.

No. 28,557.—ROBERT BRYSON, of Schenectady, N. Y.—*Improvement in Harvesters*.—Patent dated June 5, 1860.—This invention consists in suspending the finger bar by the combined agency of an inclined or vertical bracket, a cylindrical cross head, and a vertical socket plate.

Claim.—The combination of the finger bar, having a bracket K and axial cross head *c*, with the socket plate L, of the frame A, the whole constructed and arranged and operating in the manner and for the purpose described.

No. 28,558.—THACKER V. BUSH, of Gallatin, Tenn.—*Improvement in Houses for Preserving Roots*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

Claim.—In combination, with the outer walls and covering, a series of inner compartments, which inner compartments are surrounded by and covered over with dry earth as a filtering medium between the roots and the external air, for the purpose of storing and preserving said roots, substantially in the manner described.

No. 28,559.—DEXTER H. CHAMBERLAIN, of West Roxbury, Mass.—*Improved Feed of Leather Splitting Machines*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

Claim.—In combination with a rigid feed roll B, the presser roll, composed of independent disks or sections *d*, confined in a suitable receptacle or trough E, and pressed towards the roll B by pressure applied independently to each disk, substantially as described, for the purpose specified.

No. 28,560.—SIMON G. CHEEVER, of Boston, Mass.—*Improvement in Machines for Mixing Paints*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the collars which hold and move the mixers or beaters in their relation to each other, and the actuating parts, so that while the middle series move in one direction the outer and inner series shall move in the other, in combination with the central curved blades attached to the central shaft, all moving and operating substantially as set forth.

No. 28,561.—SOLON A. CLAPP, of Hamilton, Ill.—*Improvement in Machines for Packing Flour*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of spring ring or short cylinder *o* with hooks *m*, an inner cylinder *l*, a frame *h s*, and upright rods *h*, for the purpose of expanding the upper end of the sack turning and twisting while being packed, substantially as set forth.

No. 28,562.—SEWARD P. COBB, of South Danvers, Mass.—*Improved Machine for Finishing Leather*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, in combination with the tool and the vibrator, a mechanism substantially as described, by which, while the vibrator may be at rest, or nearly so, the angular position of the finishing tool relatively to the bed may be varied as described, such mechanism being the tilting plate *b* and its sectoral lever *i* and click applied to the vibrator and operated by a hand lever, as specified.

And, in combination with the tilting plate *b* or tool holder and the vibrator D, I claim a mechanism, substantially as described, by which, while the vibrator may be in motion, the tilting plate may be moved on its fulcrum so as to change its angle with the bed, such mechanism being the slider *o* and the slotted lever I, applied to the vibrator, the arm *n*, and the frame of the machine, in manner and so as to operate substantially as explained.

I also claim the combination and arrangement of the four cams K L M N, their connections and operating screws, the same being for the purposes as specified.

No. 28,563.—HENRY CRANE, of New York, N. Y.—*Improved Bridle Bit*.—Patent dated June 5, 1860.—This invention consists in the employment of supplemental bars placed within the principal one and having springs attached, the parts being so arranged as to admit of the action of the supplemental bars on the lower jaw of the animal in case of the latter grasping with its teeth the principal bar.

Claim.—The combination of the bars A C C, the latter being fitted with the bar A, connected by a joint *a* at their inner ends and having a spring F attached, substantially as shown and described, for the purposes specified.

No. 28,564.—JOHN DICKSON, JR., of Brooklyn, N. Y.—*Improvement in Hat Conformatures*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

Claim.—In combination with the hat conformature, constructed as described, the sizer *f* formed of two metallic strips connected to the ends of one of the extension bands *e*, to measure the size of hat, regardless of the shape, at the same time that said shape is taken by said conformature, as specified.

No. 28,565.—THOMAS S. DISSTON, of Philadelphia, Pa.—*Improved Machine for Making Cross Cut Tabs*.—Patent dated June 5, 1860.—This invention consists in certain devices for

cutting from a bar of iron a piece of sufficient length and width to form the required tab, bending the said strip, forming an eye and flanges on the same, and punching and otherwise completing the tabs.

The inventor says: I *claim*, first, the box P, its dies N and N¹, the movable pin L, and the pressure bar m, the whole constructed, arranged, and operated as and for the purpose set forth.

Second. In combination with the above, the plate R, with its cutting projections arranged in respect to box P, as described.

Third. The bar W, with its projection x, in combination with the pin L and its projection e, and the inclined bar g, the said bar W being operated by the appliances described, or their equivalents, and the whole being arranged for joint action, substantially as specified.

Fourth. The slide M, its levers f and f¹, and their projections h and i, in combination with the orifices in the slide K, and the stationary inclined bars j j, the whole being arranged and operating substantially as and for the purpose set forth.

No. 28,566.—HENRY EHRMAN, JOSEPH H. EHRMAN, and HENRY H. EHRMAN, of Annville, Pa.—*Improved Washing Machine*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the journal boxes or bearings BB with the concave E, springs d, and rods D, as shown and described, so that the said bearings, rubbing cylinder, concave, and springs, may be all simultaneously removed, as set forth.

No. 28,567.—H. C. FAIRCHILD, of Brooklyn, Pa.—*Improvement in Seed Planters*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The partition F introduced into the cylinder A, for separating the seed, in combination with the plates G G¹ and G², the plate G, being provided with projecting lugs i, forming a channel for dropping the pumpkin seed as the plate is semi-rotated, the whole being arranged and operating simultaneously with the plunger C, as and for the purposes set forth.

No. 28,568.—JAMES M. FISH, of Buffalo, N. Y.—*Improvement in Machines for Weighing and Bagging Grain*.—Patent dated June 5, 1860.—This invention relates to the construction of a portable grain bin having an appropriate spout upon either side to facilitate the process of discharging the grain or other produce into bags after it is weighed, and the combination of such grain bin with a portable platform weighing scale.

Claim.—The arrangement of the bin A, doubly inclined floor O, vertical gates D, spouts L, frame B, and scale L, the whole being constructed and combined substantially in the manner and for the purposes explained.

No. 28,569.—E. L. FOOTE, of Springfield, Ill.—*Improvement in Rock Drills*.—Patent dated June 5, 1860.—A represents the main frame of the machine; in the main frame there is a movable frame B placed and arranged so as to slide up and down upon the ways or guides c c made fast to the main frame; the upper end of these ways c are joined together by means of the head frame D; upon the frame B a pair of supporters H H are erected for the purpose of supporting the shaft G upon which are fixed two cams I I¹.

The inventor says: I *claim*, first, the combination of the heads v with the stop guides e, cams I, and the drill bars F, when the whole is constructed and arranged substantially as described.

Second. In combination with the drill bars F the adjustable guides h h and c c, when constructed, arranged, and operated in the manner and for the purpose specified.

No. 28,570.—WADE H. GILBERT, of Bayou Goula, and H. O. AMES, of New Orleans, La.—*Improvement in Apparatus for Evaporating Saccharine Juices*.—Patent dated June 5, 1860.—The object of this invention is to so construct and arrange an open steam train as not only to provide for the perfect defecation of the juice in the defecator, but to obviate the defects in the ordinary steam train.

Claim.—The connected steam train, composed of a series of open pans arranged and connected by "monte-jus," substantially as and for the purposes specified.

No. 28,571.—AMOS GLOVER, of Powhatan Point, Ohio.—*Improvement in Corn and Cob Crushers*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the construction of the concave o with one or more receiving spaces j.

Second. Combining crushers with millstones by means of the driver m, substantially as and for the purposes set forth in this specification.

No. 28,572.—JAMES GREEN, of Kennett Square, Pa.—*Improvement in Seed Planters*.—Patent dated June 5, 1860.—This invention consists in the combination of stationary and sliding collars, slotted tube, pins, rod, and grooved nut, for the purpose of forming adjustable seed distributing receptacles.

Claim.—The combination of stationary and sliding collars A B, slotted tube C, pins E, rod o, and grooved nut M N, for the purpose of forming adjustable seed distributing receptacles, substantially as set forth.

No. 28,573.—SAMUEL HALL, of New York, N. Y.—*Improvement in Coupling for Shafting*.—Patent dated June 5, 1860.—This invention consists in the arrangement and construction of a new mode of coupling shafts, shafting rods, or other articles, to which the same can be applied, by which economy of time and labor is gained, and the shafts, shafting rods, or other articles coupled are held together and secured in a strong manner.

Claim.—The cross key D, in combination with the slotted shafts B B, coupled within the centre hub or coupling A, by means of the longitudinal keys E E, arranged and operated as described and for the purpose as specified.

No. 28,574.—JOHN S. HARPER, of Baltimore, Md.—*Improvement in Core Boxes*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A core box which is capable of being expanded and contracted in diameter in the manner described, by the use of two or more toothed bands with catches and figures to designate the size of core required, in connection with the open cylinder, or in any other way substantially the same and which will produce the intended effect.

No. 28,575.—WILLIAM A. HARRIS, of Providence, R. I.—*Improved Heel Guard for Boots and Shoes*.—Patent dated June 5, 1860.—The claim and engravings show the nature of this invention.

Claim.—Affixing to the heel part of a boot, shoe, or overshoe, a suitable guard, in the manner substantially as described and represented.

No. 28,576.—VINES HARWELL, of Walker County, Ga.—*Improvement in Cultivators*.—Patent dated June 5, 1860.—This invention relates to a new and improved arrangement and construction of the different parts of a cultivator, whereby it may be readily adapted either for one or two horses, and when for one, either with or without shafts.

Claim.—The peculiar arrangement and combination of the removable shafts C, centre beam A, and guide G, with a cultivator; the whole being constructed and operated in the manner and for the purposes set forth.

No. 28,577.—JAMES A. HAWLEY, of Jackson, Mich.—*Improved Composition for Roofing Houses*.—Patent dated June 5, 1860.—This invention consists in forming the roof of layers of lime mortar, that is, lime and sand and oil; the oil is either mixed in or afterwards absorbed into the mass, and two or more layers or strata of sand, lime, and oil are put on to form a roof.

Claim.—Making roofs of this composition without the use of tiles or slates or canvas, or any other roofing material or agents in connection therewith, substantially as set forth.

No. 28,578.—JAMES HOLLINGSWORTH, of Chicago, Ill.—*Improved Apparatus for Heating Air by Steam*.—Patent dated June 5, 1860.—The steam chest or heater is intended to be arranged a considerable distance above the body of the boiler, that ample room may be left for the circulation of air under the bottom, between it and the body of the boiler.

The inventor says: I claim the arrangement of the furnace J, boiler B, steam boxes and pipes C D, and air box A, as and for the purpose shown and described.

I also claim the arrangement of the deflectors H I J between the steam boxes and the boiler, as and for the purpose shown and described.

No. 28,579.—J. BURROWS HYDE, of Newark, N. J.—*Material for Facing Moulds for Casting Metals*.—Patent dated June 5, 1860.—This invention consists in the employment of finely powdered peaty matter, used separately or mixed with other material in proportions according to the article to be cast and the judgment of the moulder.

The inventor says: I claim the herein described peaty material for facing moulds for casting metals, and which I propose to designate as "Vulcan dust."

I also claim the use of said material when combined with other material for the purpose set forth.

No. 28,580.—ELIAS T. INGALLS, of Haverhill, Mass.—*Improved Machine for Skiving Leather*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, in a machine for skiving counters of boots and shoes, the use of two skivers, one travelling on the arc of a circle, or nearly so, and the other in a straight line, or nearly so, operating substantially as described, whereby both the curved and straight portions of the counter are skived at one operation, as set forth.

In combination with the above, so arranging the knife stock that the knife, if desired, may bear with an elastic yielding pressure upon the former, so as to be adapted to skiving counters of irregular curves, as set forth.

No. 28,581.—HIRAM JAMES, of Barclay, Ill.—*Improved Apparatus for Measuring Liquids*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, measuring chamber D and its internal vertical supply tube E, communicating at its bottom F with the chamber, in combination with the vertical, adjustable, regulating tube L, essentially as described, so that by raising or lowering the tube L the quantity of measured liquor may be increased or diminished, as desired.

Second. The stoppers J and G, in their respective coned tubes I and E, on the rod H, in combination with the lever U T, essentially as described, by means of the slot P, so that the lever may quickly open and close the stoppers at one operation to admit or discharge the measured liquor, without permitting a continuous stream to pass from the reservoir through the measuring chamber.

No. 28,582.—REUBEN JENKINS, of Covington, Ky.—*Improved Bedstead*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, in combination with main bedstead A, the arrangement of the secondary bedstead B, the hollow side rails F of which are made to slide into and be accommodated within the tubular rails E of the main one, in the manner and for the purposes substantially as set forth.

Second. I claim the combination of the divided slats *a a a* and joints *b b*, with the sliding side rails F, the whole being arranged and operated in the manner as set forth, for the purpose specified.

Third. In combination with the bedstead, constructed as described, having hollow metal posts, I claim the bases H when made of cedar, sandal, or other fragrant wood, arranged in the manner substantially as set forth, for the purpose of rendering the bedstead vermin proof.

No. 28,583.—W. F. JOHNSON, of Wetumpka, Ala.—*Improvement in Cotton Cultivators*.—Patent dated June 5, 1860.—This invention consists in the use of a rotary wheel attached to a beam provided with hoes or cutters, and so arranged as to be placed under the complete control of the operator and rotated by the draught of the machine, the wheel being placed in such relation to the beam that the knives or hoes will pass obliquely over the rows of plants and cut or thin them out, as required.

Claim.—The arrangement of the beam A, wheel E, shaft F, with cutters or hoes *f* attached, and lever J, (with or without the wheel I,) substantially as and for the purpose set forth.

No. 28,584.—HERMANN KALLER, of Perry, Ill.—*Improvement in Grain Binders*.—Patent dated June 5, 1860.—This invention consists, first, in combining with a vibrating curved arm or arms two rotary shafts connected by gear wheels and furnished with suitable wipers and cams, in such a manner that by operating the curved arm the grain is held, and by rotating the shaft the wire is cut and twisted around the grain, leaving the gavel in complete order. Second, in the arrangement of a dog in combination with the clamp that serves to retain the end of the wire for the purpose of more effectually confining the wire in said clamp.

The inventor says: I *claim*, first, the arrangement of the two rotary shafts *f g*, with the gear wheels H I, wiper *i*, and cams *n*, in combination with the shears L and with vibrating curved arm E, constructed and operated as and for the purpose described.

Second. The arrangement of the dog *g*, in combination with the clamp J, constructed and operating substantially as and for the purpose specified.

Third. The combination, with the rotary spring catch K, of the two armed fork M, substantially in the manner and for the purpose described.

No. 28,585.—GIBBONS L. KELTY, of New York, N. Y.—*Improved Window Curtain*.—Patent dated June 5, 1860.—This invention consists in making the curtains of buckram, or similar cheap and stiff material, coated with flock.

Claim.—The lambarkin or fixed window curtain, of buckram or other material, covered in the manner specified.

No. 28,586.—BALTHASAR KITT, of Cincinnati, Ohio.—*Improvement in Ringing Bells.*—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the clapper J, attached to the curved vibrating arm I, and pivotted to projection H, and the clapper J, operated by the cord M, passing between the rollers *a* and *b b*, and secured to an arm of the wheel E, as and for the purposes shown and described.

Second. I claim the arrangement described, in relation to the bell, of the two clappers F and J, by which the sounds shall follow each other at equally successive intervals, and with harmonious or concordant sounds.

No. 28,587.—STEPHEN KROM, of New York, N. Y.—*Improvement in Buttons.*—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment of a flanged washer C, in combination with a flat headed screw B, and button A, substantially as described, so that the head of the screw, by being drawn into the recess formed on the underside of the washer, preserves the evenness of the inner surface of the cloth or other fabric to which the button is attached, affording, at the same time, a good hold on the cloth.

No. 28,588.—GEORGE LEACH, of New York, N. Y.—*Improvement in Pull Cocks.*—Patent dated June 5, 1860.—This invention consists in attaching the handle or pull of the plug of the cock, so as to be strong and durable, and at the same time allow the parts to be easily detached to grind in the plug of the cock.

Claim.—The arrangement of the follower 6, spring 5, and screw 7, in connection with the handle or pull *c*, and its screw 8, for the purpose and as set forth.

No. 28,589.—JOHN W. LOGAN, of Philadelphia, Pa.—*Improvement in Securing Reef Points of Sails.*—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, securing single reef nettles by passing them through eyelets and fastening one side by increasing the diameter of the rope, and the other by securing the nettle by seizing to a jack line, substantially as described.

Second. Securing double reef nettles by placing the centre of the double reef nettle close to an eyelet and fastening it by seizing through the eyelet to a jack line on the opposite side of the sail, substantially as described.

No. 28,590.—JOHN MATTHEWS, JR., of New York, N. Y.—*Improvement in Galvanoplastic Coating for the Interior of Metallic Tubes.*—Patent dated June 5, 1860.—This invention relates to the employment as the bath or decomposition cell of the tube itself, and to the use for the purpose of conducting the galvanic cement, and for replenishing the supply of the coating metal, of a rod or wire passing through the tube in the direction of its length.

The inventor says: I *claim*, first, the extension or stretching of the tube by screw threads and nuts, or their equivalents, substantially as and for the purpose set forth.

Second. The use of non-conducting supports *b b*, applied substantially as and for the purpose specified.

Third. Providing for the longitudinal movement of the central conductor and its non-conducting supports *b b*, within the tube, substantially as and for the purpose set forth.

No. 28,591.—JAMES W. McLEAN and ALBERT GUMMER, of Indianapolis, Ind.—*Improvement in Shingle Machines.*—Patent dated June 5, 1860.—This invention consists in using a vibrator of different construction from that found in any other machine, and also in dispensing with the ordinary cam yoke, and substituting therefor cam jaws which are adjusted by means of a tightening screw and key.

Claim.—The combination of the vibrator with the shears *m m m*, the two pins *n n*, tumbler *o o*, spring *q*, in connection with the reciprocating guide V, substantially as and for the purpose set forth.

No. 28,592.—GEORGE MILLIRAN, of Byhalia, Miss.—*Improvement in Cotton Presses.*—Patent dated June 5, 1860.—A rope or chain H is secured in a suitable position, as at *h*, to the carriage or beam, inside of the upper near roller F, back around which it presses and extends thence forward to the windlass, on which it winds in the direction opposite to that of the rope or chain I, thereby drawing the carriage or beam back.

Claim.—The arrangement and combination of the carriage or beam E, toggle lever D, and follower C, provided with the friction roller or rollers *f*, substantially in the manner and for the purposes specified.

No. 28,593.—MATTHEW MITCHELL, of Altona, Ill.—*Improvement in Seeding Machines.*—Patent dated June 5, 1860.—This invention consists in the use of an oscillating rim or band,

which encompasses a stationary cylinder with two holes or openings, the oscillating rim or band being provided with a single opening which works underneath a cut-off, the above parts being used in connection with a scatterer and seed tube.

The inventor says: I *claim* the combination of the perforated oscillating rim or band B, stationary perforated cylinder C, and cut-off *e*, arranged substantially as described, and relatively with the seed-box A, and the tube D, to operate as and for the purpose set forth.

I also claim, in combination with the perforated oscillated rim or band B, perforated stationary cylinder C, and cut-off *e*, the tube D, scatterer F, and share E; all arranged for joint operation as set forth.

No. 28,594.—WILLIAM P. MOSES, of Exeter, N. H.—*Improved Currying Knife*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The guard D, as applied to a currying knife, substantially in the manner and for the purpose specified.

No. 28,595.—DANIEL MOYER, of New Hamburg, Pa.—*Improvement in Corn Planters*.—Patent dated June 5, 1860.—In this invention the plough beams are strengthened by iron plates. The hoppers containing the seed corn are placed on the beams immediately behind the ploughs, and just before the shovel or mould board which covers the seeds in the hill. The tubes extend from the bottoms of the hoppers, and are four in number in each hopper.

Claim.—The arrangement of the centre beam A, wheel *a*, arms B B and C C, plates *v v* and *r*, the brace *g*, bars *c c*, hoppers F, ploughs M and N, mould boards or shovels *m*, tubes *n*, connecting rods *e*, slides *i*, and wheels H, as described, for the purposes specified.

No. 28,596.—ROBERT NICOLL, of New York, N. Y.—*Improvement in Stop Cocks*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment or use of two valves D E, placed at opposite sides of the seat *c*, and made to move simultaneously towards and from the seat by means of the right and left screws, or their equivalents, for the purpose specified.

No. 28,597.—PETER H. NILES, of Boston, Mass.—*Improved Telescopic Drinking Cup*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Making the cup or bottom part A, and one or more of its annular sections B C, with bottom flanches *b b*, and applying the cover so as to fit the bottom part A, and project over the same and the upper edges of its annular section or sections, as described.

No. 28,598.—FREDERICK S. OTIS, of Brooklyn, N. Y.—*Improvement in Devices for Manufacturing Skeleton Skirts*.—Patent dated June 5, 1860.—This invention consists in the combination of a reel containing covered wire or spring for forming the hoops with a former upon which the skirt is put together in the proper shape, whereby the operator draws off from said reel the length of wire required for each, as she successively measures the same, cuts it off, inserts it through the bands, puts on the clasps, and then proceeds to the next hoop.

Claim.—The combined reel and former, constructed substantially as and for the purposes specified.

No. 28,599.—GEORGE PALMER, of Littlestown, Pa.—*Improvement in Pumps*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment, for united operation, of the spherical chamber E, diaphragm *d*, gum elastic springs G G, jointed connecting rod F, and weighted lever H, when the same are constructed and arranged to operate in combination with an arrangement such as described, for raising and forcing water, as set forth.

No. 28,600.—C. G. PLYMPTON and H. M. PLYMPTON, of Walpole, Mass.—*Improvement in Tempering Steel Springs*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The application of water to steel articles while the latter are properly heated and subjected to pressure, or held by dies, presses, or other device in the particular form or shape desired, for the purpose of tempering the same, substantially as described.

No. 28,601.—WHITMAN PRICE, of Wayne County, N. C.—*Improvement in Ploughs*.—Patent dated June 5, 1860.—This invention consists in the construction of the mould board and bar, and attaching the same to a circular beam.

Claim.—The arrangement of A the circular beam, B the standards, C the shovels, D the main beam, *e* the handles, *a* the screw on the upper end of the standards, and *b* the screw nut, combined and operating as described and for the purposes set forth.

No. 28,602.—WHITMAN PRICE, of Mount Olive, N. C.—*Improvement in Machines for Planting Cotton Seed*.—Patent dated June 5, 1860.—This machine is put in motion by the main driving wheel E, the opener B opening the earth for the reception of the seed, and as the wheel E revolves the shaft F it gives motion to the wheel D, with arms revolving in hopper O, which agitates and separates the seeds, allowing them to drop through the slide e. The wheel L follows immediately after, and presses the seed into the ground, and the mould boards a a cover the seed, and the leveller C follows, levelling it over and making the ground smooth.

Claim.—The arrangement of frame A, mould boards a a, leveller C, wheels E and L, wheel D, with arms in hopper O, arms H H, flexible joint K, and standard M; the whole operating as described and for the purposes set forth.

No. 28,603.—EBEN PRITCHARD, of Waterbury, Conn.—*Improvement in Calendar Clocks*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the notched annually revolving cam E, and the movable extension piece H, applied substantially as described, in combination with the quadrennially revolving wheel I, to control the action of a spring upon a dog G, or its equivalent, for the purpose of completing the revolution of the month wheel and day-of-the-month index at the end of the months of less than thirty-one days throughout every quadrennial period.

Second. The combination of the pin 9 on the annually revolving cam, or its equivalent, and the lever like spring 7, applied to operate on the stop pawl i of the month wheel, substantially as and for the purpose specified.

No. 28,604.—A. H. RAUCH, of Bethlehem, Penn.—*Improved Devices for Drawing Water from and Supplying Air to the Air Vessels of Pumps, &c.*—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The drainer C, applied in combination with the air vessel A, and furnished with a system of cocks, substantially as described, whereby the water in the air vessel may be exchanged for air, as set forth.

No. 28,605.—C. F. RICHTER, of Columbia, S. C.—*Improvement in Ploughs*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The construction and arrangement of the two pieces E G, the mould board or share H, and their several connections, for the purpose of uniting them together and allowing the mould board to be adjusted to the pieces E G, substantially as set forth and explained.

No. 28,606.—GEORGE W. RICHTER, of Philadelphia, Pa.—*Improved Porter Bottle Boxes*.—Patent dated June 5, 1860.—This invention consists in constructing a box for the conveyance of bottles of porter, &c., by combining the bottom, sides, and ends of the box with metallic frames by means of bolts, which hold the several parts together in a strong and substantial manner without the use of nails or screws.

Claim.—Combining and arranging the sides A A, ends B B, bottom C, and partition strips G, with the metallic frames D D, and rods E E E E, substantially in the manner and for the purpose set forth.

No. 28,607.—NATHAN D. ROSS, of Braintrem, Pa.—*Improved Churn*.—Patent dated June 5, 1860.—This invention consists in lengthening or shortening the stroke, and lowering and raising the dash so as to give to it the right position in the churn, at the same time giving to the dash an independent revolving motion to the right and left, and giving to the operator power over the work to be done.

Claim.—The revolving of the churn dashers O and handle L, by means of the peculiarly constructed series of dashers O and blades N, the whole being constructed and working as described above.

No. 28,608.—O. P. ROWLAND, of Jamesport, N. Y.—*Improved Elastic Lining for Boom Jaws*.—Patent dated June 5, 1860.—This invention is intended to prevent the wear of the parts covered.

Claim.—The application of an India rubber roll R as a lining for boom, gaff, and yard jaws, constructed, arranged, and operating substantially as and for the purposes set forth.

No. 28,609.—J. S. SAMMONS, of New York, N. Y.—*Improvement in Car Couplings*.—Patent dated June 5, 1860.—In this invention there is used a vertically moving catch, a pendant dog, a lever, springs and top combined and arranged in relation to each other and the bumper head.

Claim.—The bar catch E, dog D, and disengaging lever F, combined with a stop or ledge

G, and retaining spring H, with or without the spring I; all being placed within the bumper head, and arranged, relatively with each other, to operate as set forth.

No. 28,610.—CHARLES SCOFIELD, of Adams, N. Y., and CLARKE RICE, of Watertown, N. Y.—*Improvement in Sewing Machines*.—Patent dated June 5, 1860.—By taking away the spring *m*, or moving it out of its operative position, the operation of the hook *l* may be caused to cease, and the machine will make the ordinary shuttle stitch.

The inventors say: We *claim* the combination, in the manner shown and described, of feeding dog P, with the slide L and cams M M¹, for the purpose set forth.

We also claim the combination of the sliding wedge Q with the spring feeding dog P, slide L, and cams M M¹, as and for the purpose shown and described.

We also claim the combination of the pivotted lever hook *l* with the guide plate F and plate H¹, spring *m*, and cam *p*, as and for the purpose shown and described.

No. 28,611.—GEORGE SCOTT, of Cincinnati, Ohio.—*Improvement in Moulds for Jars*.—Patent dated June 5, 1860.—This invention consists in making moulds for moulding jars in two parts, each part of which is adapted to be rotated on the potter's wheel or lathe separately, while its part of the jar is formed upon its inner surface.

Claim.—The two part mould for moulding jars, when the parts 1 and 2 thereof are made and adapted to be used with a potter's lathe, in the manner substantially as described.

No. 28,612.—E. A. SMEAD, of Tioga, Pa.—*Improvement in Corn Shellers*.—Patent dated June 5, 1860.—Surrounding the drum is a fluted concave E, having the form of a scroll described from the axis of the drum A, and gradually diminishing from the feeding point G to the place of discharge H, which is a vertical opening. The edge of the concave at G is turned up close to the periphery of the shelling drum so that the ears of corn may not escape at this point, and the bottom edge *c* of the concave is turned under so as to come sufficiently close to the base of the conical drum to prevent the ears from escaping through the bottom of the machine during the operation of shelling.

Claim.—The employment of an upright scroll shaped shell E, and drum A, arranged and operating in respect to each other as shown and described, for the purpose set forth.

No. 28,613.—CHARLES F. SPENCER, of Rochester, N. Y.—*Improvement in Anti-Friction Screws and Nuts*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment of anti-friction balls C C, arranged in adjustable sockets in the interior of a threadless nut B, in combination with a screw A, which has screw threads formed to fit said balls, substantially as and for the purposes specified.

No. 28,614.—JOHN K. STAMAN, of Mifflin, Ohio.—*Improved Boot and Shoe Wiper*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Forming a feet wiper or cleaner, substantially as described, that is to say, by binding corn shucks or other suitable material upon a suitably shaped stock, as and for the purpose set forth.

No. 28,615.—PTOLLMAN STOVER, of West Alexandria, Ohio.—*Improvement in Corn Planters*.—Patent dated July 5, 1860.—When this machine is drawn along the ground, the shovels *a* make a furrow in which the seeds drop, and the roller B gives motion to the toothed wheel E connected to its side to the toothed wheel G, and this, by means of the crank I on its shaft, moves the seed slides and so delivers the seed into the ground, where it is covered by the shares *b*, and the soil pressed down by the traction rollers B.

Claim.—The peculiar arrangement of the measuring space, having an elastic back piece *k*, and an adjustable front piece *j*, in connection with the cut-off *g*, and lower slide *f*; all constructed, arranged, and operating in the manner substantially as and for the purposes set forth and described.

No. 28,616.—JAMES STRATTON, of Brooklyn, N. Y.—*Improvement in Devices for Regulating the Pressure of Water in Pipes*.—Patent dated June 5, 1860.—This invention consists of an air chamber formed with a plunger, or yielding bottom, to which a valve stem is attached, the air chamber and valve being arranged in connection with suitable pipes and in such relation to the supply pipe as to effect the desired end.

Claim.—The employment or use of the pipe A¹, communicating with the diaphragm chamber, with or without the air chamber, in connection with the supply pipe A, valve C, and pipes D F G, with necessary cock or cocks, arranged to operate substantially as and for the purpose set forth.

I further claim, in connection with the above named parts, the perforated cap or chamber J, encompassing the valve C, substantially as and for the purpose set forth.

No. 28,617.—JAMES TAYLOR, of South Dartmouth, Mass.—*Improvement in Liquids for Fluid Gas Meters*.—Patent dated June 6, 1860.—The claim explains the nature of this invention.

Claim.—The use of the bittern or mother-water left after extracting the crystallizable salts from sea water for filling wet gas meters; all in the manner and for the purpose substantially as set forth.

No. 28,618.—BENAIAH TITCOMB, of Baltimore County, Md.—*Improvement in Harvesting Machines*.—Patent dated June 5, 1860.—This invention consists in the arrangement of a hinged lever provided with a spherical friction roller, or its equivalent, for communicating motion to the cutters from the cam groove of the driving wheel, so that by the use of a rod or lever the friction roller can be instantly thrown from the cam groove while the machine is in motion.

Claim.—The hinged lever E, provided with the spherical roller D, or its equivalent, constructed, arranged, and operated substantially as and for the purposes set forth.

No. 28,619.—RICHARD VOSE, of New York, N. Y.—*Improvement in Car Springs*.—Patent dated June 5, 1860.—This car spring is composed of centrally perforated flat sided disks *d d d* of vulcanized India rubber, or gutta percha, combined with each other by means of the caps *a b*, the rings *c c*, and the central bearings *e e*.

Claim.—The disks *d d d*, the caps *a b*, the rings *c c*, and the central bearings *e e*, when constructed and arranged substantially in the manner set forth.

No. 28,620.—L. WADDELL and W. H. WADDELL, of Staunton, Va.—*Improvement in Car Couplings*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* the combination of the lever and latch, in the manner described, with especial reference to the security of the coupling and the easy detachment of cars when in motion, and even going up grade.

We do not claim the swinging plate for the purpose of admitting the link, that being somewhat the principle both of the swinging pin and tumbler catch, which are common; nor do we claim it for the purpose of preventing the escape of the link, but only so far as it may be a novelty as a device for holding the link in such a position as to insure certainty in coupling.

No. 28,621.—THOMAS WALL, of Jones Station, Ohio.—*Improved Bedstead*.—Patent dated June 5, 1860.—This invention relates to the manner of connecting the side rails of a bedstead to the corner posts thereof and retaining them in place, also to an improved device for tightening the bed cord when the same is applied to the bedstead.

Claim.—The flanged sockets and hooked fasteners or clasps, as described, when used in combination with the windlass rail E, with its pin *f*, ratchet *e*, and latch *h*, all arranged to operate as and for the purposes set forth.

No. 28,622.—ALONZO WARREN and E. DAMON, JR., of Boston, Mass.—*Improvement in Hanging Turbine Wheels*.—Patent dated June 5, 1860.—This invention consists in a novel combination of a hollow spindle shaft with globular enlargement, adjustable step, and stationary shaft, whereby a very short hollow shaft may be used, adding on the top the necessary length of solid shaft.

Claim.—The globe coupling A, in combination with the adjustable screw step B, the same being used for a vertical turbine shaft, in the manner set forth.

No. 28,623.—CHARLES L. WILLIAMS, of Quincy, Fla.—*Improved Detachable Hook for Suspending Boats*.—Patent dated June 5, 1860.—This invention consists in the use of rods with conical enlargements on their ends that hang from the lower pulley blocks of the davits, and in applying fixedly, to the stem of the boat to be hung from the davits peculiar shaped brackets, provided with levers that in conjunction with shoulders formed on the brackets receive and hold the conical ends of the rods, attached to the tackle, by virtue of the gravity of the boat acting upon the lever.

Claim.—The combination of lever C, rod G, with shoulder *a*, on the bar A, and the treadle J, all arranged as and for the purposes specified.

No. 28,624.—THOMAS H. WITHERBY, of Worcester, Mass.—*Improvement in Rotary Engines*.—Patent dated June 5, 1860.—The single abutment F provides only for running the engine in the direction indicated by the arrow, and a similar abutment S is applied to the opposite mouth of the cylinder, to provide for its running in the opposite direction.

Claim.—The abutment S, applied in connection with the abutment F, and in combination with a reversing valve, to operate substantially as and for the purpose set forth.

No. 28,625.—JOSEPH WOODRUFF, of Rahway, N. J.—*Improvement in Harvesters*.—Patent dated June 5, 1860.—At, or near, each end of the knife K is attached a cord or belt *h*, which passes over and under the pulleys *i* and *k*; L and L¹ are the operating levers pivotted to the wheel frame; one of these levers L is attached to the pulley cord *h* by a small cord *l*; the other lever L¹ is attached to the knife by a small cord *m*.

Claim.—The arrangement of the levers L L¹, pulleys *i* and *k*, and cords *h l* and *m*, for operating the reciprocating curved knife, as and for the purposes set forth and described.

No. 28,626.—LUM WOODRUFF, of Ann Arbor, Mich.—*Improvement in Barometers*.—Patent dated June 5, 1860.—F is the screw plug for closing the orifice of communication *d* between the cistern and the reservoir, said plug screwing through a tapped hole *e* in the back of the reservoir opposite to the orifice *d*, which is tapped with a taper tap so that the plug may screw into it very tightly.

Claim.—The screw plug, constructed and applied to the reservoir and cistern, substantially as described and operating as set forth.

No. 28,627.—WILLIAM B. BERNENT, of Philadelphia, Pa., assignor to himself and JAMES DOUGHERTY.—*Improved Machine for Cutting Key Seats, &c.*—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the described combination of the reversible screwed shaft C, with the revolving drill or drills, when an intermittent motion at right angles to the said screwed shaft is imparted to the said drill or drills by the devices described, or their equivalents, and when the screw is caused to impart an uniform reciprocating motion to the drills or to the object operated on by the drills.

Second. The hollow spindle I, its clutches K and K¹, bevel pinions G and H, and internal rod J, the whole being constructed and arranged for joint action and combined with the bevel wheel F, on the screwed rod C, as set forth, so that the said screwed shaft may be reversed by the movement of the internal rod J, as set forth.

Third. Operating the reversing clutches from the carriage which carries the drills or which carries the object acted on by the drills, through the intervention of the T-shaped lever Z, or its equivalent, with its pointed arm 27, and the spring rod 26, with its pointed end, the whole being combined and arranged for joint action, substantially as and for the purpose set forth.

Fourth. I claim, in combination with the above mentioned reversible lever Z, and its adjuncts, the adjustable screw collars 17 and 18, connected to the carriage D, and arranged in respect to the rod 15, and its adjustable collars 21 and 22, substantially as set forth.

Fifth. I claim the described stop motion by which the advance of one of the drills is retarded during the movement of the machine; that is to say, I claim furnishing one of the head stocks which carries one of the drills, with a movable nut *l*, so arranged as to be thrown out of gear with the screwed shaft U, by the head stock which carries the opposite drill, through the intervention of the devices described, or their equivalents.

No. 28,628.—CHESTER BULLOCK, of Jamestown, New York, assignor to himself and DE FOREST WELD, of said Jamestown.—*Improved Mowing Machines*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of means recited for connecting the frame or bars of the fingers and cutters to the frame or body of the mower or machine.

Second. The arrangement of means set forth for allowing of the suspension and for suspending the frame of the cutters and fingers by the side of the mower.

Third. The means recited for uniting the cutter bar to the connecting rod.

Fourth. The arrangement of means described for connecting the draft pole to the mower or machine frame, and for the purposes set forth.

Fifth. The manner of attaching the cutters to the fingers and cutter bar described.

No. 28,629.—ISAAC COOK, of Mount Pleasant, Iowa, assignor to himself and HUGH McCLURE, of said Mount Pleasant.—*Improved Washboard*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination, with an ordinary washboard, of the reciprocating and hinged rubbers and frames working in suitable grooves, and made yielding to the varying thickness of articles placed between the rubbers and board, as and for the purposes set forth.

Second. The arrangement, in combination with the above reciprocating rubbers and frame, of a suitable pump, arranged so as to supply water to the top of the board over the articles between the rubbers, as set forth.

No. 28,630.—PERLEY D. CUMMINGS, of Portland, Me., assignor to D. H. FURBISH, of said Portland.—*Improvement in Chains*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* a chain link strap, one of whose ends has a head formed on it while the other end has a socket to receive the head, substantially as described.

I also claim an open coupling link for chains, with ears located at the outer sides of the legs of the link, as described.

No. 28,631.—PERLEY D. CUMMINGS, of Portland, Me., assignor to D. H. FURBISH, of said Portland.—*Improvement in Gearing*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* a universal reversible bolt standard, constructed substantially as set forth, for the purpose of securing a driving wheel to a carriage wheel.

I also claim the combination of the universal reversible bolt standard described with the driving wheel by means of a flange upon the latter, substantially as described.

No. 28,632.—DAVID FELLENBAUM, of Lancaster, Pa., assignor to himself and NATHANIEL BAKER, of Marietta, Pa.—*Improved Variable Cut-Off for Steam Engines*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the stationary lifting pieces $f f^1$, applied and operating in combination with the stems of the puppet valves, substantially as described.

Second. The combination of the two tripping levers $u v$ and $u^1 v^1$, attached to the slide valve B, and the tripping piece D, made adjustable within the steam chest; the whole applied and operating in combination with the slide and puppet valves, substantially as and for the purpose specified.

Third. The combination of the lifting pieces $f f^1$, the two tripping levers $u v$ and $u^1 v^1$, and the tripping piece D; the whole applied and operating in connection with the slide and the puppet valves, substantially as described, to constitute a variable cut-off.

No. 28,633.—HENRY W. FULLER, of Brooklyn, N. Y., assignor to himself and ANTHONY W. GOODELL, of said Brooklyn.—*Improvement in Mechanism for Marking Cloth in Sewing Machines*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* forming one, two, or more creases in cloth, by means of markers, on opposite sides of the cloth, one of which is connected with the bed of the machine, and the other operates simultaneously with vibrations of the needle in a sewing machine, whereby the crease or creases are formed in the cloth itself parallel to the line of sewing, in such a manner that the cloth is ready for doubling over at said creases for the next line of sewing, as set forth.

I also claim marking a line on the surface of cloth, or other material, being sewed in a machine by means of a pencil, or similar article, that is pressed upon the surface of said cloth at the time the needle perforates the same, and is raised therefrom when the feed takes place so as to produce a series of marks parallel to, and simultaneous with, the line of sewing, as set forth.

No. 28,634.—CHARLES J. HAYWOOD, of Durham, Conn., assignor to the MERRIAM MANUFACTURING COMPANY, of said Durham.—*Improvement in Making Tin Boxes*.—Patent dated June 5, 1860.—This invention consists in a process or method of producing a certain result in the manufacture of tin boxes, &c.

The inventor says: I *claim*, first, a properly constructed and arranged friction device, substantially such as described, for securing a head or bottom of a tin box, &c., as the recess die A, ridges E, friction sliding plate C.

Second. I claim a new manufacture of an old article or tin box, for various purposes, by a new process, substantially in the manner described.

No. 28,635.—XAVIER KARCHESKI, of New York, N. Y., assignor to LOUIS T. VALENTINE, of said New York.—*Improvement in the Manufacture of Vegetable Parchment*.—Patent dated June 5, 1860.—(Suspended.)

No. 28,636.—WILLIAM MAY, of Winchester, Ohio, assignor to J. DE BRUIN, E. A. RAMSEY, and W. W. RAMSEY, of said Winchester.—*Improvement in Self-Acting Wagon Brakes*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the chain I, operating in connection with the slotted tongue piece D, when operating reversely upon the same lever with bar C, for the purpose described.

Second. I claim the construction of the bar F, and the plate G, adapted to stops $k l$, arranged and operating substantially as set forth, being for the sole purpose of reversing the action of self-acting wagon brakes, in combination as described.

No. 28,637.—WILLIAM H. NOYES, of Boston, Mass., assignor to HARVEY T. LITCHFIELD, of said Boston.—*Improved Gauge for Filling Barrels*.—Patent dated June 5, 1860.—In this invention the indicator will rise with the float, and reaching the level of the upper surface of the bung hole, will show that the barrel has been sufficiently supplied with the liquid.

Claim.—Combining with the filling tube A, the groove or chamber B, and its float C, furnished with an adjustable slide or indicator, as described.

No. 28,638.—JOHN C. REED, of Cincinnati, Ohio, assignor to himself and S. E. HUTCHINSON, of said Cincinnati.—*Improvement in Picks*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment of the rebate F, in the jaw D, when used in connection with a spring jaw E, and slide H, to hold the bit; the spring being constructed so as to retain the slide, substantially as set forth.

No. 28,639.—JOHN F. SCHUYLER, of Philadelphia, Pa., assignor to WILLIAM E. LOCKWOOD, of said Philadelphia.—*Improvement in Apparatus for Dressing Grindstones*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The described dressing wheel, composed of a series of radiating sharp-pointed chisels, situated between two yielding washers, the whole being arranged and hung to the stem C, or its equivalent, substantially in the manner and for the purpose set forth.

No. 28,640.—JOHN TIEBOUT, of Brooklyn, N. Y., assignor to himself and WILLIAM TIEBOUT, of said Brooklyn, N. Y.—*Improved Bung Cutter*.—Patent dated June 5, 1860.—Secured to the lower end of the shaft C is a disk F by means of a screw or screws *a*. This disk is furnished with a series of radial slots *b*, the number of which corresponds to the number of cutters to be employed, and which form the guides for the adjustable hinges *c*, to which the cutters G are attached by means of pivots *d*.

The inventor says: I *claim*, first, the combination with the disk F and arms *f* of the adjustable hinges *c*, as used for the purpose shown and described.

Second. The combination of the tubular projection D, and adjustable guide plates *h*, with the sliding shaft C and disk F, as and for the purpose shown and described.

No. 28,641.—JOSHUA TURNER, of Cambridgeport, Mass., assignor to himself, F. GUILD, E. C. DANIELL, and WARREN COVELL, of Dedham, Mass.—*Improved Machine for Buffing and Reducing Leather*.—Patent dated June 5, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of the rotary grinder B, the bed roller E, the draft roller D, and the brush F, arranged and made to operate together substantially as described, and for the purpose as specified.

I also claim the application of the feed and bed rollers to a rocker frame C, or its equivalent, and combining therewith devices substantially as described, whereby the two rollers may not only be simultaneously moved away from and toward the buffing cylinder B, but the feed roller be moved from and toward the bed roller; such devices being the springs *c c*, the rotary windlass H, and its connections *b¹ b¹ e e*, and the band and treadle I, or other equivalent means.

I also claim supporting one of the rocker frame bearings in a slider, and providing such with adjusting screws, the same being for the purpose as specified.

No. 28,642.—THOMAS J. ALEXANDER, of Westerville, Ohio.—*Improvement in Mechanism for Starting Sewing Machines*.—Patent dated June 12, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, so constructing and hanging or arranging the lever, or its equivalent, which serves for the knee or knees of the operator, to set in motion mechanism for starting the treadle-driven shaft in a forward or given direction, as that said lever requires the lateral action of the knee or knees to actuate it, essentially as set forth.

Second. The employment, in combination with a treadle, and for starting the treadle-driven shaft, in a forward or given direction, of a friction pad or wheel set in motion against a band or other wheel connected with said shaft, and actuating the same substantially in the manner described.

Third. So hanging and operating the friction pad or wheel which is employed to start the treadle-driven shaft in a forward or given direction, as that the same movement on the part of the operator, which serves to rotate or communicate driving motion to the friction pad or wheel, firstly brings said friction pad in close rubbing contact with the wheel it operates, and whereby the friction pad or wheel is made self-freeing, after having started the wheel or shaft, it is employed to direct the movement of, and give starting impetus to, substantially as specified.

No. 28,643.—WILLIAM H. AKINS and DARIUS BABCOCK, of Dryden, N. Y.—*Improvement in Machines for Cleaning Grain, when Fed to the Mill, and Cooling the Mill Stones.*—Patent dated June 12, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We claim, first, the tube Q, arms c, and inclines a, in combination with the hopper X and the upper surface of the revolving cone N, and the pin P, when used for feeding grain from a hopper, as described.

Second. We claim the cone N and tube R in combination with the fan L, when the fan L surrounds the cone N and tube R, the cone distributing the grain radially from its upper surfaces, its curved sides guiding the blast of air so as to most effectually dislodge all impurities.

Third. We claim the air passage between the upper surface of the stone B and the curb U, formed by closing the opening x x and inserting the holes V V for the admission of air at the outer edge and upper surface of stone B, for the combined purpose of cooling the stone in its passage over it, from its periphery to its centre or eye, and supplying the fan with air to clean the grain.

Fourth. We claim the manner of reversing the wings of the fan L by hanging them upon the pin O, so that they may be swung around to the position shown by the red lines No. 2, and latched over the pins P³.

Fifth. We claim running the fan L directly from the bail E, (or from the driver D, which would be equivalent thereto,) at the same speed of the stone, thereby avoiding the use of gear, band, or belt.

No. 28,644.—NEHEMIAH S. BEAN, of Manchester, N. H.—*Improvement in Pumps.*—Patent dated June 12, 1860.—This invention is limited to the novelty of arrangement and combination of old parts, working together, so as to produce a double acting suction and force pump.

Claim.—The concentric arrangement and combination of the pump cylinder, suction, and discharge passage, caps, and valve plates, with valves located in opposite sides thereof, all operating substantially as described.

No. 28,645.—G. H. BEARD, of Cincinnati, Ohio.—*Improved Claw Bar.*—Patent dated June 12, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The instrument for drawing spikes and similar purposes, constructed as described, comprising the three following and several features, viz: the U-shaped space E receding towards the heel to allow the necessary traverse to the spike in the process of drawing the heel C, and the recess formed by the inclined surfaces a a to receive the head of the spike, all substantially as described.

No. 28,646.—NELSON W. BREWER, of Williamsport, Pa.—*Improvement in Self-Loading Fire Arms.*—Patent dated June 12, 1860.—This invention consists in the construction and arrangement of the cylinder A, the spiral plate S, cap L, and cap box T, together with the manner of capping.

The inventor says: I claim, first, the arrangement of the cylinder A with the spiral plate S and cap L.

Second. The cup box T and manner of capping, described.

No. 28,647.—JOHN BUTLER, of Brooklyn, N. Y.—*Improvement in Flexible Gas Tubes.*—Patent dated June 12, 1860.—The claim and engravings explain the nature of this invention.

Claim.—As an improved article of manufacture, a flexible gas conductor, composed of a flexible leaden tube covered with braid or other suitable pliable non-metallic covering, substantially as shown and described.

No. 28,648.—HUGH CAMPBELL, of Newtown, Conn.—*Improved Steam Stuffing Box for Revolving Rolls.*—Patent dated June 12, 1860.—This invention consists in constructing a steam stuffing box, the external diameter of the friction surface of which is much less than that of any heretofore used.

Claim.—The arrangement of pipe n within pipe d, as described, in combination with the stuffing box b, and its appendages, and roll a, for the purposes and operating substantially in the manner fully set forth.

No. 28,649.—JOHN D. CHISM, of Albany, N. Y.—*Improvement in Shingle Machines.*—Patent dated June 12, 1860.—This invention consists in providing a device by which oscillating head blocks of shingle machines may be adjusted and regulated with accuracy.

Claim.—The cross bar I, as attached to the rack feed bar J, in connection with the recess or chamber N in the oscillating feed head G, all in the manner and for the purpose specified; and these parts or means I only claim when they are connected with the adjustable lever feed bar T, with the lateral adjustable screw W, and feed pawl attached to handle U, regulated by the spiral spring, as represented, all for the purpose and in the manner specified.

No. 28,650.—FRANCIS CIST, WILLIAM KOSSAK, and WILLIAM H. GODFREY, of St. Louis, Mo.—*Improved Tool for Laying and Stretching Carpets*.—Patent dated June 12, 1860.—This invention consists in combining the upper jaw of a pair of pliers or pincers with an upright foot F, on the sole of which a device D is arranged, designed to hold a tack T in such a position that it may be sunk by pressure into the desired place, using the point P as a fulcrum resting on the floor after the carpet *ec* has been pulled up to that place by means of the pliers.

Claim.—The combined arrangement of the wedge W, the recess R behind the wedge, and the slit S in the wedge, with each other and with the pliers or pincers, all constructed and operating substantially in the manner and for the purpose described.

No. 28,651.—JAMES CLARK, of Newark, N. J.—*Improvement in the Manufacture of Prussian Blue*.—Patent dated June 12, 1860.—This improvement consists in furnishing by artificial means the oxygen which is essential to the color of the precipitate, in place of the usual method of agitation to assist absorption of the oxygen from the atmosphere.

Claim.—Supplying atmospheric oxygen by artificial means in manufacturing Prussian blue, in the manner and for the purposes specified.

No. 28,652.—JOSEPH CLARKE, of Syracuse, N. Y.—*Improvement in Vapor Lamps*.—Patent dated June 12, 1860.—This invention consists in constructing hydro-carbon vapor generators in such a manner that the tube which conveys the fluid upward to the generator, and also the tube which conveys the vapor downward are both contained in one piece of metal.

Claim.—The construction of the conducting tubes H and G in one solid piece of metal E, substantially in the manner and for the purpose stated.

No. 28,653.—WILLIAM A. CLARK, of Bethany, Conn.—*Improved Tenoning Auger*.—Patent dated June 12, 1860.—The claim and engravings explain the nature of this invention.

Claim.—An adjustable hollow auger having the longitudinal lines of the periphery of the inner surfaces of the barrel at all times parallel to each other, within the entire limit of the adjustability of the instrument, constructed substantially as described.

No. 28,654.—M. C. COGSWELL and JOHN MCKIERNAN, of Buffalo, N. Y.—*Improvement in Bolting Chests*.—Patent dated June 12, 1860.—The claim and engravings explain the nature of this improvement.

The inventors say: We *claim*, first, the hollow shaft A, for the purposes and substantially as described.

Second. We claim the perforated cylinder D in combination with the hollow shaft A, for the purposes and substantially as set forth.

Third. We claim the combination and arrangement of the rotating reel head S, with the stationary head board Q and stationary cylinder R, for the purposes and substantially as set forth.

Fourth. We claim the relative arrangement of the cant boards G, cylinder H, brush I, bridge K, and openings T T, for the purposes as set forth.

No. 28,655.—LEONARD COLEMAN, of New Orleans, La.—*Improvement in Mills*.—Patent dated June 12, 1860.—This improvement consists in making the metal frame, or husk and hoop of the mill, all in one piece, by casting it all together; also, in supporting the hopper by a feed pipe, with a screw on the outside working in a female screw in the top of the case, so as to adjust the pipe and graduate the feed.

The inventor says: I *claim* the metal frame A and hoop B of the mill in one piece, constructed as described.

And in combination with the parts above claimed, I claim the feed pipe R, supporting the hopper, and adjusted by a screw, substantially as described.

No. 28,656.—THOMAS M. COLEMAN, of Philadelphia, Pa.—*Improvement in Horse Shoes*.—Patent dated June 12, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The horse shoe composed of the two plates A and B, permanently secured together with an intervening strip *c* of gum elastic or other equivalent material, when the latter as well as the plate B has recesses or slots *b*, arranged in respect to the nail holes of the plate A, in the manner set forth, so that the entire shoe can be secured rigidly to the hoof by simply driving the nails, and without separating the plates.

No. 28,657.—JAMES S. COLVIN, of Pittsburgh, Pa.—*Improved Steam Boiler*.—Patent dated June 12, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination and arrangement before described of the small air tight furnace, supplied with a blast of air, with a heating cylinder inside of a steam boiler, in the manner substantially as before described, for the purpose of securing the more uniform distribution of the heat of the furnace than is practicable when the bottom of the

boiler is exposed to the direct action of the fire, so that the greatest degree of heat shall be applied near to the surface of the water in the boiler.

Second. Placing the escape flue for the air and products of combustion of the furnace in the position in relation to the furnace and boiler substantially as described, so that the air and products of combustion gradually descend as they part with their heat until they find their exit at the lowest point, thus preventing the escape of the products of combustion until they have parted with as much as practicable of their excess of caloric, and thus, by economizing heat, effecting a great saving of fuel.

Third. Connecting the surface of the boiler with a heating chamber inside the boiler, by means of the confined throat of the fire chamber, substantially as described, so that the furnace being air tight and supplied with a blast, forces the heated air to rise directly to the top of the heating chamber, and thus apply the greatest heat near to the surface of the water, for the purpose of securing the more rapid generation of steam

No. 28,658.—HORACE I. CRANDALL, of New Bedford, Mass.—*Improvement in Marine Dry Docks*.—Patent dated June 12, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Combining with a cradle or carriage D the supporting and guiding columns C C C, when the same are in any suitable manner jointed or hinged to the cradle, so as to allow of its being raised or depressed, at the same time keeping the carriage horizontal, and serving as supporting columns when the carriage is at its highest point, essentially in the manner and upon the principles set forth.

No. 28,659.—J. W. CRANE, JR., of Freeport, Ill.—*Improved Washing Machine*.—Patent dated June 12, 1860.—The frames C D are formed of side pieces *b b*, in which the journals of the rollers are fitted. The forward frame C is of slightly concave form, and extends underneath the cylinder B and is suspended at its front end by the rods *c c* from the springs E E, which are attached at each side of the box A.

Claim.—The arrangement of the hinged concave frame C, in combination with the frame D, the vertically acting spring E, adjusting connecting rod *c*, pendant H, rod G, and the horizontally acting spring I, all as and for the purpose shown and described.

No. 28,660.—WILLIAM W. CULPEPPER, of Augusta, Ga.—*Improvement in Car Couplings*. Patent dated June 12, 1860.—This invention consists in providing a self-coupling bumper for railroad cars, intended to act with certainty and prevent accidents.

Claim.—The peculiar form of the throat H, combined with the sliding plate C, spring O, stop bolt *a*, bumper rods *r*, and keys *t*, arranged and operating with bumper A and link S, as and for the purpose set forth.

No. 28,661.—ISAAC EDGE, of Jersey City, N. J.—*Improved Torch for Night Processions*.—Patent dated June 12, 1860.—This invention consists in the employment of a head piece *a* of wood or other material, to the upper part of which is attached one end of a closely fitting case *b* of paper or other proper material, made cylindrical and of a length proportionate to the requisite duration of the light.

Claim.—A procession torch made or arranged in the manner set forth.

No. 28,662.—PHILIP ESTES, of Leavenworth, Kansas Territory.—*Improvement in Quartz Crushers*.—Patent dated June 12, 1860.—This invention consists, first, in combining a friction lifter, pair of anti-friction rollers, tooth, and tongue, with a pestle rod and a double cam, for the purpose of raising and letting fall the pestle or pestles of a quartz crusher or mill.

Second. In combining the screw threaded end of a pestle rod with a female screw in a ratchet plate, for the purpose of imparting to the pestle during its descent a turning motion around its vertical axis, so as to produce a grinding as well as a crushing motion of the pestle.

The inventor says: I claim, first, combining a friction lifter *m*, pair of anti-friction rollers *n*, tooth S, and tongue *r*, with a pestle rod *a*, and a double cam *p p*, in the manner and for the purposes set forth.

Second. Combining the screw threaded end *c* of a pestle rod *a* with a female screw *i* in a ratchet plate *i*, in the manner and for the purposes specified.

No. 28,663.—SAMUEL FRAZER, of Galena, Ill.—*Improvement in the Distillation of Oils from Resin*.—Patent dated June 12, 1860.—This invention consists in producing five different products, or articles of commerce in the shape of oils, designated as No. 1, 2, 3, 4, and 5, all of which are obtained from the distillation of resin by means of a peculiar process.

Claim.—The mode of obtaining oils from resin by distillation, as set forth, by the distillation of resin at the temperatures and in the manner set forth.

No. 28,664.—GEORGE E. FREW, of Brooklyn, N. Y.—*Improved Pen and Pencil Case*.—Patent dated June 12, 1860.—This invention consists in the use of sliding tubes having endless chains attached to them and to the pencil and pen slides.

Claim.—The arrangement of the endless chains D H, tubes B C C¹ E F G J, pen slide I, and pen tube A, substantially as and for the purpose set forth

No. 28,665.—ANDREW J. GOVE, of San Francisco, Cal.—*Improved Wrench*.—Patent dated June 12, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, in combination with the rack or racks on the shank of the movable jaw, the lever and pin or stop connected to the handle for the purpose of holding and releasing the movable jaw, substantially as described.

Second. In combination with the rack on the movable jaw, and the stop and lever on the handle, the coiled spring s, for throwing out the movable jaw when the lever is compressed or the stop raised out of the rack, substantially as described and for the uses and purposes set forth.

No. 28,666.—ELIAS J. HALE, of Foxcroft, Me.—*Improvement in Lamps*.—Patent dated June 12, 1860.—This invention consists in the arrangement and application of a stationary spring catch, or wick retainer, relatively to the lamp cap and the wick tube, made adjustable vertically; also in the combination of a rack, or punctured plate, with the wick tube and the stationary spring catch, applied to the lamp cap and to operate within the movable wick tube.

The inventor says: I *claim* the arrangement and application of the stationary spring catch or wick retainer C, relatively to the lamp cap A, and the wick tube B, made adjustable, vertically, by means substantially as described.

And I also claim the combination of the rack plate g, with the adjustable wick tube B, and the spring catch C, the same being for the purpose specified.

No. 28,667.—A. B. HAWKINS and JOHN PUNTENNEY, of Cameron, Ill.—*Improvement in Moles for Drain Ploughs*.—Patent dated June 12, 1860.—A is the front of the mole made in the form of a sharp tapering wedge, the lower edge a being in advance of the upper edge a¹.

Claim.—As a new article of manufacture, a mole for draining machines constructed in the form and in the manner as above set forth.

No. 28,668.—GEORGE E. HAYES, of Buffalo, N. Y.—*Improvement in Apparatus for Vulcanizing Rubber*.—Patent dated June 12, 1860.—The inventor says: As the rubber compound is gradually softened by warming the flask, it will yield to the pressure, and the reaction of the spring rod will follow up the yielding nature of the softened compound, and thus keep a continual and uniform pressure upon the compound until it is brought within its required dimensions in the flask.

The inventor says: I *claim*, first, a spring clamp constructed and operating for the purposes and as substantially described.

Second. Constructing the flask with a recess I, for the purposes and substantially as set forth.

Third. The circular emboss g¹, in combination with the corresponding depression j³, for the purpose substantially as described.

No. 28,669.—JOHN R. HENSHAW, of Middletown, Conn.—*Improved Self Mousing Hook*.—Patent dated June 12, 1860.—The claim and engravings explain the nature of this invention.

Claim.—As an improved article of manufacture, a mousing hook having a slotted bar g, arranged to open outward, as shown, so that it cannot become entangled in the rigging when otherwise made, as represented and described.

No. 28,670.—NEHEMIAH HODGE, of North Adams, Mass.—*Improvement in Railroad Brakes*.—Patent dated June 12, 1860.—This invention consists in a combination of certain mechanical devices placed upon a locomotive engine and upon the car attached thereto, whereby common atmospherical pressure is used as the force to operate the brake machinery and brakes of the car.

The inventor says: I *claim*, first, the flexible air chamber D, constructed substantially as described, whereby, in combination with the air pump, I employ common atmospherical pressure as the force to operate the brake machinery and brakes of railway carriages, as herein set forth.

Second. The combination of the pump A, chamber B, cock C, and flexible air chamber D, arranged, combined, and operating as and for the purpose above named.

No. 28,671.—JOHN C. HUNTLY, of Philadelphia, Pa.—*Improved Burglar's Alarm*.—Patent dated June 12, 1860.—This invention consists in placing within a cylindrical or other suitably shaped case an ordinary clock alarm, the pallet shaft of which is connected with a peculiar stop mechanism and a lever.

Claim.—The arrangement of the shaft *i*, with its projection *m* and boss *j*, in connection with the hook *n* on the inner plate *l* of the alarm, the arm *g*, with its opening *h* on the pallet shaft *e*, and the clamp *B* attached to the shaft *i*, substantially as and for the purpose set forth.

No. 28,672.—H. WESLEY JELEFF, of Appleton, Ohio.—*Improvement in Dovetailing Machines*.—Patent dated June 12, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the obliquely cutting chisels *a a* in combination with the two carriages *j* and *g* and the adjustable gate *B*.

Second. I do not claim the cutter *m*, in Fig. 2, except when arranged and operated substantially as shown and set forth.

No. 28,673.—SHERMAN S. JEWETT, of Buffalo, N. Y.—*Improvement in Cooking Stoves*.—Patent dated June 12, 1860.—This invention relates to the construction and combination of an inner brick oven with outer brick walls.

Claim.—The inner brick oven, constructed as described, in combination with the outer walls of brick *D D*², for the purposes and substantially as set forth.

No. 28,674.—ALFRED JOHNSON, of Philadelphia, Pa.—*Improvement in Hydrants*.—Patent dated June 12, 1860.—This invention consists in so arranging the diaphragm between the piston and valve of a hydrant, when the whole is arranged so as to prevent the pressure due the head of water from forcing the water above the piston, and in the general construction of the hydrant to prevent waste.

Claim.—The diaphragm *E*, when arranged in the described connection, for the purposes set forth.

No. 28,675.—H. L. JUSTICE, of Nashville, Tenn.—*Improved Apparatus for Regulating the Draft and Preventing the Explosion of Steam Boilers*.—Patent dated June 12, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Connecting the piston rod *C* of the piston head *B* with the damper *Q* and the flue doors *u u* by means of the bent lever *G* and the rods *L L* and *P P*, or their equivalents, when the said piston rod *C* is acted upon by the spring *F*, and when it is made to act upon the safety valve *K* by means of the bent lever *H*, all arranged and operating substantially in the manner set forth.

No. 28,676.—JOHN LEE, of Bolivar, Ohio.—*Improved Machine for Forming Cornices of Sheet Metal*.—Patent dated June 12, 1860.—The devices of this machine differ from that described in the patent dated October 8, 1850, in first having the hooks on the roller and the slots in the strip; second, in letting a key or wedge *D*¹ into the roller *D*; third, in the use of the adjustable bearings *A*; fourth, in the extension of the frame to admit of longer or shorter rollers, as may be desired; and fifth, in the addition of the sections.

The inventor says: I *claim*, first, the use of the wedge or key *D*¹ in the roller or cylinder *D*, operating as described and for the purposes set forth.

Second. The arrangement of the adjustable braces *B* and *B*¹ in combination with the sliding braces *A*¹, as set forth.

Third. The arrangement of the slide *E*, brakes *H* and *H*¹, or roller *D*, operating as set forth and for the purposes described.

No. 28,677.—JAMES LORD, of Minersville, Pa.—*Improvement in Fire Arms*.—Patent dated June 12, 1860.—This invention relates to the manner of exploding a percussion cap or pellet within the barrel of a gun or cannon, thereby dispensing with the use of a vent hole, as said cap or pellet is in direct contact with the charge in the barrel, and also for the purpose of protecting the cap against the dampness of the atmosphere.

Claim.—The combination of the parts described for exploding a cap, pellet, or pill within the barrel of a gun or cannon without the use of a vent hole, substantially in the manner and for the purposes set forth.

No. 28,678.—PAUL MARCELIN and ERNEST EUDE, of New Orleans, La.—*Improvement in the Manufacture of Sulphurous Acid*.—Patent dated June 12, 1860.—In operating this furnace, a quantity of sulphur being introduced into it, steam is admitted to the pipes, at the bottom, until the whole mass of sulphur is heated; then, by igniting the sulphur active combustion suddenly commences, the air within the furnace is nearly exhausted, and the furnace is filled

with rich sulphurous acid gas. By opening the regulator, so as to admit a small quantity of atmospheric air, the sulphurous acid gas rises from the furnace through the tube and is conducted away by a suitable pipe to the washer.

Claim.—The above described process of making sulphurous acid gas by the use of steam heat, substantially as described, for the purposes set forth.

No. 28,679.—W. T. McGAHEY, of McGaheysville, Va., and HENRY C. FOOTE, of Fredericktown, Ohio.—*Improvement in Grain Separators.*—Patent dated June 12, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, a conducting board *d*, with sieve *b*, in combination with a partially perforated screen *i h* and apron *j*, spout *e f*, and angular directors *c*, substantially as and for the purposes set forth.

Second. An inclined plate or board *h i*, which presents a screening and blasting surface on the same plane, in combination with the inclined conducting board *d* and inclined tailing discharge board *j*, substantially as and for the purposes set forth.

Third. An apron *m*, having spouts *n*, in combination with a conducting screen *p*, substantially as and for the purposes set forth.

Fourth. A shoe *a t* containing a conducting board *d*, partially perforated screen *i h*, spout *f*, apron *j*, sieves *k l*, conducting screen *p*, and apron *m*, having spouts *n*, in combination with a single revolving screen *r q*, substantially as and for the purposes set forth.

No. 28,680.—MARVIN MEAD, of Bedford, Mich.—*Improved Tuyere.*—Patent dated June 12, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement, with the case *A*, of the water passages *C C*, the air passage *D*, and the disk *B*, as constructed, the water being made to pass on two sides of the air passage and entirely around the case, as represented, the several parts being connected, constructed, and used substantially as and for the purpose specified.

No. 28,681.—SAMUEL MOORE, of Wellsburgh, Va.—*Improvement in Grinding Mills.*—Patent dated June 12, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment of the horned bail *F* in combination with the notched driver *E*, rod *e*, spindle *C*, and stones *A B*, in the manner shown and described, so that the bearing point of the supporting rod *e* upon the spindle will be in a horizontal line or plane with the connecting points between the driver *E* and ball *F*, all as set forth.

No. 28,682.—ALBERT MOREHOUSE, of Farmer, N. Y.—*Improved Water Wheel.*—Patent dated June 12, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination, with the bucket *5*, (which may be either straight or curved,) so inclined as to deflect the water towards the centre of the wheel, with the sheeting *6*, set away from the point of the bucket, to allow a portion of the water to pass between it and the point of the bucket, and so curved as to deflect the water against the next bucket, substantially as and for the purposes set forth.

No. 28,683.—CHARLES MILLER, of St. Louis, Mo.—*Improvement in Lamps.*—Patent dated June 12, 1860.—This invention consists in the interposition of two upright metallic regulators, or wings, on each side of the flame of an ordinary coal oil lamp, which regulators, by means of a thumb screw, are made to impinge upon, partially cutting in two and dividing, the flame. These regulators are made of German silver, curved over at the top to meet the flame with a width at the top equal to the wick to be used.

Claim.—The combination of a cooler with the regulators, as herein described.

No. 28,684.—D. C. MYERS, of Richmondale, Ohio.—*Improvement in Corn Planters.*—Patent dated June 12, 1860.—This invention consists in the arrangement of certain parts in combination with each other, said parts being named in the claim.

Claim.—The arrangement of the hopper *4*, dipping cups *5, 5*, hopper *6*, foot valve *9*, connecting rods and crank by which it is connected to the trip shaft *26*, tripping pins *28*, and connecting rods *16* and *17*, operating the dripping cups; the whole being constructed and operating substantially as described for the purposes set forth.

No. 28,685.—EPHRAIM PIERCE, of Cincinnati, Ohio.—*Improvement in Feed-Water Apparatus for Steam Boilers.*—Patent dated June 12, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The spreader *D*, applied between the flues *B B*, below the water line to the discharge end of a feed water pipe traversing the steam space of a steam boiler, substantially as and for the purpose set forth.

No. 28,686.—A. P. PITKIN, of Hartford, Conn.—*Improvement in Steam Radiators*.—Patent dated June 12, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Making a perpendicular radiator *a*, with the inside connections *f*, and contracted at the bottom, forming the steam, water, and air passages at right angles with the sides, substantially as and for the purpose described.

No. 28,687.—H. A. G. POMEROY, of Providence, R. I., and R. F. HUDSON, of Hartford, Conn.—*Improvement in Ploughs*.—Patent dated June 12, 1860.—This invention relates to that class of ploughs in which a series of rotating ploughs or cutters is employed driven by steam or other power.

Claim.—The combined arrangement of the rotary screw shaped ploughs *C*, on shafts *HHH*, arranged parallel with each other and with the path of motion of the machine, with the oscillating frame *D*, when the whole is constructed and operates as described for the purpose set forth.

No. 28,688.—DAVID D. PORTER, of the United States Navy.—*Improved Marine Propeller*.—Patent dated June 12, 1860.—This improvement consists in a peculiar arrangement of blades and the wing flanches, or repressors, of the centrifugal motion.

Claim.—My improved propeller as constructed with the new arrangement of wings and flanches, substantially as above described and as represented in the accompanying drawings.

No. 28,689.—JACOB POST, of Newark, N. J.—*Improved Door Spring*.—Patent dated June 12, 1860.—The toothed rack *B* and segment *H* operate very much like two eccentrics, the power gradually diminishing as the lever is opened and increasing as the door is brought to a closed state, until the arm *J* is brought into action by coming in contact with the projection *e*, when the spring will act with its greater force on the lever *G*, in consequence of the increased distance from the fulcrum of the lever to the power exerted on the arm *J*, the door will thus be closely shut.

Claim.—The combination, with the sliding spring rod *D* and lever *G*, of the stepped or inclined rack *B*, projection *e*, arm *J*, and segment *H*, in the manner and for the purpose shown and described.

No. 28,690.—JOHN C. RANKIN, of Mount Vernon, N. Y.—*Improved Apparatus for Measuring Liquids*.—Patent dated June 12, 1860.—This invention consists in attaching to the top of a two way cock a vessel composed of metal having a glass face, or a glass cylinder may be used with suitable marks on its face for indicating the several quantities of liquor to be measured therefrom.

Claim.—The arrangement, in combination with the gauge *G* and case *A*, pipe *E*, and two way cocks *F*, of the safety air pipe *J*, as and for the purpose shown and described.

No. 28,691.—CHARLES W. RICHTER, of Madison, Ga.—*Improvement in Vapor Lamps*.—Patent dated June 12, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the air pipes *a a D*, and draft tube *C*, as and for the purpose shown and described.

Second. The employment of the cork layer *F*, in combination with the cylinders *E C*, and tubes *a a D*, as shown, for the purpose specified.

Third. The lining of cork *h*, or other suitable non-conducting substance, placed in the upper part of the wick tube *G*, in connection with the cork or other non-conducting substance *k*, attached to the under side of the button *j* of tube *i*; *k* and *i* being arranged relatively with the top of the wick *H*, to operate as and for the purpose specified.

No. 28,692.—EBEN SEAVEY, of Boston, Mass.—*Improved Fire Brick*.—Patent dated June 12, 1860.—The inventor says: This fire brick is constructed with main and lateral air conduits or passages. It also has a curved form, by which it may fit closely to the inner surface of a metallic fire pot when used therein.

Claim.—Improved fire brick lining, as made with ribs and air channels or ducts combined or arranged relatively to each other, substantially as specified.

No. 28,693.—DANIEL H. SHIRLEY, of Boston, Mass.—*Improved Table Plates*.—Patent dated June 12, 1860.—This invention consists in forming upon the rim of a plate used for table purposes one or more depressions, or receptacles for the reception of any desired articles of food, such as sauces, vegetables, condiments, &c.

Claim.—A plate formed with one or more depressions or receptacles in its rim, for the purpose specified.

No. 28,694.—GEORGE SMITH, of Macon, Georgia.—*Improved Hose Pipe*.—Patent dated June 12, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The hose pipe described, when made in such a way that several nozzles or short sections of pipe are made to be coupled together and secured by means substantially as set forth, for the purpose described.

No. 28,695.—OLIVER SNOW and HEMAN S. SNOW, of West Meriden, Conn.—*Improvement in Lamps*.—Patent dated June 12, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The method of securing the chimney in its position for use, by means of springs attached to the deflector operating on the inside of the chimney so that no outside circle points on other holders are needed, when the whole is constructed and fitted for use substantially as described.

No. 28,696.—OTIS W. STANFORD, of Cincinnati, Ohio.—*Improved Churn*.—Patent dated June 12, 1860.—A is a common upright churn tub, whose bed B has an extended tubular boss *b* to guide in a vertical path the dasher rod C; D represents a spherical, or spheroidal, dasher *j*, journalled loosely to the lower end of the rod C, and secured thereon by a screw and washer E F, or their equivalents. The body of the dasher is of smaller diameter than the inside of the tub and has spiral wings *d* whose peripheries nearly touch the sides of the tub.

Claim.—The described combination with a vertical, circular tub A, of the reciprocating rod C, spherical or spheroidal dasher D, and spiral wings *d*, fitting the interior of the tub, the said parts being constructed and arranged in the manner and for the purposes set forth.

No. 28,697.—ALFRED STAUCH, of Philadelphia, Pa.—*Improvement in Apparatus for Inoculating*.—Patent dated June 12, 1860.—This invention consists in combining the various processes and operations required, thereby securing greater efficacy in applying Baunscheidtism by means of a circular hair brush *k* fastened around the needles by a ring; and also in removing and avoiding the disagreeable scratching of the skin by the needles by means of a spring *h*, which keeps the piston *p* steady and secures the instantaneous and spontaneous withdrawal of the needles from the skin after the operation has been performed.

Claim.—The combination and arrangement of the chamber *b*, piston *p*, spiral spring *h*, circular hair brush *k*, and ring *g*, with the tube *a*, spring *d*, and needles *n*, in the manner and for the purpose specified.

No. 28,698.—WILLIAM H. STEVENS, of Syracuse, N. Y.—*Improved Toy Gun*.—Patent dated June 12, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, constructing the metallic wire bow A, with one or more coils D, substantially in the manner and for the purpose stated.

Second. Providing bows with metallic wire springs C, when the same are made with joints E, for the purpose stated.

Third. Connecting the arrow or projecting rod N with the bow string, substantially as stated.

Fourth. The loading chamber, when so arranged with respect to the muzzle as to operate substantially in the manner set forth.

Fifth. The attachment to the muzzle of the gun of a yielding or elastic material (as the springs P, or equivalent device,) when the same operates to hold the ball substantially in the manner set forth.

Sixth. The arrangement of the several parts, or their equivalent, substantially as described, and operating as a whole, substantially in the manner and for the purpose stated.

No. 28,699.—ISAAC C. TATE, of New London, Conn.—*Improvement in Faucets*.—Patent dated June 12, 1860.—This invention consists in combining with an India rubber diaphragm two springs, one for the purpose of depressing the diaphragm and shutting the faucet, and the other to force the diaphragm up when the faucet is to be opened, together with a knuckle in combination with the valve and diaphragm, and with two springs for the purpose of raising the valve and opening the faucet.

Claim.—The arrangement and combination of the India rubber diaphragm C, valve E, heavy spring G, light spring H, and knuckle F, constructed and operating substantially in the manner and for the purpose stated.

No. 28,700.—JAMES S. TOPHAM, of Washington, D. C.—*Improved Hame, Tug, and Buckle*.—Patent dated June 12, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the tug A, the clip D, and the pin B; the clip being in two parts and screwed to the tug, and the pin being provided with a head on one end and a screw near the other, when the same are used substantially as and for the purpose specified.

No. 28,701.—WILLIAM TRAPP, of Elmira, N. Y.—*Improved Stave Machine*.—Patent dated June 12, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the annular cutter stock H, as constructed, for enabling the staves to pass close to the path of the outer revolving cutters, in the manner substantially as described.

Second. So arranging and operating the two sets of revolving cutters K and K¹, that they will act simultaneously, but in opposite directions, in the manner substantially as and for the purposes set forth.

Third. The manner of adjusting the two sets of revolving cutters K and K¹, so as to dress properly staves of various thicknesses, by raising or depressing the disk L of the inner cutters K¹, in the manner substantially as specified.

Fourth. The arrangement, in relation to each other, of the two beds M and M¹, as constructed, for the purposes set forth.

Fifth. In combination with the stave-dressing machine N, I claim the rocking plane Q, as constructed and arranged, for the purposes described.

Sixth. The adjustable spring lever U U¹, as arranged, for regulating the pressure of the feeding rollers, in the manner substantially as set forth.

Seventh. In combination with the feed box N, I claim the sliding spring carriage X, as constructed and arranged for the purposes set forth.

No. 28,702.—JOSEPH VILLET-COLLIGNON and LOUIS GEORGE, of Paris, France.—*Improvement in Typography*.—Patent dated June 12, 1860.—This invention consists of combined types of two or more letters, composed each of two or more types of single letters united by solder or cement.

Claim.—The combined types described, composed each of two or more single types united by suitable solder or cement.

No. 28,703.—RICHARD VOSE, of New York, N. Y.—*Improvement in Car Springs*.—Patent dated June 12, 1860.—This invention consists in being essentially composed of disks *c c* of India rubber and concavo-convex metallic springs *e e*, arranged with metallic caps *a b*, and externally grooved metallic rings *d d*, in such a manner that the two descriptions of springs are enabled to act and react upon each other.

Claim.—The arrangement and combination of the India rubber disks *c c*, with the concavo-convex metallic springs *e e*, in my improved car spring, substantially in the manner and for the purpose set forth.

No. 28,704.—EDWARD WADE, of Norwich, Conn.—*Improvement in Pumps*.—Patent dated June 12, 1860.—This invention consists in the arrangement of a horizontally rotating cam disk, in combination with a rising and falling yoke, and with a series of lazy tongs, in such a manner that by rotating the disk a rapid reciprocating motion is imparted to a pump piston or other part of a machine attached to the extreme end of the lazy tongs.

Claim.—The arrangement and combination of the horizontally rotating cam disk A, rising and falling yoke F, and series of lazy tongs G, constructed and operating substantially in the manner and for the purpose specified.

No. 28,705.—WILLIAM WATSON, of Lowell, Ill.—*Improved Neck Stock*.—Patent dated June 12, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A stock of hard vulcanized gum as a new article of manufacture.

No. 28,706.—WILLIAM H. WILEY, of Lockport, N. Y.—*Improved Butter Worker*.—Patent dated June 12, 1860.—This invention consists in arranging the several parts of the worker, as shown in the claim and engravings.

Claim.—The arrangement of the revolving table F upon the platform A, the head or worker E, the standard D, which is adjustable laterally and horizontally, the lever C and the slide G, when the same are used substantially as and for the purpose specified.

No. 28,707.—RICHARD WILLIAMS and SAMUEL WILSON, of Buffalo, N. Y.—*Improved Feathering Paddle Wheel*.—Patent dated June 12, 1860.—H H¹ H² is a cylindrical drum, to which the arms I of the wheel are firmly attached by bolts, screws, or otherwise, and which revolves around the stationary core A. The head or hub H¹ of this drum has a journal bearing, and revolves upon the stationary shaft B, while the hub H² is made fast to the shaft J, which shaft revolves, having a journal bearing at K.

The inventors say: We *claim* the stationary cam-grooved core A, in combination with the crank shaft of the paddle and revolving cylindrical drum H H¹ H², for the purpose substantially as described.

We also claim, in combination with the above, the arrangement with the stationary shaft B, revolving shaft J, and drum heads or hubs H¹ H², substantially as set forth.

No. 28,708.—S. E. WOODWORTH and J. S. WETHERED, of San Francisco, Cal.—*Improvement in Gas Burners*.—Patent dated June 12, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The introduction of atmospheric air into the centre of the gas flame, in the manner substantially as described, and for the uses and purposes set forth.

No. 28,709.—WENDELL WRIGHT, of New York, N. Y.—*Improvement in Gas Burners*.—Patent dated June 12, 1860.—The engraving shows the partition plate A dividing the chamber of the burner, which is round, and about an inch long, and half an inch in diameter, in two parts; also the slit F, through which all the gas passes, to the flame, and the swinging valve B with the piston rod C connected therewith.

Claim.—The partition plate A, in combination with the piston C, and valve B, as described, and for the purposes set forth.

No. 28,710.—LOUIS YALE, JR., of Philadelphia, Pa.—*Improvement in Locks*.—Patent dated June 12, 1860.—M is the pod case, attached by a swivel pin s to the handle. This pod case fills the key chamber, and remains stationary while the handle revolves to move the other works by means of the key wheel, &c. It is in turn filled with the pod bits, which it holds in position while in the lock, ready for the driver F to displace by moving it perpendicularly up through it.

Claim.—The pieces M and F, when used in the manner, or an equivalent manner, and for the purpose substantially as described.

No. 28,711.—M. R. CLAPP, of Seneca Falls, N. Y., assignor to SILSBY, MYNDERSE & Co., of said Seneca Falls.—*Improvement in Steam Boilers*.—Patent dated June 12, 1860.—This invention consists in a certain arrangement of water tubes in couples, one within another, within the fire box of a boiler, with the lower end of both extending below the gate, and their upper ends even, or nearly so, with the crown of the fire box and below the surface of the water.

Claim.—The arrangement of the inner tubes G G, loosely within the outer one, with the lower ends below the fire, and both their upper ends below the water level, substantially as specified.

No. 28,712.—GEORGE W. BANKER, of Medford, Mass., assignor to himself and GEORGE O. CARPENTER, of South Reading, Mass.—*Improved Method of Securing Heads in Barrels*.—Patent dated June 12, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Securing the heads of barrels or kegs, when composed of a series of staves, by means of a screw, as set forth, for the purpose specified.

No. 28,713.—WILLIAM E. DURKEE, of Fort Edward, N. Y., assignor to himself, A. S. WILLIAMS, and JOSEPH H. HOPKINS, of said Fort Edward.—*Improvement in Hay Elevators*.—Patent dated June 12, 1860.—This invention consists in constructing an inclined framework that is braced together in a firm way, and which is pointed to suitable supports in such a way that wagons or carts, or anything loaded with hay or grain, may be drawn up the inclined plane into the barn window or in stacks.

Claim.—The supporting frame A, the inclined plane C, jointed to the same, and the several parts combined therewith, as described, for purposes set forth.

No. 28,714.—EDWARD A. GODFREY, of Hartford, Conn., assignor to ROGERS, SMITH & Co., of said Hartford.—*Improvement in Soldering Handles for Cutlery*.—Patent dated June 12, 1860.—The object of this invention is to facilitate the securing together of the two longitudinal parts of the metal handles for cutlery, so that said parts may be readily clamped, and at the same time held together for the purpose of being united by soldering.

Claim.—The rods A A, attached at one end to the cap B, and having a plate D, springs F F, and nuts E E fitted on them, substantially as and for the purpose set forth.

No. 28,715.—EDWARD A. GODFREY, of Hartford Conn., assignor to ROGERS, SMITH & Co., of said Hartford.—*Improvement in Soldering Handles for Cutlery*.—Patent dated June 12, 1860.—The object of this invention is to obviate the necessity of wiring the handle on the tang as heretofore done, in order to solder the handle to the tang, and thereby effect a considerable saving of time, and greatly facilitate the work.

Claim.—The swivel plate D, with the adjustable plate H, and rods F F attached; the whole being arranged to form a clamp, substantially as and for the purposes set forth.

No. 28,716.—ANDREW I. GOVE, of San Francisco, Cal., assignor to himself and WETHERED & TIFFANY, of said San Francisco.—*Improved Ship's Windlass*.—Patent dated June 12, 1860. The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the gearing, as represented by G and I¹, with the crank plates or arms H H, combined with the connecting rods S S, the levers K K, and pawls P P, working the windlass C, substantially as described, and for the purposes set forth.

No. 28,717.—JOHN C. JENNISON and AUGUSTUS HALE, of Foxcroft, Me., assignor to ELIAS J. HALE and AUGUSTUS HALE, of said Foxcroft.—*Improvement in Lamps.*—Patent dated June 12, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* the arrangement and application of the spring clasp and its angular notches to the chimney carrier, so as to enable the clasp to be turned upward from, and to operate with, the notches, and confine the chimney in place in the carrier, substantially as described.

We also claim the improved chimney carrier, as made to embrace and close down upon and connect to the lamp cap, and be separate from the deflector, and to have a shell or flanch for supporting the chimney arranged upon it, essentially as specified.

No. 28,718.—ENOS M. LEWIS, of Philadelphia, Pa., assignor to himself and GEORGE WILLIAMS, of said Philadelphia.—*Improvement in Slide Valves for Steam Engines.*—Patent dated June 12, 1860.—This invention consists in the combination of a slide valve of the form of a hollow box, an outer box or casing rollers, certain springs, or their equivalents, and a follower, forming a stuffing box between the said outer casing and the valve; the whole being so constructed and arranged that the pressure of the steam may be removed from the valve, and sustained by the rollers of the outer box.

Claim.—The combination of the valve B, outer box or casing D, its rollers *d d*, springs *ff*, or their equivalents, and the follower C; the whole being constructed and arranged substantially as and for the purpose set forth.

No. 28,719.—THOMAS MORRISON, of Kingston, N. Y., assignor to C. B. SAFFORD, of said Kingston.—*Improved Chronometer Escapement.*—Patent dated June 12, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arm B (Fig. 1) of the depecting bar, the form and peculiar position of the feather spring D, acting in combination with and attached to the depecting bar A as a lever, the pin C in the arm of the depecting bar, the notches F and G in the friction roller (Fig. 2) attached to the balance wheel, and the combination of the parts, (as shown in Fig. 3,) substantially as set forth and described.

No. 28,720.—LEVI SHORT, of Buffalo, N. Y., assignor to himself and CHARLES S. PIERCE, of said Buffalo.—*Improvement in the Manufacture of Illuminating Gas.*—Patent dated June 12, 1860.—In using this invention the retort A is to be filled with coal oil. In first starting the apparatus the retort *c* is to be heated with an alcohol or fluid torch until sufficient gas is made to supply the furnace from the gasometer. The gas from the gasometer is then turned on so as to pass through the pipe I into the furnace. It is then lighted, and burns on the surface of the wire gauze *h*, the flame striking the concave plate *c*², of the retort, which soon becomes red hot, a draft being through the spaces left between it and the walls of the retort house. The retort soon becomes heated, then the oil is turned on so that it will fall about two drops a second, when it is soon converted into gas.

The inventor says: I *claim*, first, a gas furnace D, constructed and operated substantially as described, in combination with the retort C, and retort house B, for the purposes set forth.

Second. I claim the relative arrangement of the oil reservoir A, retort house B, including the retort and furnace, purifier L, and gasometer N, substantially as described, for the purposes set forth.

No. 28,721.—ISAAC N. WHITAKER, of Foreston, Ill., assignor to himself and J. H. FREES & M. HELLAR, of said Foreston.—*Improved Apparatus for Heating Wagon Tires.*—Patent dated June 12, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination, with the outer periphery of the tire box B, of the furnace D, and smoke box C, when the said tire box is arranged to stand vertically, as shown, and is provided in its upper part with rollers J J, by which the tires are suspended and rotated; all as set forth and represented, for the purpose specified.

No. 28,722.—SAMUEL H. WHITAKER, of Cincinnati, Ohio, assignor to himself and WILLIAM L. THOMAS, of said Cincinnati.—*Improvement in Gas Regulators.*—Patent dated June 12, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, in the described connection with receiving and discharging chambers A and B, and a stationary seat F, supported on a stem which passes through the diaphragm, the valved diaphragm D E, or its equivalent, operated by the unequal pressures, on its opposite sides, of the entering and escaping gas, substantially as set forth.

Second. The nut H, rod G, and seat F, in the described combination with the valve E, for the purpose of adjusting the capacity of the apparatus from the exterior.

No. 28,723.—HARRY ABBOTT, of North Huron, N. Y.—*Improved Churn*.—Patent dated June 19, 1860.—The milk or cream, passing through the rods *g g* of the dashers E E, is violently agitated, while the rods *o o* of the auxiliary dashers, which have opposite and antagonistic motions, being arranged at right angles to the rods *g g*, break the currents and allay the agitation on the surface, and thereby prevent the milk or cream being dashed upward in the churn body.

Claim.—The combination and arrangement of the dashers E E, guided in their motions by the vertical grooves *b b*, and inclined grooves *i i*, or their equivalents, with the auxiliary counteracting dashers G G, constructed and operating substantially as and for the purposes specified.

No. 28,724.—WILLIAM HENRY ALLEN, of Brooklyn, N. Y.—*Improved Steam Pressure Gauge*.—Patent dated June 19, 1860.—The action of the gauge is as follows: The steam or other fluid, pressing equally against the lower surfaces of both pistons C C, forces them upward and overcomes the pressure of the spring in a greater or less degree, and so brings the index *d* to a higher or lower point on the scale J, and indicates thereon the pressure of steam, or other fluid, and the spring and its piston F, and piston rod *g*, being midway between the two pistons C C, are acted upon directly by the pressure on the said pistons, without any tending to racking or distortion.

The inventor says: I *claim* the combination of the two cylinders B, pistons C C, and adjustable cross head D, with the central indicating rod G, spring E¹, and spring box E E, in the manner and for the purpose shown and described.

I also claim the arrangement and combination of the caps H H, in combination with the plate G, and cylinders B B, as shown and described, so that said caps will serve to cover the cylinders B B, to guide the piston rods *b b*, and also to confine the plate G, all as set forth.

No. 28,725.—EDWARD ANDREWS and JOSEPH H. CARR, of Palo Alto, Pa.—*Improvement in Lubricating Journals*.—Patent dated June 19, 1860.—This invention consists in an arrangement of spring valve or valves for filling an air tight chamber in the centre of the journal with a lubricating material, an escape for the air while filling, and a spring pad over an aperture to the air tight chamber to prevent the too free passage of the lubricating material to the surface of the journal.

The inventors say: We *claim*, first, the pad E, and spring D, when used for the purpose as fully specified and described.

Second. The combination and arrangement of the plug F, valve H, cross piece J, air escape O, and guard piece M, constructed and operated substantially as and for the purpose specified.

No. 28,726.—DAVID BAKER, of Harwick, Mass.—*Improved Spout and Lid of Pitchers*.—Patent dated June 19, 1860.—This invention consists in providing the spouts of molasses pitchers, or other vessels, with a receiving chamber, either separately or in combination with an inner lid; the same being so disposed and arranged as to prevent the drippings of the liquids reaching the outside of the cup or vessel, the same being arrested and returned back into the vessel by a channel formed between the spout and an outer lip surrounding the same.

Claim.—The combination and arrangement of the channel *a a a*, the lid B, the outer lid A, and the lever C, substantially as and for the purpose specified.

No. 28,727.—SAMUEL BARLEY and J. H. BARLEY, of Longwood, Mo.—*Improvement in Harvesters*.—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the arrangement of the rake bar and head *e¹ e²*, to operate in combination with the guard plate S, crank *d¹*, shafts C C, and platform I, as shown and described.

Second. We do not claim, broadly, the invention of the divider, but we do claim the arrangement of the horn shaped divider T, to revolve, so that it can be adjusted to any desired position, in the manner shown and described.

No. 28,728.—HENRY BARRINGER, of Wataga, Ill.—*Improvement in Machines for Upsetting Tire*.—Patent dated June 19, 1860.—This improvement in tire upsetting machines relates to the clamping of tires between movable jaws preparatory to the operation of upsetting or contracting the tire.

Claim.—The combination of the movable segment clamping lever D, rocking piece F, block G, and clamping portion H, when arranged in a manner to produce the result set forth.

No. 28,729.—LAFAYETTE BARTOO, of East Aurora, N. Y.—*Improved Sash Fastener*.—Patent dated June 19, 1860.—A is the window casing; B B¹ are the window sash; C C¹ are spring stops which hold the lower sash in the frame, and guide it when raised or lowered; h is a catch projecting from the stop C¹, which catches into the series of holes i, in the upper sash B¹, and operating in the same manner as the stop C and catch f.

Claim.—The spring stops C and C¹, having the catches f and h, for the combined purposes as specified.

No. 28,730.—CHARLES F. BAXTER, of Boston, Mass.—*Improvement in Furnaces*.—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of a double cylinder steam generating fire pot, with pipes E E, substantially as described and for the purposes set forth.

I also claim the arrangement of the steam generating fire pot F, to stand apart from, but within the inner wall J of the hot air chamber H, so that the exterior surface of the fire pot will be constantly surrounded by the hot products of combustion, as shown.

I also claim the arrangement of the oven G, directly above the fire pot F, but within the inner wall J of the hot air chamber H, as shown.

No. 28,731.—SIDNEY A. BEERS, of Brooklyn, N. Y.—*Improvement in Iron Rails for Street Railroads*.—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the construction and use of a box or coping rail for street railroads of such width as to accommodate a car and carriage track, in combination and of such depth as to give strength to the rail, whether the same is laid with or without a continuous string piece, constructed substantially as described.

In combination with the rail constructed substantially as described, I also claim the wedge and cleats, for the purpose set forth in the accompanying specification.

No. 28,732.—ALBERT BIGELOW, of Hamilton, Upper Canada.—*Improvement in Steam Ploughs*.—Patent dated June 19, 1860.—This machine is erected and properly secured to a good substantial frame of timber, which frame N¹ is carried by a pair of driving wheels marked N, and in front by a pair of smaller or leading wheels N², provided with ordinary gearing to be worked by hand, or by the engine, for the purpose of guiding it to the right or left.

The inventor says: I *claim*, first, the arrangement, with the main supporting frame N¹, and with the endless chain D, and ploughs C C C, of the auxiliary radius frame Q R, wheels F, transverse shaft O, and longitudinal shaft A, substantially in the manner and for the purposes described.

Second. The arrangement of the chains E, radius frame Q R, and adjusting mechanism G G¹ G² G³, substantially as and for the purposes set forth.

No. 28,733.—SYLVANUS F. BROOKS, of Weston, Mass.—*Improved Game Box*.—Patent dated June 19, 1860.—A represents a shallow quadrangular box surrounded with a neat frame, and having a glass plate a within the frame to form the top of the box; the top, bottom, and three sides are thus closed. In this box slides a drawer B, which is made to fit nicely in its place; this drawer is divided into four side apartments C, and one large middle apartment D, which is in size equal to the space enclosed by the frame, and the side apartments are in width equal to that of the frame.

Claim.—The box A, with its frame and glass plate, in combination with the drawer B, and its furniture, as set forth, for the purposes specified.

No. 28,734.—JOHN M. CARLISLE, of Greenwood, S. C.—*Improved Machine for Sawing Shingles from the Bolt*.—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment or use of the two saws H I, having respectively oblique and parallel cutting planes relatively with the end of the bolt O, in connection with a rectilinear feed movement of the bolt, all being arranged and operated substantially as and for the purpose set forth.

No. 28,735.—CHARLES B. CARPENTER, of North Attleboro, Mass.—*Improvement in Watch Chains*.—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

Claim.—My improved manufacture of jeweler's chain, as constructed, with each link having two arms a a, two scales b b, and a connection c, arranged and applied to a succeeding link, as described.

No. 28,736.—JAMES CHESLEY, of Concord, N. H.—*Improved Boot and Shoe Cleaning Apparatus*.—Patent dated June 19, 1860.—The operation of this invention is as follows: By drawing the foot across the scraper and brushes D E E the bottom of the boot or shoe is thoroughly cleaned, and at the same time the dirt and dust are allowed to pass through the open spaces *b b b*, into the draw below. By pushing the foot into the oval formed brush B B C C, formed of the two upright and quarter round brushes, the top of the boot or shoe is cleaned, and at the same time the dirt is allowed to pass freely through the open spaces *a a a*.

Claim.—The arrangement of the frame A, the brushes B and C and E, the scraper D, the spaces *a*, and the draw H, substantially as and for the purpose specified.

No. 28,737.—CHARLES W. CLEWLEY, of Providence, R. I.—*Improved Method of Constructing Rims for Watches*.—Patent dated June 19, 1860.—This improvement consists in the use of a combined forming and cutting die D and plunger A, by which the rim is formed out of sheet metal at a single operation.

Claim.—The use of a combined die and cutter D, and a plunger A, in combination with the same, or their equivalents, the two so combined operating in the manner substantially as described for the purposes specified.

No. 28,738.—CORNELIUS COLLINS, of Brooklyn, N. Y.—*Improvement in Machinery for Making Wire Rope*.—Patent dated June 19, 1860.—The object of this invention is to obtain a machine adapted to lay a number of wires in one or more convolutions around a central strand, or core, while avoiding any twisting of the separate wires.

Claim.—The combination of the standard B, fixed crank C, disks D and E, cranks F, and reels R, the whole being arranged and operating in the manner and for the purposes set forth.

No. 28,739.—E. M. CORBETT, of New York, N. Y.—*Improvement in Photographic Cameras*.—Patent dated June 19, 1860.—The object of this invention is to construct the camera so that it serves for taking stereoscopic pictures, and also for taking ordinary photographic pictures, particularly that kind where a great number of impressions are to be taken.

The inventor says: I *claim*, first, the combination, with the plate holder G, of the double combination slide D, constructed and operating substantially as and for the purpose set forth.

Second. Arranging the main slides *d d¹* of the slide D, with central rails *ff¹*, substantially in the manner and for the purpose described.

Third. The arrangement and combination of the double adjustable lenses E, slides *ee^{*} e¹ e^{1*}*, and adjustable plate holder G, constructed and operating substantially in the manner and for the purpose set forth.

No. 28,740.—CHARLES W. CROSLY, of New York, N. Y.—*Improved Fire Escape*.—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The application to large canvas tubes of metallic and India rubber bands, which will gradually stretch at a given pressure, and allow the person entering the tube to escape from the burning building without the slightest injury, as described, using for that purpose the metallic and India rubber ring or band, or any other substantially the same, and which will produce the intended effect.

No. 28,741.—CHARLES A. DESOBRY, of Plaquemine, La.—*Improvement in Bagasse Furnaces*.—Patent dated June 19, 1860.—This invention consists in the construction of the fire chamber of the furnace, of square or other polygonal form in its horizontal section, with its outlet at one angle and with doors arranged at its other angles, for the introduction of rakes or pokers in such a manner as to provide for the clearing of the outlet and the prevention of the choking of the draft, and for the stirring of the fuel on all parts of the hearth.

Claim.—The arrangement of the outlet B, and the openings *ff¹*, in combination with each other, and with the square or polygonal fire chamber, substantially as and for the purpose set forth.

No. 28,742.—WILLIAM DOUGHERTY, of Philadelphia, Pa.—*Improvement in Machines for Grinding Saws*.—Patent dated June 19, 1860.—This improvement consists of a block with inclined sides for receiving the saw blades to be ground, the said block being combined with, and arranged in respect to two revolving grindstones, and a horizontal as well as vertical motion being imparted to, the block by the devices described, or their equivalents, so that the blades may be so far reduced as to have the desired taper or variation in thickness as well as a uniform and smooth surface.

Claim.—The block G, with its inclined sides, in combination with, and arranged in respect to, the two revolving grindstones E and E¹, when a vertical as well as horizontal reciprocating motion is imparted to the said block G, by the devices set forth, or their equivalents.

No. 28,743.—JAMES B. DUFF and T. W. KEATING, of New York, N. Y.—*Improvement in Machines for Measuring the Strain on Pulley Belts*.—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Uniting the ends of the belt by an elastic material placed on a clasp or fixture constructed with arms attached to the belt and indicator and scale, in the manner and for the purposes described.

No. 28,744.—A. K. EATON, of New York, N. Y.—*Improvement in the Treatment of India Rubber*.—Patent dated June 19, 1860.—This invention consists in the combination of the oxide of aluminum, or pure alumina, with the caoutchouc and sulphur, or with gutta percha and sulphur, or its combination with any other agent than sulphur, that will affect or influence the curing of these gums.

Claim.—The combination of oxide of aluminum with sulphur and caoutchouc or allied gums, and the treatment of the compound, in the manner substantially as specified.

No. 28,745.—WILLIAM FUZZARD, of Charlestown, Mass.—*Improvement in Surfacing Fibrous Materials*.—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment or use, in connection with a heated surface, of an apron formed of any textile or other similar or suitable fabric, as a vehicle to convey and discharge on the fibrous web the surfacing compound or materials.

No. 28,746.—JOSEPH GEIERMANN, of Albany, N. Y.—*Improvement in Sewing Machines*.—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of two shuttles and one needle, operating together so as to form with three threads a stitch, substantially as described and in the manner specified.

No. 28,747.—E. P. GLEASON, of Providence, R. I.—*Improved Die Plate for Cutting Screws*.—Patent dated June 19, 1860.—This invention consists in combining with the thread cutting dies a like number of smooth steel jaws situated directly beneath the dies in a receiver formed for their reception, the same being acted upon by a separate set of scrolls, formed upon the reverse side of the circular plate in a manner to surround in a loose embrace the pipe or rod to be threaded, for the purpose of giving direction to the cutting dies and to insure a true and correct inclination of the thread, relatively with the outer surface of the object to be threaded.

Claim.—Combining with such die plates the guiding jaws *l l l l*, or their equivalent, in the manner and for the purpose specified.

No. 28,748.—WILLIAM D. GRIMSHAW, of Newark, N. J.—*Improved Hot Air Engine*.—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the employment of the solid metallic packing I, in the manner substantially as shown and described, so that when a sufficient degree of heat is applied to the engine the packing will melt and remain in a fused state until the heat is withdrawn, as set forth.

I also claim the heating of the air or steam by bringing it in contact with the fused metallic packing I, substantially as and for the purpose shown and described.

I also claim the covering of the fire chamber C with the metallic packing I, which fuses on being heated.

I also claim the combination of the pipe E, cylinder C¹, piston F, and packing I, in the manner and for the purpose shown and described.

I also claim the introduction of air or steam between the surface of the fusible packing I and the interior of the piston F, substantially as and for the purpose shown and described.

No. 28,749.—ELIAS J. HALE, of Foxcroft, Me.—*Improvement in Lamps*.—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* my improved wick retainer, as made, not only with a spring clasp by which it may be readily attached to, or detached from, the cap, as described, but so as to extend up through the lower end of, and into, the wick tube and against the wick, essentially as specified.

No. 28,750.—JOHN P. HAYES, of Philadelphia, Pa.—*Improvement in Making Plumbers' Joints*.—Patent dated June 19, 1860.—This invention consists in providing a mould or case with a secondary chamber, whereby the melted metal which is used in making the required joint is caused to pass in contact with the pipes therein, so as to first strongly heat or partially melt, and thus prepare them for intimate union or combination, when both chambers in the mould become filled with the said metal, and also in the employment, in combination with a mould adapted for making plumbers' joints by melting the ends of the pipes together, of a tubular protector within the said pipes.

The inventor says: I *claim* a mould or case provided with a secondary chamber *f*, to operate substantially in the manner and for the purpose set forth and described.

I also claim, in combination with a mould or case adapted for making plumbers' joints in pipes by the process of melting the ends of the said pipes, as described, the employment of a tubular protector C, as and for the purpose specified.

No. 28,751.—WILLIAM A. HERRICK, of Leeds, Me.—*Improvement in Coupling and Uncoupling Cars*.—Patent dated June 19, 1860.—A is the draw bar; *b* is the shackle bolt; *c c* is the lever for lifting and depressing the shackle bolt; this lever is curved downward in its middle part, where it is attached to the bolt; *e e e* is a bent lever, of round iron.

Claim.—The combination and arrangement of the levers *c c* and *e e*, constructed and operating substantially as described in the specification.

No. 28,752.—CHARLES W. HIGGINS, of Somerville, and ALBEN S. WILLARD, of Charlestown, Mass.—*Improved Clothes Wringer*.—Patent dated June 19, 1860.—This invention relates to the method of releasing the wringing cylinder or bag from its twist, and causing it to extend itself, by an automatic movement, after the water has been expelled from it.

Claim.—The arrangement and combination of the sliding shaft of pinion D with pinion E, for operating the bag B, substantially in the manner and for the purpose set forth.

No. 28,753.—CHARLES J. HOBE, of New York, N. Y.—*Improved Machine for Bundling Fire Wood*.—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment of a reciprocating knife C, more or less curved, in combination with the relatively shaped hollow bottom of the hopper B, both operating together, for the purpose of gathering, cutting off, and thus forming conjointly between them a bundle of wood of the size and shape required, the whole substantially as described.

Second. The employment of a conical or tapering hole *f*, substantially as described, as a simple means of effectually compressing within it the aforesaid loosely gathered bundle, and to firmly hold it while receiving the cord.

Third. The combination of said hole *f* and the plunger E, for forcing the bundles into and through said hole, arranged and operating substantially as described.

Fourth. The method of arranging the cords *h* on an adjustable sleeve G and fixed drum H¹, or their equivalents, substantially as described, enabling the operator to quickly adjust a large number of cords at a time, and to have them at hand in such convenient position, so that said cords can be readily passed, one after another, on to the cord carrier H, when required.

Fifth. The arrangement of the reciprocating tubular cord carrier H, and the combination of the same, and the fingers I, constructed and operating substantially as and for the purpose set forth.

Sixth. The arrangement of the doubly flanged bundle remover K¹ attached to a vibrating arm K, or its equivalent, when operating as and for the purpose specified.

Seventh. The arrangement and combination of the knife C, hopper B, hole *f*, plunger E, drum H¹, and sleeve G, cord carrier H, fingers I, and bundle remover K¹, constructed and operating substantially in the manner and for the purpose specified.

No. 28,754.—HENRY S. HOLMES, of Lynn, Mass.—*Improvement in Congress Boots*.—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Securing the edges of the gores to the gaiter tops and lining by a seam common to all, in the manner and for the purpose substantially as set forth.

No. 28,755.—J. NELSON JACOBS, of Worcester, Mass.—*Improved Portfolio Paper File*.—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination, with the two boards, when attached together by a back B, as set forth, of the cords D D attached to the edge of one board, eyes G G attached to the edge of the other board, and the elastic straps E E, forming a self-holding, self-adjusting, book-shaped portfolio, substantially as set forth.

No. 28,756.—JABEZ JENKINS, of Philadelphia, Pa.—*Improved Composition for Lining Safes*.—Patent dated June 19, 1860.—This invention consists in the employment of copperas or sulphate of iron, mixed with plaster of Paris or some other suitable material, as a composition for the purpose of lining fire proof safes.

Claim.—The employment of copperas or sulphate of iron, mixed with plaster of Paris or some other suitable material, in the manner described, for the purpose set forth.

No. 28,757.—SAMUEL A. KERR, of Arbor Hill, Va.—*Improved Churn*.—Patent dated June 19, 1860.—This invention consists in arranging blades or slats on a vibrating or turning

dasher staff, so that they pass diagonally through the staff or are set obliquely, one above another, after the manner in which the slats of a window blind are framed.

Claim.—The manner, described and shown, of arranging the blades or slats *a a* on a vibrating or turning dasher staff, for the purpose set forth.

No. 28,758.—RUFUS LAPHAM, of New York, N. Y.—*Improvement in Blowers.*—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The application of an India rubber or flexible tube, closed at both ends elliptically and held and operated upon by plates and a lever, substantially as and for the purposes set forth.

No. 28,759.—THOMAS R. MARKILLIE, of Winchester, Ill.—*Improvement in Ploughs.*—Patent dated June 19, 1860.—This improvement consists in a mode of connecting the plough to the truck, by means of which, in passing round curves, &c., the plough is made to follow in the curve described by the truck, and by means of which, notwithstanding the truck may rise over little inequalities in the ground, stones, &c., the plough is still left unaffected and continues on without changing its relative depth of the furrow, when used in connection with levers, suitably arranged, for the purpose of raising or depressing the plough at will.

Claim.—The arrangement of the plough or ploughs, as connected to the truck, in combination with the levers G and L, the whole being constructed and operated in the manner and for the purposes described.

No. 28,760.—J. P. McLEAN and P. A. MORLEY, of New York, N. Y., assignors to P. A. MORLEY, aforesaid.—*Improved Egg Beater.*—Patent dated June 19, 1860.—This egg beater consists in the application and arrangement of the corrugated, twisted, or spiral arms, or beaters *b b¹ b² b³*, in combination with the revolving cylinder *e*, operated by means of the cog wheel *c c¹*, between the heads of the lid of the vessel, or by means of a flexible band of gutta percha or India rubber around the face of the hand wheel N, thereby operating the cylinder, whose head is analogous to the rough surface of a nutmeg grater, capable of taking hold of the rubber surface with force, and free from noise.

Claim.—The arrangement and use of corrugated or twisted beaters *b b¹ b² b³*, in combination with the cylinder *e*, and operated in the manner and for the purpose set forth, and shown in the drawings at Figs. 1 and 2.

No. 28,761.—JAMES MCGLENSEY, of Philadelphia, Pa.—*Improvement in Gas Burners.*—Patent dated June 19, 1860.—This invention consists in combination of the perforated cover D, the tube B, the jet A, and the holes C C, arranged as shown in the engravings.

Claim.—The arrangement of the cover D, provided with holes in the top to spread the flame, with the tube B, the jet A, and the holes C C, when used in the manner and for the purpose set forth.

No. 28,762.—RUFUS S. MERRILL, of Lynn, Mass.—*Improved Coal Oil Lamp.*—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The adaptation, to the said wick tube, and arranged in a plane parallel with, and at a suitable distance from, its border, of one or more flanges, constructed substantially as described, to operate in the manner and for the purposes set forth.

No. 28,763.—FREDERICK I. MILLER, of Brooklyn, N. Y.—*Improved Cigar Rack for Hats.*—Patent dated June 19, 1860.—The body part *a* is formed of wire, or any other suitable material, any suitable number of clasps *b* being placed thereon to hold the cigars. The spring *c* on one end of the piece *a*, and a shoulder *d* on the other end of the same, are provided to fit and hold the rack in place.

The inventor says: I claim, first, the cigar hat rack, constructed and applied in substantially the manner described and shown.

Second. I claim the clasps *b*, constructed and operating as set forth, when applied to a hat rack for cigars, for the purposes and as specified.

No. 28,764.—HENRY MITCHELL, of Cincinnati, Ohio.—*Improvement in Sprinkling Attachments for Railroad Cars.*—Patent dated June 19, 1860.—This invention consists in the provision of a water-sprinkling apparatus for street or other railroad cars, by means of which said cars may sprinkle the roads they traverse.

Claim.—The combination of the tanks H H¹, sprinkling tubes I J, valve K, and brake gearing E F, arranged and operating substantially as and for the purposes set forth.

No. 28,765.—JACOB MOOMEY, of Clinton, Iowa.—*Improvement in Fenders for Docks, Wharves, &c.*—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment or use of a frame or fender B, provided with rollers D, and suspended from a windlass or other fixture at the top of the dock, pier, or other structure, when said frame or fender is provided with India rubber rollers E, at its inner side, to operate substantially as and for the purpose set forth.

Second. The peculiar manner of attaching the India rubber rollers E to the inner side of the frame or fender B, namely: by means of the springs or elastic staples F, to operate as and for the purpose set forth.

Third. The connecting of the frame or fender B to the dock A, by means of the chains *k* and slides *j*, substantially as described.

No. 28,766.—WILLIAM A. MORSE and D. S. BEAN, of Boston, Mass.—*Improved Spring Bed Bottom*.—Patent dated June 19, 1860.—This invention relates to that class of bed bottoms in which wooden slats are used in combination with elastic attachments.

Claim.—The arrangement of the hooks C, elastics D, and metal frames F, as shown, for the purpose of attaching the slats E to the rails B of the bedstead.

No. 28,767.—BENJAMIN MORRISON, of Philadelphia, Pa.—*Improved Envelope*.—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

Claim.—An envelope provided with an opening or openings through which the usual postmark or marks may be imprinted or stamped, as heretofore, directly or exclusively upon the letter or document inclosed therein, substantially as set forth and described.

No. 28,768.—JEHIEL MUNSON, of Burlington, Vt.—*Improved Composition for Paste for Attaching the Coverings to Pianoforte Hammers*.—Patent dated June 19, 1860.—This paste is prepared by mixing six ounces of wheat flour, two ounces of isinglass, one ounce of gum arabic, and half an ounce of common glue. There are to be soaked in water long enough to effect a perfect solution of the materials, and then scalded.

The inventor says: I *claim*, first, the composition from the materials, and in the manner described, of an adhesive composition or paste.

Second. The application of such paste for the purpose of attaching to the whole face of the felt with which pianoforte hammers are usually covered, the leather by which they are protected from the action of the strings.

No. 28,769.—HERMAN G. C. PAULSEN, of New York, N. Y.—*Improvement in Clarifying Sugar*.—Patent dated June 19, 1860.—The inventor says: My invention consists in effecting a separation of the nitrogenous substances and the earthy salts from the crude sugar, by the application of dilute alcohol; for this purpose I combine alcohol with water in certain proportions, which, applied to the sugar, is heated to a certain temperature, effecting thereby the clarification and defecation of said sugar.

Claim.—The application of a temperature above the boiling point under atmospheric pressure of said combined liquors, as stated, to raw sugars or the concentrated juices of sugar-bearing plants, for the purpose of clarifying and defecating said raw sugars.

No. 28,770.—WALTER PECK, of Rockford, Ill.—*Improvement in Wind Mills*.—Patent dated June 19, 1860.—This invention consists in a certain combination of parts constituting the mechanism through which the effect of the governor is conveyed to the wheel; also in the use, in combination with the mill, of an atmospheric governor; and, further, in forming in the main driving pitman a universal coupling joint.

The inventor says: I *claim*, first, the combination of shoe N, pitman L, arm F, spider E, and spring *e*, or its equivalent; the whole arranged and operating as described, for the purpose set forth.

Second. I *claim*, in connection with the above-claimed combination of devices, the employment of an atmosperic governor S, substantially as and for the purpose described.

No. 28,771.—O. Z. PELTON, of Middletown, Conn.—*Improved Beer Pitcher*.—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The beer pitcher having a movable froth partition, with a curved top and a lid provided with a packing ring; all as shown and described.

No. 28,772.—FREDERICK PLANT, of New York, N. Y.—*Improved Machine for Making Needles*.—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of the feeding and groove-stamping apparatus with the needle-holding tubes, substantially as and for the purposes specified.

I also *claim* the revolving needle tubes for holding the wire and relieving the same, as described.

I also claim the combination of a series of grinding apparatuses, with their adjustable blocks for pointing the needles, and polishing the same with a series of needle tubes or holders, as specified.

I also claim the apparatus for bending the barbs of the needles, as set forth.

I also claim the combination of a series of needle-holders, feed apparatuses, grinding and bending apparatuses, by which a perfect needle can be formed without manipulation in a single machine.

No. 28,773.—H. POISSONNIER, of New York, N. Y.—*Improved Composition for Silvering Mirrors*.—Patent dated June 19, 1860.—This invention consists in a certain composition of nitrate of silver, tartrate of potassa, and liquid ammonia, mixed together and diluted with a sufficient quantity of water, so that when the mixture is spread upon a glass plate it adheres to the same and forms a precipitate which produces the desired effect.

Claim.—The employment of tartrate of potassa, mixed with nitrate of silver and liquid ammonia about in the proportion specified, for the purpose set forth.

No. 28,774.—WILLIAM PRICE, of New York, N. Y.—*Improvement in Binding Guides for Sewing Machines*.—Patent dated June 19, 1860.—In using this machine the operator takes the desired width of binding and inserts it in the mouth C, and by means of the screw and slot *d* and screw *g* adjusts the hooks *c* and *f* to the central upper edge of the binding, and then adjusts the hook *a* by the screw and plate E, to control the under edge, allowing sufficient room for the binding to pass freely to the material; the binder is then secured to the machine by a screw passing through the slot B, and by cutting away, or, in most cases, replacing the ordinary presser foot, so as to get the binder in proper position to receive the edge of the material and binding for the successive stitches.

Claim.—The arrangement of the guide hook *c* and bar *b* on the bar D, as described, in combination with the hook guide *a*, wide mouth C, and supplementary guide *f*, the whole being constructed and operating substantially as and for the purposes set forth and described.

No. 28,775.—ISAAC RANDALL, 2d, of Claremont, N. H.—*Improvement in Apparatus for Drying Fruit*.—Patent dated June 19, 1860.—This apparatus consists of a drying box, and its contents made of timber or other suitable material, two and a half feet deep and seven and a half feet high, of which A A are the sides, B the back, C the top, with the aperture O O for the egress of heated air, D the bottom, and E E the doors.

Claim.—The fire box H and the hot air chamber G in combination with the drying box, as shown in Fig. 1 and above described, and shelves K K, &c., constructed and arranged substantially as set forth.

No. 28,776.—WILLIAM RANKIN, of Richmond, Va.—*Improvement in Cording Guides for Sewing Machines*.—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A cording guide, composed of a single bent piece of metal, and having upon it a guide *e*, a groove *i*, and an eye *n*, and in close proximity to said eye a recess *r*, and also furnished with oblique nicks or indentations *o*, inclining in the direction of the feed of the cloth and so arranged as to come directly under the presser foot, and between it and the lower feed, substantially as and for the purpose set forth.

No. 28,777.—ALONZO J. ROGERS, of Stephentown, N. Y.—*Improvement in Seed Planters*. Patent dated June 19, 1860.—The cavities 1 2 3 are made of different sizes, to accommodate different sized seeds, and are placed at a sufficient distance from each other to allow proper space between the seeds sown; directly above the cylinder A is placed the hopper B held in position by the set screw E; the position of the hopper B may be adjusted, to bring it in a direct line with any particular row of cavities 1, by means of the screw E in conjunction with a slot in the cross piece.

Claim.—The arrangement of the axle H, wheels D D, roller G, plough F, cylinder A, and hopper B, arranged and operated as described and for the purposes set forth.

No. 28,778.—MAHLON B. RUPP, of McVeytown, Pa.—*Improvement in Seeding Machines*. Patent dated June 19, 1860.—The frame of the machine consists of the front bar A, rear bar B, connected by the side bars C C, which side bars are also connected by the cross bar D, in the rear of the front bar A, by the diagonal bar E and by a second cross bar F, to which the fore ends of the plough beams G G are hinged by means of the stands H H fastened to the bar F.

Claim.—The arrangement of the ploughs Q¹, upper guides *a*, lower guides R, adjustable board P, castor wheel *o*, and the seeding apparatus, the whole being constructed as described.

No. 28,779.—ANDRE SABATIER, of New York, N. Y.—*Improved Polish for Furniture*.—Patent dated June 19, 1860.—The component parts of this polish are as follows: Alcohol, one quart; gum benzoin, seven ounces; and linseed oil, six ounces.

Claim.—The polish, composed of gum benzoin, alcohol, and linseed oil, in about the proportions specified.

No. 28,780.—CHARLES H. SAYRE, of Utica, N. Y.—*Improvement in Cultivator Teeth*.—Patent dated June 19, 1860.—To prevent the upper end of the shank A from cutting the under side of the rail, a loose top plate D is passed over the cylindrical part of the shank and covers its upper edges, there being a tongue *i* formed on its under side, interposed between the two edges of the shank, to prevent their being compressed or forced together, while another is formed on the upper side *k*.

Claim.—The shank A, as constructed, in combination with the loose top plate D, for the purposes set forth.

No. 28,781.—WILLIAM F. SHAW, of Boston, Mass.—*Improved Apparatus for Broiling or Roasting by Gas*.—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the arrangement of the steak holder, the broiling chamber, and the burner or burners.

Also, the arrangement of the two deflectors with the heating chamber and with respect to the burner or burners and the steak holder, when arranged as specified.

Also, the combination of the closed air chamber or space in the cover with the steak holder and the heating chamber, arranged as specified.

Also, the combination of the vertical side or cover with the steak holder and drip pan, said side or cover having a closed air chamber or space as specified and shown in the drawings.

No. 28,782.—DANIEL SHEETS, SAMUEL H. DUBOIS, and JOHN B. PRESSEY, of Suisun City, Cal.—*Improvement in Machines for Reaping and Mowing*.—Patent dated June 19, 1860.—This invention consists in the combination of the forward and backward reciprocating cutter with the stationary spear-shaped fingers or cutters, arranged and operating together.

Claim.—The combination of the forward and backward reciprocating cutter with the stationary spear-shaped fingers or cutters, arranged and operating together in the manner and for the purpose set forth.

No. 28,783.—A. B. SMITH, of Clinton, Pa.—*Improvement in Raking and Binding Apparatus for Harvesters*.—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the mechanism described, or its equivalent, arranged to operate one or more compressing arms, independent of the binding arm, and work said compressing arm down on top and over the gavel, substantially as described.

And, in combination with one or more compressing arms, arranged to work down over the grain or gavel, as described, I claim the mechanism described, or its equivalent, for operating one or more compressing arms working up under the gavel, independent of the binding arm, substantially as described, so as to compress the gavel without the aid of the band or arm carrying the band.

I also claim the mechanism, or its equivalent, for making the compressing arms to work before or in advance of the arm that carries a band, to open a space between the grain or straw on the platform and the gavel for the end of the binding arm to come through, substantially as described.

I claim the application and arrangement of the devices, substantially such as are described, which operate the binding arm N with a positive motion in each direction, for the purpose specified.

I claim the hook P hollowed on its under side, operating in combination with the binding arm N carrying the knotted end of the band, as described.

No. 28,784.—J. P. SMITH, of Hummelstown, Pa.—*Improvement in Corn Shellers*.—Patent dated June 19, 1860.—In this invention a suitable frame A is provided in which are mounted the working parts of the machine, consisting of a shelling wheel B the periphery of which is of ogee form, in its axial section, that is, having a convex surface *r* of larger, and a concave surface S of smaller circumference, and of an ear holder C provided with a device for regulating the passage of the ears of corn down through it, and also to assist in shelling.

Claim.—The combination of the ogee-shaped shelling wheel B with the ear holder C provided with the adjustable teeth *p p*, the several parts constructed, arranged, and operating substantially in the manner and for the purpose set forth.

No. 28,785.—WILSON H. SMITH, of Birmingham, Conn.—*Improvement in Sewing Machines*.—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Obtaining the lateral portion of such movement by means of a link W connecting the needle carrier S with the feed rock shaft, and acting in combination with a spring W¹, as described.

No. 28,786.—WILLIAM H. SMITH, of Newport, R. I.—*Improvement in Stoves*.—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the opening *h*, partitions *c c*, and compartment F, in combination with the base A, compartment G, trunks H H¹, and annular passages I, as and for the purposes shown and described.

Second. Placing the oxygen supply tubes Q P P, between the inner and external cylinders A E, and consequently in contact with the heated products of combustion, for the purpose of admitting warm oxygen to the inflammable gases within the cylinder A, and thereby insure their perfect combustion.

No. 28,787.—JACOB STAMM and JOHN SHUBERT, of Sardinia, Ohio.—*Improvement in Spoke Machines*.—Patent dated June 19, 1860.—This invention consists in the use of a travelling pendulum frame, in connection with a swivel frame, to carry the cutters, the object of which is to secure to the cutters the proper lateral movement corresponding to the position and shape of the pattern, and at the same time a swiveling movement corresponding to the angular surface which may occur upon the pattern.

Claim.—The combination, with the pendulum frame P, of the swivel frame Q, in which the shaft of the cutter head is mounted—the whole being constructed and made to operate substantially as and for the purposes set forth.

No. 28,788.—JACOB S. STEINER, of St. Louis, Mo.—*Improvement in Sewing Machines*.—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* imparting to the shuttle K a receding motion from the needle the moment after said needle has entered the cloth and before it has arrived at the lowest position, for the purpose of taking up the slack of the shuttle-thread after the latter has been turned over the edge of the cloth, to work a button-hole, substantially in the manner and for the purpose described.

I also claim so combining the hook Q with a needle and shuttle as that it may be readily coupled or uncoupled from the driving part of a sewing machine, by means substantially such as described, for the purpose of changing the machine from a button-hole to plain work sewing machine, and vice versa, substantially in the manner described.

No. 28,789.—AMBROSE S. STERLING, of Buffalo, N. Y.—*Improved Boiler for Cooking Stoves*.—Patent dated June 19, 1860.—This improvement relates to making the bottom of the boiler concave upwards, as shown at B, and in providing flues C which connect with the concave bottom and open into the fire-chamber and pass through the water to the outside of the boiler, for the purpose of increasing the heating surface and forming a passage for the flame through the interior of the boiler.

Claim.—The combination and arrangement of the concave bottom B, extension rim E, and saucer concave F, for the purposes and substantially as set forth.

No. 28,790.—ROBERT STOKES and DAVID JOHN JONES, of New York, N. Y.—*Improvement in Skirt Hoops*.—Patent dated June 19, 1860.—In order to adjust the circumference of the hoop, the slides D are drawn towards each other so as to be free from the pressure or spreading effect of the spreaders *c*, the members of the hoop can then be freely moved to and fro to shorten or lengthen the hoop; and when it has been thus adjusted to the required size, the slides are drawn back towards the ends of the members so as to jam over the inclined or spread ends of the hoops and secure the members of the hoops in their new relative position.

Claim.—The employment, in combination with the hoops A B and slides D D, in the manner substantially as shown and described, of spreaders *c*, for the purpose set forth.

No. 28,791.—CORNELIUS TEACHOUT, of Waterford, N. Y.—*Improved Drill Rest*.—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

Claim.—As an improved article of manufacture, a drill rest provided with a shank F, movable guide blocks C C, and adjusting screws D D—all constructed and arranged together substantially as described, for use in tool-holders of machinists' lathes.

No. 28,792.—ISAAC LERU VANSANT, of Red Lion, Del.—*Improvement in Adjustable Carriage Seats*.—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the hinged, knuckled, and slotted legs with the levers, shoes, and ways described and shown by my drawings, as and for the purposes, of self-adjusting carriage seat composed wholly or in part of iron, or other suitable metal or wood, as before set forth.

No. 28,793.—HIPPOLYTE CHARLES VION, of Paris, France.—*Improved Method of Utilizing Atmospheric Electricity.*—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the peculiar arrangement or means specified whereby I am enabled to use the positive electricity contained in the atmosphere and the negative electricity contained in the earth, and thus form an electric pile of considerable power and make the electricity therein contained available for industrial purposes, as set forth.

Second. The combination of an aerostat and vertical wire-work with a tube I for admitting gas into the aerostat, in the manner and for the purposes set forth.

No. 28,794.—H. NICHOLS WADSWORTH, of Washington, D. C.—*Improved Tooth Brush.* Patent dated June 19, 1860.—This invention consists of an improved brush for cleaning the molar teeth, so constructed that it can be conveniently run behind the molar teeth for the purpose of perfectly cleaning them.

Claim.—The construction of a brush with a wedge-shaped end, in combination with the obliquely set bristles—the whole arranged and operating as specified and for the purposes set forth.

No. 28,795.—CALEB C. WALWORTH, of Boston, Mass.—*Improved Steam Trap.*—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of the high pressure steam chamber *f*, reduced steam chamber *c*, valve *g*, and diaphragm *a*, or its equivalent, so arranged that the communication between these chambers is controlled by the direct action of high pressure steam upon one side of the valve, to open it, and of reduced steam upon the diaphragm and the other side of the valve, to close it.

Also, in combination with a reduced steam chamber, a siphon *m¹ m*, substantially as and for the purpose specified.

No. 28,796.—H. M. WALKER, of Watertown, Conn.—*Improvement in Connecting Shafts to Two-wheeled Vehicles.*—Patent dated June 19, 1860.—This invention consists in constructing the platform and shafts of the dray separately, and in connecting the shafts to the platform in a novel manner so that they may be turned at right angles to the platform when the horse is hitched thereto, and keyed or locked in this state when loading or unloading the dray; and when it is desired to start the horse, the shafts may be brought back to their original position, properly secured, and made to serve the purpose of stiff shafts.

Claim.—The manner essentially described of attaching the shafts to two-wheeled vehicles, whereby said shafts may be operated in the manner and for the purposes set forth.

No. 28,797.—A. F. WARREN, of Brooklyn, N. Y.—*Improved Pen Holder.*—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Having the noses *a*, which form the socket for the pen, turned up or otherwise arranged, substantially as described, so that if the pen is inserted, the stick or pencil is allowed to pass clear through the tube.

No. 28,798.—E. T. WHEELER, of Camelton, Ind.—*Improved Shingle Machine.*—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination, with a reciprocating carriage *B* and saw *C¹*, of the adjustable head blocks *E E E E*, their clamps *h h*, arranged and operating automatically, substantially as set forth, and the adjustable tables *J J*—all arranged in the manner and for the purposes described.

I also claim, in combination with the tables *J J*, and carriage *B*, when the machine is used for sawing shingles, of the pawl *m*, vibrating rod *N*, connecting rods *n n*, bars *J¹ J¹*, with their adjustable blocks *K K*, arranged and operating in the manner described and represented.

No. 28,799.—LOUIS WILHELM, of Buffalo, N. Y.—*Improvement in the Ventilation of Casks Containing Liquids.*—Patent dated June 19, 1860.—The nature of this invention consists in the arrangement of a ventilator in the top of the cask, and the connection of the same by means of a cord or chain to the top or faucet, so that when the plug of the faucet is turned to allow the liquor to escape from the cask, the ventilator will be opened and admit air in at the top of the cask, and when the plug is turned to stop the flow of the liquor, the ventilator will close itself by the action of a spring.

Claim.—The combination of the plug *b b*, valve *f*, rod *d*, spring *e*, cord *I*, and faucet *H L*—the said parts being constructed and arranged and operating in the manner and for the purposes set forth.

No. 28,800.—WILLIAM P. WOOD, of Washington, D. C.—*Improved Scroll Sawing Machine.* Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the horizontal pitman *K*, and sectional wheel *H*, or their or either of their equivalents, as arranged in combination with the hinged connecting strips *I* and *I*¹, connecting arms *J*, and straining block *c*, or their or either of their equivalents; the whole being constructed, arranged, and operated in the manner and for the purposes substantially as set forth.

Second. Combining the guide way *R* and buffer in one piece, so that they can be simultaneously adjusted to suit saw blades of different lengths, substantially as described.

Third. The adjustable slotted plates *p*, in combination with buffer foot *n*, having in its fork a plain friction roller, in the manner and for the purposes substantially as set forth.

No. 28,801.—L. B. WOOLFOLK, of Nashville, Tenn.—*Improvement in Steam Ploughs.*—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the shaft *C*, the loose pinions *G G*, and the clutches *H H*, with the driving wheels *E E*, the whole being constructed and arranged substantially as herein described.

Second. The arrangement of the wheel *T*, having its axis out of the line of attachment to the frame *S*, in the journal at *U*, so as to answer and adjust itself to the movements of the driving wheels, substantially as set forth.

Third. The employment of the wheel *T*, having its shank *z*, turning loosely in the journal box at *W*, and provided with an oblong *d*, confined between the springs *a a*, in combination with the lever *x*, the rack bar *w*, and the segments *y y*, substantially as set forth.

Fourth. The arrangement of the friction wheels *m m*, the shafts *s s t t*, with the driving wheels *E E*, and shaft *C*, substantially as represented.

No. 28,802.—CLARK WRIGHT and WILLIAM PHELPS, of Sycamore, Ill.—*Improved Churn.* Patent dated June 19, 1860.—This invention consists in a rotary tub, and stationary spout and gathering basket combined.

Claim.—The combination of the rotary tub *F*, stationary spout *K*, and basket *H*, operating substantially as and for the purposes set forth.

No. 28,803.—THOMAS YATES, of Dubuque, Iowa.—*Improvement in Coffee Pots.*—Patent dated June 19, 1860.—This invention consists in the arrangement of an inverted bell shaped chamber, and a perforated cylinder, both covered by a strainer, in combination with a water vessel of ordinary construction, in such a manner that the essence of the coffee or other substance to be boiled is retained under the bell shaped chamber, and on cooling said essence is absorbed by the water pushing in and filling the chamber.

Claim.—The arrangement and combination of the inverted bell shaped chamber *H*, perforated cylinder *F*, strainer *G*, and vessel *A*, constructed and operating substantially in the manner and for the purpose set forth.

No. 28,804.—ENOCH S. YENTZNER, of Middletown, Pa.—*Improvement in Sewing Machines.* Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination and arrangement of the horizontally reciprocating shuttle *X*, vertically reciprocating needle *N*, feed pad *I*, disk *R*, having cam grooves *S U*, of the peculiar configuration described, in its opposite faces, eccentric *O*, lever *E*, lever *T T*¹, and lever *L*; the whole constructed and operating in the manner described, for the purpose of making the peculiar stitch represented in Figs. 7 and 8 of the drawings.

Second. A shuttle, for sewing machines, constructed with a sliding block *a b*, spiral spring *c*, and set screws *z*; the said parts being so arranged that a positive friction on the bobbin *Y*, is produced by the screw, and the action of the spring, when the screw is slackened, is to throw the block out of contact with the bobbin, substantially as and for the purposes set forth.

No. 28,805.—LYMAN BRIDGES, of Chicago, Ill., assignor to himself and N. M. SIMONDS, of said Chicago.—*Improved Heating Apparatus.*—Patent dated June 19, 1860.—When the stove becomes heated, the oil, as fast as it escapes through the perforated plate, is converted into gas and consumed without producing much smoke. The heat is regulated by adjusting the cock *K* to give a greater or less supply of oil.

The inventor says; I *claim* the combination of the oil reservoir *J*, with the oil chamber *H*, and cylinders *A D*, as and for the purpose shown and described.

I also claim the combination of the inclined or conical plate *F G*, arranged as shown, with the cylinders *A D*, in the manner and for the purpose shown and described.

I also claim the arrangement and combination, in the manner shown and described, of the cylinder M, and plates B N, with the cylinders A D, so that both surfaces of the combustion chamber will be protected by ascending columns of air, which will also become heated, all as specified.

No. 28,806.—ALBERT BROUGHTON, of Malone, N. Y., assignor to himself and ALEXANDER LINDSAY, of said Malone.—*Improvement in Stump Extractors*.—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the mode of converting the hoisting gin into a cart or vehicle for the transportation of the machine and its apparatus, as shown in Fig. 6.

Second. The arrangement, connecting together, and combination of the hoisting gin and main lever, in the manner shown in Figs. 1 and 2, for the purposes stated.

Third. The method of attaching the main lever to the roots of the tree or stump, as shown in Figs. 1 and 2, and above described, together with the use of the main lever, as arranged, for the purpose stated.

Fourth. The arrangement, connecting together, and the combination of all the several parts of the machine, substantially in the manner shown in the annexed drawings and above described, for the purposes and uses in this specification above stated and set forth.

No. 28,807.—PHILETUS W. GATES and D. R. FRASER, of Chicago, Ill., assignors to themselves and THOMAS CHALMERS, of said Chicago.—*Improvement in Machines for Stamping Metal Quartz*.—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the combination of a toothed and collared rising and falling power bar D G, or its equivalent, with a combined plain and tooth lifting device H I, substantially as and for the purposes set forth.

Second. The manner, substantially as specified, of arranging the lifting device on its shaft, for the purposes set forth.

Third. The combination of two eccentric gears M, toothed and collared power bar D G, and the combined lifting device H I, substantially as and for the purposes set forth.

Fourth. The combination, with the inclined screens P P, of the mortars of the overhanging shields or guards N¹ N¹, substantially as and for the purposes set forth.

No. 28,808.—JOHN GREEN, of Brooklyn, N. Y., assignor to NATHAN THOMPSON, JR., of said Brooklyn.—*Improved Machine for Planing Warped Surfaces*.—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of concave and convex rotating cutters, or either of them, mounted on a frame free to turn on an axis, with a stationary table or support for the plank to be reduced, the turning frame being provided with proper contrivances for rotating and holding it, and the combination constructed so as to produce warped surfaces, substantially in the manner described.

No. 28,809.—STEPHEN JACKSON, of Ossipee, N. H., assignor to DAVID L. HODSDON, of Somersworth, N. H.—*Improved Blind Slat Machine*.—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, in combination with the awls and cutters, or mechanism for piercing the edges of a blind slat, and forming it with tenons on its ends, as specified, the slat hopper or rests X X, and platform V, and the impeller O, or mechanism for successively removing the slats therefrom and feeding them forwards between and away from the journal cutters.

I claim the self acting or spring cam stops Z Z, in combination with the impeller O, the platform V, and the inclined rails U U, the said cam stops being arranged and applied substantially in manner and to operate as specified.

I also claim the combination of inclined rails U U, with the platform V, and the awls or awl carrier; the object of such inclined rails being to cause an inclination out of the path of the awls of a slat while being expelled from the machine.

I also claim the combination of the end guides and slat holders T T, with the tenon cutting mechanism, the platform and spring pressers or slat supporting devices, as specified.

I also claim the combination of the rests p p, with the impeller O, in manner and for the purpose substantially as specified.

No. 28,810.—EBENEZER A. KIMBALL, of Boston, Mass., assignor to himself and ADRIAN L. MILLER, of said Boston.—*Improved Alarm Gauge for Steam Boilers*.—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the arrangement and application of a slide valve, alarm whistle, valve seat, float lever and index pointer, in such manner that, by the movements of the slide valve, occasioned by the float lever, the indicator or index pointer shall be moved along its index or arc of divisions; and whenever the water of the boiler may have reached its lowest

safety level, the valve port of the steam whistle or the alarm apparatus shall be opened so as to enable the steam to pass into the whistle and sound an alarm.

I also claim providing the float stem with a steam passage extending longitudinally through it and opening into the boiler and dry steam chamber, as and for the purpose specified.

I also claim so applying to the index chamber the device for moving the indicator that any steam which may escape from the valve opening of such device may not enter the index chamber, so as to foul or condense on its glass.

No. 28,811.—JOHN LOW, of Clinton, Mass., assignor to NATHAN BRUCE, of Southboro', Mass.—*Improvement in Dulcimers*.—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement, as described, of the central bridge 6, in relation to and in combination with the bridges 4 and 5, in the manner described, by which one part of each string is made to give a single chromatic interval of pitch higher than the other part, substantially as and for the purposes set forth.

No. 28,812.—GILBERT W. OLIVER, of New York, N. Y., assignor to HENRY PARKER and COLIN W. YALE, of said New York.—*Improvement in Preserving Meats*.—Patent dated June 19, 1860.—The claim explains the nature of this invention.

Claim.—The application or employment of heat to the specific purpose of curing and preserving meats, as corned provisions, in such a way and to such an extent as will effectually or sufficiently coagulate the albumen of the tissues and fluids, in combination with the subsequent application of heated brine or preservative fluid.

No. 28,813.—ALPHEUS D. ROLLINGS, of Green Point, N. Y., assignor to himself and H. J. HOWLAND, of New York, N. Y.—*Improved Steering Apparatus*.—Patent dated June 19, 1860.—By turning the hand wheel F, the gear wheels M and N work each to an equal extent in the respective segments *m* and *n*, and turn the rudder without any side strain on the rudder head, while the rudder, in rising and sinking, carries the boxes E E¹ and all the gearing with it.

The inventor says: I claim, first, the shaft and wheels G M N, reverse segments *m n*, guard R, rider T, and open jaws E E¹, arranged to operate together substantially as and for the purpose set forth.

Second. In steering gear, substantially as above described, the geared shafts G and H, and socket *f*, adapted to receive either G or H at pleasure, substantially as and for the purpose set forth.

Third. In steering gear, substantially as above described, the stop K, arranged to operate in the gear wheel *g*, substantially as described.

No. 28,814.—ISRAEL M. ROSE, of New York, N. Y., assignor to JOHN R. MORRELL, of Brooklyn, N. Y.—*Improvement in Sewing Machines*.—Patent dated June 19, 1860.—This invention consists in the combination of a revolving hook, bobbin, and reciprocating needle, with an eye-pointed needle that perforates the cloth in such a manner that the under thread is interlaced with the needle thread at the surface of the goods, and the loop of the needle thread being passed around the bobbin of the second thread, prevents the loop needle thread drawing up through the cloth.

Claim.—The revolving hook 1 carrying the bobbin 3, and lower needle *o*, in combination with the perforating eye-pointed needle *i*, substantially as specified, whereby the threads are concatenated, as set forth.

No. 28,815.—RHODA SOWLE, of Fall River, Mass., administratrix of the estate of DAVID SOWLE, deceased, late of Fall River, Mass.—*Improvement in Lozenge Machines*.—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, the arrangement of a plain smooth roller F, to operate in combination with the plunger E and cutters *c*, substantially in the manner and for the purpose described.

Second. I claim combining with each row of cutters C, on the rotary cylinder B, a separate clearer K, constructed and operating substantially in the manner and for the purpose described.

Third. The arrangement of the two endless aprons H and M, one at right angles to the other, to operate in combination with the cylinder of cutters B, and with the drum D, and with the clearers K, or their equivalents, substantially as and for the purpose set forth.

No. 28,816.—JOHN H. STEINER, of Philadelphia, Pa., assignor to himself and JAMES E. THOMSON, of Buffalo, N. Y.—*Improvement in Railroad Car Wheels*.—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Constructing the cast iron part of the wheel with chambers or tapering pockets,

in combination with wedge-like blocks of wood B, having shoulders B¹ and the wrought iron band c shrunk thereon, for the purposes and substantially as described.

No. 28,817.—JOHN H. STEINER, of Philadelphia, Pa., assignor to himself and JAMES E. THOMSON, of Buffalo, N. Y.—*Improvement in Railroad Brakes*.—Patent dated June 19, 1860. When it is required to apply the brake, the wheel M, under the control of the engineer, is turned so as to lower the shoe to the rail. The spring C will relieve the brake from a too sudden action upon the rail, and will compensate for any unevenness in the rail, and prevent any sudden jar or wrenching of the locomotive.

The inventor says: I *claim*, first, the spring C, in combination with the shoe A and cam D, substantially as set forth.

Second. The combination and arrangement of the hook N N¹, and the flange N², with the cam D², cam shaft E, spring C, and shoe A, for the purposes and substantially as described.

No. 28,818.—GEORGE STORER, of New Britain, Conn., assignor to himself and the STANLEY RULE AND LEVEL COMPANY, of said New Britain.—*Improved Machine for Finishing Works in Wood and Metal*.—Patent dated June 19, 1860.—This invention consists in the construction of a proper frame work and gearing, in or upon which is arranged, in a suitable manner, a series of sliding plates, planed or trued up in a uniform shape and size, and connected at their ends by a properly formed joint, so made in their shape and distance from centre to centre, as to just fit into bearings made in the ends of projecting arms, or in the periphery of wheels, the centres of which bearings are made of a corresponding distance from centre to centre, so that the joints of the sliding plates will mesh into the bearings, as the said wheels and arms revolve, similar to the action or mesh of gearing.

Claim.—The combination of the sliding plates *j*, the milled or cutting plates *n*, guide ways *m*, with a proper holding jack *r*, upon the bed *p*, constructed and operating substantially in the manner as and for the purpose described.

No. 28,819.—DAVID H. THORP, of Chelsea, Mass., assignor to the BOSTON FAUCET COMPANY, of Boston, Mass.—*Improvement in Faucets*.—Patent dated June 19, 1860.—The claim and engravings explain the nature of this invention.

Claim.—In the basin faucet having a conical tubular elastic packing C made and applied to its valve, the stem, and case thereof, as described, the arrangement of the stop *x*, and its shoulder *y*, or chamber by which such shoulder is formed in the part D, with operating screws *i k f m*, and tubular elastic packing C applied to the valve stem *e* and its valve B, substantially as specified.

No. 28,820.—WILLIAM WRIGHT, of Philadelphia, Pa., assignor to himself and JOHN BRADY, of said Philadelphia.—*Improved Animal Trap*.—Patent dated June 19, 1860.—This invention consists in the general arrangement of the base of the trap, an upright, a spiked board hinged to the base, a spring, a retaining lever, and a trigger plate; also in a notched projection secured to the spiked board, and arranged in respect to the spring, so as to prevent the animal from escaping after it has been caught between the spiked board and the base.

The inventor says: I *claim*, first, the general arrangement of base A, the upright B, spiked board C, spring G, lever D, and trigger plate F.

Second. I claim the projection *m* on the spiked board C, when the notches of the said projection are arranged in respect to the spring, as and for the purpose set forth.

No. 28,821.—PETER Z. ALLEN, of KNOX, N. Y.—*Improved Washing Machine*.—Patent dated June 26, 1860.—This invention consists of two rubbers, so arranged that one shall hold the clothes in one direction while the other operates on them in a contrary direction.

Claim.—The combination and arrangement of the convex rubbers C C C, upright arms D D, slot *a*, cross bars E, bracket arms F, pivots *f*, cross bars J J J J, connecting rods K K, and shaft *m*, when used for the purposes specified.

No. 28,822.—W. H. ANGELL, of Clermont, Iowa.—*Improvement in Unloading Hay*.—Patent dated June 26, 1860.—This invention consists in the use of a carriage placed on suitable ways within the barn at its peak, said carriage having a tackle connected with it, and a catch or fastening, the above parts being used in connection with a detaching device.

Claim.—The employment or use of the carriage C fitted on the ways B B provided with a tackle frame F and hooks H H, and used in connection with the rope mechanism M and the hook separator formed of the bars L *d* and bevelled projections *e*, or their equivalent, all being arranged and applied substantially as and for the purposes set forth.

No. 28,823.—MOSES S. BEACH, of Brooklyn, N. Y.—*Improved Printing Press*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, closing the fingers of printing cylinders by the combined operation of the coil spring G^1 , the finger crank H , and friction roller H^2 , and the cam J^2 , or their equivalents, constructed and operated substantially as described.

Second. Closing the fingers of printing cylinders by means of the pendulum switch cam L and the operating pin N , or their equivalents, constructed and operated substantially as described.

Third. Closing the fingers of printing cylinders by means of the cam K , and the combination of friction roller I^2 and pin I^1 , or their equivalents, constructed and operated substantially as described.

Fourth. Opening or throwing backwards the fingers of printing cylinders or paper rollers by means of the coil spring a^1 , and closing them by the combined operation of the finger crank c , the crank pin c^1 , and the cam e , or their equivalents, constructed and operated substantially as described.

Fifth. Depositing sheets on a board or table by means of the rollers $T T$, or their equivalents, having an axial combined with a planetary motion, constructed and operated substantially as described.

Sixth. The rollers T^2 used, in connection with the rollers $T T$, in drawing forward and depositing sheets, or their equivalents, constructed and operated substantially as described.

Seventh. The concave form of the fly board D , Fig. 1, as described.

Eighth. The deflecting points F , or their equivalents, used in connection with the rollers $T T$, in depositing the sheet, constructed and operated substantially as described.

No. 28,824.—LEVI A. BEARDSLEY, of South Edmeston, N. Y.—*Improved Machine for Removing Bark from Willows, &c.*—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a rubbing slab having its acting surface of undulating form, as described, the said surface being formed of yielding segments, the whole being constructed substantially as described and for the purpose specified.

Second. The rubbing slab H , having a flat, elastic, and yielding surface, acting in combination with another properly formed slab and a feeding device, acting substantially as specified.

Third. Receptacles for water, forming part of the rubbing slab, as described.

Fourth. Giving to the rubbing slabs, or one of them, a motion, at times and by means of the cams dd , or their equivalents, which shall separate the two slabs and prevent their action upon the twigs while the twigs are moved for the purpose of feeding.

Fifth. A yielding clamping surface in combination with another surface, the said surfaces acting in combination with a separate rubbing device when the said clamping surfaces act to feed the twigs, substantially in the manner described.

Sixth. The mode, substantially as specified, for presenting different portions of the twigs to the action of the rubbing surfaces, its characteristics being that the twigs are moved by the feeding device during the time when the pressure of the rubbing surfaces upon the twigs is relieved, and that the feeding device ceases to act upon the twigs at a time when the pressure of the rubbing surfaces is upon the twigs.

Seventh. In combination with a rubbing mechanism for loosening the bark and a feeding device, an automatic raking or scraping device, constructed substantially in the manner described and for the purpose specified.

No. 28,825.—CHARLES C. BIER, of New Orleans, La.—*Improved Iron Tie for Cotton Bales.*—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The particular novel mode of making an iron tie, for the purpose of securely fastening cotton bales, or other baled goods, as described, using for the manufacture of the same any metal suitable for the purpose.

No. 28,826.—CALEB BOND, of Richmond, Ind.—*Improvement in Water Wheels.*—Patent dated June 26, 1860.—This invention consists in the employment and peculiar adaptation and arrangement of hinged auxiliary buckets by means of which the water wheel can be adjusted as required, so as to secure the best effect from any given quantity of water.

Claim.—In combination with the passages g , I claim the hinged auxiliary buckets h , the whole being constructed and arranged to operate, substantially in the manner as specified, for the purposes described.

No. 28,827.—N. W. BONNEY, of Victoria, Texas.—*Improved Bolt for Doors.*—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of lever stop j , cam i , and spring b , with the two wings $m n$ of a door, when the same is so applied that the closing of two wings brings the bolt into effective action, and the opening of the wing which has the lock applied to it allows the bolt to automatically cease its action, as set forth.

No. 28,828.—E. W. BRETTELL, of Newark, N. J.—*Improved Lock.*—Patent dated June 26, 1860.—This invention consists in constructing and arranging the several parts of the machine

Claim.—The employment or use of the tumblers *b* placed within the tube *F*, which is fitted within the cylinder *E* attached to the lock case, in connection with the plate *I*, stationary or yielding, the tube *F* having the dog *J* attached, and all arranged substantially as and for the purpose set forth.

No. 28,829.—R. M. BROOKS, of Greenville, Ga.—*Improvement in Cultivators.*—Patent dated June 26, 1860.—This invention consists in constructing and arranging the different parts of the machine.

Claim.—The arrangement of the seed box *H*, as constructed, with the standard *B*, distributing cylinder *G* provided with pins or teeth *x x*, and with the slide *I* provided with an opening *S*, when the same are used substantially as and for the purpose specified.

No. 28,830.—W. W. BURSON, of Yates, Ill.—*Improvement in Grain Binders.*—Patent dated June 26, 1860.—This invention has reference to binding grain upon the platform of any reaping machine before it is thrown to the ground, and consists of a certain combination of devices.

The inventor says: I *claim* extending and contracting the fore arm *A* by the action of the rear portion of *A*¹ upon the cords *B* and *C*, substantially as set forth.

The combination of the hooks *Z P u* and the bent lever *S*, operating substantially as described.

The arrangement of hooks *P* and *u*, whereby the latter is passed through the loop, substantially as and for the purposes described.

The arrangement of lever *S* in combination with shield *h*, acting substantially as and for the purpose set forth.

The slotted hook *Z* in combination with hook *a*, substantially as described, for the purposes specified.

The hook *a* and receptacle *c*, arranged and operating together substantially as described and for the purposes set forth.

No. 28,831.—JOSHUA F. CAMERON, of Livingston County, Mo.—*Improvement in Cultivators.* Patent dated June 26, 1860.—This plough consists of a main helve *A* through main beam *B*, to which is attached the heel bar *C* and braces *D E*, so constructed that any form of share, right or left, can be fastened on the main helve by means of a screw through the socket into the helve upon which the share is fastened; and by unscrewing or moving the front brace and changing the hind bolt in the hind brace, the beam can be raised or lowered to any pitch; and by means of holes in the different helves the bar and braces and beam *B* can be hoisted or lowered at the will of the operator.

Claim.—The described arrangement and combination of the rotary coulters *Z Z*, beam *B*, bar *C*, helves *A F G H I K* and *L*, cross bars *M N*, and braces *D E O P Q R S T U V*, in the manner and for the purposes set forth.

No. 28,832.—JOHN CHAMPLIN, of East Middlebury, Vt.—*Improvement in Water Elevators.* Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the buckets *F*, one or more, attached to the pulleys *C C*¹ of shaft *B*, in connection with the tilting shoes *E*, through the medium of the links and rims *j i*, or their equivalents, and the pawls arranged relatively with the ratchet *a*, as and for the purpose set forth.

Second. The ball *I*, and box *H*, on shaft *G*, in connection with the pawls *b b*¹, attached to the inner side of the curb *A*, the shaft being connected to the shoes *E* through the medium of the links and arms *j i*, or their equivalents, and the pawls arranged relatively with the ratchet *a*, as and for the purpose set forth.

Third. The adjustable spout *L*, arranged in connection with the slide *M* and tilting shoes *E*, and adjusted respectively within and to the curb, substantially as and for the purpose set forth.

No. 28,833.—JAMES CHARLTON, of Allegheny, Pa.—*Improvement in Cultivators.*—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the flanged bar *e*, bent so as to form the segment of a circle and furnished with slots *x* and *i*, the bar point or mould board and scraper being attached to said flanged bar, arranged, constructed, and operated as described, and for the purpose set forth.

No. 28,834.—E. D. CLARK, of Earlville, N. Y.—*Improvement in Mills.*—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

Claim.—So combining a fanning device with a mill for crushing and shelling corn as that by the movement of the shifter *N*, the contents of the hopper *G* may be discharged into mill *B*,

or through spout C; the parts composing said mill being arranged substantially as described, and for the purposes set forth.

No. 28,835.—JAMES M. COBB, of Jackson, Tenn.—*Improvement in Cotton Scrapers*.—Patent dated June 26, 1860.—This invention relates more particularly to the frame which supports the mould board, said frame being so connected with the beam as to be made adjustable thereon to set the point and share of the scraper, more to or from the plants that are to be cultivated.

Claim.—The construction and arrangement of the frame, sole, and mould board, when united in the manner and for the purposes represented and described.

No. 28,836.—JAMES M. COBB, of Jackson, Tenn.—*Improvement in Ploughs*.—Patent dated June 26, 1860.—This invention relates to the construction and arrangement of the mould board and its connected parts, the share and landside plate, and the subsoiler.

Claim.—The combination and arrangement of the mould board, standard, and sole with landside plate H and beam A, and with the subsoiler I, as represented, and for the purpose set forth.

No. 28,837.—CELADON L. DABOLL, of New London, Conn.—*Improvement in Fog Alarms*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the general method, substantially as set forth, by which air, which has been mechanically condensed, shall be applied to the sounding of a trumpet or whistle for the purpose of giving marine signals by sound.

Second. The use of the cam C, when used for the purpose of communicating a series of signals more intelligible than mere independent sounds, substantially as set forth.

Third. The combination of the cam C, the stem D, and valve E, for the purpose of giving a variety of sounds of a trumpet or whistle, for the purposes and in the manner described.

Fourth. The trumpet T, in combination with the reservoir R, and connecting pipe L, when used for the purpose set forth.

No. 28,838.—WILLIAM A. CROWELL, of Salisbury, Conn.—*Improvement in Spring Balances*.—Patent dated June 26, 1860.—This invention consists in adjusting the index, or pointer, upon the rod by which the hook, or pan, is connected to the spring in lieu of adjusting both the point and the spring relatively to the graduated scale.

Claim.—Arranging the adjustable index finger I, relatively to the rod E and shoulders K, substantially in the manner and so as to secure the advantages set forth.

No. 28,839.—WILLIAM DIXON, of Chicago, Ill.—*Improvement in Loading Hay*.—Patent dated June 26, 1860.—The object of this invention is to rake hay from the ground and elevate it to a determined height and deposit it in a wagon, or other vehicle, which is to be drawn over the hay after it is cut and dried.

Claim.—The arrangement of the endless chains K, rake teeth J, guide pieces L, stationary rake P, apron R, and castor wheel S, as and for the purpose shown and described.

No. 28,840.—WILLIAM C. DRUM, of Belvernon, Pa.—*Improvement in Feed Water Heaters for Steam Boilers*.—Patent dated June 26, 1860.—This invention consists of a vessel of cylindrical, or other suitable form, having inclosed within it a smaller vessel, so arranged as to leave a space between them, above, below, and on all sides, such smaller vessel having tubes running through it and communicating at each end with the interior of the larger, but not with the interior of the smaller vessel, constituting a water space having an inlet from the feed pipe and an outlet to the boiler and a receptacle below it for sediment.

Claim.—The heater composed of the vessels A and B, the tubes C C, with inlet and outlet pipes D E F G, sediment collector H, and receiver L; the whole combined and arranged substantially as described.

No. 28,841.—JOSIAH P. FULLER, of New York, N. Y.—*Improved Garter*.—Patent dated June 26, 1860.—This invention consists in the application of a steel spring to the formation of a band for a garter, which shall encircle and clasp around the leg over the stocking in such a manner that it shall be securely held in place. The characteristic feature of said spring or garter consists in tempering it while in the coil in contradistinction to tempering it in the flat state.

Claim.—As a new article of manufacture, the garter, constructed substantially as described.

No. 28,842.—E. N. FOOTE, of New York, N. Y.—*Improved Watch Chain Hook*.—Patent dated June 26, 1860.—This invention consists in the employment of a jointed ring, or two elliptical bows, having a pointed tenon at the point where the two ends come together that

fits in a corresponding hole made in one end of the bows, in combination with a female screw socket that confines the jaws of the bows together.

Claim.—The watch hook, constructed as described and represented.

No. 28,843.—O. F. FITCH, of Morristown, Ind.—*Improvement in Cultivators.*—Patent dated June 26, 1860.—The object of this invention is to construct a hand plough for light ploughing only, and to construct it in such a way that a harrow may be conveniently combined with it, which will be supported, braced, and strengthened by the plough, and capable of being extended or contracted according to circumstances.

Claim.—The described combination and arrangement of braces and frames, arranged in the relations set forth, and made to serve the purposes described.

No. 28,844.—WILLIAM C. FISHER, of Charlestown, Mass.—*Improvement in Bolts for Store Shutters.*—Patent dated June 26, 1860.—This invention consists of an improved spring bolt, which secures itself when it is pushed into place.

Claim.—As a new article of manufacture, the described bolt for securing store window shutters, operating substantially as set forth.

No. 28,845.—J. P. FISHER, of Rochester, N. Y.—*Improvement in Iron Bridges.*—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, combining the posts and the sections A A and F, of the lower chord of the truss by means of the double dovetail lower portions *b* of the post, the dovetail grooves in the ends of the said sections, the shoulder *x*, and the screws *e*, on the posts, and the plates *i i*, and nuts *g g*, the whole applied and operating substantially as set forth.

Second. In combination with the sections A and C, posts B, saddles *j*, connected and secured together as described, I claim the transverse girders G, and the tension braces H I and J, applied and arranged relatively to each other and to the said sections and posts, substantially as specified.

Third. The tightening of the wire rope braces H H and I, or any other wire rope tension braces of a bridge, by means of screws and nuts *r s* and *t u*, constructed and applied substantially as described—that is to say, so that the screws tighten the braces by twisting their parts together and holding them tight, and serve to tighten them further by bearing in recesses in a rigid part of the structure, substantially as specified.

No. 28,846.—D. F. ELMER, of Haydenville, Mass.—*Improved Watch Key and Guard Bar.*—Patent dated June 26, 1860.—This invention consists in a novel mode of combining the outer movable sheath with the inner tube, at the end of which is the key, whereby the construction of the combined key and bar is rendered more simple and stronger.

Claim.—The combined watch key and guard bar, constructed as described, with a sheath having an L-shaped slot fitted to the key tube and to a pin or projection thereon, substantially as described.

No. 28,847.—DAVIS DUTCHER, of Blue Grass, Iowa.—*Improvement in Corn Planters.*—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, the combination of the seeding and marking apparatus, operating together in the manner and for the purpose substantially as described.

Second. I claim the combination of the ploughs and supporting and gauging wheels *f*, so that they may be self-yielding to pass over any intermediate obstacle and be raised up by the driver from his seat, in the manner and for the purpose mentioned.

Third. I claim, in combination with the rear supporting wheels and the front self-yielding wheels, the marking and seeding devices arranged between them, and a driver's seat behind, for the purpose of balancing the machine, and still allowing the front wheels to rise and fall with the ploughs, as represented.

No. 28,848.—DANIEL N. DUNZACK, of Salem, Mass.—*Improved Chisel for Opening Boxes.*—Patent dated June 26, 1860.—This invention consists of a chisel B, with a slot I and a notch R cut in its thin end to admit a nail; the chisel B also has a groove O cut near its thin end to admit a small oblique chisel T; the chisel T operates in the groove O by a fulcrum N; the fulcrum N is secured between two thin oblong plates of iron or steel L L; said plates vibrate freely on, and serve as a rest for, the chisel B.

Claim.—The arrangement and combination of the several parts, when arranged and combined as described, for the purposes set forth.

No. 28,849.—F. N. DU BOIS, of Chicago, Ill.—*Improvement in Machines for Crushing Quartz.*—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, so constructing and arranging the stationary back of the hopper and the vibrating front of the hopper that the escape passage S shall extend on a curved line in rear or on one side of a line drawn vertically through the apex of the angle formed by the two inclined sides of the hopper, substantially as and for the purposes set forth.

Second. An adjustable stirrup *u*, in combination with eccentrics *e f* and the arms *g h* of two or more vibratory jaws *p p*, for the purpose of limiting the extent of the motion of these jaws, substantially as set forth.

No. 28,850.—JAMES W. GAINES, of Melrose, Texas.—*Improvement in Mill Stone Dress.*—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Making each of the main grooves in five sections *a a b b*, *a h i e*, *j f g k*, *c h l d*, *m d n d*, in combination with the shoulders *b c*, *i j*, inclined planes *o e f*, *p m l*, in the manner and for the purpose described.

No. 28,851.—JAMES E. A. GIBBS, of Mill Point, Va.—*Improvement in Sewing Machines.*—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, so constructing a rotating looper and a stationary thread guard or guide, and applying the same in combination with the needle of a sewing machine, as to effect the twisting of the loop and the passage of each loop twice through its predecessor, substantially as described, for the production of the stitch specified.

Second. The employment of a stationary thread guard or guide, in combination with a rotating looper, for the purpose of spreading the loops to facilitate the entrance of the needle thereinto, substantially as specified.

Third. The stationary guard M applied in combination with a rotating looper, substantially as described, to prevent the looper from entering the loop which is being drawn up towards the cloth.

No. 28,852.—J. J. GREENOUGH, of New York, N. Y.—*Improvement in Pegging Machines.*—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* transferring the contact between the sole of the boot or shoe and the rest piece *e*, or its equivalent, to the block *d* or awl stock *a*, or their equivalent, while the lateral movement is made to space the distance between the pegs, substantially as and for the purposes set forth.

I also claim driving the stock *a* by the combined action of the cam *f*, or its equivalent, for raising the same, and the spring for forcing it down to drive the awl or peg.

I also claim the boot clamp described, consisting of a heel and toe rest and intermediate forceps or clamps, substantially as and for the purpose specified.

No. 28,853.—THOMAS GRUNDY, of Boston, Mass.—*Improvement in Water Closets.*—Patent dated June 26, 1860.—This improvement consists in forming in the pipe that supplies the basin an air tight chamber, in which plays up and down a piston that is raised by a cam, when the handle is raised so as to open communication between the supply pipe and the basin, and drops slowly by its own weight, so that the supply of water cannot suddenly be cut off from the basin when the handle drops or is pushed down.

Claim.—The arrangement of devices described, the same consisting of the piston valve *k*, playing up and down in the cylinder *j*, and operated substantially as and for the purpose specified.

No. 28,854.—DANIEL GUPTAIL, of Elgin, Ill.—*Improvement in Raking Attachments for Harvesters.*—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment or use of lazy tongs I, with rake J attached, in connection with the bar H, with the rake or plate M attached; the lazy tongs and bar being operated by the revolving arm E, pin K, and slot G, substantially as described.

Second. The frame N, in combination with the lazy tongs I, for the purpose of preventing the grain that is being cut, while the rake is in operation or passing over the platform, interfering with the operation of the rake, as specified.

No. 28,855.—ELIAS J. HALE, of Foxcroft, Me.—*Improvement in Lamps.*—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* so combining or arranging a tubular air guard D within or with

the cone or deflector C, and with respect to the wick tube, that air passing up through the cone or deflector C shall be caused to freely circulate not only against the sides and edges of the flame of the wick, when inflamed, but against the outer surfaces of the sides and ends of the air guard.

I also claim so combining an air guard with the cone or deflector as to be removable with and by it, with respect to the wick tube, as set forth.

No. 28,856.—JOHN HAMLYN, of Bellevue, Mich.—*Improvement in Stump Extractors*.—Patent dated June 26, 1860.—In using this invention the lifting apparatus is adjusted properly on one side of a stump, and the fulcrum or pedestal on the other; the lever L² is next placed in proper position, and a chain, which is linked to an adjustable clevis K, is fastened as snugly as possible to the stump, after which the machine is so worked as to remove the stump from its bed.

Claim.—The application and use of the described arrangement of toggle bars T T, disks G and H, rollers c c c, &c., rack bar E, and catch pins p¹ p², in combination with an auxiliary lever L², substantially in the manner and for the purposes described and set forth.

No. 28,857.—HENRY HARGER, of Delhi, Iowa.—*Improvement in Setting Type*.—Patent dated June 26, 1860.—This invention consists in the arrangement of machinery in connection with the type case by which the types are fed to the composing stick, and of an arrangement of levers and fingers in connection with the composing stick, by which the types may be taken from the case and set in line.

The inventor says: I *claim*, first, the follower C, with the arm c, in connection with the pawl E, and rod D, or their equivalents, substantially as described and for the purpose set forth.

Second. The finger G, or its equivalent, substantially as described and for the purpose set forth.

Third. The composing stick H, in connection with lever K, bent lever L, connecting rod M, spring N, follower S, finger P P, and bar I, substantially as described.

Fourth. The guides V V, or their equivalents, substantially as described and for the purpose set forth.

No. 28,858.—HENRY M. HARTSHORN, of Malden, Mass.—*Improved Carpet Stretcher*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the tack holding cup with the carpet stretcher, composed of a toothed plate and provided with a handle, as specified.

No. 28,859.—JAMES HATHEN, of Philadelphia, Pa.—*Improved Carpenters' Square*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The use of one or more adjusting clamps J, attached to either end of the square stock, and made to serve in conjunction with the pins C and C¹, for securing the blade to the stock, and setting the same in a proper position, substantially as described and represented.

No. 28,860.—HENRY L. HAYNES, of Keene, N. Y.—*Improved Coupling for Shafting*.—Patent dated June 26, 1860.—The shafts B B are so fitted to the hole E, in the coupling A, that the coupling can be slipped entirely into the shafts, which enables a single piece to be taken out of a line of shafting without disturbing the other parts of the line.

Claim.—In combination with the keys D D, and coupling A, the scarfs J J, in the ends of the shafts B B, constructed as described.

No. 28,861.—GEORGE J. HILL, of Buffalo, N. Y.—*Improved Dating Machine*.—Patent dated June 26, 1860.—This invention is particularly designed for dating railroad tickets, but may also be used in banks, post offices, and other places where it is desirable to stamp or print names and dates upon tickets, cards, &c.

Claim.—The relative arrangement of the type apron G, type D, and platen H, with the inking rollers E K K¹, and automatic lever M, for the purposes and substantially as described.

No. 28,862.—J. J. HOLWELL, of New York, N. Y.—*Improved Fire Escape*.—Patent dated June 26, 1860.—This invention consists in arranging the tormentors F, which serve to elevate and to steady the ladders, with wheels or rollers at their lower ends, and with suitable sockets to receive the ends of pointed rods attached to the truck in combination with a rope or ropes, extending over a windlass in such a manner that by turning the windlass the tormentors serve to assist in elevating the ladders, and that when elevated the truck, together with the ladders, can be easily drawn from place to place; and it consists also in combining with said tormentors adjustable cross braces in such a manner that the same are steadied when the ladders are elevated.

The inventor says: I *claim*, first, the arrangement and combination of the wheeled tormentors F, pointed rods *e*, windlass E, truck B, and ladder A, constructed and operating substantially in the manner and for the purpose specified.

Second. The arrangement of the adjustable cross brace *d*, in combination with the tormentors F, constructed and operating substantially as and for the purpose set forth.

No. 28,863.—J. W. HOUGHTLIN, of Du Quoin, Ill.—*Improvement in Bran Dusters*.—Patent dated June 26, 1860.—This invention consists in the use of a fan, revolving screen or bolt in connection with revolving beaters and gatherers arranged within a suitable case.

Claim.—The employment or use of the bolt or screen F, plates *f*, and gatherers *g*, placed within a case A, and arranged to rotate in reverse directions, when combined with the spiral wire or ledge G, feeders *h*, and scrapers *d*, substantially as and for the purpose set forth.

No. 28,864.—GEORGE C. HOWARD, of Philadelphia, Pa.—*Improved Printing Press*.—Patent dated June 26, 1860.—This invention consists in connecting the plate or table A, by suitable mechanism with the belt shifter rod B B, so that at the proper moment the machine will stop itself; also in connecting the shifter rod with treadles, or their equivalents, so that the press may be started in the right direction.

Claim.—The combination of the plate A, the sliding rod L, the shifter rod B B, and the treadles H H¹, or their equivalents; the whole being connected by levers, or their equivalents, and so arranged that the machine cannot be started in the wrong direction, substantially as described.

No. 28,865.—JOSEPH CHARLES HOWELLS, of Madison, Wis.—*Improved Nozzle for Fire Engines*.—Patent dated June 26, 1860.—The object of this invention is to render a nozzle instantly adjustable, thus enabling the person having control of the pipe to discharge such a sized stream of water as may be desirable under the circumstances.

Claim.—The arrangement and combination of the rotary collar C, cap F, the ears *b b*, the pins or screw heads *c c*, with the adjustable mouth pieces B B, substantially as and for the purposes set forth and described.

No. 28,866.—AUGUSTUS P. HUTCHINSON, of Pembroke, N. H.—*Improvement in Attaching Whiffletrees to Sleighs*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* arranging the whiffletree so as to project beyond one of the thills, in the manner described.

I also claim the application of the whiffletree to the thill bar, by an adjustable slider, or its equivalent.

I also claim the arrangement or combination of the spring stops *c d*, with the thill bar and the adjustable slider applied thereto and made to support the whiffletree, substantially as specified.

No. 28,867.—WALTER H. JENIFER, of Baltimore, Md.—*Improved Military Saddle*.—Patent dated June 26, 1860.—H represents a flat English seat, A the curved pommel, B the curved cantle, C the valise, F the flaps, D the surcingle, and E E the slots through which the surcingle passes.

Claim.—The combination and arrangement of the flat English seat H, the curved cantle B, the pommel A, the curved valise C, the flaps F, surcingle D, slots E E; the whole constructed and used as specified.

No. 28,868.—THOMAS J. JOLLY, of Olean, Ind.—*Improvement in Loading Hay*.—Patent dated June 26, 1860.—A is a frame supported on a pair of ground wheels B, and provided with a tongue C, for attachment to the rear end of the wagon bed; D D¹ is an open work grid or cradle, whose lower portion is nearly semi-cylindrical and concentric with the axle of the wheels B, and whose upper portion D¹ inclines forward and upward at an angle of about forty-five degrees; E is a cylinder rigidly attached to the axle within the frame, and armed with spikes *e*.

Claim.—The reciprocating toothed rods H, constructed and operating in combination with gathering mechanism E F G, in manner substantially as and for the purposes set forth.

No. 28,869.—GEORGE JUENGST, of New York, N. Y.—*Improvement in Shuttles for Sewing Machines*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The brush *b*, in combination with the centre *a*, spring *c*, and screw *d*, as specified, whereby the whole of the parts can be removed for changing the spring, and the position of the centre *a*, can be adjusted, as set forth.

No. 28,870.—THOMAS KINGHORN and ROBERT KINGHORN, of Morgan, Ohio.—*Improvement in Cultivators*.—Patent dated June 26, 1860.—A shows the central draft beam, the front end of which is curved up, as at A¹, and is supported at its front end by a castor wheel E, whose standard F passes up through the clevis G, and the end of the draft beam A; the clevis is fastened to the standard F by a set screw, whereby the end A can be sustained on the wheel E, at any desired height, while the clevis and wheel can freely turn to follow in the direction of the team, although the team turns abruptly.

Claim.—The combination of the adjustable side pieces B B, with their teeth H, and adjusting rear supports D D, with the central beam A, hooks e e, and castor wheel E, arranged operate in relation to each other, substantially as and for the purposes set forth.

No. 28,871.—KIMBALL P. KIDDER, of Burlington, Vt.—*Improvement in Bee Hives*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The removable and reversible bee catcher or passage way g, shown in Fig. 4, provided with a series of pivotted pendant doors or slats R, arranged and applied to the bee hive in the manner and for the purposes specified.

No. 28,872.—GEORGE LAVALLY, JR., of Champlain, N. Y.—*Improvement in Coupling for Railroad Cars*.—Patent dated June 26, 1860.—In unshackling, the brakeman, instead of going between the cars, stands on the platform or top of the car, and by means of the cord raises the lever, thus drawing up and freeing the bolt.

Claim.—The application to rail car bunters of slots T V and L, a lever N, supported at the centre by a fulcrum G, and attached to the pintle A, a bar S, a spiral spring R, the steel spring C, and the cord or chain M, constructed and arranged substantially as described.

No. 28,873.—O. L. LAWSON, of New York, N. Y., assignor to the NEW YORK CAR AND STEAMBOAT GAS COMPANY.—*Improvement in Portable Gas Holders*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The reservoir E, composed of one or more cylinders, or its equivalent, placed between the force pumps B and holders K, for the purpose of facilitating the filling of said holders, substantially as set forth.

No. 28,874.—JOHN LEE, of Bolivar, Ohio.—*Improvement in Post Hole Diggers*.—Patent dated June 26, 1860.—This digger is made either hollow or solid. The lower end is made square and hollow, with sharp cutting edges at the lower end, and of any required length; the opening I is from eighteen to thirty inches from the cutting edges, and is as wide as the inner side of the digger, and extends up high enough to allow the earth to escape readily from the digger.

The inventor says: I *claim*, first, the hollow self-discharging digger, constructed and operating as set forth.

Second. I claim the wheel A and levers B, in combination with the digger C, operating as described, and for the purposes set forth.

No. 28,875.—WILLIAM H. LETTERMAN, of Philadelphia, Pa.—*Improvement in Desulphurizing Ores and Coal*.—Patent dated June 26, 1860.—This invention consists of an improved process for desulphurizing coal.

Claim.—The described process of treating oil and coal with chemical ingredients and steam, substantially as set forth, for the purposes specified.

No. 28,876.—WILLIAM LEWIS and WILLIAM H. LEWIS, of New York, N. Y.—*Improvement in Photographic Baths*.—Patent dated June 26, 1860.—This invention relates to a peculiar manner of forming baths for the nitrate of silver and other chemicals, and for photographic plates.

Claim.—Securing the edges of the glasses d g in grooves in the frame a a b, in the manner and for the purposes specified.

No. 28,877.—AUSTIN LEYDEN, of Atlanta, Ga.—*Improvement in Sewing Machines*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Giving the swivel hook the necessary movement upon the spindle n, which carries it around the spool-carrier bed N by means of two eccentrics r and s, attached to the hollow stem and working in eccentric ways t and u, surrounding the said bed N, substantially as described.

No. 28,878.—LEON LONDINSKY, of New York, N. Y.—*Improved Mode of Binding Cap Fronts*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The binding of cap fronts with japanned, colored, or enamelled metal, by means of flexible tools, substantially as described, and for the purpose set forth.

No. 28,879.—D. W. M. LOWER, of Albia, Iowa.—*Improvement in Seeding Machines.*—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the connecting of the wheels B B and roller C, by means of the cranks *a a b b* and rods E, when said wheels and roller have the pins *l l* and rib *c* attached respectively to them, as shown, and are used in connection with the seed distributors H, or their equivalents, substantially as and for the purpose specified.

Second. The attaching of the shares J, hoppers G, and seed-distributing devices to adjustable frames F, arranged as described, to admit of the varying of the depth of the furrows as circumstances may require.

No. 28,880.—WILLIAM McCORD, of Sing Sing, N. Y.—*Improved Fire Escape.*—Patent dated June 26, 1860.—The inclination of the ladder can be governed by the rope *t*, and the ladder can be turned on the swivel M in any desired direction, thus affording means of escape for persons in the upper stories, or on the top of buildings on fire.

The inventor says: I *claim*, first, the arrangement and combination of the rising and falling frames G H I, (more or less,) links F, braces *i*, and platform L, constructed and operating substantially as and for the purpose specified.

Second. Arranging the links F and braces *i*, with rounds, substantially as described, so that the same form the means to go up to and down from the platform L.

Third. The combination with the platform L of a ladder N and swivel M, constructed and operating substantially as and for the purpose specified.

Fourth. The arrangement of the derrick O and rope T, to operate in combination with the ladder N and swivel M, substantially as and for the purpose described.

No. 28,881.—ROBERT McCORMICK, of Greenville, Va.—*Improved Machine for Stoning Fruits.*—Patent dated June 26, 1860.—B B are revolving brushes for cleaning the pulp from the screws; D D are cog wheels of equal diameter, and of the same diameter of the screws; E and E are bands which drive the brushes; *i* is a screw check which acts in connection with the follower *h*, and regulates the distance between the screws; K K are band tighteners for the revolving brushes.

Claim.—The combination and arrangement of the right and left screws A A¹, the brushes B B¹, the cog wheels D D¹, the bands E E¹, the pulleys *f f*¹, the hopper H, the follower *h*, the screw check *i*, the gauge *a*, the band tighteners K K; all substantially as and for the purpose specified.

No. 28,882.—JOHN McCULLOCK, of San Francisco, Cal.—*Improved Process for Treating Ores of Gold, Silver, and Copper.*—Patent dated June 26, 1860.—The claim explains the nature of this invention.

Claim.—The mode of reducing and liberating the metals—gold, silver, and copper—from their ores, together or separately, by mixing with any one or more of the said ores, in a very finely powdered or comminuted state, and when intimately mixed with ground charcoal or other carbonaceous matters, a certain proportion of plastic material, as common brick clay, china clay, or any other natural or compounded materials, that will agglutinate only at temperatures under a white heat, forming the metalliferous and carbonaceous mixture so compounded with plastic material into masses, bricks, blocks, or cakes, and then submitting the whole to artificial heat, which is continued while the earthy frame work, which forms a porous matrix commanding a great extent of internal as well as external surface, holds and exposes the metallic ores or compounds; and also the carbonaceous matters to the decomposing action of atmospheric air, oxygen, carbon, and heat, in a kiln, clamp, oven, or furnace. The reduced metallic constituents may then be collected by pulverization, washing in water, and subsidence therefrom, by melting and fluxing, or by amalgamation, as may be most convenient.

No. 28,883.—JAMES W. McLEAN and A. GUMMER, of Indianapolis, Ind.—*Improvement in Lath Machines.*—Patent dated June 26, 1860.—This invention consists in using a spiral cam for propelling the knife which moves forward and back at an angle of about forty-five degrees. By the peculiar construction of this cam, the knife, after having made its cut, is brought back instantaneously by means of a spiral spring belt attached to the knife plate and the frame work, thus giving it the entire surface of the cam, and a gradual wedge motion to make the cut of the lath.

Claim.—The rack *d d*, the angular slot *g*, Fig. 2, the section of wheel *e e*, or their equivalents, in connection with the rod *k*, Fig. 1, the two supporters *l l*, and the set screw *m*, substantially as and for the purpose set forth.

No. 28,884.—DAVID M. MEFFORD, of Jeffersonville, Ind.—*Improvement in Corn Huskers.*—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of spiral beads and grooves on vertical

or inclined rollers adapted in the manner set forth, to act continuously during the descent of the ear, substantially as described.

Second. The use of teeth or serrations in the bead, substantially in the manner and for the purpose set forth.

No. 28,885.—GEORGE E. MILLS, of New York, N. Y.—*Improved Amalgamator*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A series of floors inclined reversely one above another, in combination with the several dams and compartments to retain the minerals, as described and for the purposes specified.

No. 28,886.—T. S. MILLS, of Iberia, Ohio.—*Improvement in Corn Planters*.—Patent dated June 26, 1860.—The object of the invention is to obtain a corn planting machine of simple construction by which corn may be planted in check rows without previously forming the ground.

Claim.—The cam E, when formed of two parts *h i*, for operating the seed slide F and markers H, and fitted in the adjustable frame D, having the shares G attached by the rods *n* for the purpose of admitting of the connection or disengagement of the wheels *d g*, and the adjustment of the shares G, substantially as described.

No. 28,887.—GEORGE A. MITCHELL, of Turner, Me.—*Improved Machine for Cutting Blanks from Shoe Tips*.—Patent dated June 26, 1860.—This invention consists in so constructing a double die holder, and the die and follower, as to give a sheering stroke or cut, and in combining therewith a guide to gauge the sheet metal thereto, and a stamp, so arranged as to guide the plate and stamp and cut the blank for the tip all at one operation.

Claim.—The double die holder E and G, and cutting die H, in combination with cutter J, stamp S, and guide U, to cut and stamp the blank at one operation, essentially in the manner and for the purposes fully set forth and described.

No. 28,888.—GEORGE A. MITCHELL, of Turner, Me.—*Improved Machine for Swaging Shoe Tips*.—Patent dated June 26, 1860.—This invention consists of the die box, die plunger and guide, so arranged and operating towards each other, that flat sheet metal blanks, or other substances, are instantly formed into the required shape to conjoin with the toe of the boot or shoe, and constitute a protecting tip.

Claim.—The combination of the die G, guide K, die box or holder E, and follower J, arranged and operated in the specific manner described and for the specific purpose fully set forth and described.

No. 28,889.—WILLIAM P. MITCHELL, of Baltimore, Md.—*Improvement in Hemming Attachments for Sewing Machines*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement and combination described of the toothed wheel C, and the non-metallic concave wheel D, of larger diameter, formed of India rubber, leather, or other equivalent flexible material, both wheels being attached to, and revolving on, the same axis *g*, as and for the purposes set forth.

No. 28,890.—STEPHEN A. MORGAN and CURTIS C. MORGAN, of Auburn, N. Y.—*Improvement in Harrows*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A harrow composed of at least two hinged and separately adjustable segments A A, furnished with adjusting bars running across the frames, and so that they may be detachable and capable of use when so separated, as cultivators, by applying handles to the adjusting bar, substantially in the manner and for the purpose set forth.

No. 28,891.—LEVI MORRIS, of Woodbury, Ill.—*Improvement in Corn Planters*.—Patent dated June 26, 1860.—The corn planting mechanism consists of a box, in which the corn to be planted is placed, in the shape of an ordinary millers' hopper, except that the front and rear sides of it occupy a vertical position in respect to the main frame, and is placed on a line crosswise to the main frame, just in rear of the studs F.

Claim.—The combination of the double crank L with the pitman K, the rod R, the slide P, the levers J J, the hoes and handles *m* and *n*, and the mechanism connecting and regulating them, for the purposes and substantially as described.

No. 28,892.—JOHN A. NAYLOR, of Rahway, N. J.—*Improvement in Adjustable Carriage Seats*.—Patent dated June 26, 1860.—This invention consists in making an additional seat to a carriage, and arranging it in such a manner that when it is not needed for use, it may be

folded up and pushed back under the permanent seat of the carriage; and also in such a way that when in use it may be elevated above the seat to which it is attached to any height required.

Claim.—The jointed and branched bars C C, and the rod N, in combination with the slots or slides I, and the seats A and B, when constructed substantially in the manner described.

No. 28,893.—CÆSAR NEUMANN, of New York, N. Y.—*Improvement in Machines for Making Hoop Skirts.*—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the twisting apparatus, constructed substantially in the manner and for the purposes set forth, and consisting of a spool holder and tension apparatus as described, and strand guides or head and cap, as described.

I also claim the head and cap i, as specified, however combined in the manufacture of hoop skirts.

I also claim the tension apparatus and flyer frame, constructed and applied as set forth, in the manufacture of skirts by machinery.

I also claim the guides g for guiding the springs or loops into place, in the manufacture of hoop skirts, however made, so that a spring can be inserted by one end and pushed around into place without being guided by hand into the curve—all as specified.

I also claim the employment of the elevating cord c and drum d, combined with the machinery for forming the spring skirts, as specified.

No. 28,894.—JOHN OLLIS, of Bloomington, Ill.—*Improvement in Automatic Rakes for Harvesters.*—Patent dated June 26, 1860.—This improvement consists in a new and improved mode of operating the rake by which the cut grain is swept off the platform to the ground in gavels.

Claim.—The mechanism, substantially as described, for operating the rake.

No. 28,895.—ANDREW OVEREND, of Philadelphia, Pa.—*Improved Machine for Wetting Paper.*—Patent dated June 26, 1860.—This invention consists substantially in the employment of a reciprocating frame, perforated water supply tubes, feed and receiving boards, or platforms, and a holding device for joint operation, to effect the desired end.

Claim.—The reciprocating carriage C combined with the perforated water tubes I I J J, the feed and receiving platforms V R E¹, and the paper holding and discharging device formed of the rod D¹, and plate C¹, or their equivalents, arranged for joint operation substantially as described.

No. 28,896.—BENJAMIN OWEN, of Dayton, Ohio.—*Improvement in Cotton Seed Planters.*—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the cylinders D D with the slides C C, when said cylinders are provided with teeth and revolve in opposite directions to each other, and when the slides are provided with seed apertures and have an alternate reciprocating motion under the cylinders, substantially as and for the purpose specified.

No. 28,897.—NATHAN PARRISH, of Galesburgh, Ill., assignor to GEORGE B. PETERS, of the same place.—*Improvement in Stump Extractors.*—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the rocking lever b with the frame a, the cords e and m, the tackle block d¹, and with the chain, or its equivalent, which passes around the stump or grub in such a manner that power may be exerted by both ends of the lever, substantially as specified.

No. 28,898.—JOHN W. PATTEN and GRIFFITH P. TERRY, of Albany, N. Y.—*Improved Fire Escape.*—Patent dated June 26, 1860.—This invention is as follows: A drum or reel, upon which the escape rope is wound, is secured to a shaft revolving in journals fixed in the frame of the machine, constructed of light wrought iron; upon one end of the shaft is secured a spur wheel which gears into a pinion on a short shaft projecting beyond the frame to receive a sheave pulley or crank; by turning this the drum or reel is made to revolve; the other end of the shaft carries a pinion which gears into a spur wheel on a short shaft; said shaft projects a sufficient distance to receive a spiral elastic spring, is wound around and firmly fixed to it at one end.

Claim.—The arrangement of the spring S and the check rope N, in their relation to the brakes K K¹ and to the drum or reel F, as set forth.

No. 28,899.—JAMES G. PAVYER, of St. Louis, Mo.—*Improved Machine for Scouring Type.*—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the application of endless aprons, or their equivalents, to

stones, or their equivalents, substantially in the manner described, for the purposes specified.

Second. Connecting the upper and lower stones and aprons with each other by means of yielding connections, so as to allow the type to pass between them, and so that they will adjust themselves to the different thicknesses of type, substantially as described.

No. 28,900.—JOHN G. PERRY, of South Kingston, R. I.—*Improved Sausage Filler*.—Patent dated June 26, 1860.—The operation of this machine is as follows: Motion being given to the cylinder with one hand, by means of the crank H the meat is fed into the hopper E by the other, and is drawn into the chamber by the stud slips D; but, as it cannot go around with the cylinder, because it is set close to one side of the case, it is forced by the spiral position of the studs to pass along towards the other end of the chamber and out of the opening F through the mould into the cases.

Claim.—The combination of the cylinder B and stud slips D, substantially as described herein and for the purposes set forth.

No. 28,901.—LUDLOW PIERSON, of Jeffersonville, Ind.—*Improvement in Making Eave Troughs*.—Patent dated June 26, 1860.—This invention consists in the provision of a series of clamps, for the more perfect and expeditious soldering and crimping of metal eave troughs.

The inventor says: I *claim*, first, the combination of block A, rocker B, and jaw C c D, the whole being constructed and operating substantially as set forth.

Second. The crimping clamp, composed of the hinged blocks G G, jaw G², lever H, and staple I I¹.

Third. The final soldering clamp J K L M, constructed and operating as explained.

No. 28,902.—A. D. PERINTON, of Dover, N. H.—*Improved Hat Cushion*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The elastic felted cushion C interposed between the sweat leather A and the crown of the hat, substantially as described, for the purpose specified.

No. 28,903.—THOMAS H. QUICK, of New York, N. Y.—*Improved Machine for Cutting Sugar*.—Patent dated June 26, 1860.—This invention is explained by the claim and engravings.

Claim.—The arrangement and combination of two pairs of movable cutting surfaces, having their cutting edges one at right angles to the other, and at such distances one from the other that, by the successive action of said cutting surfaces, the sugar is cut up in the desired shape, substantially as described.

No. 28,904.—J. J. REEVES, of Sulphur Springs, Texas.—*Improved Medical Compound*.—Patent dated June 26, 1860.—The following is the recipe for compounding this medicine: Take one pound of leptandra Virginica, pulverized, one pound of asclepias tuberosa, pulverized, one pound of the seeds of lobelia inflata, pulverized, one pound of ground African ginger, one fourth of a pound of capsicum or African cayenne pepper, one fourth of a pound of cinnamon bark, pulverized, one half a pound of cimicifuga or the root of black cohosh, pulverized; mix all thoroughly together, and put the mixture up in four ounce bottles and seal it air-tight.

Claim.—The medical compound described.

No. 28,905.—JOHN RIX and JOHN S. SHAW, of Springfield, Mo.—*Improvement in Rotary Engines*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the two hollow, sliding abutments E E¹ and the slide valve K, the said abutments being provided with parts *d d*¹, as described, and applied within separate compartments of the box D, to which steam is admitted by the said valve alternately, and the whole operating as set forth.

No. 28,906.—CHARLES SELTMAN, of Washington, D. C.—*Improved Shutter Operator*.—Patent dated June 26, 1860.—The whole apparatus, exclusive of the upper part, is cast in three parts, the brass boxing F and the lower part of the hinge E making the first piece, the shank *a*, rack *c*, and tongue *k* the second, and the crank hinge E, grooved bar *h*, pinion D, and plate cog *d* making the third.

Claim.—The combination and arrangement of the shank A, notches *f f*¹, cog plate *d*, spring *i*, pinion D, rack *d*, wedge-shaped tongue *k*, correspondingly grooved bar *h*, crank hinges E E¹, and the metal boxing F, when used in the manner and for the purposes specified.

No. 28,907.—J. W. SHIPP and C. W. CRENSHAW, of La Grange, Tenn.—*Improvement in Ploughs*.—Patent dated June 26, 1860.—A is the bar, with the standards B and C for attachment to the beam and handles; D is the beam; E is the wing or mould board; F the double reversible point; G the heel or landside which is let into the bar A and fastened there by bolts or screws; H shows the handles, which are first driven into the rings *a* on the standard B, and are then fastened to the beam by screws or bolts.

Claim.—The arrangement of the handles H, standard B, ring *a*, notches *ll*, bar A, standard C, mould board E, heel G, and double point F, the whole operating substantially as set forth.

No. 28,908.—CHARLES W. SMITH, of Evans, N. Y.—*Improvement in Window Blinds*.—Patent dated June 26, 1860.—This invention relates to a new mode of constructing and operating blinds for windows, and consists, first, in attaching the slats of such blinds at each end to a series of jack levers, by means of which they are folded together at the top of the window, or extended downward, closing the same. Second. In weighting the said levers to facilitate the operation of raising them. Third. In so attaching the slats to the levers that they will be thrown open when the levers are but slightly raised.

Claim.—First, the described method of operating the blind slats *a a*, by means of jack levers.

Second. The described method of attaching them to the levers.

Third. Weighting said levers to assist in elevating the blinds.

No. 28,909.—HERVEY SLOAN, of Franklin, Ind.—*Improvement in Seed Planters*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the arrangement of the seed boxes A A¹ A², which are provided with three slides connected together and to a pitman or driving rod *a*, by means of a cross head *d*, substantially as and for the purpose specified.

The arrangement of the seed boxes A A¹ and B B¹, in the relative positions seen, their seed slides being connected together by the bars *c c*, substantially as and for the purpose specified.

The combination of the gear frame F, provided with levers *m* and *n*, and chains or cords *p*, with the frame upon which the seed boxes are placed, when the same are arranged substantially as and for the purpose specified.

No. 28,910.—O. M. STILLMAN, of Stonington, Conn.—*Improvement in Air Engines*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, compressing and working the air in the single cylinder A, by the single piston B, in combination with the valves, an air passage R *r*¹, E F F and M, or their equivalents, arranged and operating substantially in the manner specified.

Second. The combination of the induction valve R, with the stuffing box R¹, piston rod B¹, and head A¹ of the cylinder A, so that the friction of the stuffing box upon the piston rod aids and controls the motion of the valve, substantially as shown and described.

Third. Causing a circulation of air through an annular space between the plunger O and the interior of the piston or piston rod, for the purpose of cooling the latter, substantially as set forth.

Fourth. Cooling the exterior of the cylinder A, by alternately inducting and expelling air through an annular space X, substantially in the manner described.

No. 28,911.—O. M. STILLMAN, of Stonington, Conn.—*Improvement in Air Engines*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, using a portion of the power of an engine to cool the air used in the same by blowing currents of air over the moistened surfaces of the refrigerating vessels, substantially in the manner set forth.

Second. The arrangement of the refrigerating reservoir G, and blowing vessel O, relatively to the cylinder A and piston B, substantially as set forth.

No. 28,912.—JOHN SWEENEY, of Chicago, Ill.—*Improved Tobacco Press*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the worm wheel and screw E F, chains J, cross head L, guides B B, follower C, one or more, and base or box A, with the ratchet and lever H¹ I¹, or their equivalents, arranged for mutual action, as and for the purpose set forth.

No. 28,913.—WILLIAM A. SUDDITH and JOHN F. SUDDITH, of Charlestown, Va.—*Improvement in Cotton Seed Planters*.—Patent dated June 26, 1860.—This invention consists in laying off the ground in rows and planting the seed in hills, then covering the seed up and rolling the ground.

Claim.—The arrangement of the rocking beam C, arm *o*, piston D and Y, spring R, shaft G, with spiral spring and cavity B, constructed and operated as described, for the purpose specified.

No. 28,914.—JOSEPH SUTTER, of New York, N. Y.—*Improvement in Seeding Machines*.—Patent dated June 26, 1860.—This invention consists in arranging and constructing the several parts of the machine.

Claim.—The arrangement of the arms L, the mould boards N, the seed spouts F, the cylinder D, as constructed, and the cylinder G, provided with harrows *d*, when the same are connected together and to the frame C, in the manner and for the purpose specified.

No. 28,915.—ALVA B. TAYLOR, of Newark, N. J.—*Improved Printing Press*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of the endless rack of the type carriage with the cog wheel that imparts motion to it, by means of two pinions and a solid pinion shaft having boxes or bearings that adapt themselves to the different positions which the pinion shaft assumes in the operation of the printing press.

I also claim the combination of the griper shaft, an arm and stop, (for rocking it,) and a cam and pin, (which control its rocking,) substantially as set forth.

No. 28,916.—C. A. TAYLOR, of Chicago, Ill.—*Improved Bonnet Box*.—Patent dated June 26, 1860.—This invention consists in arranging in the bonnet box an adjustable stand with a suitable form to receive the crown of the bonnet, in combination with a spring pad, in such a manner that bonnets of different sizes can be secured between said form and spring pad and sent from place to place without injury.

Claim.—The arrangement of the sliding stand D, form E, and movable spring pad F, in combination with the box A, constructed and operated substantially in the manner and for the purpose set forth.

No. 28,917.—RICHARD TAYLOR and RENSSELAER SPRAGUE, of Prairie City, Ill.—*Improvement in Corn Planters*.—Patent dated June 26, 1860.—This invention consists in having the seed boxes and the shares attached to a sliding frame, which are fitted on inclined planes in the main frame of the machine.

The inventors say: We *claim* the attaching of the seed boxes F, and the furrow and covering shares *l* H, to sliding frames E, placed on inclined surfaces *b c c*, and having the seed slides G, of the boxes F, arranged in relation with the staples or tappets *i i*, on the axle *c*, substantially as and for the purpose set forth.

We further claim, in connection with the sliding frames E, having the seed boxes and shares attached, the lever K, provided with the notch *o*, and arranged relatively with the pin *p*, for the purpose, when necessary, of stopping the rotation of the axle C, as set forth.

No. 28,918.—JAMES THIERRY, of Detroit, Mich.—*Improvement for Regulating the Exhaust of Steam Engines*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the exhaust nozzle or nozzles of locomotives or other steam blast employing engines with a steam balanced exhaust valve controlled by the variable pressure of the steam in the boiler, through the medium of an elastic siphon-shaped steam tube, or its equivalent, said combination producing a governor to regulate the generating of steam for said engines, substantially as described.

Second. The combination of said nozzle or nozzles with said balanced exhaust valve controlled by the engine man through the medium of a convenient hand gear, in substance and for the purpose as described.

No. 28,919.—JOHN T. THOMPSON, of Jackson, Tenn.—*Improvement in Ploughs*.—Patent dated June 26, 1860.—This invention relates to the construction of the plough and the manner of uniting the several parts thereof.

The inventor says: I *claim* the frame *c*, with its plough point *j*, and wings or mould boards D, when the whole is constructed, arranged, and united, as set forth and described.

No. 28,920.—FR. TOGGENBURGER, of Chicago, Ill.—*Improvement in Sewing Machines*.—Patent dated June 26, 1860.—This invention consists in the arrangement of a tube projecting from the cap of the shuttle, in combination with a suitable loop, or projection attached to the shield to keep the lower thread in the proper direction and prevent its turning.

Claim.—The arrangement of a tubular projection *v* on the cap P, in combination with a loop *w*, or its equivalent, on the shield Q, constructed and operating substantially as and for the purpose described.

No. 28,921.—ALBERT TRACY, of the United States Army.—*Improved Folding Furniture*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, in the construction of articles of furniture, the combination

of the swinging straps or arms C, constructed as described, with either pair of legs, or their equivalents, substantially as set forth.

Second. I claim the fixed strap or arm C, constructed as described, and connected and operating with the legs, substantially as set forth.

No. 28,922.—GREGOR TRINKS, of Jersey City, N. J.—*Improved Window Curtain Slide*.—Patent dated June 26, 1860.—The object of this invention is to effect the release of a curtain and pulley slide, which has no other motion than a sliding one, without making further tension on the cord, and simply by pressing down the thumb piece of the spring catch.

Claim.—In connection with the slide of a sliding cord pulley of a window curtain fastening, the improved construction and arrangement of the spring latch and double rack, substantially as described, and substantially for the purposes set forth.

No. 28,923.—HENRY C. VELIE, of Poughkeepsie, N. Y.—*Improvement in Mills*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Casting the arm J on the case of the mill, to support the journal of the shaft and allow room for the hopper around the shaft, between said arm and the case of the mill, substantially as described.

No. 28,924.—GEORGE WALKER, of Philadelphia, Pa.—*Improvement in Vapor Lamps*.—Patent dated June 26, 1860.—This invention relates to a lamp for burning volatile hydrocarbon, by first vaporizing or gasifying the same, the illuminating flame being fed by the vapor, and the invention being applicable to ordinary fluid lamps.

The inventor says: I *claim*, first, the combination of the external shell or tube G with the wick or packing tube F, and heater tube I, provided with the heater J and plates c c, for the purpose set forth.

Second. The connecting of the described vapor burning apparatus to the body of a lamp by means of a tube D, in the manner substantially as and for the purpose set forth.

No. 28,925.—ALONZO WARREN and E. DAMON, JR., of Boston, Mass.—*Improvement in Dynamometers*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Combining the index g with the two pulleys C D by means of a spring pawl f, slide I, arc-formed ratchet bar H, spring l, and a socket j, or other suitable projection from an arm E, the whole applied and operating substantially as specified.

No. 28,926.—DAVID WARREN, of Gettysburgh, Pa.—*Improvement in Seed Planters*.—Patent dated June 26, 1860.—To the bar F is secured an arm H, and to the arm H is secured an arm a; when the bar F partially revolves backward and forward, the arm a rises and falls; as said arm falls, it passes through an opening in the seed slide which contains the seed.

Claim.—The arrangement of the turning bar F, the arms H and a, the slide d, rod c, and stirrer e, substantially in the manner and for the purpose fully set forth.

No. 28,927.—GEORGE WHEELER, of New York, N. Y.—*Improved Boot Jack*.—Patent dated June 26, 1860.—The claim and engraving show the nature of this improvement.

Claim.—The new article of manufacture described, consisting of the forked base piece a and the detachable inclined standards b b, with the swelled pins 3 3, arranged in the manner and so as to combine the advantages set forth.

No. 28,928.—WILLIAM WICKERSHAM, of Boston, Mass.—*Improved Nail Cutting Machine*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the described mechanism in nail cutting machines for shifting or moving laterally the sheet of metal or material to be cut into nails the distance of the length of two nails, or more if desired, for each series of nails cut from said sheet, substantially as described.

Second. I claim feeding the material to be cut into nails far enough towards the cutters for the width of a nail, while it is moving laterally, substantially as described.

No. 28,929.—JOHN M. WILLIAMS, of Greenville, Ga.—*Improvement in Cultivators*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the beam A, the two collateral beams B B, the graduated bars a a, the handles M M, the supports F F, and the bar D, when said bar is secured to the main beam and rests upon the collateral beams, and when the several beams are provided with vertical and horizontal mortises for receiving the bars and shanks, as is fully set forth, and for the purpose specified.

No. 28,930.—R. S. WILLIAMS, of Bairdstown, Ga.—*Improvement in Ploughs*.—Patent dated June 26, 1860.—The claim and engravings explain the nature this invention.

The inventor says: I *claim* the casting of the foot D with a socket E and pockets *d*, substantially as shown, to receive the beam A and the lower ends of the handles C C, substantially as described.

I further claim, in connection with the sockets E and pockets *d d*, the base or cross piece B and taper beam A, the former being attached to the beam and handles, as described.

No. 28,931.—THOMAS WILSON, of Winterset, Iowa.—*Improvement in Seeding Machines*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of frame C, set forth, in combination with the lever G, toggle levers *k k*, and clutching devices *e e g g*, as set forth, whereby the dropping of the seed may be stopped and the ploughs raised from the ground at the same time.

No. 28,932.—E. M. WOODWARD and JAMES E. WOODWARD, of Philadelphia, Pa.—*Improvement in Railroad Station Indicators*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The application of the hand A to an ordinary clock, used in combination with a dial having the various points along the route marked upon it, the whole being so arranged as to show whether the car is in advance of, or behind time at any point, substantially as described.

No. 28,933.—L. B. WOOLFOLK, of Nashville, Tenn.—*Improvement in Steam Ploughs*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the cylinder S provided with bevel wheel R having the shaft C passed through it eccentrically, shaft I, springs *g g*, bevel wheels *f f*, sleeves *i*, pinion G, rim F, wheels E, and ploughs W, the whole being constructed in the manner and for the purpose described.

Second. I also claim, in combination with the above, the cylinders S S², sleeve *u*, bevel wheel R, and shaft C, as described.

No. 28,934.—WILLIAM WORKMAN, of Ripon, Wis.—*Improvement in Seeding Machines*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the principal seed box C and supplemental seed boxes F, the latter being provided with inclined planes *h h* and wheels H and fitted in the trough D having the inclined bottom or scattering board E, as and for the purpose set forth.

No. 28,935.—GEORGE C. WRIGHT, of Le Roy, Ohio.—*Improvement in Cutting and Coring Apples*.—Patent dated June 26, 1860.—This invention consists in the arrangement of the machine.

Claim.—The arrangement of the slide E, cross head E, treadle K, spring L, and the cutting and coring knives *a b*, the several parts being constructed and combined for operation in the manner described, for the purpose specified.

No. 28,936.—ELIJAH YOUNG, of Fayetteville, Mo.—*Improvement in Seed Planters*.—Patent dated June 26, 1860.—When this machine is used for planting corn, the corn is put into the box E, whence it is taken by the tubes *a*, one kernel at a time, and deposited in the tube D through which it falls to the ground in the rear end of the ploughs.

Claim.—The use of the ploughs B in combination with tubes D and C C¹, and the boxes E F, and the wheels I and H, for the purpose specified.

No. 28,937.—HENRY M. ZIMMERMAN, of Washington, D. C.—*Improved Hinge*.—Patent dated June 26, 1860.—This invention consists in making a butt hinge capable of being used either as a right or left hand hinge, by placing one leaf above the other on a pin or spindle, and so constructing it, that only one half the quantity of metal usually employed is required.

Claim.—As a new and improved article of manufacture, a butt hinge, constructed as specified, for the purposes set forth.

No. 28,938.—DANIEL C. COLBY, of Newport, N. H., assignor to himself and JAMES P. UPHAM, of Claremont, N. H.—*Improvement in Harrows*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the toothed rollers B B, (and more than two if need be,) at a greater or less angle with the line of draft, so that the teeth of the rollers shall cut the soil diagonally to the lines made by the stationary teeth *a a*, &c., in the frame of the harrow.

Second. The frame of the harrow, composed of the side pieces A A and A¹ A¹, the cross braces C and D, and the connecting bar E, arranged as described, so that the angle of the rollers B B with the line of draft and the width of the harrow may be raised when desired,

thereby throwing the lines described by the two rear permanent teeth *a a* in the side pieces *A¹ A¹* outside or inside (as the case may be) of the lines described by the two permanent teeth *a a* in the side pieces *A A*.

No. 28,939.—SOLOMON GODFREY, LOREN BARNES, HENRY BLISH, and SOLOMON S. SMITH, of North Fairfield, Ohio.—*Improvement in Stills*.—Patent dated June 26, 1860.—This invention consists in the combination of three or more chambers of a still, with bent tubes, radiating perforated tubes, and straight tubes, arranged in relation to each other; also in the combination of the same with the heater and doubler.

The inventors say: We *claim*, first, the combination of three or more chambers of a still with bent tubes *I G*, radiating perforated tubes *O*, and straight tubes *K L*, when arranged in relation to each other, substantially in the manner and for the purposes set forth.

Second. The combination of the above with the heater and doubler, in the manner and for the purpose set forth.

No. 28,940.—JOSEPH OTTNER, of New Britain, Conn., assignor to P. and F. CORBIN, of the same place.—*Improved Lifting Handles*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The raised socket *e* having parallel slits *f* starting from the underside or edge of the sockets, and extending upward to the centre (or nearly so) thereof, so as to hold the handle in a proper lifting position, with the double pivotted shanks *h*, made to correspond to the chamber of the sockets so as to hold it (the handle) in place, as and for the purpose described.

No. 28,941.—SAMUEL S. SHERWOOD, of New York, N. Y., assignor to himself and ALEXANDER DOUGLAS, of the same place.—*Improvement in Skeleton Skirts*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the device described for securing the braids or tapes from slipping laterally upon the hoops, by sewing the braid or tape through the covering of the hoop, with the device described for securing the hoops from slipping upon the tapes or braids which form a vertical support, by returning the braid or tape over the hoop, and sewing it through itself, substantially as set forth.

No. 28,942.—T. C. SIMONTON, of Paterson, N. J., assignor to DE GRASSE B. FOWLER, of the same place.—*Improvement in Filters*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The placing of the tube *D* and the plates *B B*, containing the filtering mediums *C*, secured as described in the case *A*, as shown, in connection with the pipes *E F G J*, provided with the cocks *H I K* communicating with the case, and arranged relatively with the plates or the compartments formed thereby, to operate as and for the purpose set forth.

No. 28,943.—JAMES L. SMITH, of Neoga, Ill., assignor to himself and JAMES Q. SLOAN, of the same place.—*Improvement in Corn Planters*.—Patent dated June 26, 1860.—The peculiar arrangement of parts in combination with each other, is what the nature of this improvement consists in.

Claim.—The arrangement of the seed boxes 8, 9, slide 10, crank 11, lever 12, 13, operating as described, for the purpose specified.

No. 28,944.—ARTHUR W. SWEENEY, of Washington, D. C., assignor to himself and CHARLES N. TYLER, of the same place.—*Improvement in Hinges*.—Patent dated June 26, 1860.—This invention consists of a peculiar arrangement of the latch and the cam or catch for self-fastening hinges for window blinds.

Claim.—The described hinge as a new article of manufacture, the cam, latch, and catch being constructed and arranged substantially in the manner and for the purposes set forth.

No. 28,945.—JOSIAH TURNER and THOMAS P. SMITH, of Sunapee, N. H., assignors to themselves and EDMUND BURKE, of Newport, N. H.—*Improvement in Cultivator Teeth*.—Patent dated June 26, 1860.—*A* shows the coulter or section of the tooth which penetrates and breaks the soil; the cutting or breaking edge of which should be constructed in the form of an angle more or less acute, but, in order to work well, should not exceed ninety degrees. *E* is a recess in the rear of the coulter.

The inventors say: We *claim*, first, the coulter *A*, with the indentation or recess *E*, constructed substantially as described.

Second. The coulter *A*, in combination with the concave wing *C*, with the curved point *G*, constructed and operated substantially as described.

No. 28,946.—JOSHUA TURNER, of Cambridgeport, Mass., assignor to himself and FRANCIS GUILD, of Dedham, Mass.—*Improvement in Plane-Iron Sharpeners*.—Patent dated June 26, 1860.—This machine will answer for sharpening gouges and other tools used by turners. A is a whetstone supported by a stand or table B; S is a wooden socket resting in or on the table. The table has two parallel rails C C for supporting and guiding a carriage D.

The inventor says: I *claim* the combination and arrangement of the separate cutter carrier and its carriage with the whetstone supporter, with parallel ways or equivalent means of guiding the carriage, the whole being to operate together substantially as and for the purpose specified.

I also claim the arrangement of ball bearings on opposite sides of the cutter carrier, and to operate with a socket of the carriage, as specified.

I also claim making the socket or step adjustable vertically for the purpose explained.

I also claim the combination and arrangement of an adjustable stop, with the table, the cutter carrier, and its carriage applied to the table, and with reference to the whetstone or its supporter, as specified.

No. 28,947.—MILTON D. WHIPPLE, of Charlestown, Mass., assignor to the WHIPPLE FILE COMPANY.—*Improvement in the Manufacture of Files*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

Claim.—As a new article of manufacture, a file having its teeth sheared off smooth, and of a uniform height, substantially as specified.

No. 28,948.—JOSEPH A. SMITH, of Fond du Lac, Wis., and ISAAC ORVIS, of Oakfield, Wis., administrator of the estate of L. M. ORVIS, deceased.—*Improved Printing Press*.—Patent dated June 26, 1860.—The claim and engravings explain the nature of this invention.

Claim. First, the arrangement of the form beds I J and stationary platen K, substantially as shown, so that the impression may be given simultaneously and by the same application of power, and the under side of the upper form be made to serve as a platen for the lower one.

Second. The arrangement of the form beds I J and platen K, with the roll of paper O, substantially as shown, and operated respectively and intermittingly, so that the paper may be printed from a continuous sheet and at both sides during a single passage through the press.

Third. The endless wet blanket N arranged to pass underneath the platen K, and to be moved simultaneously with the paper O, for the purpose of moistening the same during the pressure which causes the paper to receive the impression from the forms.

Fourth. The ink rollers $k k k^1 k^1$, operated through the medium of the bars $h i$, arms g , rockshaft G, the slotted curved bar F, and wrist pin e , on wheel d , when said rollers are used in connection with the form beds I J, and platen K, as set forth.

Fifth. The combination of the form beds I J, platen K, endless blanket N, ink rollers $k k k^1 k^1$, paper roll O, rotary knife R, and stationary bar S, all arranged for joint operation as and for the purpose set forth.

No. 28,949.—CALVIN ADAMS, of Pittsburgh, Pa.—*Improvement in Door Locks*.—Patent dated July 3, 1860.—This invention consists in the form of the latch bolt, and keeper of the lock, so that the lock may be used as a reversible or right and left hand mortise lock, as well as for a rim lock, the interior of the lock being of any well known construction.

Claim.—In combination with a mortise or rim lock, a bolt having the inclines $a a$, and vertical part b on its end, for the purpose of adapting said locks to either a right hand or a left hand door, substantially as described.

No. 28,950.—STEPHEN ALBRO, of Buffalo, N. Y.—*Improved Bed Cords*.—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The formation of common rope cords with detached loops or reaches, to be used as bed cords, in combination with the metallic swivels a and catches d and e , by which they are attached to bedsteads, substantially as described.

No. 28,951.—ETHAN ALLEN, of Worcester, Mass.—*Improvement in Revolving Fire Arms*.—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Providing the recoil plate of revolving fire arms with a projection in the form of an inclined plane, so that the cylinder will be free to revolve at the first minute movement of the hammer, substantially in the manner and for the purpose set forth and described.

No. 28,952.—ITHIEL S. ARNOLD, of South Milan, Ind.—*Improvement in Hay Presses*.—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination with the grooved pressing chamber and follower, of the slatted top or side door O, end door M, and notched slide N, substantially as

specified, or the equivalents of these devices, whereby the bale may be hooped while in the press without opening the press for the purpose.

Also combining, with the follower, mechanism for raising the ends of the hoops in the press without opening the latter, to secure the action of the follower upon the hoops, substantially as specified.

Likewise the arrangement of the doors F O and M, essentially as shown and described.

And lastly, the combination with the follower of the clutch *a*, conical pulley J, rope or chain I, and sweep L, substantially as specified and for the purposes set forth.

No. 28,953.—ALEXANDER ASBOTH, of New York, N. Y.—*Improvement in Composition for Roofing and Cement*.—Patent dated July 3, 1860.—This invention consists in connecting by a mixture of litharge and linseed oil, gravel or broken stone mixed with pounded brick in such a solid manner that the mixture, when dry, attains the consistency of stone.

Claim.—The mode described of making a concrete by the mixture of gravel, powdered brick, oil, and litharge.

No. 28,954.—WILLIAM AUSTIN, of Philadelphia, Pa.—*Improvement in Attaching Water Pipes to Buildings*.—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The described method of attaching water pipes to buildings whereby any one joint may be removed or replaced without either injuring the wall or disturbing the remainder of the joints, the whole being constructed and operating substantially as set forth.

No. 28,955.—CHARLES H. BAKER, of Red Wing, Minn.—*Improvement in Steam Land Carriages*.—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of means set forth for connecting the engine frame to the frame or body of the carriage.

Second. The arrangement of means, as set forth, for allowing the inside wheel to accommodate itself to the movements of the carriage in turning.

No. 28,956.—WILLIAM R. BENNETT and CHARLES STORER, of Boston, Mass.—*Improved Mode of Polishing Varnish*.—Patent dated July 3, 1860.—The ware is first prepared for receiving the varnish in any of the usual modes; when prepared, the varnish is put on in the usual manner and allowed to dry; when well dried, pumice stone is used for polishing and removing the little inequalities which appear on the surface of the ware; after rubbing with pumice stone, the ware is subjected to heat in any convenient manner sufficient to cause the varnish to flow, by which means it is equally distributed; the ware is removed from the heat after the flow of varnish, and is allowed to cool.

Claim.—The described mode of polishing japanned and varnished ware, whereby we are enabled to give a better polish with less labor than can be given in any other known manner.

No. 28,957.—W. BIRKBECK, of Jersey City, N. J.—*Improvement in Steam Engines*.—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* operating the secondary valve *V** by the excess of pressure in the newly open port *f* or *f*¹ over that which is acting in the cylinder to complete the stroke of the piston, substantially in the manner set forth.

I also claim, in connection therewith, so constructing and arranging the valves, ports, and passages, that the pistons, or equivalents, *V V*¹, which are moved in the chamber *a* by such excess of pressure, are themselves puppet valves for the exhaust, and make a tight contact with the seats *w w*¹, substantially as and for the purposes set forth.

No. 28,958.—JOEL S. BLOOD and JAMES W. MILLER, of Newport, N. H.—*Improved Socket for Fence Posts*.—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The socket A for the reception of the fence posts, constructed substantially as described.

No. 28,959.—EZEKIEL BOOTH, of Troy, N. Y.—*Improvement in Sewing Machines*.—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Causing the spreader *c* to spread the loop of the looper thread by a mechanism that is independent of the mechanism that operates said looper, and whilst said looper remains stationary, and after the needle has cleared the same, substantially in the manner and for the purpose described.

No. 28,960.—WILLIAM E. BOULGER, of Janesville, Wis.—*Improvement in Machines for Cutting Fats*.—Patent dated July 3, 1860.—This invention consists of a series of peculiarly shaped knives, rotary and stationary, arranged to work in such a manner that they may cut the fat into the smallest required pieces with rapidity without becoming clogged.

The inventor says: I *claim*, first, the combination of the rotary serrated knives C, and stationary knife D, constructed and arranged substantially as and for the purposes explained.

Second. The arrangement of the beater I K in the described relation to the rotary knives C and stationary knives H, acting to recut the fat, and also preserve the knives C from clogging, as set forth.

Third. The vertical sliding plate F, and springs *a*, in combination with the knife D, substantially as and for the purposes set forth.

No. 28,961.—CHARLES A. BOYNTON, of Hyde Park, Vt.—*Improved Clothes Frame*.—Patent dated July 3, 1860.—This clothes frame is either to be hung up in a room or out of doors, and for this purpose the pulleys *d d d*¹ are used, over which the rope G passes; the pulley *d*¹ has a stop piece *g* applied to it for nipping the rope and holding the frame at any desired height.

Claim.—A clothes dryer composed of two hubs A C, arms B, braces E, ropes *c*, legs J, and rod F, arranged and constructed as shown and described.

No. 28,962.—JAMES F. and ISAAC W. BRISTOW, of Vevay, Ind.—*Improved Machine for Jointing Staves*.—Patent dated July 3, 1860.—This invention consists in so constructing a stave jointer that the stave will always be presented to the knife perfectly parallel, and the joint be cut the proper shape. It also consists in a novel device for clamping the staves when cutting, and also in the use of two guides to guide the knife to cut the proper curve to form the bilge and chamfer, and making the guides adjustable to give the proper chamfer to any sized staves for making barrels.

The inventors say: We *claim* the guides F F¹, stops O, cross-head M¹, vertical piece M, and spring N, arranged substantially as and for the purposes set forth.

We also claim the vibrating lever H, links I, stops J, bolt L, and springs L¹, for operating frame P, and clamping the staves, substantially as described.

We also claim the groove V in the knife U, to act as a guide and prevent it becoming dull by passing over the guides F and F¹, as set forth.

No. 28,963.—THOMAS ALFRED BRYAN, of Queenstown, Md.—*Improvement in Dredging Apparatus*.—Patent dated July 3, 1860.—The principal elements of this improvement are a vertical horse power drum A, a cradle P, a bucket B, and a pulley float N.

Claim.—The arrangement of the vertical drum A with the cable P, the pulley float N, the bucket B, and the mud receptacle C, substantially in the manner and for the purposes set forth.

No. 28,964.—R. P. BUTTLES, of Mansfield, Pa.—*Improved Wrench*.—Patent dated July 3, 1860.—The claims and engravings explain the nature of this invention.

The inventor says: I *claim*, first, constructing the die with a transverse groove across the face, for the purpose of holding a straight bar-crotch wrench, for the purpose set forth.

Second. Constructing the handle of the wrench with an open space or recess at the end, above the die seat, in combination with a die open at the side, whereby the same die is available both as a socket and crotch die.

Third. The combination of the projecting flange on the die with the pawl, when so arranged as to project over this flange and hold the die to the ratchet handle.

No. 28,965.—ANGUS CAMPBELL, of Jersey City, N. J.—*Improved Apparatus for Working Anchors*.—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the plate *f*, hinged to the rolling block *d*, for the purposes and as specified.

Second. I claim the chain *g*, attached at one end to the rolling block *d*, and at the other end taking the pin 5, for holding the anchor in place, or disconnecting by the self-acting movement in casting anchor, as set forth.

Third. I claim the slide 6 and T-shaped end 7 to the chain *i*, for liberating the ring of the anchor when the slide 6 is allowed to move, as set forth.

Fourth. I claim the combination of the stopper *k* and rolling block *d*, by means of the chain *l*, whereby both ends of the anchor can be simultaneously liberated, as described and shown.

Fifth. I claim the chain *m* and wheel *n*, in combination with the rolling block *d*, and acting in the manner and for the purposes set forth.

No. 28,966.—CHARLES W. CHAPMAN, of Hartford, Conn.—*Improved Ice Breaker*.—Patent dated July 3, 1860.—This invention consists in the construction of a cylindrically shaped metallic case, with a toothed disk stamper, to break ice into fragments for various purposes.

Claim.—The arrangement of the cylinder A, draw B, and toothed disk D, in combination, for the purpose and in the manner set forth and described.

No. 28,967.—L. S. CHICHESTER, of New York, N. Y.—*Improved Lemon Squeezer*.—Patent dated July 3, 1860.

The inventor says: In this invention I employ a cap and cone, arranged so that a lateral pressure is exerted against the lemon, and in such a way as to fully express the juice with a moderate application of power. I also employ, in connection with the cap and cone aforesaid, a cup, so arranged as to hold or retain the juice and serve as a convenient means to pour the juice into the receptacle prepared for it.

Claim.—The combination of cap E, cone C, and cup A, substantially as and for the purpose described.

No. 28,968.—COUNCIL CLARK, of Andersonville, Ga.—*Improvement in Cultivators*.—Patent dated July 3, 1860.—A brace, consisting of two straight and parallel ends *c c* and an arched connecting part *c*¹, is fastened to the plough beam *d*, by means of the bolts *e i* passing through both ends of the brace. The upper end of the plough shank *a* is also secured to the rear end of the plough beam by the bolt *e*, while the lower part of the shank *a* is bolted to the brace *c* at *c*¹.

Claim.—The arrangement of the arched brace *c c c*¹, in combination with the plough beam *d*, standard *a*, and runner *j*, in the manner and for the purposes set forth.

No. 28,969.—AARON B. COOLEY, of Philadelphia, Pa.—*Improvement in Dumping Railroad Cars*.—Patent dated July 3, 1860.—This invention consists of a car body of any suitable form having at or near its opposite ends flanged wheels on permanent axles, and any convenient number of hinged doors carrying flanged wheels; the whole being combined with rails so constructed and arranged that as the cars traverse the same the doors may be self-opening, thereby discharging the load, and self-closing, thereby forming the bottom of the car ready for the reception of another load.

Claim.—The body A of the car, having at or near the opposite ends the wheels *b b* turning on permanent axles, and any convenient number of doors D carrying wheels *h h*, in combination with rails H and H¹ and I and I¹, so constructed and arranged that as the car traverses the said rails, the doors may be self-opening and self-closing, as set forth, for the purpose specified.

No. 28,970.—A. B. COOPER, of Gratis, Ohio.—*Improved Churn*.—Patent dated July 3, 1860.—This invention consists in a device for operating the dasher of the ordinary or common dasher churn, for the purpose of rendering the operation of churning less laborious; also, in adapting the same to churns of any altitude or height.

Claim.—The described mechanism for operating a churn dasher, the same consisting of the following parts: base B, upright E, block *c*, hand lever F, pivotted bar *d*, links *e f*, and springs *k l*, as combined and arranged in relation to each other, for the purposes specified.

No. 28,971.—L. E. CUSHMAN and J. S. FRENCH, of North Bloomfield, N. C.—*Improvement in Rock Drills*.—Patent dated July 3, 1860.—This invention consists in the use of a swinging weight, arranged with a drill and automatic turning or rotating device, all being placed on a mounted and adjustable frame.

The inventors say: We claim, first, the arrangement of the swinging weight C, drill rod F, ratchet G, and the pawl H, attached to rock shaft E, in combination with the adjusting frames *a b c*, operated substantially as and for the purpose set forth.

Second. The handle D, when attached to the weight C by means of the joints and segment bar, to admit of the lateral adjustment of the handle, as specified.

No. 28,972.—HENRY DALTON, of New York, N. Y.—*Improvement in Trusses*.—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A truss, combining the belt A, slide C, hinge E, and set screws *h h*, when the same shall be arranged and operated as herein described and for the purpose specified.

No. 28,973.—CHARLES DIGETON, of Philadelphia, Pa.—*Improved Potato Parers*.—Patent dated July 3, 1860.—This invention consists in extending the shank of the blade entirely through the handle, with a nut on the end to tighten the blade against a milled ferrule, and thus secure it at any desired angle with the guard.

Claim.—The method herein described of adjusting the blade to the guard, by means of the

milled ferrule, in combination with the nut B, on the shank of the blade, substantially as set forth.

No. 28,974.—CELESTO DOMINIQUEZ, of San Francisco, Cal.—*Improvement in Quartz Crushing Apparatus*.—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* combining a crushing apparatus with a pulverizing apparatus, when constructed and operated as herein set forth.

I also claim, in combination with a pulverizing apparatus, constructed and operating as described, an amalgamating wheel T, having a metal bottom *i* and working on a metallic plate *m*, in the manner and for the purpose herein set forth.

No. 28,975.—TIMOTHY DRAKE, of Windsor, Conn.—*Improved Machine for Sawing Boards into Required Lengths*.—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination and arrangement of the vibrating circular saw frame C, and its saw D, with the swinging feed roller frame F and its roller *g*, the gauge head H, with an opening in the table, as represented, to allow the cut boards to fall after they have been sawed off; all operating in the manner and for the purposes herein set forth.

No. 28,976.—JOHN DYKEMAN, of Greenbush, N. Y.—*Improved Variable Exhaust for Locomotive Engines*.—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the conical nozzle C C with the exhaust pipes B B, as constructed, in such a manner that four steam passages may be employed when necessary, or only two may be used, and the steam concentrated in said nozzles, thereby diminishing or increasing the draught of the fire, as is herein fully set forth.

No. 28,977.—J. H. ENHOLM, of St. Louis, Mo.—*Improved Burglar's Alarm*.—Patent dated July 3, 1860.—The frame or chief part of this invention is shown at A¹; it consists of a small metal shell or box into which is introduced a percussion hammer D, a spring F, and a second spring Y.

The inventor says: I *claim* the described arrangement of the spring F, the hammer D, and the trigger Y, within the shell or frame A¹, constructed as described.

I also claim the combination of the barrel C with the described arrangement of spring F, hammer D, and trigger Y, within the frame or shell A, for the purpose specified.

No. 28,978.—RICHARD J. GATLING, of Indianapolis, Ind.—*Improvement in Cotton Cultivators*.—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a rotary cutter head, provided with hoes or cutters capable of being adjusted, to vary the depth of their cut, as well as to escape or pass over obstructions that may be in their path, substantially as herein shown and described.

Second. The employment of two adjustable plough shares or scrapers, capable of scraping or cultivating both sides of the rows of cotton or other plants by once passing over the ground, when arranged and constructed substantially as set forth.

No. 28,979.—DANIEL C. GERARD, of Patchogue, N. Y.—*Improved Centre Board for Vessels*.—Patent dated July 3, 1860.—G is a shaft that passes longitudinally through the box B above the board C, and has its bearings in each end of the box B; from this shaft, which is a rolling shaft, is hung the centre board C by chains or ropes *e e*, one connecting with the front end of the board C and the other with its rear end; the shaft G carries a level spur wheel I on its rear end which engages with a horizontal level wheel J, the shaft of which is in an upright position.

Claim.—The arrangement and combination, with a centre board C, in the manner herein shown and specified, of the lateral rollers *a a* projecting through upon each side of the board C, the longitudinal end rollers *b b* lifting the shaft G, driving shaft I, and gear wheels, all as set forth and for the purposes specified.

No. 28,980.—JOHN GRIFFIN, of Louisville, Ky.—*Improvement in Cotton Pickers*.—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the cylinder F, chamber C, valve chest B, and exhaust receiver G, in connection with the picker tube A, and cup B, substantially as and for the purpose set forth.

Second. The arrangement of the picker tube A with the condensed air chamber C, valve chest D¹, and pipe O communicating with the cup B¹ and valve chest, as and for the purpose specified.

Third. Attaching the cotton conducting tube or tubes N to the carriage by means of the tube Q suspended or hung on trunnions N N¹, and the hollow stem R fitted within the tube Q and secured therein by the springs S S, substantially as described.

Fourth. The combination of the flexible and open tubes N, for the purpose specified.

No. 28,981.—WILLIAM GRIFFIN, of Bennettsville, S. C.—*Improvement in Ploughs*.—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—In connection with a mould board and landside, in one piece, and united to the standard E by a strap and key, the arrangement of the two braces J K, as herein described and represented, for holding the several parts to the beam, as set forth.

No. 28,982.—W. S. HARRISON, of Carson's Landing, Miss.—*Improvement in Adjusting Tire on Wheels*.—Patent dated July 3, 1860.—This invention consists in the use of a metal sectional felloe, in connection with a screw rod, cap, and lips on the tire.

Claim.—The metal felloe B, lips c c at the ends of the tire C, the screw rod D, and cap E, arranged and applied to the wheel, substantially as and for the purpose set forth.

No. 28,983.—WILLIAM HATHAWAY, of Providence, R. I., assignor to himself and DANIEL H. TILLSON, of said Providence.—*Improved Clothes Frame*.—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the cross bars of the frame with a hinged collar, so arranged that the end of the bar pivoted to the collar extends beyond the joint pivot towards the centre of the collar, and bears against the under side of the arms and is supported by them from dropping, substantially as described, for the purpose set forth.

No. 28,984.—JEREMIAH HEATH, of Providence, R. I.—*Improvement in Skates*.—Patent dated July 3, 1860.—This invention consists in making the sole plate conform to the shape of the shoe, and of one piece of thin steel, and fixing a runner or skate iron to said plate of a peculiar construction, having a slip joint immediately behind the ball of the foot.

Claim.—The runner, made in two parts A A¹ and united by a slip joint, in combination with the elastic steel sole plate B, the whole arranged and operating upon the principle set forth.

No. 28,985.—ABEL T. HOWARD, of Hartford, Vt.—*Improvement in Odometers*.—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the cam-shaped tooth g, constructed and combined with a toothed wheel in the manner described, to impart an intermittent motion to the said wheel and prevent its rotation at other times.

Second. The combination and arrangement of the plate D, eccentric pawl E, and ratchet wheel G, for the purposes set forth.

No. 28,986.—WESTEL W. HURLBUT, of Muscatine, Iowa, and J. HURLBUT, of Chicago, Ill.—*Improved Machine for Sawing Staves*.—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the arrangement of the saws and manner of adjusting them to any required angle, to cut a plane-faced stave for barrels of larger or smaller diameter.

Second. The stave cut straight from each outer edge to the centre, forming any required angle, in the manner as above described, or its equivalent.

No. 28,987.—BENJAMIN A. JENKINS, of White Water, Wis.—*Improvement in Machines for Windrowing Sugar Cane*.—Patent dated July 3, 1860.—This invention consists in the combination of two furrow ploughs, arranged to turn furrows in opposite directions upon the windrowed cane, with a cane windrowing machine.

Claim.—The combination, in the manner described, of two furrow ploughs H H, arranged to turn furrows in opposite directions, with a cane windrowing machine, constructed and operating substantially as described, for the purpose specified.

No. 28,988.—ADOLPHUS B. JOHNSON and MILTON H. VAUGHAN, of Clarksville, Ark., and J. STINNETT, of Shelby County, Tenn.—*Improvement in Detaching Horses from Vehicles*.—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* attaching the pole or thills of a carriage to the front axle by means of the lugs h which fit into triangular recesses of the brackets F, the latter being secured to the front axle, substantially in the manner described.

We also claim, in combination with the thills K, lugs h, brackets F, bolts K, and rock shaft G, the lever L for operating the bolts k, substantially in the manner described.

We also claim giving the lever L, by which the rock shaft G is operated, a curved shape, so as to embrace the hub of the wheel when operated, and to arrest the motion of the carriage, when the horses are detached therefrom, substantially in the manner described.

No. 28,989.—WILLIAM JOSLIN, of Cleveland, Ohio.—*Improvement in Mills*.—Patent dated July 3, 1860.—This invention consists of a reverse operation of grinding, also of blowing air into the grain between the reverse grinders, after the grain is partly ground, and a self-regulating feed ring and hopper bottom.

The inventor says: I claim, first, dividing the runner and reversing the motion of the separate parts, as described.

Second. The introduction of air through the unbroken space between the upper runner B and the lower runner A, from the fans N N N N in the upper runner B, as specified.

Third. The self-regulating feed ring and hopper bottom for regulating the feed of the grain, as set forth.

No. 28,990.—CHARLES F. LANGFORD, of Fall River, Mass.—*Improvement in Railroad Brakes*.—Patent dated July 3, 1860.—B B are the straps that connect and brace the jaws; to the straps are secured the pieces n by welding or bolting; said pieces have slots i cut in the ends; levers D are supported and have their fulcrums in slots i and pass diagonally across the face of the wheels e.

Claim.—Hinging the levers D, which support the brake rubbers, to the ends of the pedestal brace B, when constructed and operated substantially as described.

No. 28,991.—Z. W. LEE and E. D. LEE, of Blakely, Ga.—*Improvement in Cotton Bale Ties*.—Patent dated July 3, 1860.—This invention consists of a tie plate, as shown in the claim and engravings.

Claim.—The tie plate C D, constructed, applied, and operating as described, for the purpose set forth.

No. 28,992.—JAMES MARTIN, of Florence, Ind.—*Improvement in Water Wheels*.—Patent dated July 3, 1860.—This invention is a new arrangement of parts, whereby a full head of water may be brought to act upon all the buckets of a centre vent wheel; at the same time the water will have a free discharge, and not be crowded back against the bucket.

Claim.—In centre vent water wheels the combination of the horizontal sluices D, vertical pipes E E, and chutes C C, when arranged relatively with the buckets of the wheel, the whole constructed and operated in the manner and for the purpose set forth.

No. 28,993.—JAMES S. McCURDY, of Brooklyn, N. Y.—*Improvement in Sewing Machines*.—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Driving the needle of a sewing machine by means of a wrist pin, or its equivalent, attached to a gear or wheel which is caused to roll round a stationary gear, wheel, or circle of a similar diameter, and so to give the said wrist pin, or equivalent, an epicycloidal movement, substantially as described.

No. 28,994.—NATHANIEL S. McFARLAN, of Syracuse, N. Y.—*Improvement in Attaching Sash Stops to Windows*.—Patent dated July 3, 1860.—The inventor says: I construct my invention of brass or malleable iron; the spring is placed on the jam casing of the window directly under the window stop; the fastener is placed in the stop and meshes in the adjustable spring which holds the stop in its place.

Claim.—Said self-adjusting window spring and stop fastener.

No. 28,995.—CHARLES S. MOORE, of Alexandria, Va.—*Improved Mode of Connecting Car Bodies with Trucks*.—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Securing the trucks of a car, locomotive, or tender, to the body or frame by means of the connections described, so that whilst the trucks have the usual play on the body or between the rails they will, in case of the breaking of the wheels or axles, or both, be held parallel, or nearly so, to the body or frame, and thus prevent the car, locomotive, or tender, from being thrown off the track, substantially as described.

No. 28,996.—HUGO MUELLER, of New York, N. Y.—*Improvement in Sewing Machines*.—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim the so connecting of the needle arm of a sewing machine with the driving shaft thereof, as that the said arm or the needle bar which it drives may be instantly stopped or started, whilst the shaft runs continuously and at full speed, substantially in the manner and for the purpose described.

No. 28,997.—FREDERICK WM. NIEHAUS, of Boston, Mass.—*Improved Piano Forte Action*.—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* arranging not only the support bar D, and the fulcrum of the lever B, between the back catch F and the fly E, but the regulator cam *d*, on the back of the supporting bar and its adjusting screw *f*, in such bar, in manner as specified.

I also claim applying or arranging the back draft strap to K, the back catch F, and the loaded arm I, as described.

I also claim the arrangement of the damper lever relatively to the hammer and its back rest block—that is, placing it between the head and tail block of the hammer, and so as to pass under the back rest bar, as specified.

No. 28,998.—JOHN B. NORRIS, of Berryville, Va.—*Improvement in Tuning Pianos*.—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the manner or mode of tuning pianos, harps, and other similar instruments, by means of a grooved pulley *h h*, in the end of an adjusting, tightening screw and draft pin *e e f f*, by combining and arranging said devices with a continuous string *k k k k*, passing around the pulley *h h*, so that the point of contact and draught in the centre or middle of the string, instead of at the extremities, and by which means the pressure or strain of the string is divided upon the centre or middle, and at both extremities where hitched; thus giving an equality of draught throughout both parallel lengths $k^2 k^2$, and through all of which the parallel lengths $k^2 k^2$ are readily and most perfectly put in unison, or tuned to the required degree of unison or pitch, or slackened as desired, substantially in the manner as set forth and described.

No. 28,999.—T. J. PENNY and W. B. BOTSFORD, of Wooster, Ohio.—*Improvement in Sewing Machines*.—Patent dated July 3, 1860.—The nature of this improvement is shown in the claim and engravings.

Claim.—The combination of the wiper J, the rising and falling upright rockshaft J¹, the arm J², rod L, and inclined plane *j*, with the needle lever D E, and feeding slide I, substantially as described, to produce the necessary movements of the feeding slide by means of the needle lever.

No. 29,000.—WILLIAM PHELPS, of Sycamore, Ill.—*Improvement in Transmitting Motion to Machinery*.—Patent dated July 3, 1860.—The object of this invention is a peculiar combination of disks and friction wheels adapted to communicate a continuous rotary motion without the use of cog gearing.

Claim.—The combination of the disks B C and D, and rollers G and H, operating substantially as and for the purposes set forth.

No. 29,001.—WILLIAM PHELPS, of Sycamore, Ill.—*Improvement in Car Axles*.—Patent dated July 3, 1860.—This invention relates to axles which are swivelled so as to allow the wheels to rotate independently, and consists of an improved device for the purpose of combining great strength and freedom of motion.

Claim.—The swivelled axle A B, disk plates D and E, yoke G, and rollers H, constructed and combined substantially as and for the purposes set forth.

No. 29,002.—BENJAMIN L. PHILLIPS, of Providence, R. I.—*Improvement in Machines for Engraving Copper Cylinders*.—Patent dated July 3, 1860.—This improvement is particularly applicable to pentographic engraving machines, in which the motions of the cylinders and of the engraving points are governed by a tracer point which is carried by the hand of the operator over the lines of the drawing or sketch to be engraved.

The inventor says: I *claim*, first, making the carriage of the graver supporter in two parts D and C, and hinging them together as set forth, for the purpose specified.

Second. Connecting the carriage D C with the shaft X, by means of metallic bands, as set forth, for the purpose described.

Third. The shoe P, upon the end of the graver arm, as applied to machinery for engraving cylinders.

No. 29,003.—CAREY PITTS, of Troy, N. Y.—*Improved Sawing Machine*.—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Raising a saw or saw gate by a positive motion and against the action of a spring, which spring, when the raising mechanism ceases to act, brings down the saw into the stuff to be cut with a quick jerk or motion, substantially in the manner described and represented.

No. 29,004.—DAVID R. PRINDLE, of East Bethany, N. Y.—*Improved Pressure and Vacuum Valve for Steam Boilers*.—Patent dated July 3, 1860.—This invention consists of an improved

valve, which is to be used either for safety against excess of internal or external pressure, or of both, at different times, in the same boiler or vessel, and is entirely complete and independent in itself, requiring nothing but a simple aperture in the boiler or vessel to receive it.

Claim.—The construction, arrangement, and combination of parts, substantially as described, so as to produce a combined expansion and vacuum valve entirely unattached, except by its weight and simple contact, to the boiler or vessel in which it is used, and consequently portable and transferable for the conveniences and purposes specified.

No. 29,005.—VEITUS RADSPINNER and WILLIAM H. MOSS, of New Richmond, Ohio.—*Improved Lubricating Compound.*—Patent dated July 3, 1860.—This compound is composed of the following ingredients, in the stated proportions: thirty pounds caustic lime, fifteen ounces calcined magnesia, fifteen ounces Husband's or Henry's magnesia, (carbonate of magnesia,) fifteen ounces pulverized soap stone, fifteen ounces chloride of lime, and one gallon alcohol, to which is added sufficient quantities of water and oil.

Claim.—The preparation of a homogeneous lubricating compound of the ingredients, in the proportions and in the manner, substantially as set forth, for application as a lubricator to all surfaces subject to friction.

No. 29,006.—FITZ JAMES RICE and GEORGE W. HAYWARD, of Providence, R. I.—*Improvement in Rollers for Pressing Dough.*—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—As a new article of manufacture, a hand roller covered with vulcanized rubber or gutta percha, and furnished with handles B, for the purpose of rolling dough against cutters in making candies or confectionery, as set forth and explained.

No. 29,007.—EDWARD S. RITCHIE, of Brookline, Mass.—*Improved Mechanism for Stopping and Starting City Railroad Cars.*—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim the combination of the following elements, or their mechanical equivalents, adapted and arranged together as explained, viz:

1. The spring F.
2. The two separate barrel heads connected respectively with the ends of the spring F.
3. The two clutch gears or ratchets *l l'*.
4. The two clutches H I, and—
5. The two friction brakes of the two heads *c d*—such combination being applied to the wheel axle, and so as to operate substantially in manner and for the purpose as described.

I also claim the combination of mechanism applied to both ends of the carriage, to the brakes and the clutches, and for operating the brakes and clutches from either end of the carriage, as specified.

No. 29,008.—HENRY H. ROBERTSON, of Kingston, Mo.—*Improved Fly Trap.*—Patent dated July 3, 1860.—This invention consists in the use of a vertical suspension standard, in combination with a case having an opaque funnel-shaped fly entrance passage at its top, and tubular opaque fly entrance passage at its bottom.

Claim.—The employment of the vertical suspension standard, in combination with a case having an opaque funnel-shaped fly entrance passage at its top, and tubular opaque fly entrance passage at its bottom, substantially as and for the purposes set forth.

No. 29,009.—CHARLES ROSE, of Allentown, Pa.—*Improved Device for Straining Scroll Saws.*—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the lever, link, hook, thumb, nut, and noddle iron, substantially as described, for the purpose of making a convenient and effective connecting and disconnecting device for the saws of scroll sawing machines and for straining them up in the gate, as set forth.

No. 29,010.—JOAN RUOF, ANTHONY HEUPEL, and FRANK LEUTHY, of Lancaster, Pa.—*Improvement in Grinding Mills.*—Patent dated July 3, 1860.—This invention consists in a manner of laying off the dress of the mill stones, so that they will the more effectually grind grain, and the quantity ground will be increased with a given power.

Claim.—The two plates E F, arranged and operating as described, when their dress is laid off in spiral eccentric grooves *c c¹ c²*, as described and represented, for the purpose set forth.

No. 29,011.—FRANCIS SCHAWLM, of Joliet, Ill.—*Improvement in Rock Drilling Machines.*—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the clamp bars I I¹, when attached to the boxes J, which are formed of two laterally sliding parts *c d*, fitted on conical or taper uprights A, and operated through the medium of the rods H H and arms L L G, substantially as and for the purpose set forth.

I further claim the adjustable bar P, one or more, when applied to the bars I I¹, substantially as shown, to admit of the simultaneous employment of drills of varying diameters.

No. 29,012.—FREDERICK LEIDLE and SAMUEL EBERLY, of Mechanicsburg, Pa.—*Improvement in Horse Rakes*.—Patent dated July 3, 1860.—This invention consists in arranging the pressure bar extending across the teeth to hold them down, back of the rear bar of the rocking frame, in order to bring it more nearly over the points of the teeth, for the purpose of giving increased support and steadiness to the teeth.

Claim.—The combination of the rocking frame supporting the rake with a spring pressure bar extending across the rake teeth and bearing upon them, back of their rear support on the frame.

No. 29,013.—JOHN G. SHAFER, of Fulton County, Pa.—*Improvement in Mill Bushes*.—Patent dated July 3, 1860.—This invention consists in so arranging the parts of a mill bush that it shall operate to tighten itself by the force of gravitation, the followers being held in the place into which they fall by means of pawls and ratchets.

Claim.—The combination of the follower F, the pawls *p*, and ratchet R, to form a mill bush which will tighten itself by the operation of gravity, substantially in the manner described.

No. 29,014.—GIDEON SIBLEY, of Troy, N. Y.—*Improved Machine for Turning Cylinders*.—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the spiral cutter E, varied in the form of its surface and edges according to the form to be cut upon the block, as described.

Second. The spiral cutter E, in combination with the several pairs of spindles *a a*¹, arranged and operating substantially as described.

Third. The mode of rotating and holding the cylinder bearing the spindles *a a*¹, &c., by means of a crank wheel O and cam *i*, the latch arm 2 and latch *f*², stop rod *d*, and the ratchet wheel I, arranged and operating substantially as described.

Fourth. The compressing arch Y, constructed and operating in combination with the spindles *a a*¹, &c., substantially as described.

No. 29,015.—GEORGE S. G. SPENCE, of Boston, Mass.—*Improvement in Apparatus for Distilling Sea Water*.—Patent dated July 3, 1860.—This invention consists in the arrangement and combination of a boiler with a movable condensing apparatus, and a funnel receptacle within the chamber of the boiler for discharging the condensed distillate therefrom.

Claim.—The arrangement of the receptacle B, in combination with the boiler A and condenser C, in the manner substantially as and for the purposes set forth.

No. 29,016.—GEORGE R. STEVENS, of Clarksville, Mo.—*Improvement in Shoeing Horses*.—Patent dated July 3, 1860.—This invention consists in the combination of a sliding rest with a swinging frame, guide or rollers, and arched guide way, for the purpose of constructing an adjustable rest for a horse's foot while being shod.

Claim.—The combination of the sliding rest *b* with a swinging frame *e a c c*, guide or rollers *d d*, and arched guide way *g*, for the purpose of constructing an adjustable rest for a horse's foot while being shod, substantially as set forth.

No. 29,017.—ANDREW J. SWEENEY, of Wheeling, Va.—*Improvement in Moulds for Glass Goblets, &c.*—Patent dated July 3, 1860.

The inventor says: This is an improvement in the form of moulds for making the foot on a goblet, or other article which may be made of glass, by the use of which the foot is made ready to finish without having or showing the mark of a mould joint on its surface.

Claim.—The combination of the block D with the piece K, or its equivalent, and with the piece E E¹, operating as above described and for the purpose set forth.

No. 29,018.—PHIL. TOMPERT and JOHN COYLE, of Louisville, Ky.—*Improvement in Apparatus for Rendering Fats*.—Patent dated July 3, 1860.—In this invention the kettle is surrounded with a steam jacket, into which the steam is conducted through a pipe terminating in two bent branches, perforated with holes of different sizes, for the purpose of causing the steam to heat all parts of the kettle with equal intensity.

Claim.—As an improved article of manufacture, a tub A, arranged with a kettle C, and

steam pipe E, with the perforated branches c, and a cold water pipe F, and faucets e and f, as and for the purposes set forth and described.

No. 29,019.—A. P. TORRENCE, of Oxford, Georgia.—*Improved Machine for Felling Trees.*—Patent dated July 3, 1860.—This invention is an improvement on a tree-felling and girding device, for which letters-patent were granted December 6, 1859. The object of the invention is to simplify the patented device above alluded to.

Claim.—The two levers B D, provided respectively with the cutter A, and rollers C E, and connected by the bars F, substantially as and for the purpose set forth.

No. 29,020.—HORACE TRUMBULL, of Jersey City, N. J.—*Improvement in the Manufacture of Glass.*—Patent dated July 3, 1860.—This invention consists in making a new composition for the manufacture of flint glass, in which the usual ingredient, oxide of lead, is replaced by the oxide of zinc.

Claim.—The substitution of the oxide of zinc for the oxide of lead in the composition of ordinary flint glass, substantially in the manner and for the purpose fully set forth.

No. 29,021.—SILAS T. VALLETT, of Providence, R. I.—*Improved Washing Machine.*—Patent dated July 3, 1860.—This invention consists in arranging in the interior of a tub or box a central slatted clothes chamber, in combination with two fans revolving in opposite directions, for the purpose of agitating the water and forcing it through the clothes.

Claim.—The arrangement in the interior of the tub or box A of the central slatted clothes chamber D, in combination with the revolving fans F, constructed and operating as and for the purposes specified.

No. 29,022.—ISAAC W. VAN HOUTEN, of Philadelphia, Pa.—*Improvement in Car Couplings.*—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, reducing the lower end of the coupling pin D, and forming a collar e on the same, the part reduced and the collar being so arranged in respect to the upper opening i of the buffer piece that the pin is rendered self-retaining in an elevated position in the said opening, as set forth.

Second. Forming on the pin an enlargement with upper and lower bevels, the said enlargement being arranged in respect to the larger lower opening and smaller upper opening of the buffer block, as and for the purpose set forth.

No. 29,023.—CORNELIUS J. VAN OECKELEN, of New York, N. Y.—*Improvement in Melodeons.*—Patent dated July 3, 1860.—This invention consists in combining, with an ordinary melodeon A, a support B, on which the wrists of the performer shall rest, and which support B being connected with the bellows C of the instrument, by means of the uprights D D, enables the party performing upon the instrument to supply sufficient air for the production of sound without using his feet or employing an assistant.

Claim.—The combination of the support B, uprights D D, and melodeon A, when the same shall be arranged and operated as described and for the purpose as set forth.

No. 29,024.—WILLIAM M. WALLACE, of Cameron, Ill.—*Improvement in Portable Fences.*—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A portable fence, in which the posts A B and C are combined with the rails D E F, as described and shown, and for the purposes set forth.

No. 29,025.—JEROME WHEELOCK, of Worcester, Mass.—*Improvement in Centrifugal Governors for Steam Engines.*—Patent dated July 3, 1860.—This invention consists in attaching springs to the arms or balls of the common centrifugal governor, so as to nearly counterpoise or counteract the centrifugal force of the balls, they acting with an increasing force in proportion as the balls increase in centrifugal force, as they pass from a smaller circle to a larger one by the increase of speed.

Claim.—The hold fasts F F and the springs G G, constructed and operating in the manner as set forth and described.

No. 29,026.—WILLIAM WILMINGTON, of Toledo, Ohio.—*Improvement in Harvesting Machines.*—Patent dated July 3, 1860.—This invention consists in arranging a hinged platform and feeding apparatus with a threshing cylinder.

Claim.—The combination of the contracting hinged platform, the rotary reciprocating rakes O O¹, and short threshing cylinder, when the parts are arranged and operated jointly with the harvesting and winnowing apparatus, in the manner and for the purpose specified.

No. 29,027.—J. C. WILSON, of Cedar Hill, Texas.—*Improvement in Gang Ploughs*.—Patent dated July 3, 1860.

The inventor says: My invention can be used in ploughing lands of almost any character, but it is particularly designed for ploughing prairies or extensive tracts of land and in places where it may be desirable to carry the tools and implements for cultivating the soil from one tract to another.

Claim.—The arrangement of the plough frame upon the wagon frame, as and for the purpose described.

No. 29,028.—EDWIN A. WOODS, of Utica, N. Y.—*Improvement in Boiler Feeders for Steam Engines*.—Patent dated July 3, 1860.—This invention consists in regulating and controlling the pump or hydrant and the alarm whistle by means of the height of water in the boiler, and by the expansion and pressure of steam.

The inventor says: I *claim* the arrangement of the float L, cylinder N, and piston O, constructed and operating as described, in combination.

Also the said float, cylinder, and piston, constructed and operating as described, in combination with the alarm whistle.

No. 29,029.—HJALMAR WYMBLAD, of West Hoboken, N. J.—*Improved Mousing Hook*.—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—As a new article of manufacture the projection *p* on the hook, the ring *r* having a recess or notch *n* on the inner peripheries, and the spring *s*, arranged substantially as and for the purpose specified.

No. 29,030.—CHRISTIAN YOST, of Intercourse, Pa.—*Improved Machine for Pointing Fence Rails*.—Patent dated July 3, 1860.—By removing the carriage and its appurtenances, and placing on the table W, adapted to receive the saw D and rollers H, with its gauge X, the machine is made adjustable for the purpose of sawing laths, clap boards, &c. This table W has also three holes *z* into which the pegs are inserted for the purpose of sawing fuel.

Claim.—The traversing carriage I I, combined with the pivoted and grooved bars K K, and sliding swivel jaws M M, constructed, arranged, and operating in the manner set forth.

No. 29,031.—CYRUS W. BALDWIN, of Boston, Mass., assignor to himself and HENRY MESSER, of said Boston, and LUTHER AIKEN, of Malden, Mass.—*Improved Fastening for Garments*.—Patent dated July 3, 1860.—This invention consists of one, two, or more link hooks, with one end fastened to a plate of metal, and the other end pointed so as to be easily and readily inserted into the skirt or garment to be fastened.

Claim.—The new article of manufacture for fastening garments, described, to wit: a garment fastening consisting of one, two, or more link hooks fastened to a plate, substantially as described.

No. 29,032.—N. S. BEAN, of Manchester, N. H., and J. G. COLLINS, of Boston, Mass., assignors to the AMOSKEAG MANUFACTURING COMPANY.—*Improved Steam Boiler*.—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The described relative arrangement of parts in a vertical boiler having five tubes, the same consisting of an enlarged fire box and dome, contracted waist and submerged smoke box, substantially as set forth.

No. 29,033.—STEPHEN A. BRIGGS, of Philadelphia, Pa., assignor to himself and C. G. CROWELL, of said Philadelphia.—*Improvement in Corn and Cob Mills*.—Patent dated July 3, 1860.—This invention consists in the application of spiral flanges or propelling vanes around the cylinder of the rotary feeder and crusher between horizontal arms, arranged in two vertical rows on the same, for the purpose of giving it a positive feeding capacity; and also in the application of stops in the grooves, or between the raised grinding surfaces of the disks.

The inventor says: I *claim* the application of the spiral propeller vanes *g g* around the cylinder of the rotary crusher A, when the same are arranged in relation to the arms *h h*, substantially as and for the purpose specified.

I also claim the application of the stops *n n*, in combination with the grooves *j j*, and ridges *m m*, on the disks B¹ and C¹, substantially in the manner and for the purpose set forth and described.

No. 29,034.—ARNOLD DE WITT, of Brooklyn, N. Y., assignor to himself, JOHN WIARDA, and J. N. H. DE WITT, of said Brooklyn.—*Improvement in Wind Mills*.—Patent dated July 3, 1860.—This invention consists in arranging, in a rotary frame, a series of fans, to which a rotary motion is imparted by a stationary cog wheel in the centre of said revolving frame and gearing into corresponding cog wheels on the ends of the rotary fans; the whole being

inclosed in a round or polygonal scroll, with a spout to conduct the wind to the fans in such a manner that a light, simple, and powerful wind wheel may be obtained.

Claim.—The employment of a series of revolving fans *A*, with gear wheels *d*, arranged around a stationary cog wheel *e*, in a rotary frame *B*, together with an adjustable scroll *D*, substantially in the manner and for the purpose specified.

No. 29,035.—JOHN FIRST, of New York, N. Y., assignor to himself and JAMES FROST, of said New York.—*Improvement in Sewing Machines.*—Patent dated July 3, 1860.—This invention consist in a certain combination and arrangement of levers and connections, whereby the needle is moved rapidly where there is little resistance, slower when passing through the material, and caused to pause for a short period after it has risen sufficiently to slack the thread, thus adapting its motion to the resistance, and giving time for the passage of the shuttle through the loop of the thread.

Claim.—The combination and arrangement of the crook *C*, lever *D*, radius bar *E*, crank or lever *G*, and connection *H*, for the purpose of giving the proper periods of rest and motion to the needle of a sewing machine, substantially as described.

No. 29,036.—ISAAC M. GATTMAN, of Cincinnati, Ohio, assignor to himself and H. G. STEIBLE, of said Cincinnati.—*Improvement in Brick Machines.*—Patent dated July 3, 1860.—This invention consists in a combination of mechanism by which bricks are rapidly formed under high pressure from untempered clay, and by which the bricks, after being formed, are delivered from the machine by a means which, at the same time, smoothes their surfaces, giving them a finished outer surface.

The inventor says: I *claim*, first, the plunger *H*, slide *I*, and lateral slides *J J*¹, arranged and operating in combination substantially as and for the purpose set forth.

Second. The shafts *b c* at right angles, bevel wheels *E F*, and cams *f f*¹ *g g*¹, or their equivalents, in connection with plunger *H*, slide *I*, and lateral slides *J J*¹, arranged and operating substantially as and for the purpose set forth.

No. 29,037.—SAMUEL H. JONES, of Jamaica Plains, Mass., assignor to HENRY W. SMITH, of West Newton, and S. D. SMITH, of West Roxbury, Mass.—*Improvement in Melodeons.*—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, with a single set of bass and treble reeds, and two swell valves therefor, arranging one swell valve at the back of the reed board, and the other swell valve at the front thereof, substantially as and for the purpose described.

Also arranging the two sets of the treble and bass reeds relatively to the line of range of valve pins, and with respect to each other, as specified.

No. 29,038.—GEORGE A. KEENE, of Lynn, Mass., assignor to himself and SETH D. WOODBURY, of said Lynn.—*Improved Combined Bed and Chair.*—Patent dated July 3, 1860.—This improvement consists in the use of a frame arranged in such a manner as to slide under and from the bed on one side of the same, so that it may be used to move an invalid on when the bed is to be made, or for a watcher, or whenever occasion requires a wider bed; and in so arranging the extension either to operate as a bed or a reclining chair.

Claim.—The combination and arrangement of a bedstead, extension bed or couch, and chair, substantially as specified.

No. 29,039.—LESTER PATEE, of Peoria, Ill., assignor to himself and ABRAM H. RYAN, of said Peoria.—*Improvement in Soldering Irons.*—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The use of a heating centre of wrought or cast iron for soldering, in connection with a movable, tinned, copper cap, when the latter is constructed with a spiral spring, as set forth, for the purpose of keeping the cap and centre in contact under varying temperatures.

No. 29,040.—ELI W. ROWE, of Brewer, Me., assignor to himself and J. T. HARDY, of the same place.—*Improvement in Drain Tile.*—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the tongue *c* and groove *d*, arranged on opposite sides of, and in combination with, the tile, substantially as and for the purpose specified.

I also claim moulding or forming the clay or plastic drain tile, above described, with the tenon recess, and the tenon for side connections, in the manner and for the purpose set forth.

No. 29,041.—HENRY W. SMITH, of Boston, Mass., assignor to himself and SAMUEL D. SMITH, of West Roxbury, Mass.—*Improvement in Harmonions.*—Patent dated July 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—When two sets of valves are employed with a supplementary lever to be operated by the key, as described, constructing that part of the key frame which supports the key separate from that which supports the supplementary lever, and hinging or applying the two together so as to enable the key and its supporting part of the said key frame to be raised or moved in such manner as to enable access to be had to the inner reed holders as occasion may require.

No. 29,042.—HARRY A. WILLS, of Reeseville, N. Y., assignor to A. W. KINGSLAND, of said Reeseville.—*Improvement in Machines for Making Horse Shoes.*—Patent dated July 3, 1860.—This invention consists in arranging the shaping die or mould of a cylinder machine with a movable front, which, when thrown forward, bends the iron to the required shape and holds it in the proper position until the swaging die gripes it, and then being thrown back allows the iron to spread; and it consists also in the employment of a crank shaft which is subjected to the action of a spring and the bent end of which sweeps over a stationary die, rigidly attached to the side of the frame, forming the bearings for the cylinders, so that at the proper intervals said front is drawn in and the iron set free.

The inventor says: I *claim* the arrangement of the movable front, substantially as described, when the same is used in combination with the shaping die or mould E, on the surface of the rotary cylinder B¹, for the purpose set forth.

Also the arrangement of the stationary cam i, crank h, spring j, and front f, in combination with the shaping die or mould E, constructed and operating as and for the purpose specified.

No. 29,043.—ALLEN AGNEW, of Chester Co., and WILLIAM MORRISON, of Chadd's Ford, Pa.—*Improvement in Cultivators.*—Patent dated July 10, 1860.—This invention consists mainly in the shape of the teeth and the manner of hanging them to the frame, so that the soil will freely rise up and fall behind them without clogging, and so that the teeth may be let down on the frame or its branches as they are worn away by use.

Claim.—A cultivator composed of a stem and branches and teeth projecting from the ends thereof, and secured and made adjustable thereon, as set forth, the whole being constructed and arranged substantially in the manner and for the purposes described and represented.

No. 29,044.—SYLVESTER M. ANDRUS, of Bellevue, Mich.—*Improved Apparatus for Protecting Buildings from Fire.*—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Connecting the wad I, with a tilting and distributing arrangement of water, substantially in the manner as described, so that when an explosion occurs an alarm will not only be given, but water will be discharged almost simultaneously on and around the spot where the fire first communicated with the fuse.

No. 29,045.—GEORGE ARROWSMITH, of Lockport, N. Y.—*Improvement in Grain Separators.*—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The construction and arrangement of the separating chamber B, consisting of the alternate series of angular dividing partitions f, and opposing inclined planes g g, with the blast orifices h h and i i, operating in connection with the fan A, and secondary chambers of separation D D, substantially as and for the purposes set forth.

No. 29,046.—SAMUEL AVERY, of Pisgah, Mo.—*Improvement in Corn Planters.*—Patent dated July 10, 1860.—This invention consists in a peculiar arrangement of gear wheels operated by means of driving wheels which support the machine and connected with a shaft that transmits motion to the various parts of the machine.

The inventor says: I *claim* the main shaft, operated by gearing b b¹, connected with the driving wheels B B, and the brakes P, for regulating the motion of said driving wheels, so that the same shall rotate alike, and be under the control of the operator, as and for the purposes set forth.

I also claim the lime boxes G, mounted on the frame A, and provided with ratchet wheels H, said ratchet wheels being operated by means of pawls j, on each end of a slide bar I, said slide bar receiving its motion from the main shaft D, by means of the cams c, acting on the lever k, all arranged and operating substantially as shown and described.

No. 29,047.—MINOR H. BACON, of Mystic, Conn.—*Improvement in Machines for Dressing Mill Stones.*—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the loose joint B, reversible wiper E, and reversible cutter bar G¹, or their respective equivalents, on the hinged frame A C, so

that the path of the cutters may be adjusted to all the lines required upon the face of the stone, substantially as described.

Second. I claim operating the hook M, or its equivalent, by the same motion which graduates the force of the blow or by a continuation of such motion, substantially as set forth.

Third. I claim reversing the position of the wiper E, and arm G¹, substantially as described, to allow of dressing stones which turn in opposite directions.

No. 29,048.—E. O. BALL, of Greensburgh, Ohio.—*Improved Self-Heating Smoothing Irons*. Patent dated July 10, 1860.—This invention consists in constructing and arranging the several parts of the iron.

The inventor says: I *claim*, first, the arrangement of the pipes F F, the wick tubes *a a*, the wire conductors *c c*, with the partitions H H, on the body of the iron, the same being used substantially as and for the purpose specified.

Second. The arrangement of the flanged lampstand, the lamp provided with tubes F F, tubes *a a*, and partitions *i i i*, the partitions H H, and the dampers *e*, the whole being used substantially in the manner and for the purpose specified.

No. 29,049.—JOHN S. BELCHER, of Albany, N. Y.—*Improvement in Attaching Movable Carriage Tops*.—Patent dated July 10, 1860.—This invention consists in a certain novel means for attaching and detaching a shifting carriage top to the seat rail, whereby the top may be taken off or put on, and also the attachment may be made rigid and secure.

Claim.—The mode of securing shifting carriage tops to their seats by means of the hooks F, eyes E, and the keys or pins G, described, so that the tops can be put on or removed with facility and ease, as set forth.

No. 29,050.—FRANCIS H. BELL, of Washington, D. C.—*Improvement in Hat Ventilators*. Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A new article of manufacture, to wit: a portable hat ventilator, consisting of the narrow spring *i*, knobs *m*, anti-absorbent net work O, slotted attaching strips *e*, and buttons *a*, the whole constructed in the manner and for the purpose set forth.

No. 29,051.—JOHN BELL, of Harlem, N. Y.—*Improved Method of Operating the Cutters in Dovetailing Machines*.—Patent dated July 10, 1860.—This invention consists in combining with a rotating cutter a tipping gauge table, when either the cutter or the table has also a rising and falling motion, for the purpose of cutting dovetails.

Claim.—The combination of rotating cutters and a tilting table, when one is made to pass the other vertically, in addition to its other movement, substantially as described, the object being to cut dovetails on wood, as stated.

No. 29,052.—LEVI BISSELL, of North Bergen, N. Y.—*Improved Churn*.—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination and arrangement of the oppositely inclined sets of dasher wings L L, following each other on their respective shafts, while those of one dasher alternate and intermatch with those of the other dasher and the intermediate horizontal dasher wings M M, substantially in the manner and for the purpose specified.

No. 29,053.—CORNELIUS R. BRINCKERHOFF, of Batavia, N. Y.—*Improvement in Harvesters*. Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the peculiar construction, location, and arrangement of the back action rake, the gearing, and the mechanism for connecting them, in combination with the driving wheel, platform, and main frame, substantially as described.

Second. The arrangement of the compound elongating levers *ff*, operated by the eccentric on the shaft B, in combination with the platform and the back action rake, or its equivalent, in the manner and substantially as described, for the purpose specified.

No. 29,054.—ABRAM C. BROWN, of Philadelphia, Pa.—*Improvement in Condensers*.—Patent dated July 10, 1860.—The object of this invention is to facilitate the cooling of the vapor rising from the still of distillatory apparatus of any description, and condense the same whilst passing from the still to the worm tub, by keeping the main pipe between the worm tub and still as cool as the worm in the tub, and to accomplish this without the waste of water and in a simple and practical way.

Claim.—The employment of a perforated refrigerating conductor G in combination with the discharge pipe B of the still or retort A, substantially as and for the purpose shown and described.

No. 29,055.—CHARLES F. BROWN, of Warren, R. I.—*Improvement in Wheels for Gun Carriages, &c.*—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Binding the groove *a* with a shoulder *b* of greater depth than the shoulder *c* which binds the other side of the groove *a*, so that a support and guide for the central plate *D* will be provided during the shrinkage of the tire upon the plate, as set forth and described.

No. 29,056.—THOMAS BYRNE, of Baton Rouge, La.—*Improved Method of Cooling Water.*—Patent dated July 10, 1860.—This invention consists in the combination of a subterranean reservoir with a feed pipe and a discharge pipe.

Claim.—The combination of a subterranean reservoir *e* with a feed pipe *b* and a discharge pipe *a* *a*¹, when constructed, arranged, and operated in the manner and for the purpose set forth.

No. 29,057.—GEORGE W. CLARK, of Mt. Washington, Ohio.—*Improvement in Seeding Machines.*—Patent dated July 10, 1860.—The operation of this machine is as follows: The driver, being seated upon the seat *H*, governs the team with one hand, and with the other operates the slide *D*, by means of the lever *E*, so as to drop seed with any desired rapidity as the machine is drawn forward; the harrow, following immediately, covers the seed, and the drag *F* succeeding it operates to effectually pulverize the soil and compact it about the seed.

Claim.—The combination of the harrow *A*, seed box *C*, and drag *F*, constructed, combined, and operating in the manner and for the purposes set forth.

No. 29,058.—GILBERT H. CLEMENS, of Cincinnati, Ohio.—*Improvement in Saw Mills.*—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the setting screw *y*¹, clamp nut *w*¹, double eccentric *x*¹, and weighted lever *g*², constructed and operating in connection with the head block of a saw mill, substantially as and for the purposes set forth.

Second. A joint in a saw mill dog near its spike end, or at it, substantially as described, and for the purposes specified.

Third. The arrangement of two or more head blocks with one end of each upon a single carriage sill, and at their opposite ends, each resting upon an independent truck, substantially as described and for the specified purposes.

Fourth. The combination of the levers *m* and *q*, mandrel *c*, steady pins *s*, and adjustable rod *o* *p*, said parts being constructed and operated in the manner and for the purposes set forth.

Fifth. The combination of the conical feed pulleys *f* *u*, lever *f*¹, and pulleys *b* *w* and *z*, constructed and operating in the manner and for the purposes explained.

No. 29,059.—EBENEZER CLEMO, of Toronto, Province of Canada.—*Improvement in the Manufacture of Paper Pulp.*—Patent dated July 10, 1860.—This invention consists in the employment of nitric acid, or the aqua fortis of commerce, in the conversion of straw and grasses into pulp for the manufacture of paper; it also consists in the use, in connection with nitric acid or aqua fortis, of a subsequent treatment with a solution of a hydrate or carbonate of an alkali, for the purpose of reducing the stock to a fine fibrous pulp, without subjecting it to the beating or other mechanical operation.

Claim.—The mode or process of treating straw, and other fibrous substances, in the manufacture of paper stock, substantially as described.

No. 29,060.—JACOB CLOSS and ISAAC N. PYLE, of Decatur, Ind.—*Improvement in Water Wheels.*—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the wheels *F* *D* and their shafts *B* *E* in combination with the openings *e* *e* *l* *l* and gates *m* *o*, as shown and described, so that one or both wheels may be operated as desired, all as set forth.

No. 29,061.—WILLIAM COMPTON, of New York, N. Y.—*Improvement in Bridges for Pianos.*—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the arrangement of the bars *d* *g* and *h*, with their flanges, to form up and down bearings for the strings at the sounding board bridge, in the manner and for the purposes set forth.

I also claim the arrangement of a series of bars, having up and down bearings at the wrest plank bridge, in the manner shown, when such bars are separate from the wrest plank plate and attached to the wrest plank, so as to be removable in sections, in the manner and for the purposes specified.

And I also claim the perforated bar or box *f* or *m*, when combined with an up-bearing rest *4* or *n* and fitted so as to be removed from, or attached to, the wrest plank, for the purposes set forth.

No. 29,062.—G. W. CORSON, of Corson's Post Office, Pa.—*Improved Lath Machine*.—Patent dated July 10, 1860.—This invention consists in having a table or frame containing a circular saw turned by a crank shaft, by which the laths are sawed twice the width required, and the width is regulated by an adjustable guide piece which is attached to the table; at the end of the table is a movable carriage, elevated on an inclined frame to which it is fastened by screws through slots in it, so as to allow it to be adjusted on the inclined block, as desired.

Claim.—The combination of the oblique saw C^1 , the adjustable carriage B on inclined block D, with plane saw C, adjustable guide piece g, shaft S, and band b, operating substantially as and for the purposes set forth.

No. 29,063.—THOMAS COURSER, of Princeton, Ill.—*Improvement in Machines for Binding Grain*.—Patent dated July 10, 1860.—When the pin b in the movable jaw of the nipper stands at the cam m^2 and the curved arm lm, the sheaf of grain should be placed immediately under the knotting apparatus before moving the lever u from right to left, which will enable the horns of the clutch o^1 to retain the cord in forming the loop around them.

Claim.—The knotting apparatus, composed of the several parts specified, when the said parts are constructed and arranged for joint operation in the manner and for the purposes described.

No. 29,064.—JAMES A. DAVIS, of Portsmouth, Va.—*Improvement in Lowering and Detaching Ships' Boats*.—Patent dated July 10, 1860.—This invention consists first, in constructing a trip hook to which to attach boats, of three parts, to wit: a hinge, a catch, and a ring, when the said parts are combined in relation to each other. It consists, in the second place, in the relative arrangement of suspension ropes, trip ropes, pulleys, and trip hooks.

The inventor says: I claim, first, constructing a trip hook for attaching boats to, of three parts, to wit: a hinge, a catch, and a ring, when the said parts are combined and arranged, in relation to each other, in the manner and for the purposes described.

Second. The relative arrangement of suspension ropes $a a^1$, trip ropes $b b^1$, and $c c^1$, pulleys $d d^1 d^2$, and trip hooks $k l m o p$, substantially as and for the purposes set forth.

No. 29,065.—ZINA DOOLITTLE, of Perry, Ga.—*Improvement in Cotton Seed Planters*.—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, the arrangement and combination of the hinged oscillating hopper D, vibrating curved fingers G, and pin wheel B, constructed and operating substantially in the manner and for the purpose specified.

Second. The combination, with the vibrating curved finger G, of the curved slotted seed passage way F, constructed and operating substantially as and for the purpose set forth.

Third. The arrangement of the thumb screw m in combination with the vibrating curved fingers G, operating substantially in the manner and for the purpose described.

No. 29,066.—F. ELDER, of Winnsboro, S. C.—*Improved Mattress and Bed*.—Patent dated July 10, 1860.—This invention consists in an improved method of connecting a mattress immediately with bedstead posts, without the use of bedstead rails, and without the employment of mortises and tenons for uniting the same, while the whole bed is rendered strong, firm, and convenient.

Claim.—The combination and arrangement of the frame A B, strips C, with mattress L, corner notches E, and false posts I, substantially as and for the purpose specified.

No. 29,067.—EZRA EMMERT, of Franklin Grove, Ill.—*Improvement in Seeding Machines*.—Patent dated July 10, 1860.—This invention consists in the novel arrangement and combination of a seed box mounted on two wheels, and having perforations, or seed cells, in its bottom, and a correspondingly perforated slide for contracting said cells so as to regulate the discharge of seed, and of oscillating pendants, or agitators, for preventing the seed from becoming clogged over the seed cells: said agitators being operated by pitmen connected with crank shafts and crank pins on the wheels, and of a guide board and apron attached to the under part of the seed box, to ensure an even and undisturbed distribution of the seed, and in connecting to it a harrow for the purpose of working in, or covering the seed after it has fallen to the ground.

Claim.—The combination, with a seed box A, of the perforated slide E, pendants or agitators d, pitmen e, inclined guide board F, plate or apron G, and harrow H, all arranged and operating substantially as described.

No. 29,068.—JOHN U. FISCHER, of New York, N. Y.—*Improvement in Piano Fortes*.—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, the arrangement of the strings in the triangular form specified, for balancing the strain on the metallic plate, as set forth.

Second. I claim the metallic plate *g*, and sounding board *m*, connected together at the edges of the openings for the hammers by the ribs or strips 4 4, when the length of string is determined by bridges at each end that rest on the sounding board and pass through openings in said plate *g*, as specified.

Third. I claim forming the base or bottom *e* of the piano of the wooden cross-pieces or sills within the wooden surrounding frame, in combination with the metallic plate *f*, screwed on to the bottom of the instrument, for the purposes described and shown.

Fourth. I claim the openings 1 1, in the bottom of the piano, to afford access to the nut 2, or fastenings for attaching the legs *c c*, substantially as specified.

No. 29,069.—JOHN FITCH, of Seneca Falls, N. Y.—*Improvement in Filters*.—Patent dated July 10, 1860.—The water, or liquid, to be filtered, is let upon the top of the cylinder *E*², and passing down said cylinder and through the pipe *D* into the cylinder *B*¹, and up through the filtering material contained therein, is drawn from the faucet in a purified state.

Claim.—The filter, when constructed, arranged and operated in the manner and for the purposes set forth.

No. 29,070.—RUSSEL FRISBIE, of Middletown, Ct.—*Improved Bench Hook*.—Patent dated July 10, 1860.—This invention consists in so arranging its several parts as to be adapted to tall benches. The cam lever *B* is hinged to a case or stand *F*, which is connected to the upper case *c*, and fastened to the underside of the bench.

Claim.—The cam lever, in combination with the case and bench hook, substantially as described.

No. 29,071.—JOHN S. GAGE, of Dowagiac, Mich.—*Improvement in Seeding Machines*.—Patent dated July 10, 1860.—This invention consists in an improved arrangement of seed distributing device, rollers, and coverers, whereby the seed may be planted and covered.

Claim.—The combination of the rollers *B*, with the seed boxes *D E*, and coverers *J*, arranged for joint operation, as and for the purpose set forth.

No. 29,072.—R. J. GATLING, of Indianapolis, Ind.—*Improved Lath Machine*.—Patent dated July 10, 1860.—This invention consists in the use of a cutter, or knife bar, and a bolt bar attached to eccentrics, so arranged relatively to each other that the two bars will have an oblique reciprocating movement toward and from each other. It also consists in a peculiar means of applying the power of the knife and bolt bars, whereby the stroke or movement of the same may be varied as occasion may require.

The inventor says: I *claim*, first, the employment or use of the two obliquely reciprocating bars *F G*, provided respectively with the bolt *I*, and knife *J*, and operated substantially as, and for the purpose set forth.

Second. The arrangement of the slotted arm *M*, rod *O*, and adjustable frame *P*, substantially as shown, to vary the length of stroke or movement of the bars *F G*, for the purpose specified.

No. 29,073.—LE ROY C. GILLASPIE, of Denmark, Tenn.—*Improvement in Harrows*.—Patent dated July 10, 1860.—This invention consists of a metallic side harrow head, open at the front and rear, and having a central oblique, or diagonal slot *c c*, and openings *e e*¹, in combination with a plough beam.

Claim.—A metallic side harrow head *a b d d*, open at front and rear, and having a central oblique or diagonal slot *c c*, and openings *e e*¹, in combination with a plough beam, substantially as and for the purposes set forth.

No. 29,074.—HENRY GLOVER, of East Douglas, Mass.—*Improvement in Wind Mills*.—Patent dated July 10, 1860.—In order to set the slats of the wind sails at any desired angle to regulate the speed of the parts in a high wind, it is only necessary to pull the rod *R*, when the collar *P*, through which the spindle *B* turns loosely, will draw down the bent arm *N*, move the arm *M* in the direction of the vane *F*, and clutch the plate *I* of the shaft *H* with the fixed plate *I*, and disengage the shaft *H* from the hollow shaft *G*. The chains *e* of the slats are then wound around the fixed shaft *H* until the slats are entirely open, when the wind will cease to have any effect on the parts, and the mill will stop.

Claim.—The arrangement and combination of the fixed disk *I*¹, with the rotating horizontally sliding disk *I*, arms *k*, shafts *G H*, sails *J*, lever *M*, rod *N*, sliding collar *P*, and rod *R*, as and for the purpose shown and described.

No. 29,075.—HORACE P. HAWKINS, of Akron, Ohio —*Improvement in Hay Racks for Carts*.—Patent dated July 10, 1860.—This rack is composed of bottom or base pieces *D D*, arms *B B*, and top pieces *C C*. The arms *B B* are rigidly secured at their lower ends to the base

pieces D D, and are also hinged together, as shown at F. The top pieces C C are provided with eyes or staples e.

Claim.—A removable folding hay rack for carts or wagons, constructed and operating substantially, as set forth.

No. 29,076.—JOHN P. HENDERSON, of Franklin, La.—*Improvement in Arrangement of Sugar Kettle Trains.*—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A range of kettles on double arches B B, supported partly upon centre pins or pillars C C between the kettles, substantially as and for the purpose specified.

No. 29,077.—DANIEL HESS, of West Union, Iowa.—*Improved Carpet Sweeper.*—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the bellows D with the water chambers F F and the brush C, the same being used and made to operate substantially as and for the purpose specified.

Second. The arrangement of the pipes c c b b d d and G with the bellows D, brush C, and water chambers F F, whereby dust is drawn into the machine and submerged in water, substantially as specified.

No. 29,078.—GEORGE HETRICK, of Reidsburgh, Pa.—*Improvement in Seed Planters.*—Patent dated July 10, 1860.—This improvement consists in the arrangement of the different parts of the machine.

Claim.—The arrangement of the standards D D, axle B, wheels A, with spikes C C¹, and castor wheel O; the whole being constructed and arranged for joint operation substantially as described.

No. 29,079.—ENOCH HIDDEN, of New York, N. Y.—*Improved Side Lights for Ships.*—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment on a hinged or swinging ship's light of a spring catch bar, in combination with a locking screw or its equivalent; the two arranged to operate substantially as described for the purposes set forth.

No. 29,080.—B. B. HOTCHKISS, of Sharon, Conn.—*Improvement in Cartridges.*—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the compound cartridge case A B, composed of metal and cloth, or other soft material, combined substantially in the manner described, so as to be removed from the gun by the explosion of the powder, and also to sponge the gun in its passage through the bore, substantially as specified.

Second. A metallic cartridge case with a strong front end and a weak back, for the purpose of causing it to be blown out of the gun by the explosion of the charge.

Third. Radially dividing the metal of the back end of the cartridge case and joining it by weak solder, substantially as and for the purpose described.

Fourth. The block D of wood, or other suitable material, in the forward end of the cartridge, for the purpose of strengthening the end of the case A, and giving momentum to the structure, substantially as described.

Fifth. Extending the covering D over the front end of the case A, substantially as and for the purpose set forth.

No. 29,081.—G. HENRY HULSKAMP, of Troy, N. Y.—*Improvement in Piano Fortes.*—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the use of a strained sounding board in piano fortes, whether made of wood, metal, or other material, substantially as described.

Second. I claim the same when made to counteract the tension of the strings, substantially as described.

Third. I claim the oblique sounding posts or braces, or the continuous curved sounding bridge or board, whereby the vibrations of the strings are transmitted to near the middle part of the sounding board, substantially as described.

Fourth. I claim the extension of a wooden hitch board, made thick with different pieces of wood, as described, nearly to the sounding board bridge, in combination either with a sounding board bridge (the frame extending no further than the sounding board bridge) or a sounding board below the frame, or both, for the uses and purposes set forth.

Fifth. I claim the mode set forth of strengthening the piano forte by making the iron brackets K K K K bear not only against the iron plate on the upper side, but also against an iron plate through intermediate bars on the underside, and connecting that iron plate with the top plate by the iron bolts J J, substantially as described.

Sixth. I claim the construction of the bridge L and the agrafe Fig. 4, substantially as described, or making the bridge L of soft metal, in the manner as the agrafes.

No. 29,082.—A. R. HURST, of Chambersburgh, Pa.—*Improvement in Horse Hay Rakes*.—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, providing each of the rake teeth *h e* with an adjustable weight *k*, substantially as and for the purposes set forth.

Second. Combining two levers *d o* with a lever *d* and a ratchet bar *c* for the purpose of operating the rake teeth *h e*, substantially as set forth.

Third. Making the weights *k* adjustable by hinging them to one of the bearers *d*, substantially as and for the purposes set forth.

Fourth. So arranging and combining the bearers *d o*, rake teeth *h e*, and weights *k*, that one lever answers for regulating the weight upon each rake tooth, and for elevating the rake teeth above the ground, as set forth.

No. 29,083.—BENJAMIN IRVING, of New York, N. Y.—*Improvement in Syringes*.—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—As an improved article or manufacture, a syringe, for the cure of internal hemorrhoids, that is provided with an enlargement B for the reception of the ointment, a screw plunger C to fit said enlargement, a holding wire D, and discharge tube A; the whole constructed as shown and described.

No. 29,084.—BENJAMIN A. JENKINS, of White Water, Wis.—*Improvement in Harvesters*.—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a toothed rake arm *a*, pivotted at one end and actuated by two springs *j k*, cord *m*, and lever *n*¹, so as to move in an arc of a circle in a plane parallel to a platform, and also to turn on its own axis, in combination with a spring plate *c*, forked deflectors *h h*¹, slotted platform *g*, and cutters *i i*¹, in the manner and for the purpose described.

Second. Arms *m*¹, pivotted at the lower end, in combination with stirrups *l*¹, supporters *k*¹, cord *v*, pulleys *r*¹ *r*¹, perforated crank shaft S, and ratchet *u*, for the purpose of operating the two arms *m*¹ simultaneously, and thereby to elevate or depress the reel, in the manner and for the purpose described.

Third. The arrangement of the reel-supporting bar *k*¹ so that its fulcrum is behind the driving wheels, and always in line with the centre of the pulleys *c*¹ *d*¹, in combination with the pivotted arm *m*¹, in the manner and for the purpose set forth.

No. 29,085.—CORNELIUS R. KETCHUM and W. L. HUNT, of Port Jefferson, N. Y.—*Improvement in the Construction of Centre Board Vessels*.—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The keelson log J, introduced between the keel and keelson, substantially in the manner and for the purposes set forth.

No. 29,086.—JOHN K. LEWIS, of Rising Sun, Ind.—*Improvement in Supporting Scaffolds*.—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Elbow-jointed reversible extension brackets for sustaining staging of scaffolding on two or more ordinary ladders, as set forth in the above specification.

No. 29,087.—JOSEPH B. LIVEZY, of Clarksboro', N. J.—*Improvement in Cultivators*.—Patent dated July 10, 1860.—This invention consists in the arrangement and combination of a sliding head with the side wings, operated with a hand lever and fastened to both wings in front, together with two pivotted links, which connect the rear parts of said wings to the beam in such a manner that the said wings, on being expanded or contracted receive, at the time a longitudinal sliding motion.

Claim.—The arrangement of the sliding cross head D, pivotted links E, and hand lever F, in combination with the side wings C and beam A, constructed and operated substantially as and for the purpose specified.

No. 29,088.—J. R. LONNSBERRY, of New England Village, Mass.—*Improvement in Hooks for Watch Chains*.—Patent dated July 10, 1860.—This invention consists in the use of a jointed elliptical ring, or two elliptical bows, jointed together in a suitable manner, one of which is securely attached to the end of a hollow stem, while the end of the other is attached to the hollow stem by an eye-shaped head pin and movable slotted tube that works within the stem, said tube being rotated by a thumb ring so that the movable jointed bow may be opened and passed through a button hole, and then closed and secured fast by a single turn of the thumb ring.

Claim.—The jointed bow *d*, with its tongue *g* and the slotted portion *h*, for locking the end of the bow to the stem, substantially as and for the purpose specified.

No. 29,089.—WILLIAM N. MANNING, of Salem, Mass.—*Improved Planing Machine.*—Patent dated July 10, 1860.—This invention consists in placing radially within a rotating cutter head a series of rotating cutters, whereby the cutters have two movements, to wit: an independent rotating one on their own axis, and the one produced by the rotation of the head in which they are placed.

Claim.—The combination of the rotary cutters *c* and rotating disk *G*, arranged to operate as and for the purpose set forth.

No. 29,090.—JOHN W. MASURY, of New York, N. Y.—*Improved Paint Can.*—Patent dated July 10, 1860.—*A* represents a can made of tinned sheet iron. The top edge of this can is strengthened by a bead *a*, formed with or without a wire. *B* is a solid cover of wood or any other rigid material. The cover is fastened down by two or more straps *C*.

Claim.—The combination, in the manner shown and described, with the wooden cover *B* and the head of the can *A*, of the hook-shaped straps *C*, for the purpose set forth.

No. 29,091.—SIMON H. MIX, of Schoharie, N. Y.—*Improved Process for Making Stereotype Plates.*—Patent dated July 10, 1860.—The claim explains the nature of this invention.

Claim.—The use of foil of tin, or other metal, upon the face of the type form to be stereotyped, and interposed between it and the matrix or mould for the stereotype plate, in the manner and for the purposes described.

No. 29,092.—N. Q. MUNGER, of Brookfield Centre, Wis.—*Improvement in Œsophagus Tubes.*—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—An instrument for the relief of choke and bloat, having a hollow tube *A*, with a flaring mouth piece *b* and with an egg-shaped perforated bulb *c*, constructed and operating substantially as and for the purpose described.

No. 29,093.—RICHARD MURDOCH, of Baltimore, Md.—*Improvement in the Running Gear of Vehicles.*—Patent dated July 10, 1860.—This invention relates mainly to the mode of bracing the short axles so as to give them firm support in every position, and also to a mode of supporting the king bolts and attaching the springs to the axletree, and relieving the sliding pivot or bolt from wear.

The inventor says: I *claim*, first, the combination of the curved braces *F F* with the bed *C* and plates *H H*¹, substantially in the manner and for the purpose described.

Second. The combination, with the bolt *n*, of the slide piece working in the slot *o*, in the manner and for the purpose specified.

No. 29,094.—HARRISON OGBORN, of Greenfork, Ind.—*Improvement in Cultivators.*—Patent dated July 10, 1860.—This machine is constructed with four ploughs *U U V W*, which are attached to beams *A B C D* by means of sheaths or foot pieces *x x*; these beams are attached to the cross piece *E* in front, which sustains the weight of the beams and ploughs, and are connected to it by staples *R*.

Claim.—The arrangement of the spring bolts *K K*, the piece *H*, staple *B*, and movable seat *M*, in combination with the ploughs *U U* and *V W*, the whole being arranged, constructed, and operated substantially as set forth.

No. 29,095.—S. E. OVIATT, of Richfield, Ohio.—*Improvement in Threshing Machines.*—Patent dated July 10, 1860.—This improvement relates to a certain arrangement of devices, by which the dust caused by a threshing machine when at work is conveyed off with the chaff.

Claim.—The arrangement of the pipes *C C*¹ and *F*, and flue *H*, in combination with the revolving screen *J* and valve *P*, substantially in the manner and applied to the purposes described.

No. 29,096.—W. H. PAINE, of Sheboygan, Wis.—*Improved Surveyors' Tackle Case.*—Patent dated July 10, 1860.—This invention consists of a tape divided into yards, feet, links, or some other unit of measurement, a set of pins, usually ten in number, a thermometer, two peculiar rings or handles for the ends of the tape when it is in use, and an index plate, for indicating the tally. The whole arrangement is to be combined and put compactly in a box or case.

Claim.—The surveyors' measuring tackle case, constructed of any suitable material, essentially in the manner and for the purposes set forth.

No. 29,097.—GEORGE M. PHELPS, of Troy, N. Y.—*Improvement in Pendulum Clocks*.—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—So mounting two vibrative pallets upon the pendulum of a timekeeper that, in the oscillations of the pendulum, the axis or centre of vibration of each pallet will be carried to, nearly to, or past, a line drawn from the axis or centre of oscillation of the pendulum, through the point where the swing wheel bears on the pallet, substantially as set forth.

No. 29,098.—NATHANIEL POTTER, JR., of South Dartmouth, Mass.—*Improvement in Apparatus for Protecting Trees from Insects*.—Patent dated July 10, 1860.—This invention consists in an improved construction of the trough A; also, in combining with the trough and its covering a lamp and reflector, to throw a circle of light around the trough, to attract such insects into it as may fly at night and are destructive to the fruit.

The inventor says: I *claim*, first, the flange g on the trough A, substantially as described, for the purpose specified.

Second. I claim the combination, with the hood D and trough A, the lamp E and reflector G, arranged and operating substantially in the manner and for the purpose specified.

No. 29,099.—JOHN H. POWER, of Middletown, Iowa.—*Improved Broom or Brush*.—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the brush fibres or broom corn between the screw of the handle and the inner surface of the hollow head, as shown and described, so that the said fibres will, by the pressure consequent upon introducing the screw into and among the said fibres, cause the latter to press into and fill the threads of the screw, and thus hold the handle firmly to the broom or brush, all as set forth.

No. 29,100.—JOHN PRICE, of Harrison, Ohio.—*Improvement in Corn Planters*.—Patent dated July 10, 1860.—This improvement relates chiefly to the arrangement for elevating the markers, coverers, and rollers, and to the arrangements for dropping the seed.

The inventor says: I *claim*, first, the arrangement of the hinged frames E and F in combination with the main frame, the levers K and L, the shovels G, the coverers H, and rollers I, the whole being arranged and operated substantially as set forth, for the purposes described.

I also claim the combination of the bar U, cams V, spring Z, arms T, shaft S, and seed cup n, arranged substantially as set forth, for the purposes specified.

No. 29,101.—GEORGE M. RAMSAY, of New York, N. Y.—*Improved Machine for Sweeping Streets*.—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the manner of attaching and detaching the frame e, brushes g and k, pinion h, and apron J, to and from the axle d.

I also claim the revolving dirt box c, when in combination with frame e, and its appurtenances, as described.

No. 29,102.—EDWIN RITSON, of Sanbornton Bridge, N. H.—*Improvement in Seeding Machines*.—Patent dated July 10, 1860.—This invention consists in combining in one machine, in a novel manner, the operation of forming ridges in the surface of the soil for receiving the wheat, sowing the wheat, and harrowing and rolling the same.

Claim.—The combination of castor wheel C, wheels g, and the seeding arrangement, with rotary harrow and roller B, all arranged relatively with each other to effect the objects in the manner set forth.

No. 29,103.—MILTON ROBERTS, of Worcester, Mass.—*Improved Lathe*.—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* arranging one or more shaping or moulding tools, in one piece or in parts, on an oblique bar in a reciprocating gate which moves transversely of, and at right angles with, the piece to be turned, in the manner and for the purpose specified.

I also claim, in combination with the middle chuck, two reciprocating gates, in the manner and for the purpose set forth.

I also claim the application of the hollow universal chuck, or its equivalent, in the manner and for the purpose set forth.

No. 29,104.—HENRY H. ROBERTSON, of Kingston, Mo.—*Improvement in Ploughs*.—Patent dated July 10, 1860.—This invention consists in the arrangement of a hinged plough, vertical adjusting screw, carriage, segment guide frames, toothed segmental adjusting bars, and cog pinion, and pawl, or stop.

Claim.—The arrangement of a hinged plough F, carriage A A¹ B, vertical adjusting screw d, segment guide frames E, toothed segmental adjusting bars i j, cog pinion k, pawl o, or stop m, substantially as and for the purposes set forth.

No. 29,105.—WILLIAM SCHNEBLY and THOMAS SCHNEBLY, of Hackensack, N. J.—*Improvement in Horse Rakes.*—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* the arrangement of the axis bar d of the swinging frame E, between the axis of the wheel B B and the traverse bar d, as shown and described, so that the rear ends of the bars b b will be supported against the inward pressure of the wheels, all as set forth.

We also claim the arrangement of the wheels B B and their axis upon the extremities of the said bars b b, which carry the swinging frame, whereby the employment of an axle tree extending from wheel to wheel is avoided, and the inside of the frame is left entirely open for the unobstructed operations of the rake, all as represented and described.

No. 29,106.—FRANCIS SCHWALM, of Joliet, Ill.—*Improvement in Stone Dressing Machines.* Patent dated July 10, 1860.—This invention consists in the use of a sliding eccentric, connected with a bar, in which a series of chisels are fitted, the chisels being provided with a rack, and all the working parts being fitted in sliding frames, so arranged as to admit of the perfect adjustment of the chisels and a proper adaptation to their work.

The inventor says: I *claim* the employment or use of the sliding eccentric I, connected with the chisel bar K, and arranged to operate as and for the purpose set forth.

I also claim, in connection with the eccentric I and chisel bar K, the adjustable guide bar Q, for the purpose specified.

No. 29,107.—FREDERICK SEIDLE and SAMUEL EBERLY, of Mechanicsburg, Pa.—*Improved Machine for Bending Wood.*—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the combination of a revolving yielding pressure pattern with an unyielding sliding bed, arranged substantially as described, for the purpose set forth.

Second. Attaching the pattern to the frame, substantially as described, so that it can be removed by simply drawing it out without unloosing any bolts.

No. 29,108.—CHRISTIAN SHARPS, of Philadelphia, Pa.—*Improvement in Packing Cartridges.* Patent dated July 10, 1860.—This invention consists in a process of packing the hollow collars of metallic cartridges with detonate, by means of a wad of a peculiar form, and applied in a novel manner, so that the detonate may be conveyed to the hollow collar, as well as packed into and confined therein.

Claim.—The process of packing the hollow collars of metallic cartridges with detonating powder, by means of a wad d, of a form substantially as specified, and applied substantially in the manner and for the purpose set forth.

No. 29,109.—JAMES T. SMITH, of Portsmouth, Va.—*Improvement in Cranes.*—Patent dated July 10, 1860.—This invention consists in the use of a diagonal brace, with a wheel, which runs on or against an annular way on a platform of the crane, in connection with wheels attached to a horizontal arm of the mast below the platform, and which wheels run in contact with the under side of the mast.

Claim.—The brace E, attached to the upright beam or mast C and provided with the wheel F which runs on or against the annular way G on the platform A, in connection with the rollers b b on the cross bar H bearing against the under side of the platform A, substantially as and for the purpose set forth.

No. 29,110.—JOHN A. C. J. SMITH, of Philadelphia, Pa.—*Improvement in Pumps.*—Patent dated July 10, 1860.—A represents a hollow cast metal sphere which forms the body or chamber of the pump; this body or chamber is formed of two equal parts, connected together by bolts, which pass through proper flanches cast with the parts.

Claim.—The employment of the spherical shell A in combination with the rounded partition E E¹ and rounded piston H, as and for the purpose shown and described.

No. 29,111.—WILLIAM STEPHENSON, of Galion, Ohio.—*Improvement in Gas Pipes.*—Patent dated July 10, 1860.—This invention consists in employing wood gas pipes instead of metal pipes, and coating the inside of the pipes with a composition of sulphur and graphite, or its equivalent, for the purpose of preventing leakage.

Claim.—A wooden gas pipe A coated on the inside with a composition of graphite and sulphur, or its equivalents.

No. 29,112.—ELBRIDGE G. STEVENS, of Biddeford, Me.—*Improvement in Syringes*.—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a sheath or retainer, having a lip or flange, so as to embrace and compress the external parts with which it comes in contact, said lip being on its periphery and curved upward, and its internal parts *l*, so shaped as to fit when pressed between the labiæ, and also to penetrate the vagina, said sheath being also fitted with a valve, or its equivalent, and said sheath being used either above, or in combination with, a syringe of any description.

Second. I claim the tank *a a*, plunger *b*, tubes *i* and *f*, spring *x*, and spring *e*, when combined and arranged substantially as and for the purposes specified.

No. 29,113.—ANTHONY STRATTON, of Brooklyn, N. Y.—*Improvement in Flexible Joints for Gas Tubes*.—Patent dated July 10, 1860.—This invention consists in suspending the pendant burner tube to the main tube by means of a chain, or its equivalent, to obtain a secure and flexible connection, and covering the ends of the tubes or their sockets with a tube of India rubber, or other similar substance, to form a gas-tight connection.

Claim.—The chain *C*, or its equivalent, in connection with the India rubber or other flexible tube *D*, applied to the sockets *A B*, substantially as and for the purpose set forth.

No. 29,114.—SEWALL P. TOLMAN and NATHANIEL F. BLODGETT, of North Orange, Mass.—*Improvement in Tuyeres*.—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The improved tuyere, as constructed, with a valve opening *h* and valve *k*, arranged on or applied to the air case, so that the said valve shall not only close upon the opening by the force of the blast from the induction pipe, but, on cessation of the blast, move away from such opening and permit air to enter the case and pass from thence into the mass of fuel.

No. 29,115.—J. J. UMBEHAZEN, of Baton Rouge, La.—*Improvement in Apparatus for Draining Sugar*.—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of a cooler *C*, with an air tight hinged case *B*, constructed and operating substantially in the manner and for the purpose specified.

Second. Arranging the cooler *C*, with double walls, viz: the perforated inner wall *c*, and the air tight inclosure *f*, constructed and operating substantially in the manner and for the purpose described.

Third. The arrangement of the perforated conical tube *D*, in combination with the cooler *C*, substantially as and for the purpose set forth.

No. 29,116.—LEONARD WHITE and ICHABOD JEWETT WHITE, of Buffalo, N. Y.—*Improvement in Skates*.—Patent dated July 10, 1860.—This improvement relates to the construction and manner of fastening a skeleton skate runner to its wood.

Claim.—The hook *G*, projecting from the stud *F*, of a skeleton skate runner, in combination with the screw lock *H*, for the purposes and substantially as set forth.

No. 29,117.—S. B. WILKINS, of Milton, Pa.—*Improved Spoke Machine*.—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the rocking clamp, consisting of the lever shaft *E*, lever *F*, and adjustable plate *I*, operating as set forth and for the purposes described.

No. 29,118.—THOMAS F. WOODWARD, of South Reading, Mass.—*Improved Signal Lantern*.—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the portable signal apparatus for vessels, substantially as described, the same consisting of a lantern, or its equivalent, for producing a constant light, with which is combined an apparatus for instantaneously producing a report, or an alarm, and an intense pyrotechnic light, as set forth.

Second. In combination with the igniting and discharging apparatus, the cover *n n*, so operated as to be instantaneously thrown open when the contents of the barrels are ignited, and serving to protect the same from exposure to dampness, &c., as set forth.

No. 29,119.—JOHN M. BOWMAN, of Brockport, N. Y., assignor to HUNTLEY BOWMAN & Co., of said Brockport.—*Improvement in Harvesting Machines*.—Patent dated July 10, 1860. This invention relates to the mode of forming and combining the finger bar and the guard finger, to the manner of constructing the cutter bar, the mode of clearing the cutting apparatus of any obstructing matter, and to a mode of depositing the cut grain when the machine, to which it may be applied, is used to harvest grain.

The inventor says: I *claim*, first, a cutter bar with acute angular notches on the back thereof, for the purpose and substantially as described.

Second. The finger beam and guard fingers when constructed, connected, and operating in combination, in the manner and for the purposes specified.

Third. The cutter bar with its acute angular notches on the back thereof, in combination with the projections on the shank of the guard finger, made and operating substantially as described.

Fourth. The second or dumping platform *a*, in combination with the mechanism for operating it, and with the first platform, constructed and arranged in the manner and for the purpose substantially as described.

No. 29,120.—CHILTON F. BROWN, of Bridgeport, Conn., assignor to himself and JOSIAH BAXLIES, of said Bridgeport.—*Improved Lock*.—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the sliding cam B, with the bevelled end of the latch C, in such a manner that the latch is raised and the door or window opened by the continuation of the same motion or impulse.

No. 29,121.—JOHN CONTRELL, of New York, N. Y., assignor to himself and JOSEPH CONTRELL, of said New York.—*Improved Washing Machine*.—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment of the rack sectors J J¹, and intermediate oscillating pinion K, gearing with both of said sectors, in combination with the oscillating rubbing tub B, and conical rubber D, as and for the purposes shown and described.

No. 29,122.—JOHN SPERRY, of New York, N. Y., assignor to himself and CALVIN W. SHERWOOD, of said New York.—*Improved Tool for Enamelling Picture Frames, &c.*—Patent dated July 10, 1860.—This invention consists in the employment of cylindrical rollers constructed and shaped with reference to the size and shape of the moulding they are intended to be used upon, said rollers having handles projecting from each end that guide them in their movements over the moulding, and also by which they are rolled and controlled.

Claim.—A cylindrical roller having the form of the surface to be enamelled made in bas relief around its circumference, substantially in the manner and for the purposes set forth.

No. 29,123.—S. A. CORSER, of Northampton, Mass., assignor to himself and J. A. NIMS, of said Northampton.—*Improvement in Moulds for Casting*.—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the employment of a mould carriage that moves in a circle, in combination with the compression plungers L M, substantially as and for the purpose shown and described.

I also claim the employment, in combination with the flasks N Q, of pistons L M, that have their faces shaped to correspond with the form of the article to be moulded, so that the compression of the sand within the flask will be equal in every part, as set forth.

I also claim the employment of the supplemental moulds P P, in combination with the pistons L M, and flasks N Q, as and for the purposes shown and described.

No. 29,124.—ERASTUS CROOKER, of Buffalo, N. Y., assignor to himself and JEFFERSON T. UPSON, of said Buffalo.—*Improvement in Vapor Lamps*.—Patent dated July 10, 1860.—This invention consists in the construction and relative arrangement of its different parts.

Claim.—The arrangement of the fluid pipe K, converging chambers *d* and *e*, screw tops *f* and *g*, recess *f*¹, and gas pipe *h*, as and for the purposes set forth.

No. 29,125.—HARRY H. EVARTS, of Chicago, Ill., assignor to himself and PHINEAS T. MERRIHEW, of said Chicago.—*Improved Machine for Sawing Staves*.—Patent dated July 10, 1860.—This improved machine is intended to saw staves from the block with a circular saw. The staves thus produced require to be planed to the proper form for the market, or for use.

Claim.—The combination of the vibrating and reciprocating carriage with the circular saw, as described, and for the purposes set forth in the specification.

No. 29,126.—A. J. GIBSON, of Worcester, Mass., assignor to himself and J. P. HALE, of said Worcester.—*Improvement in Revolving Fire Arms*.—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* so applying a so constructed cylinder, in combination with a so constructed frame, that when the frame is opened the cylinder remains attached to and

swings with the front part of the frame and the barrel, substantially as and for the purpose specified.

And I also claim the construction of the hinge jointed cylinder frame with chambers in its front and rear ends to receive and cover the front edges of the cylinder, substantially as and for the purpose specified.

Also the recess or chamber *k*, in the front or forward end of the cylinder.

No. 29,127.—JOSEPH HINMAN, of Watertown, Mass., and D. S. FRENCH, of Marietta, Ga., assignors to themselves and NATHAN KING, of Middlesex, Mass.—*Improvement in Cotton Cultivators*.—Patent dated July 10, 1860.—This invention consists in the use of a series of runners or plates provided with cutters, or shares, and attached to a suitable framing a requisite distance apart, and in such a way that a certain degree of vertical adjustment will be allowed them, and the plants thinned out by the cutters by drawing the implement transversely over the drills in which the plants are growing.

The inventors say: We *claim*, first, the employment or use of a series of plates *B*, provided with cutters *C*, and attached to a frame *A*, substantially as shown, for the purpose set forth.

Second. Attaching the cutters *C* to the plates *B*, by means of tangs *h*, secured by set screws in semi-circular bars *g*, on the plates directly over slots *f* therein, as and for the purpose specified.

No. 29,128.—CHARLES KINSLER, of New York, N. Y., assignor to himself and J. H. VOSS, of said New York.—*Improvement in Apparatus for Washing Bone Black*.—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement and construction of a triangular box, turning on its axis for the purpose of washing animal coal, when said box is provided with internal flanches, forming a spiral screw, in the manner substantially as specified.

Second. The general construction, combination, and arrangement of the washing machine, as shown and described, so as to operate substantially in the manner and for the purpose set forth.

No. 29,129.—JOHN H. RIBLE, of Somerset, Ohio, assignor to JACOB W. BOPE, of St. Louis, Mo.—*Improvement in Harvesting Machines*.—Patent dated July 10, 1860.—This invention relates to certain improvements in corn harvesting machines, with mechanism for binding and discharging the corn in shocks or sheaves set on end.

The inventor says: I *claim*, first, in combination with the main frame and gearing for operating the cutter and reel, the elevating and dumping platform, the parts being arranged and operating in the manner and for the purposes specified.

Second. The combination of the mechanism for binding, elevating, and dumping the shock substantially as described.

Third. The revolving platform *K*, in combination with the cutting apparatus and elevating mechanism, constructed, arranged, and operated in the manner described, for the purposes specified.

No. 29,130.—JAMES C. COOKE, of Middletown, Conn., assignor to himself and D. C. SAGE of said Middletown.—*Improved Machine for Cutting Files*.—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the attachment of the chisel stock, at two points, to two vibrating rods *G G*, by which it is made to receive a movement of a character, substantially as specified, for the purpose of throwing up the cut.

Second. Providing for shifting the two fixed centres *d d*, on which the vibrating rods *G G* work, for the purpose of giving the chisel a greater or less degree of horizontal movement, by means of a movable plate *N*, or its equivalent, so applied as to provide for the raising and lowering of said centres.

Third. The construction of the chisel stock of two parts *F F*¹, one of which is capable of a rolling or oscillating movement substantially as and for the purpose specified.

Fourth. Providing for controlling the force applied to the chisel, so that it shall be always in proportion to the varying width of a file blank, by means of a compound cam *K l*, applied and governed substantially as described, to give a greater or less lift to the chisel or hammer according as the width is greater or less at the part presented to the chisel.

Fifth. The combination of the single chisel-edged dog *r* applied to the point of the blank, and the double or grooved chisel-edged dog *S* applied to the heel of the blank, substantially as specified.

Sixth. The employment, for holding down the file blank at the time of the operation of the chisel, of a presser which possesses sufficient elasticity in a proper direction to enable it to adapt itself to the varying thickness of the blank and to blanks of different thicknesses, and which is raised from the blank before, and kept raised during, the feeding operation, substantially as set forth.

Seventh. Making the guide or guides for the file carriage D adjustable around the axis of a feed pinion gearing with a rack formed upon or attached to the said carriage, substantially as and for the purpose specified.

Eighth. So combining a clutch lever, by which the driving pulley or gear may be uncoupled from the main shaft of the machine, with an adjustable wedge attached to the file carriage, substantially as described, that the said wedge may be made to act upon the said lever to uncouple the pulley or gear at such point in the movement of the carriage as may be desired.

No. 29,131.—G. W. N. YOST, of Cincinnati, Ohio, assignor to G. W. N. Yost & Co., of Yellow Springs, Ohio.—*Improvement in Harvesters of Corn and Sugar Cane.*—Patent dated July 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the knife B with its supporter A, when arranged in relation to each other and to the side of the main frame, as described, whereby the opening *f* is provided at the heel of the knife, in the manner and for the purpose specified.

Second. The combination and arrangement of the knife B, drum E, and arms D, guards F, endless chains J, and inclined platform I; the whole operating substantially as described, for the purpose of cutting corn stalks or cane and carrying the same to the rear of the machine when cut.

No. 29,132.—JOHN N. ARVIN and SAMUEL H. PERKINS, of Valparaiso, Ind.—*Improvement in Axle Trees.*—Patent dated July 17, 1860.—The inventor says: In using this machine place a straight edge on the rests A, extending through the rings B, lower the set screws d^1 as much below the straight edge as you wish to give pitch to the axle; set the lateral set screws d^2 , by the assistance of the straight edge, a sufficient distance back to give the desired gather; heat the axle tree at the shoulders, place it on the rests A, the ends extending through the rings B; then fasten the axle tree at A with the set screws d^1 , then turn the set screws in the rings B until the points of the axle come in contact with the set screws $d^1 d^2$.

Claim.—An improved mode of setting axle trees and giving them the required pitch and "gather," by means of metallic set screws, rests and sets, or their equivalents, as exhibited and described by the specification.

No. 29,133.—SAMUEL BARNET, of Washington, Georgia.—*Improved Plotting Instrument.*—Patent dated July 17, 1860.—This invention consists in combining a protractor, graduated rule, and T square, in one and the same instrument, by the simple adjustment of which both the direction and length of any given line can be readily obtained without calculation.

Claim.—The instrument, constructed essentially as described and represented, combining a protractor, graduated rule and T square, arranged in such a way that the adjustment of the protractor adjusts the rule.

No. 29,134.—G. T. BENNETT, of Mt. Olive, N. C.—*Improvement in Seed Planters.*—Patent dated July 17, 1860.—In operating this machine, peas being placed in the hoppers A, it is put in motion; as the wheel B revolves, the pin *i* strikes against the slide, and brings the aperture in it under that in the bottom of the hopper; two or more peas fall into the aperture in the slide, thence into the discharge spout *f*.

Claim.—The arrangement of the slide C, hand lever *b*, standard *d*, and the wheel B, provided with the pin *i*, in combination with the cultivator, constructed substantially as and for the purpose set forth.

No. 29,135.—CHARLES A. BOYNTON, of Hyde Park, Vt.—*Improved Butter Worker.*—Patent dated July 17, 1860.—This invention consists in the combination of an adjustable clamp for holding the pails with a horizontal disk spur wheel and a pinion level spur wheel and crank, for giving to the tub or disk wheel a rotary motion, and in arranging over this disk wheel in a suitable manner a conical pressing or packing roller that is made to act upon the top of the butter when put into the tub by a hand lever, so as to forcibly pack the butter down in the tub, and if necessary print or stamp the surface of the butter in the tub at one and the same operation of pressing.

Claim.—Attaching a tub to receive the butter to a rotary disk B, in combination with the conical pressing roller K, arranged and operated substantially as described and to obtain the described results.

No. 29,136.—EPHRAIM BRIGGS, of Medina, Ohio.—*Improvement in Cultivators.*—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the main beam A and the side beams or wings C C, the posts D D D D, the shovels E E E E, bars F F F F, bolts G G G G G G, changeable braces H H, handles I I, and round K, in the manner and for the purpose set forth.

No. 29,137.—WILLIAM A. BROWN, of Philadelphia, Pa.—*Improvement in Couches for Railroad Cars.*—Patent dated July 17, 1860.—In this invention a support G is slid out from the side of the car, at a height sufficient to clear the backs of the seats; the support G is made to turn up or down in the side of the car, between the frame work, one end to work in a groove or rabbet; a post, rod, or brace H, is connected or disconnected with the support G, to turn from the side, bottom, or top of the same to the floor, or to turn up from the floor or side, by supporters from the ceiling.

Claim.—Supporting the couch by supports G drawn from the side of the car, when used in combination with the posts H, substantially as described.

No. 29,138.—GEORGE CHURCHILL, of Hartford, Conn.—*Improvement in Spools for Sewing Machines.*—Patent dated July 17, 1860.—This invention consists in the construction and arrangement of a conical pin, with a thin elongated elastic spring tube surrounding and revolving on the same.

Claim.—The revolving conical spring tube E, in combination with the taper or conical shaped pin A, in the manner and for the purpose substantially as set forth and described.

No. 29,139.—ELIJAH B. CLARK, of Tallahassee, Fla.—*Improvement in Ploughs.*—Patent dated July 17, 1860.—When the bar E is taken up or shortened, the foot G has a greater inclination given it, and made to approach nearer a vertical line as the bar E is let out from the beam A. The landside F always retains its horizontal position, whatever degree of inclination the foot G may have.

Claim.—The arrangement of the adjustable diagonal bar E, swinging foot G, swinging bar D, horizontally and vertically moving sole F, and beam A, as and for the purpose shown and described.

No. 29,140.—DAVIS J. COCHRAN, of Centreville, Ind.—*Improvement in Compounds for Tanning.*—Patent dated July 17, 1860.—By this invention the hair is removed from the hides, by any of the known ways, after which they are handled from two to four days in the following compound or solution: Eight gallons of water, eight pounds of terra japonica, sixteen pounds of common salt, one half pound of extract of elder, two pounds of saltpetre, one pound of alum, one pound of aloes, one ounce of opium.

Claim.—The employment of the within named ingredients, compounded in substantially the proportions specified, for the purpose of making a tanning liquor, as fully set forth.

No. 29,141.—ELEAZER COFFIN, of Indianapolis, Ind.—*Improved Mortising Machine.*—Patent dated July 17, 1860.—The claim and engravings give an idea of the nature of this invention.

Claim.—The cutter and clearer H, cutter holder I, adjustable hinged table O, crank K, and screw U, when connected and operated in connection with the end cutting chisel R, holder A, lever B, pitman C, lever D, and the rests F F and G, or their equivalents, as set forth.

No. 29,142.—GEORGE COLLYER and A. HAMILTON PATTERSON, of Philadelphia, Pa.—*Improvement in Coupling for City Railroad Cars.*—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, constructing the enlargement *d* of the pole with a bevelled face, in the manner and for the purpose substantially as set forth.

Second. Giving the tumbler B a rounded form at the end, in the manner and for the purpose substantially as set forth.

Third. The extension *a*, having an eye *b*, for joining the box to the car.

No. 29,143.—JAMES CONNELL, of Port Huron, Mich.—*Improvement in the Preparation of Tanning Extracts.*—Patent dated July 17, 1860.—The claim explains the nature of this invention.

Claim.—The process of manufacturing the aqueous extracts of the tanning principles contained in trees and shrubs, by concentrating the extract by evaporation, and then mingling with it a desiccated pulverized vegetable fibre containing the principles of the extract.

No. 29,144.—JOSEPH CORDUAN, of Brooklyn, N. Y.—*Improved Mode of Coating Type Metal with Brass.*—Patent dated July 17, 1860.—This invention consists in the nature of the solution forming part of the electrical circuit, in preparing which the ingredients and the manner of preparing and mixing them together in solution are, to a considerable extent, different from any process heretofore known.

The inventor says: I *claim* the solution composed of the ingredients and prepared and mixed together, as described, for the purpose of plating or coating the faces of printers' type,

made of type metal, with brass, in a manner more hard, smooth, and durable, and with greater economy, than has heretofore been attained.

I also claim, in connection and combination with the above, the using of a brass vat for containing the solution, to be connected with the positive pole of the battery, instead of having a separate plate of brass for that purpose.

No. 29,145.—HAROLD J. COSTER, of Chicago, Ill.—*Improvement in Flower Stands*.—Patent dated July 17, 1860.—This invention consists in adapting to a flower stand a heating apparatus, in connection with a movable frame.

Claim.—The combination of the different parts described, that is to say, the flower stand proper A, the heating apparatus C, in combination with the movable cover B, weight F, cord g, pulleys P, or their equivalents, and outer case or bureau G, all arranged substantially as and for the purpose set forth

No. 29,146.—LUCIUS DIMOCK, of Hebron, Conn.—*Improvement in Machines for Stretching Silk in the Hank*.—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination, with a steaming and stretching box for stretching hanks of silk, of the cylinder and piston, whereby a direct application of power may be obtained in a simple and compact manner, essentially as described.

No. 29,147.—THOMAS H. DODGE, of Washington, D. C.—*Improvement in Cotton Cultivators*.—Patent dated July 17, 1860.—As this machine is drawn forward by the beam A the plough share attached to E turns the earth towards the plants, while the guard or shield F prevents it from falling on and covering up the same. The coulter H, which runs in advance of the shield F and the plough, scrapes the top of the earth away from the plants, thus cutting up the weeds, while the plough which follows turns back the earth towards the plants.

The inventor says: I *claim*, first, in combination with a plough or cultivator, the self-adjusting rotary shield F, arranged to protect the young plants, as described, and as shown in Fig. 1.

Second. I claim, in combination with the plough or cultivator, the self-adjusting guard coulter H and rotary shield F, as and for the purposes set forth.

No. 29,148.—JAMES DOTY, JR., of West Falls, N. Y.—*Improved Mop Head*.—Patent dated July 17, 1860.—This invention consists in the employment of a pivotted lever, and in the combination of the same with other devices.

Claim.—The lever *b* and staff A, in combination with roller *a* and link *d*, substantially as and for the purpose specified.

No. 29,149.—J. W. DURHAM, of Durhamville, Tenn.—*Improved Engine for Employing Steam or any other Aeriform or Gaseous Body under Pressure to obtain Motive Power*.—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—An engine, composed of an endless chain of buckets, arranged within a box of water, with suitable pipes or other means of ingress and egress to and from the said box, the whole being constructed, arranged, and combined so as to produce an operation substantially as described.

No. 29,150.—ADAM ERNST and C. SHEPARD, of Milwaukie, Wis.—*Improvement in Hot Air Furnaces*.—Patent dated July 17, 1860.—The whole furnace is surrounded by brick work, and suitable flues lead from its space within the brick work, and around the furnace, to the apartments to be supplied with hot air.

Claim.—Combining the flues of a furnace, surrounded by double walls, with collars S, and covers R U W V, substantially as and for the purposes described

No. 29,151.—CHARLES J. FERGUSON, of New York, N. Y.—*Improved Clothes Frame*.—Patent dated July 17, 1860.—A is a shaft arranged to revolve in and between two upright pillars or posts B, connected at the bottom by a bed piece or tie C, the fixing of which to the ground or otherwise, maintains the entire machine firmly in proper position. Near each end of A, and inside or between the uprights B, are fixed two counterpart metallic hubs D bearing eight equi-distant arms *a*.

Claim.—The combination, with the reel, of the revolving slats, the cog-wheel G, and endless screw or worm H, arranged and operating together in the manner and for the purpose specified

No. 29,152.—AUGUST FRIEDRICH and CONRAD WALTER, of New York, N. Y.—*Improvement in Tobacco Boxes*.—Patent dated July 17, 1860.—This improvement consists in providing the box with a vertical plate secured to a spring, for the purpose of compressing tobacco contained within the box.

Claim.—The combination of the vertical plate *b* and spring *a* with the segment-shaped bow *c e¹ g*, substantially in the manner and for the purpose described.

No. 29,153.—JOHN U. FIESTER, of Winchester, Ohio.—*Improvement in Shovels*.—Patent dated July 17, 1860.—The scoop or shovel bowl *A* has edges or sides *a*. *B* is a hinge at the upper end of the scoop, by which it is hinged to the lower handle *C*. *D* is the upper handle, similar to the handles of other spades or shovels. *E* is a short metallic lever extended to the handle *D*, and fastened therein by a ferule.

Claim.—The lever-hinged shovel, constructed and operating as described and for the purposes set forth

No. 29,154.—C. J. FISHER, of Waukwow, Iowa.—*Improvement in Horse Collars*.—Patent dated July 17, 1860.—*A* represents the two parts of the collar, and the lower ends connected by the strap *B*, or by any suitable snap. In the upper end of each part *A* a slide *C* is fitted; the slides are perforated with holes, and their outer ends may be connected by a strap *D*.

Claim.—The combination of the curved and pivotted hames *E E*, having their ends connected at *F*, and provided with socket joints *G*, with the divided collar *A A*, in the manner and for the purpose substantially as shown and described.

No. 29,155.—JOSEPH H. FISHER, of Placerville, Cal.—*Improvement in Fastening Handles to Picks and Other Tools*.—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination, with a handle which extends partly into the eye of the pick, and has a socket in its rear end, and two shouldered spring straps at its sides, of a portable wedge constructed with a tongue and a gib, and a key seat or slot.

No. 29,156.—HENRY C. FOOTE, of McGaheysville, Va.—*Improved Pocket Calendar*.—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The calendar composed of the three perforated plates *A A¹* and *B*, held in place by a split ring, or its substitute, as and for the purposes set forth.

No. 29,157.—MAHLON J. GALLAGER, of Savannah, Ga.—*Improvement in Breech-Loading Fire Arms*—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—In combination with a breech-loading gun, in which the cartridge chamber is divided at or near its middle, and a lever and link connection for sliding and tipping the barrel, the slide piece *h*, and guiding ways *g*, and opening *k*, or their substantial equivalents, for causing the barrel, when opening up the cartridge chamber, to move in a right line before it swings on its pivot, substantially in the manner and for the purpose described.

No. 29,158.—BENJAMIN GARVEY, of New York, N. Y.—*Improvement in the Manufacture of Bread*.—Patent dated July 17, 1860.—This invention consists in removing the atmospheric pressure when the materials have been mixed to such a degree that the air diffused through the mass shall, in virtue of the elastic force inherent in it, expand the requisite raising or lightness.

The inventor says: I *claim*, first, the process described of employing atmospheric air, by exhaustion, to produce lightness in bread, cake, confectionery, &c., without the aid of ferments, chemicals, or drugs of any kind.

Second. I claim the same process to insure the raising of bread, &c., under all circumstances, when ferments or chemicals are employed.

No. 29,159.—JOHN GEHR, of Clear Spring, Md.—*Improvement in Hominy Machines*.—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The wheel *C*, having spikes projecting from its side surfaces, and having its entire surface, spokes and all, serrated or ribbed in the manner set forth, when the same is arranged within a drum *E*, with spikes projecting from its sides inside; the whole being arranged in the manner and for the purposes set forth

No. 29,160.—WILLIAM GOWEN, of Wausau, Wis.—*Improved Washing Machine*.—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the corrugated stationary wash board *E*, and the corrugated reciprocating spring rubber *F*, in combination with the double crank

shaft *f*, hooks *h*, and frame A of a table, constructed and operating substantially as and for the purpose specified.

Second. The combination, with the crank shaft *f*, and rubber carrying frame G, of the double rotary hook H, substantially in the manner and for the purpose specified.

No. 29,161.—JOHN C. GREGG, of Hillsboro', Ohio.—*Improvement in Grain Separators*.—Patent dated July 17, 1860.—This invention consists in a peculiar combination of concentric screens and spiral conductors for the separation of different kinds of grain.

Claim.—The combination of screens A B C, spiral conveyors E E¹ E², and apertures d¹ b c c¹, substantially as and for the purposes set forth.

No. 29,162.—LOURE GREEN, of Great Bend, Pa.—*Improvement in Ploughs*.—Patent dated July 17, 1860.—This invention consists in constructing and combining the several parts of the plough.

Claim.—The arrangement and combination of the mould board Z, share Y, landside Q, and standard X; the whole being constructed as and for the purposes described.

No. 29,163.—ASA GREENWOOD, of Toulon, Ill.—*Improved Clothes Frame*.—Patent dated July 17, 1860.—A is a rod or pole, provided with a hub, or cap B, and a slider C. A series of radial arms D is connected to the cap B, each arm being hinged to the cap, so as to be capable of being turned through a quadrant of a circle, and either parallel with, or at a right angle to, the pole A. Another series of arms E is similarly applied to the slider C, which is so adapted to the pole A as to be capable of being moved thereon, both toward and away from the hub B, is stationary on the pole.

Claim.—The combination and arrangement of two sets of radial arms D D D E E E, and one set of parallel bars F F F, together and with the pole A, stationary cap B, and slider C, substantially as specified.

No. 29,164.—WILLIAM D. HALL, of Hamden, Ct.—*Improvement in Fish Oils*.—Patent dated July 17, 1860.—This invention consists in the process of boiling the fish in the water until the sounds, or air bladders, have burst, or have been dissolved, so as to allow the air to escape, when the residuum, or solid portion of the fish, will sink to the bottom, while the oil, in a clarified state, will float upon the top of the water, entirely separated by a stratum of water from all the solid substances, when the oil may be drawn off in any convenient way.

Claim.—As an article of manufacture, an oil extracted from fish in the manner set forth.

No. 29,165.—AMOS B. HARLAN, of Ercildown, Pa.—*Improved Washing Machine*.—Patent dated July 17, 1860.—This invention consists in the arrangement and combination of the different devices.

Claim.—The arrangement of the swinging beater *d*, and pins *i i*, when used in combination with the open revolving wheel provided with bevelled slats, substantially as and for the purpose specified.

No. 29,166.—JACOB A. HARTSFIELD, of Kinston, N. C.—*Improvement in Cotton Cultivators*.—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of A, the main frame; A¹ and A², the cross bars; E and E¹, the scrapers; G, the gear wheels; C, the shaft; D, the chopper; F, the guide pole; H, the handles; B and B¹, the vertical posts; c and c¹, the slots; d¹, the slot in revolving shaft; a¹, the pinion gear wheel; and F¹, the hounds; the whole being constructed and combined as described, for the purposes set forth.

No. 29,167.—FRANCIS P. HELLER and ELIAS YOUNG, of Cincinnati, Ohio.—*Improvement in Warm Air Furnaces*.—Patent dated July 17, 1860.—This invention consists in an arrangement of warm air passages and flues for the more effective, equable, and healthy action of this class of furnaces.

The inventors say: We *claim*, first, the combination of the vertical diaphragms *c*, with the drum C, and tubes G and G¹, operating in the manner and for the purposes set forth.

Second. The arrangement of the air reservoir E, annular air and smoke chambers *a* and *b*, and tubes G G¹ G², operating in the manner and for the purposes explained.

No. 29,168.—DANIEL HEMINGWAY, of Covington, Ky.—*Improved Fire Place and Chimney*.—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the aperture in the back of fire places, to be closed by sliding doors, in combination with a cooking stove or range in the rear, substantially as and for the purposes specified.

Second. I claim the enlarged space on each side and above the mantel, as arranged, the

contracted flue above, the metal plates in front, the partition in the top, and small outlets, all in combination as specified, for the purposes set forth.

No. 29,169.—THOMAS S. HEPTINSTALL, of Mendota, Ill.—*Improvement in Gang Ploughs*. Patent dated July 17, 1860.—This improvement consists in the arrangement of the several parts.

Claim.—The peculiar arrangement of the frame A, plough B, arms F, with wheels attached, lever C, with castor wheel on its lower end, connecting rod H, lever *a*, curved rack *i*, and pinion *x*, operating by means of crank handle *b*, when the several parts are connected substantially as and for the purpose specified.

No. 29,170.—J. S. HICKEY, of Pike, Ill.—*Improvement in Grain Binders*.—Patent dated July 17, 1860.—This invention consists in the arrangement and combination of mechanism to simplify the construction and facilitate the operation of the machine.

The inventor says: I *claim*, in combination, with a binding mechanism arranged on the rear edge of the platform of a harvester, and operated by hand, the vibrating lifter B, and bifurcated foot lever B¹ I, constructed, applied, and operating as specified for the purpose set forth.

I also claim, in combination with the slotted pinion L, and a slotted holder bar *b*, the vibrating shear *d d*², and hook *c*, and actuating cam *m*, and spring *e*, when the whole is arranged to operate substantially as described, for the purpose set forth.

No. 29,171.—JAMES HOTCHKISS, of Yellow Springs, Ohio.—*Improvement in Brick Machines*. Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination and arrangement of the single spiral wing H, and the double spiral wings I I, turning in opposite directions and both producing a downward action, substantially in the manner and for the purposes specified.

No. 29,172.—JAMES Y. HUMPHREY, of Philadelphia, Pa.—*Improved Mica Chimney for Lamps*.—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the tapering cap *b*, with the mica tube A *a*, and metal ring or supports *c c*¹ *g g*¹, as and for the purpose described.

No. 29,173.—(Suspended.)

No. 29,174.—LAWSON C. IVES, of Hartford, Ct.—*Improvement in Thread Polishing Machines*.—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a rotating, polishing surface, composed of alternate brushes and rods, substantially as described; and this I claim also, when an apparatus for heating either the rods or the brushes, or both of them, substantially such as specified, is combined with such a polishing surface.

Second. A rotating polishing brush, in combination with an apparatus substantially such as specified, for drying and heating the brushes, and in combination with a size vat.

No. 29,175.—CHARLES JONES, of Philadelphia, Pa.—*Improvement in Stoves*.—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—As a new article of manufacture, a stove provided with a flue from the space below the grate to the space above the fire within the outside case of the stove, for the purpose specified.

No. 29,176.—HERMANN KALLER, of Perry, Ill.—*Improvement in Seeding Machines*.—Patent dated July 17, 1860.—The object of this invention is to facilitate and perfect the seed dropping operation, and also to render the shares capable of being more readily raised by the driver than heretofore.

Claim.—The arrangement of the rods *ff*, bars K, distributing wheels J, spouts E, runners H, levers L M, castor wheel N, and frames A D, as and for the purpose shown and described.

No. 29,177.—HENRY KAY, of Brooklyn, and THOMAS AVERY, JR., of Morrisiana, N. Y.—*Improvement in Planishing Copper Vessels*.—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The application of the screw, nuts, and link, as described, to the head or heads in the interior of the work, for adjusting and controlling the position of the heads from the outside during the operation of planishing, rivetting, &c., as set forth.

No. 29,178.—LORENZO D. LANE, of Freeport, Ill.—*Improved Governor Attachment to Grain Separators*.—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment or use of a governor F, connected, substantially as shown, to slides *y y* fitted over the blast induction orifice *x* of the fan of a grain separator, for the purpose set forth.

Second. Connecting, substantially as shown, with the governor F the link slide *h* fitted in the slotted bell crank *d*, and arranged to operate as and for the purpose specified.

Third. Attaching the shaft *l*, of the governor F, to the platform D, which is fitted on an axis and adjusted by screws *k*, or their equivalents, for the purpose set forth.

No. 29,179.—THOMAS LANGDON and CHRISTIAN WEITMAN, of Hazleton, Iowa.—*Improved Broom*.—Patent dated July 17, 1860.—This invention consists in the use of a screw iron of a T-shaped metal cap for the ends of the whisps of broom corn, two clamping plates between which the T-iron is interposed, and a handle that secures the whole together.

Claim.—The combination of the T-piece B, its rod C, clamping plates D D, cap B, nut *a*, with the handle A, all relatively arranged in the manner set forth.

No. 29,180.—JOHN LEMMAN, of Cincinnati, Ohio.—*Improvement in Hoisting Apparatus*.—Patent dated July 17, 1860.—This invention consists in an apparatus designed for the purpose of hoisting and lowering merchandise and heavy bodies; it is adapted to the ordinary hatchways of vessels and warehouses.

The inventor says: I *claim*, first, the pulleys M K U and the tension pulley R carried by the bar S, all arranged and operating substantially as and for the purpose described.

Second. The system of gearing, composed of gear wheels G G H H I I and racks F F, all arranged and operating substantially as and for the purpose described.

No. 29,181.—JOHN H. LYON, of New York, N. Y.—*Improved Seal Lock for Railway Cars*.—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination, with the ends *c c* of shackle A, of the soft metallic rivet B, as and for the purpose shown and described.

Second. Bevelling the ends *c c* of the shackle A, as and for the purpose shown and described.

Third. Making the hole in the shackle which receives the fastening rivet of conical or bevelled form, so that, by the act of opening, the rivet cannot draw through the hole, but will break in or about its middle, as and for the purpose shown and described.

No. 29,182.—GILBERT S. MANNING, of Springfield, Ill.—*Improvement in Excavating Machines*.—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the spring mould board, for the purpose of allowing stones and other substances to pass between the plough and the bucket wheel, thus preventing choking the machine, substantially as set forth.

Second. The spring plate in combination with the wheel A, substantially as set forth.

Third. The use of the wheel B, the same being adjustable both vertically and laterally, the whole being arranged and operated substantially as set forth.

Fourth. The forked guides K and S in combination with the hinged mould board, substantially as set forth.

No. 29,183.—P. T. MAYNE, of Keosauqua, Iowa.—*Improvement in Excavating and Grading Machines*.—Patent dated July 17, 1860.—This invention consists in the combination of hinged spades hung to central disks, with a wheel, the rim of which is provided with stops.

The inventor says: I *claim*, first, the combination of the hinged spade *c* hung to its central disks *e*, with a wheel, the rim *a* of which is provided with stops *b*, substantially as and for the purpose set forth.

Second. An angular frame *n*, pivotted at one end and bearing with the other end upon the tongue *k*, in combination with pulleys *q s t* and rope *p*, substantially as and for the purposes set forth.

No. 29,184.—MATTHEW C. McCULLERS, of Herndon, Ga.—*Improvement in Ploughs*.—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Securing the beam handles and mould board together by means of the braces C D, straps *d*, and pins or bolts 2 3, the whole being constructed, arranged, and united substantially in the manner set forth and explained.

No. 29,185.—THOMAS MCINTIRE, of Franklin Furnace, Ohio.—*Improvement in Cotton Bale Fastenings*.—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The new article of manufacture herein described, to wit: a stiff metal tie plate for cotton bale hoops, made with T-slots in it, a transverse stop bar C between the slots, and two vertical square shoulders *a a* at the termination of the slots and below the under side of the bar C, for use in combination with a cotton bale hoop which has T-shaped ends, in the manner and for the purpose described

No. 29,186.—JOHN E. MCNAIR and JOHN C. ELLIOTT, of Augusta County, Va.—*Improvement in Railroad Gates*.—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the curved levers A A, connecting rods E E, eccentrics B B¹ B², connecting rods L, and levers C C, with the gate, which slides in grooves in the posts, and which is provided with cords and pulleys for elevating it, when the several parts are connected and used substantially as and for the purpose set forth.

No. 29,187.—LEMAN C. MINER, of Hartford, Conn.—*Improvement in Attaching Thills to Vehicles*.—Patent dated July 17, 1860.—This invention consists in the arrangement of the shackle and shaft, connecting with the axles of carriages, to prevent rattling.

Claim.—The projection on the bolt D and the arrangement and insertion of an elastic and compressible substance in the countersink of the jaw or jaws of the clip A, all in combination in the manner substantially, and for the purpose, as set forth and described.

No. 29,188.—T. J. NEWLAND, of Wolcott, Vt.—*Improvement in Corn Shellers*.—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the rigid angular frame with the stationary plate P, movable plate B, adjustable bearing piece D, adjustable guide piece C, adjustable hook *c*, eye *b*, in position described, spring S, roller *r*, when these parts are arranged for joint operation as and for the purpose set forth

No. 29,189.—JOHN PAFF, of Eden, N. Y.—*Improved Churn*.—Patent dated July 17, 1860. This invention principally consists in the construction of the dashers and their arrangement on the dasher rod.

Claim.—The dashers K and L, provided with inclined wings *l l*, as described, secured one above the other loosely on the dasher rod I, the connection with said dasher rod being effected by means of the grooves *m m* and pins *n n*, the whole arranged, combined, and operating substantially in the manner and for the purposes specified

No. 29,190.—LEONARD PARKER, of Winterset, Iowa.—*Improved Rat Trap*.—Patent dated July 17, 1860.—This invention consists in an arrangement of transparent guards, in combination with drop doors, placed on the ordinary rat trap, furnished with a conductor or passage, which is perforated for the purpose of admitting light into it.

Claim.—The combination of the transparent guards, consisting of uprights C, and glass *x*, drop doors *b*, and conducting tube *f*, when used in connection with the ordinary rat trap, the whole being combined, arranged, constructed, and operated in the manner described and for the purpose set forth.

No. 29,191.—WORDEN P. PENN, of Belleville, Ill.—*Improvement in Seeding Machines*.—Patent dated July 17, 1860.—A represents the frame of the machine, and L the axle upon which the wheels are fixed to transport the machine; B is the hopper box for the grain, and C the hopper box for the grass seed.

Claim.—The arrangement of the hook and cam bracket Q on the bar P, and, with the bracket *d* on the bar I, to open and close the valves *b b*, in the manner set forth.

No. 29,192.—ANCEL W. PORTER, of St. Johnsville, N. Y.—*Improved Metal Cap for Axe Helves*.—Patent dated July 17, 1860.—This invention consists in providing an axe head with an adjustable head, and also in providing the helve with a suitable tenon, in order to secure the head of the helve firmly in its position.

Claim.—The head or cap for axe helves manufactured of metal or any suitable material, and constructed as described, so as to be readily attached to the helve, in the manner as set forth and specified.

No. 29,193.—IGNAZ RAMMINGER, of New York, N. Y.—*Improvement in Detachable Whiffletrees for Vehicles*.—Patent dated July 17, 1860.—This invention consists in the construction and operation of an apparatus which is intended to be attached to the axle of a vehicle, and

by the use of which the horses, when running away, may be quickly detached from the vehicle.

Claim.—The use or employment of the rods G G, provided with the right handed (I) and left handed (J) screw threads, in combination with the spring O, strap R, provided with handles S, hub L, and axle B, when the same shall be arranged and operated in the manner described and for the purpose as set forth.

No. 29,194.—SILAS G. RANDALL, of New Britain, Conn.—*Improvement in Hay Presses.*—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the arrangement of the platen O and its double rock bars L L with the sliding frame K K, the actuating detents *e e*, the driving shaft R, the cam *g*, and the retaining detents *e¹ e¹*, substantially in the manner and for the purpose set forth.

I also claim the grooves *j j* in the upper and lower sides of the compressing box, in connection with the grooved angle blocks *i i*, combined with the platen of the press, and the apertures *n* in said platen, all substantially as set forth.

No. 29,195.—CHARLES L. RICE of Milwaukee, Wis.—*Improvement in Pumps for Locomotive Engines.*—Patent dated July 17, 1860.—The cross pieces *x x*, being a part of the caps, are removed with the caps, and, when in place, in connection with the projections *i i*, hold the caps firmly in position.

The inventor says: I *claim*, first, constructing the valve chambers and air chambers of one piece, and arranging them in relation to each other, as set forth.

Second. The cross pieces *x x*, and the cap in connection with the projections *i i¹ i² i³*, constructed and arranged as and for the purposes described.

No. 29,196.—MARK RIGILL and W. D. IVEY, of Dawson, Ga.—*Improvement in Cotton Cultivators.*—Patent dated July 17, 1860.—A guard wheel G is attached to a brace or plate H on a fulcrum *d*, the brace or plate H being pivotted at the end *e*, while its other end is perforated with the holes *f f*, whereby it can be adjusted to set the wheel G up or down, by means of the bolt *g*, which passes through the beam A and one of the holes *f* in the plate H.

Claim.—The arrangement of the guard wheel G, plate H, adjusting rod F, with the beam A and standard E, as and for the purposes set forth.

No. 29,197.—GEORGE A. ROLLINS, of Nashua, N. H.—*Improved Machine for Crushing Stone.*—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the crushing chambers E¹ E¹ with a central vibrating crushing block, for the purposes stated.

Second. The combination of the corrugated jaws D¹ D¹ and adjusting screws *f¹ f¹* with the central block D, constructed and operating substantially as set forth.

Third. The combination of the shaft *e*, eccentric *e¹*, and sliding piece *f*, with the crushing block D, substantially as set forth.

No. 29,198.—EDWARD L. SEYMOUR, of New York, N. Y.—*Improvement in Ore Separators.*—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of a series of horizontal and stationary sieves, each acted upon by an air blast from bellows, when arranged in steps, as explained, and so that the pulverized ore driven from each preceding one by the air blast shall fall upon and supply the next, all in the manner and for the purpose made known.

Second. With sieves so acting and arranged, the combination of the transverse ribs *i i i*, &c., for the purpose set forth.

No. 29,199.—WILLIAM M. SLOANE, of Buffalo, N. Y.—*Improvement in Stave Machines.*—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The application and use of the drums A A, when constructed in the barrel form, in combination with the formers F F F, so that the stave may be chamfered and crozed while it is bent in the exact form, or nearly so, which it will occupy when set up in the barrel, substantially as described.

No. 29,200.—FREDERICK E. SICKELS, of New York, N. Y.—*Improvement in the Mode of Steering Vessels.*—Patent dated July 17, 1860.—The principle of this invention consists in bringing to the aid of the steersman the power of steam, so arranged as to alternately move and hold the rudder of the vessel in any required position, according to the action of the steersman

The inventor says: I *claim* the combination of the rudder of a vessel with machinery to cause the power of steam, in connection with the action of the steersman, to alternately move and hold the rudder.

I also claim the specific arrangement of machinery shown, or any other substantially the same, for the purpose specified.

No. 29,201.—C. W. STAFFORD, of Burlington, Iowa.—*Improvement in Mole Ploughs*.—Patent dated July 17, 1860.—This improvement consists in a novel mode of supporting, bracing, and operating the mole tooth, with its attachments, for the purpose of regulating its depth below the surface of the ground, and to run it into or out of the ground at pleasure.

Claim.—The adjustable saddle N, in combination with the mole tooth and its coulter I, arranged and operating in the manner and for the purpose set forth.

No. 29,202.—WILLIAM A. SUTTON, of New York, N. Y.—*Improvement in Sewing Machines*.—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Combining a rocking lever D, which has a curved slot E F G near its forward end, with the eccentric pin H upon cam shaft P, which latter is arranged near the front end of the machine and near the shuttle and the cloth feeder, with the cams L K N T¹, pin R¹, hinged shuttle driving device Q T, and cloth feeding mechanism E W Z, substantially as and for the purposes set forth.

No. 29,203.—ISAIAH W. TABER, of New Bedford, Mass.—*Improvement in Lamps*.—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Locating the independent air chamber *e* in the space between the flat wicks of said lamp, and then supplying the said chamber with air through the medium of independent induction tubes *g g*, when the united flame produced by both of said wicks is made to pass up through a slit in the deflector *c*, which surmounts the perforated sides *b* of the outer air chamber of said lamps, all substantially as set forth.

No. 29,204.—EPHRAIM U. THOMPSON, of Bristol, Me.—*Improvement in setting up Ships Rigging*.—Patent dated July 17, 1860.—This invention consists of a device for grasping the ends of the shrouds, so that when the shrouds are set up every fibre bears its proportionate share of the strain, at the same time the ends of the shrouds are sheathed and protected from the weather; and also in a peculiar construction and combination of the lanyard and jack.

The inventor says: I *claim*, first, the combination of the fid C and thimble B, constructed, applied, and operating substantially as and for the purposes set forth.

Second. The lanyard E E¹, constructed and operated substantially as described.

Third. The described combination of the jack H I J K, and lanyard E E¹, operating as set forth.

No. 29,205.—L. THORP and WILLIAM D. SHURTLEFF, of Turner, Me.—*Improvement in Railroad Car Couplings*.—Patent dated July 17, 1860.—The inventor says: I have contrived a mechanical hand which supports and guides the link and directs it into the flaring mouth of the buffer whenever the cars are brought in contact with each other, and without requiring the aid of the operative, or rendering it necessary for him to be between the cars as they approach each other.

Claim.—The hand P, operating in connection with the guide bar R, and pin *m*, or their equivalents, for the purpose specified.

No. 29,206.—HENRY D. VANDERCOOK, of Marshall, Mich.—*Improved Clap-boarding Gauge*.—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The mode of holding clapboards in true parallel lines to a building, while they are being scribed, fitted, and nailed, by means of the clamping stock A and attachments, in combination with the adjustable gauge stem G, constructed and used substantially in the manner as described and set forth.

No. 29,207.—JOHNATHAN WARNER and THOMAS C. SILLIMAN, of Chester, Ct.—*Improvement in Fastening Pins in the Bows of Ox Yokes*.—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The method of fastening pins in the bows of ox yokes by means of the upright loop or staple B, and the ring C, or their equivalents, operating substantially as described and for the purpose specified.

No. 29,208.—J. C. WHITSON, of Marion, N. C.—*Improvement in Railroad Switches*.—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of yielding bars $j\ i$, each provided with two links $m\ p$ and $n\ o$, toothed head block S , arm Z , star wheel $i^1\ j^1$, slotted disk j^2 , and wedge-shaped pawl d^1 , or their equivalents, substantially as and for the purposes set forth.

Second. The combination of the above device A , with two devices $B\ C$, each of the latter consisting of a sliding bar v^1 , and two star wheels $x^1\ y^1$, substantially as and for the purposes set forth.

Third. The combination of a slotted sleeper b , and a wedge-shaped switch bar c , with wedge-shaped and slotted lifters $o^1\ o^1$, substantially as and for the purposes set forth.

Fourth. The combination of the wedge-shaped switch bar c , wedge-shaped slotted lifters $o^1\ o^1$, and vanes p, p^1 , substantially as and for the purposes set forth.

No. 29,209.—TURNER WILLIAMS, of Providence, R. I.—*Improved Window Stop and Fastening*.—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Combining with a roller and an inclined surface, serving as a stop and support by a nipping action, a spring catch having a locking action, by means of a shank or guiding piece and a spring or constant force, whereby both the said roller and the spring catch may be controlled by a lever attached to the said shank, for the purpose substantially as set forth.

No. 29,210.—O. H. WOODWORTH, of Coffeville, Miss.—*Improvement in Watches*.—Patent dated July 17, 1860.—This invention consists in enclosing the movement of a watch or other time keeper within a case which is permanently air tight, not only during the ordinary running of the movement, but while it is being wound up, or regulated, or having its hands set.

The inventor says: I *claim*, first, enclosing the movement of a watch, or other time-keeper, within a case which is permanently air tight, not only during the ordinary running of the movement, but while it is being wound up or regulated, or having its hands set, as described.

Second. I claim the combination of the setting post i , the toothed wheel m , the wheel p , the pawl r , the spring n , and ratchet wheel q , substantially as described and for the purposes specified.

Third. I claim the arbor s , with its crank t , in connection with the forked regulating lever u , substantially as described and for the purpose specified.

No. 29,211.—G. W. N. YOST, of Yellow Springs, Ohio.—*Improvement in Cotton Cultivators*.—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination and arrangement of the body of the implement and its movable ploughs B , scraper E , and standards G , constructed as described, whereby it is readily adapted to receive, in turn, the several ploughs and scraper, in order to perform the various modes of cultivation specified

No. 29,212.—ABRAM ACKER, of Ramapo, N. Y., assignor to J. S. WANMAKER & Co., of the same place.—*Improvement in Spring Hinges*.—Patent dated July 17, 1860.—This invention consists in constructing the eyes of a butt hinge somewhat larger than they are at present made for ordinary hinges, and with a sleeve joint to keep them in their proper places; and also in introducing within the tubular eyes, when the two leaves forming the hinge are brought together, a helical spring, which is connected at the bottom, and a cap that interlocks with the eye of one leaf and at the top, and to a hexagonal or octagonal nut.

The inventor says: I *claim*, first, the combination of fixed cap D , spring C , and the cylindrical cap E , with the tubular eyes $B\ B^1$, arranged and operating as set forth, in combination with a locking ring G , or any such equivalent device possessing the advantages set forth.

Second. I claim the projecting lugs on the caps $D\ E$, as and for the purposes set forth.

No. 29,213.—CHARLES R. ALSOP, of Middletown, Ct., assignor to JOSEPH W. ALSOP, of New York, N. Y.—*Improvement in Revolving Fire Arms*.—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the employment, for the purpose of forcing forward the cylinder longitudinally towards the barrel before firing, and of permitting the movements longitudinally away from the barrel, of a cam formed with a regular series of projections and recesses on its periphery, applied substantially as described, and rotating in one direction only.

And I also claim combining such cam with the hammer, either directly or indirectly, by a ratchet and pawl, or their equivalent, in such manner as to be operated by the cocking of the hammer, substantially as described, but to remain stationary during the fall of the hammer

No. 29,214.—LESTER BUTLER, of Kenosha, Wis., assignor to himself and C. B. FORD, of the same place.—*Improvement in Railroad Gates*.—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The application of the spiral groove attached to either the posts of the gate or to the cross piece G, in combination with the construction of the rails, as set forth, as and for the purpose described.

No. 29,215.—SAMUEL FAVINGER, of Philadelphia, Pa., assignor to himself and ABSALOM BARNED, of the same place.—*Improvement in Smut Machines*.—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the fan chamber G, with its vanes H, when arranged in respect to the hopper *p*, the passage *m* and *q*, and the casing L containing the burr K, substantially as and for the purpose set forth.

Second. I claim the peculiar construction of the tapering block or burr K, with its V-shaped projections, having V-shaped ribs, as and for the purpose specified.

Third. The arrangement of the plate D, with its ribbed surface, the bar *d*, with its ribbed branches and tapering burr and casing L, for the purpose set forth.

No. 29,216.—BENJAMIN GARVEY, of New York, N. Y., assignor to himself and JOSEPH B. DAVOL, of Brooklyn, N. Y.—*Improved Arrangement for Lubricating Pistons*.—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination and arrangement of a lubricator with a piston and cylinder, a valve, or other bearing, for forcing water between rubbing surfaces, substantially as described.

No. 29,217.—BENJAMIN GARVEY, of New York, N. Y., assignor to himself and JOSEPH B. DAVOL, of Brooklyn, N. Y.—*Improved Steam Generator*.—Patent dated July 17, 1860.—A is a "couple" or cell, formed of two thin sheets of metal rivetted together with rivets so close, one to another, that they are held together with a greater force than the steam to be generated between them is calculated to exert.

Claim.—The form of steam generator, substantially described, when employed as specified.

No. 29,218.—BENJAMIN GARVEY, of New York, N. Y., assignor to himself and JOSEPH B. DAVOL, of Brooklyn, N. Y.—*Improvement in the Distillation of Coal Oil*.—Patent dated July 17, 1860.—This invention consists in using compressed air to support combustion, so that the gaseous products may be held under compression until so much of their heat has been utilized, the amount of such utilization depending upon the pressure under which they are generated, that, on being allowed to expand, they will be of about the same temperature and in the same state of elasticity as the surrounding atmosphere.

Claim.—The economizing of caloric, in the manner substantially as described, whatever form of apparatus may be employed for carrying out said invention, and to whatever purpose the same may be applied.

No. 29,219.—OTIS HOOD, JR., of Turner, Me., assignor to himself and H. G. LE BARON, of Portland, Me.—*Improved Coupling for Railway Cars*.—Patent dated July 17, 1860.—A and B show the two bunters, each being furnished with a link socket *a*; from one of them a connection link D extends, it being held therein by a pin *b* extending downward through the bunter; there is hinged to the said bunter a shackle pin supporter or frame E, and in such manner as to be capable of being moved up and down in a vertical plane.

Claim.—My improved railroad carriage coupling, having its separate parts constructed and arranged in relation to each other, and so as to operate together, substantially as shown and described.

No. 29,220.—J. T. VAN KIRK, of Philadelphia, Pa., assignor to A. VAN KIRK & Co., of the same place.—*Improved Ice Pick*.—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The pointed stem A, with its weighted handle B, in combination with the tube D, or other equivalent guide, serrated or otherwise so constructed at its lower end as to retain a hold on the ice during the descent of the said weighted stem, as set forth, for the purpose specified.

No. 29,221.—J. T. VAN KIRK, of Philadelphia, Pa., assignor to J. T. VAN KIRK & Co., of the same place.—*Improvement in Lamps*.—Patent dated July 17, 1860.—This invention consists of a tube containing a rod surrounded by a coiled spring and having a collar near one end and a disk or other suitable handle at the opposite end, the whole being constructed applied to, and combined with the flange or projections which enclose the lower end of the glass chimneys or shades of lamps, &c.

Claim.—Combining the tube G, its rods H, and coiled spring *e*, with the flange or projection which encloses the lower end of the chimney or shade of a lamp, in the manner and for the purpose set forth.

No. 29,222.—J. J. McCORMICK and J. E. JERROLD, of Paterson, N. J., assignors to J. E. JERROLD and EUGENE BEGGS, of the same place.—*Improvement in Car Springs.*—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: I *claim*, first, the employment, for the purpose of producing a car spring, of a long thin strip of sheet steel, wound up so as to form a close coil A, and fastened in this position by clamps B, or their equivalents, substantially in the manner set forth.

Second. The arrangement, in combination with the coil A, of a case C, constructed and operating substantially as and for the purposes specified.

No. 29,223.—F. W. MALLETT, of New Haven, Conn., assignor to G. F. KIMBALL, of the same place.—*Improved Felloe Machine.*—Patent dated July 17, 1860.—This improvement consists in constructing the machine with one or more pairs of cutters, fitted into proper holders or stocks so as to be adjustable, and having between the inner parts of the cutters a circular rest or guide for the felloe while being operated upon, and an adjustable and movable hook to enter into the spoke hole, to hold the felloe steady during the operation of rounding it.

The inventor says: I *claim*, first, the combination of the hook *e*, with the cutters *n n*, &c., with the guide or rest F, when constructed, arranged, and made to produce the result substantially as described.

Second. I claim the combination of the cutters *n n*, &c., with the guide or rest F, when the whole is constructed, arranged, and made to produce the result substantially as described.

No. 29,224.—LOUIS PLANER and JOHN N. SIEGL, of New York, N. Y., assignors to LOUIS PLANER, of said New York.—*Improvement in Shuttles for Sewing Machines.*—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination, with the shuttle A, bobbin D, movable centre B, and spiral spring *b*, or its equivalent, of a transversely arranged adjusting screw *c*, formed or provided with an eccentric *e*, for operating within a recess made in the movable centre, or for action against the latter in a direction contrary to that of the spring and away therefrom, the same forming an adjustable stop or locking pin to the movable centre, substantially as and for the purposes set forth.

No. 29,225.—JOHN C. PLUMER, of Portland, Me., assignor to himself and DAVID ROBINSON, of the same place.—*Improved Shoemakers' Last.*—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the longitudinal hollow or depression on the bottom of the last.

Second. The combination of the longitudinal hollow with the advanced position of the heel seat.

Third. The constricted portion of the last *c e* in combination with the longitudinal hollow

No. 29,226.—ROBERT WILLIAM SIEVIER, of Upper Holloway, England, assignor to WILLIAM LILLEY, of the State of Ohio, U. S.—*Improved Apparatus for Exhausting Atmospheric Air or Gases.*—Patent dated July 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The application to ships, mines, buildings, &c., of a jet of steam or air in a shaft or flue, in connection with the fan and director, when the said devices are constructed and arranged as specified, in the manner and for the purpose set forth.

No. 29,227.—ALBERT WILD, of New York, N. Y., assignor to DINKERSPIEL & OPPENHEIMER, of the same place.—*Improvement in Watchmakers' Lathes.*—Patent dated July 17, 1860.—This invention consists, first, in arranging on the shear of a watchmaker's lathe a sliding head, with a swinging frame, which receives the rotary cutters in such a manner that by swinging said frame backward and forward the cutter is forced towards and from the centre of the lathe spindle or of the wheel; second, in the arrangement of a pivotted two-armed lever, provided with adjustable centres to receive and hold the wheels after the same have undergone the first operation of cutting.

The inventor says: I *claim*, first, the arrangement, in combination with the shear B of a watchmaker's lathe, of the sliding head G, with the vertically adjustable part *d* and with the swinging frame H, constructed and operating in the manner and for the purpose set forth.

Second. The combination, with the spiral toothed adjustable cutter K, of the pivotted two-armed lever M, with the set screw *o*, constructed and operating substantially as and for the purpose described.

No. 29,228.—ANTHONY B. ALLEN, of New York, N. Y.—*Improvement in Mowing Machines* Patent dated July 24, 1860.—This invention relates to the means for causing the inner shoe to turn on its hinges, together with the finger bar attached thereto; also to a new and improved combination and arrangement, upon the main frame, of certain means or devices for actuating the lever which moves the finger bar.

The inventor says: I *claim*, first, in combination with the pivotted shoe supporting the inner end of the finger bar, the arrangement of the lever F and projection c, in the manner substantially as and for the purpose set forth.

Second. In combination with the lever F, operating as set forth, I claim the hand lever I, the segments H and H¹, and chain G, or its equivalents, the whole being arranged and operated in the manner substantially as and for the purposes set forth.

No. 29,229.—JOHN R. AGNEW, of Philadelphia, Pa.—*Improvement in School Globes*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the calipers C C¹, with a horizon F, and hemispheres H H¹, as set forth.

Second. In combination with a concave hemisphere the movable horizon G, turning upon a universal joint at its centre, said joint being supported upon the inner end of the semi-axial rod L, passing through the cylindrical screw Q, as and for the purpose described.

Third. The double pointed zodiacal index M, constructed and operating as described.

Fourth. I claim placing and operating an orrery, more or less complete, within a concave hemisphere or globe representing the celestial universe, substantially in the manner set forth.

No. 29,230.—S. S. BURLINGAME, of Warwick, R. I.—*Improvement in Moulds for Casting Needle Threaders*.—Patent dated July 24, 1860.—This mould consists of two jaws A B, hinged together by means of pivots a, and operated by the handles C. Each of the jaws contains one half the mould, and the jaw A is furnished with two sliding pistons or cone pieces b, which may be operated by the hand levers D, or in any other convenient manner.

Claim.—As an improved article of manufacture, a mould for casting needle threaders, made and constructed as shown and described.

No. 29,231.—JOHN A. BRADSHAW and A. FRANK COLBY, of Lowell, Mass.—*Improved Punching Machine*.—Patent dated June 24, 1860.—A is the bed piece or frame to which the working parts are attached; B is the main shaft. The cam C, on the main shaft, operates the lever D, which lever moves the sliding plate E, carrying the concentric punches F and G up and down. The cam C is a double cam, having one of its throws greater than the other, and as it revolves the lesser throw operates the small punch F, which punches the hole in the nut or washer.

The inventors say: We *claim*, first, the shifting die, in combination with the concentric punches, operated in the manner substantially as and for the purpose described.

Second. The combination of the wedge L, and punch F, in the manner substantially as and for the purpose set forth.

Third. We claim the double inclined plane d, or equivalent, for the purpose and substantially as described.

Fourth. We claim the feed rolls T T¹, operated in the manner and substantially as described.

No. 29,232.—J. H. H. BENNETT, of Hunt's Hollow, N. Y.—*Improved Wagon Brake*.—Patent dated July 24, 1860.—This invention consists in uniting the brake head and the reach by means of a hinge, so that, in backing, the brakes are turned up and the motion of the hind wheels is not interfered with.

Claim.—The arrangement of the hinge e, in combination with the reach E, and brake head G, constructed and operating substantially as and for the purpose set forth.

No. 29,233.—JOHN BEAN and BENJAMIN WRIGHT, of Hudson, Mich.—*Improvement in Grain Winnowing Machines*.—Patent dated July 24, 1860.—This invention consists in combining, with a distributing sieve, a series of sieves peculiarly formed and arranged, by means of which the grain, as it passes from the hopper, becomes equally distributed on the various sieves.

Claim.—The combination of a distributor I, with the sieves K K K, when said sieves are arranged in relation to said distributor, as set forth, for the purpose of equally distributing the grain as it is supplied from the hopper.

No. 29,234.—GEORGE E. BAKER, of Waukegan, Ill.—*Improvement in Gates*.—Patent dated July 24, 1860.—A A represents two parallel sill pieces which are secured at a proper distance

apart by end cross ties *a a* and a central cross piece *B*, the ends of which project beyond the sides of the sill pieces. This central cross piece *B* has a way or guide *b* secured to its upper surface, and the gates *C C*, which are provided with rollers, are fitted in this way, the gates being retained in a proper vertical position by posts *D D*, which are attached to the cross piece *B*, at points in line with the sill pieces *A*, and slotted vertically to allow the gates to work them through.

The inventor says: I *claim* the combination of the pivotted weighted frame *I*, with the platforms *F*, and laterally moving gates *C*, as and for the purpose shown and described.

I also claim, in combination with the pivotted locking lever *K*, bars *L*, rods *M*, and levers *N*, with the platforms *F*, and gates *C*, as and for the purpose shown and described.

No. 29,235.—G. W. R. BAYLEY, of Brashear, La.—*Improved Fastening for Nuts on Railroad Bolts*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Locking the nuts of railroad bolts by means of a nut guard *G*, inserted under them, when the same is held in place under the nuts by one or more hold down spikes countersunk into notches or recesses therein, said spike or spikes serving, at the same time, to secure the bracket and rail down to the cross tie, essentially in the manner described.

No. 29,236.—ETIENNE BERNOT, of Paris, France.—*Improved Machine for Cutting Files*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the peculiar arrangement of the buffer carrier for the manufacture of files, as described and referred to in Figs 1 and 2, drawing I, and Figs. 4 and 5 and 6, drawing II

Second. The combination of a chain composed of levers and connecting rods, with ordinary or universal joints, capable of working in all directions, as described and referred to in Figs. 1 and 2, drawing I.

Third. In the arrangement of a guide set parallel to the graver, as described and referred to in Figs. 1 and 2, drawing I, and Fig. 2, drawing II.

Fourth. In the arrangement of an eccentric, the pressure of which is proportionally exerted upon the spring as before described and referred to in the Figs. 1 and 2, drawing I, and Figs. 1 and 2, drawing II.

No. 29,237.—MATTHEW BARTHOLOMEW, of Enterprize, Pa.—*Improvement in Machines for Scouring and Separating Grain*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment or use of the rotating beaters *H I J*, placed within the case *G*, formed of perforated segments *i k m*, provided with vertical convex ribs *o¹*, at their inner sides, in connection with the central openings *g p p¹*, in plates *F K L*, to permit of a blast or draught passage at the centre of case *G*, or around the shaft *E*, as and for the purpose set forth.

Second. The combination of the spouts *B¹ C*, fan *N*, beaters *H I J*, and case *G*, when arranged for joint operation, as described.

No. 29,238.—JOHN S. BROOKS and LEAVITT S. GROVER, of Rochester, N. Y.—*Improved Gridiron*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—An improved cooking utensil, consisting of the sunken grate *c*, with the air and flame passages *e e*, at the sides thereof, frying surface *G*, and reservoir *H*, arranged and combined substantially in the manner and for the purposes shown and described.

No. 29,239.—LOUIS BONNET, of New York, N. Y.—*Improved Meat Cutter*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the shanks of the stationary knives *D*, between the flanges of the concaves, so that the inner surfaces of the open part of said shanks shall constitute a part of the hollow cylinder, all as shown and described.

No. 29,240.—THOMAS L. BRAYNARD, of New York, N. Y.—*Improved Sash Fastener*.—Patent dated July 24, 1860.—This invention consists of a hinged, or pivotted bar, or latch *a*, which, by its frame *b*, is secured to the bottom bar *c* of the upper sash, and of catch *d*, which by its frame *e* is secured to the top bar of the lower sash *j*; a spring *f* bears against the rear part of the latch, and its end rests against a projection *g*, and its flat surface against a broad base *h* of the latch.

Claim.—The spring catch *d*, and latch *a*, constructed and arranged as set forth.

No. 29,241.—JOHN BROWN, of New York, N. Y.—*Improvement in Steam Boilers*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the circulating pipes g^1 and h , formed with the casing f of the flue A, and connected to the casing d , the said flue and casings being constructed and arranged in the manner specified, to afford access for packing the joints, as set forth.

I also claim arranging the water flue guard B within the furnace, in the manner specified, when fitted with the circulating pipes i and k , connecting the same to the respective parts of the boiler, for the purposes and as specified.

No. 29,242.—WILLIAM CLEVELAND, of New York, N. Y.—*Improved Curtain Fixture*.—Patent dated July 24, 1860.—This invention consists in a spring barrel sufficient to roll up the spring and draw down the curtain when the weight of the slat is removed, combined with a weighted slat that is sufficient to overcome the spring and draw down the curtain, and with double cords arranged over pulleys or sheaves in such a manner that the weighted slat can be lifted at both ends, while the spring keeps the curtain rolled up, allowing the weighted slat to descend.

Claim.—The brackets and sheaves ff^1 , and cords $d e$, in combination with the spring roller b and weighted slat c , in the manner and for the purposes specified.

No. 29,243.—CHARLES CHITTERLING, of Dunkirk, N. Y.—*Improved Composition for Lubricating Purposes*.—Patent dated July 24, 1860.—This invention consists in a composition of oxalic acid, epsom salts, lampblack, sulphur, and black lead, which, when it is to be used, is diluted with oil and applied to the axles, or to the journals of the shafts, in the usual manner.

Claim.—The composition of the within-named ingredients mixed together in about the proportion specified, for the purposes set forth.

No. 29,244.—R. K. CAVANAUGH and H. Y. LAZEAR, of Jersey City, N. J.—*Improvement in Cooking Stoves*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the combination and arrangement, with a stove constructed as described, of the fire box B, perforated flue box H $b b$, and vertical cold air pipe G, in the manner and for the purpose set forth.

Second. We claim the smoke flue K, descending flues $c c$, flue L, and ascending flue M, combined and arranged with relation to the several parts of the stove, all as and for the purpose set forth.

No. 29,245.—JOHN V. B. CARTER, of Albany, N. Y.—*Improvement in Stove and Furnace Grates*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the arrangement of grate bars, substantially as described, in order to their being moved past each other with a reciprocating movement, for the purpose of agitating the coal.

Second. The employment of a tridental bar or bars shaped as described, in combination with the fulcrum sockets g or n , the grate bars, and the liberating bar G.

Third. The construction and arrangement of the door T, with its opening $k k$, to pass the ends of the grates, sliding door S, to keep grates in place, and niche L, with its fulcrum socket n .

No. 29,246.—THOMAS CHAMPION, of Washington, D. C., and CHARLES CHAMPION, of Eldorado County, California.—*Improvement in Gas Regulators*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, in combination with a valve and valve stem and an elastic diaphragm, a flanged nut d for connecting said stem and diaphragm, the whole being encased within an outer shell, substantially in the manner and for the purpose described.

We also claim, in combination with an enclosed diaphragm and an enclosed chamber, the air opening in the cap I and the valve J, for the double purpose of furnishing atmospheric air to the enclosed chamber when the regulator is working, and for closing said air opening should the diaphragm rupture, substantially as described.

No. 29,247.—JAMES J. CLARK, of Philadelphia, Pa.—*Improvement in Telegraphic Repeaters*.—Patent dated July 24, 1860.—This improvement consists in what is called "a repeater," or an arrangement by which telegraph lines divided into more than one circuit, shall operate with the same advantage as though the whole line were constructed in one long circuit.

Claim.—The application of springs or mercury cups, or their equivalents, in conjunction with extra local circuit or circuits, applied in the manner and for the purpose specified.

No. 29,248.—CHARLES F. CORY, of Lebanon, Ill.—*Improved Furnace Grate*.—Patent dated July 24, 1860.—This invention consists in constructing the grates or furnaces of swinging, pendant, movable, and detachable grate bars, as shown at A, and by the use of such a construction of grate bars, and the peculiar arrangement thereof in a furnace, to bring about several important results.

Claim.—The construction and arrangement of pendant, swinging, movable and detachable grate bars and grates for furnaces, substantially as set forth, shown, and described.

No. 29,249.—LUCIUS CRANDALL, of Plainfield, N. J.—*Improvement in Coal Stoves*.—Patent dated July 24, 1860.—This invention consists in the combination of a peculiarly constructed fire box capable of revolving on its axis, with a peculiar means of connecting the same with the flues, and also in connection therewith in certain specific arrangement of parts.

The inventor says: I *claim*, first, the combination and arrangement of the spherical fire chamber M, grated at the side N, and capable of revolving on the trunnions *m*, with the sliding tube R, substantially as set forth.

Second. The arrangement of the revolving vessel M, sliding tube R, case A, and dust damper *h*, substantially in the manner and for the purpose set forth.

Third. In combination with the above, the arrangement of the flues F E G, and dampers I and *e*, substantially as shown.

No. 29,250.—JOHN G. DECOURSEY, of Philadelphia, Pa.—*Improvement in Scissors*.—Patent dated July 24, 1860.—This invention consists of two blades similar to those of ordinary scissors, two springs, a knife blade, and a spring catch.

Claim.—As a new article of manufacture, the blades A and A¹, B and B¹, knife blade E, and spring catch G, or its equivalent, the whole being constructed, combined, and operating substantially as and for the purpose set forth.

No. 29,251.—JACOB DUTCHER, of Gibson, Pa.—*Improved Self-Acting Sleigh Brake*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Constructing the roller to which the draught pole is attached so as to act like a crank, as set forth, in combination with the longitudinal rods *m m*, cross rod R, lifting rods *h h*, bars B B, and knives or shoes *k k*—the whole arranged and operating substantially as set forth.

No. 29,252.—DANIEL DE GARMO, of Rochester, N. Y.—*Improvement in Potato Diggers*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, corrugating the shovel D of potato diggers, as and for the purpose specified, and giving a corresponding arched shape to the separator M.

Second. The manner of suspending the shovel D and separator M, by means of the adjustable arms *d* and the draft straps *b*, in combination with the cross rod *m* and lever K, as and for the purposes specified.

Third. Constructing the separator M of potato diggers with the fingers suspended from a single rib or stock *q*, at the front end, which leaves the interstices entirely open, thereby providing a free and unobstructed passage for the earth, vines, &c., longitudinally.

Fourth. Giving a side shake or vibration to the rear end of the separator M, as described, the front end being hung to the shovel D by the pivot *p*, thus providing a centrifugal force, which greatly facilitates the clearing of the shovel D and separator M.

Fifth. The revolving wings P, in combination with the shovel D and separator M, for the purpose specified.

No. 29,253.—JOHN DENLEY, of Warsaw, Ill.—*Improvement in Coffee Pots*.—Patent dated July 24, 1860.—A is the outer case of the pot, which is made of the ordinary size and form, and has the usual spout D attached. Arranged in the lower part of the spout is a cup C of smaller diameter than the pot, and having a circular flange B at its upper edge, which flange is soldered tightly to the inner wall of the pot A, so as to sustain the cup C. The bottom of the cup C is intended to be raised above the bottom of the pot. The cup C and flange B constitute a partition, which divides the interior of the pot into an upper and lower chamber.

Claim.—The combination of the cup C, syphon F, and tube E with the pot A and spout D, as and for the purpose shown and described.

No. 29,254.—WILLIAM W. DINGEE, of York, Pa.—*Improvement in Threshing Machines*.—Patent dated July 24, 1860.—A is the shaft on which the cylinder revolves. B B are the bars into which the teeth are inserted. C is a cast iron cover. D is the concave, having teeth similar to those in the bars. E is the feed table, from which the sheaves of grain are fed.

The inventor says: I *claim* forming the cast iron cover with the double concave, as shown, and the peculiarly formed flange F at the feed opening, constructed and arranged as and for the purpose specified.

I also claim the combination of the double boxes N, cast with the hollow support O, and filled with the wood P, arranged substantially and for the purposes set forth.

I also claim, in connection with the above, securing the bevel pinion I to the cylinder head Q, as and for the purpose above described.

No. 29,255.—WILLIAM EBBITT, of New York, N. Y.—*Improvement in Switch Plates for City Railroads*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the tongue *d*, having bevelled sides at and near the ends thereof, in combination with the switch plate, containing a bevelled or undercut groove, as and for the purposes specified.

Second. The steadying portion 8 8 on the switch plate at the ends of the grooves, to take the flanges of the wheels, for the purposes specified; but this I only claim when combined with the bevelled tongue *d*, as set forth.

Third. Forming the tongue *d*, with an inclined or bevelled end taking beneath the part 2 of the switch, to prevent the same rising, as set forth.

No. 29,256.—THOMAS EARHEART, of Donelson, Tenn.—*Improvement in Grain Separators*. Patent dated July 24, 1860.—This invention consists in the use of a feed roller, placed at the discharge orifice of the hopper, and using in connection therewith a slide, adjusted in a novel way, to vary the capacity of the discharge orifice.

Claim.—In combination with the roller I, the slide G, when arranged with the rod H and rotating screw *k*, for the purpose specified.

No. 29,257.—EPHRAIM EVERSON, of Haverhill, Mass.—*Improvement in Pegging Jacks*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the arrangement of the two curved slots *d e* of the plate D, with the clamp screw and its plates, the same being for the purpose specified.

I also claim the arrangement of the slipping and holding teeth of the cammed and heel stud levers, in connection with the toe rest, so applied to the base plate as to be adjustable with reference to the heel rest, as specified.

I also claim the arrangement of the two studs *g h*, with the two reversed quadrantal slots, the clamp screw, and its plates.

No. 29,258.—ELIAS FORBIS, of London, Ohio.—*Improvement in Capstans for Ditching Ploughs*.—Patent dated July 24, 1860.—This invention consists in the employment and arrangement of the different devices.

The inventor says: I *claim*, first, the levers C C and cord *a*, or their equivalents, when both shall be operated in the manner and for the purpose substantially set forth and described.

Second. The capstan B, hinges *a a*, tongue G, slide *e*, brace or lever *x*, in combination with levers C C, cord *d*; the whole being arranged in the manner and for the purpose substantially set forth and described.

No. 29,259.—DANIEL J. FERRY, of Philadelphia, Pa.—*Improved Machine for Making Friction Wires*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the tools D and E, when arranged in respect to each other and the die F, substantially as described, and for the purpose of pressing out, punching, and cutting off in proper lengths, at one operation, the friction wires, for frictional priming.

Second. The projection *r*, with its angular opening, when arranged in respect to the tool D, substantially as described, and for the purpose specified.

Third. The guide H, with its opening C, when arranged in respect to the tools D and E, substantially as described, and for the purpose specified.

Fourth. The stop I and its recess *t*, when arranged in respect to the tool E, substantially as described, and for the purpose specified.

Fifth. The projection *y*, with its angular opening, when arranged in respect to the tool E, substantially as described, and for the purpose specified.

No. 29,260.—WILLIAM FULTON, of Cranberry, N. J.—*Improvement in Lamps*.—Patent dated July 24, 1860.—This invention relates to an improvement in round wick lamps burning coal oils and other substances that are rich in carbon, and which require a considerable amount of heated oxygen to support a proper combustion for illuminating purposes; as one

gallon of oil contains more than double the amount of carbon that the same quantity of whale oil possesses, thereby requiring a greater intensity of heat to consume the carbon of the oil.

Claim.—The peculiar construction of button G, as shown in Fig. 5 and Fig. 6, or its equivalent, in combination with the gauze wire plates C and D, as shown in Fig. 2, or the perforated plates C and D, as shown in Fig. 3, the whole being arranged substantially as and for the purpose set forth.

No. 29,261.—HENRY FELLOWS, of Bloomfield, Ind.—*Improvement in Water Wheels.*—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The attaching of the curved flanches D to the bottom of the penstock A, so as to project within the wheel and form scrolls and water passages *ee* at the inner sides of the buckets, or between the same and the shaft C and chutes E, all being constructed, arranged, and operated in the manner and for the purpose set forth.

No. 29,262.—THOMAS J. FITZPATRICK, of New Orleans, La.—*Improved Chimney Cap.*—Patent dated July 24, 1860.—The part *b* is circular, and mounted on the chimney. In this part is placed the bar *c*, held in position by the cross bars *d*; this bar *c* passing through the guide *f*, which is joined to the upper plate, that has also the step *e* attached, to take the end of bar *c*, on which the cap is suspended, and revolves a pin passing through the bar at *o*, above *f*, to secure a permanent position.

Claim.—The combination of cap *a*, pipe *b*, and bar *c*, made and operated as and for the purpose set forth.

No. 29,263.—JAMES FLATTERY, of Brooklyn, N. Y.—*Improvement in Faucets.*—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Suspending the valve vertically beneath the valve seat solely by the flexible disk or diaphragm D, substantially as described, when said valve is completely detached from and acting independently of the spigot handle G, in the manner and for the purposes specified.

No. 29,264.—WILLIAM FLOWERS and Z. S. PATTON, of Bangor, Me.—*Improved Boat Lowering Apparatus.*—Patent dated July 24, 1860.—This invention consists in certain devices for the purpose of expeditiously raising and lowering a boat.

The inventors say: We *claim*, first, the disks *l*, and pawls *p*, for locking the davits E E¹, operating substantially in the manner described.

Second. Lifting the pawls by the movement of the cradle H, substantially as set forth.

Third. The above described boat-lowering apparatus, consisting of the davits E E¹, with their locking apparatus, the winch D, with its pawl *v*¹, and brake lever *v*, and the pawls *f*, arranged and operating in the manner substantially as specified.

Fourth. The blocks F, with their hooks *m*, substantially as described.

No. 29,265.—GEORGE GAGE, of Kendalls Mills, Me.—*Improved Secretary Bedstead.*—Patent dated July 24, 1860.—The secretary case A is constructed with apartments, or chambers, C D E, disposed on opposite sides of a partition *f*.

Claim.—The arrangement of the chambers D E with the case A, the bed frame and the stationary part B, arranged and operating as described.

No. 29,266.—BIRDSILL HOLLY, of Lockport, N. Y.—*Improvement in Pumps.*—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of the curve-flanged spout section B, with the side plates A A, and cross bolts *b b*, so as to furnish a suitable and convenient support for the pump cylinder and its dependent parts, and a ready means of reversing the position of the spout; the whole constructed, arranged, and operating substantially as specified.

I also claim the arrangement and combination of the adjustable fulcrum yoke G, and arcs L L, having adjusting holes therein with the lever H, having a curved short arm with adjusting holes *cc* therein; all substantially as and for the purpose specified.

I also claim the connecting link *m*, between the piston and valve *k*, in combination with the notch *o*, and the stop *w*, operating substantially as and for the purposes set forth.

No. 29,267.—HENRY HUMPHREYVILLE, JR., of Strasburg, Pa.—*Improvement in Hot Water Apparatus.*—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The vessel L, provided with a removable perforated partition M, and valve V, combined with and secured to the furnace by means of the tubular screw K, and adjustable burrs B B¹, on said furnace, substantially as and for the purposes specified.

No. 29,268.—WILLIAM CLEVELAND HICKS, of Boston, Mass.—*Improvement in Sewing Machines*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The application to a single-thread sewing machine of an automatic feeding apparatus or device, operating in concert with an eye-pointed needle and looper, or their equivalents, so as to make a succession of chain stitches of different lengths, so that the long stitches in a seam are connected by one or more short stitches alternately, substantially as and for the purpose or purposes set forth.

No. 29,269.—ISAIAH HODGSON, of New Michigan, Ill.—*Improved Mole Ditching Machine*. Patent dated July 24, 1860.—A represents a beam made of any suitable length and strength, having two stay plates B B secured near its rear end to both the top and the bottom surface, and recessed into the beam. Through this beam, and through the stay plates, passes a standard C, the front edge of which is a knife edge, thus making it serve as a coulter. This coulter passes perpendicularly through the beam, and is fixed in any desirable position by a key *a*.

Claim.—The combination of the scraper J and shaft *e*, with the revolving mole G and coulter C, as and for the purpose shown and described.

No. 29,270.—SHELDON S. HARTSHORN, of New Haven, Ct.—*Improvement in Buckles*.—Patent dated July 24, 1860.—This improvement consists in making the buckle of two pieces of wire, of any suitable kind of metal, by swaging them into shape, and then putting them together so that the tongues will rest across the shanks of the bow part.

Claim.—As a new article of manufacture, the combination of the tongue part with the bow part, when the whole is constructed for use substantially as described.

No. 29,271.—JOSEPH F. HAMILTON, of Pittsburgh, Pa.—*Improvement in Pumps for Steam Engines*.—Patent dated July 24, 1860.—This invention consists in the use of a stopper, or regulating valve, placed in one of the receiving ports of the cylinder of the engine, for the purpose of regulating the power used for lifting and forcing the plunger of the pump.

Claim.—The use of the stopper or regulating valve *i*, when placed in the receiving port *h*, and used as described, and for the purpose set forth.

No. 29,272.—B. B. HOTCHKISS, of Sharon, Ct.—*Improvement in Projectiles for Rifled Ordnance*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the tapering body B, and the corresponding form of the belt D, in combination with the cap piece F *f*, or its equivalent, for the purpose of expanding D equally and to a definitely controlled extent at each end, substantially as set forth.

Second. Causing the edge of the cap F to embrace a portion of the belt D, so as to lock and confine D at that edge, substantially as and for the purposes shown and described.

Third. The combination of the lip C, at the forward edge, with the means herein described of confining the rear edge of the belt D, for the purpose of retaining the parts of the latter between them when burst open or otherwise fractured, as set forth.

No. 29,273.—JULIUS HORNIG, of Newark, N. J.—*Improvement in Window Sash Fastenings*. Patent dated July 24, 1860.—This invention consists in the use of an eccentric fitted within a suitable plate, so arranged and applied to the sash as to effect the desired result.

Claim.—The combination of the eccentric C, and plate D, applied to the sash B, and arranged relatively with the stile *d* of the frame A, to operate as and for the purpose set forth.

No. 29,274.—M. W. HELTON, of Bloomington, Ind.—*Improved Machine for Registering Fares*.—Patent dated July 24, 1860.—This invention consists in arranging a slide, connected with a rotary shaft, in such relation to a series of movable stops that, by means of said stops, the amount of motion given to the slide is regulated, thereby rotating the shaft one, or more, or only part of a revolution; also, in combining with said slide two series of stops, each to be operated independent of the other, and one to indicate the number of cents from 10 to 100, and the other the number of dollars, in combination with a registering apparatus in such a manner that, by adjusting said stops, the motion given to the rotary shaft, by means of the slide, can be regulated to correspond to any given sum of money, and to register the same.

The inventor says: I *claim*, first, the arrangement of a slide E, or its equivalent, in combination with a rotary shaft F, and stops *d*, or their equivalents, constructed and operating substantially as and for the purpose described.

Second. Combining with the slide E two series of stops *d* and *i*, and a series of registering wheels K L M N, or their equivalents, substantially as and for the purpose specified.

No. 29,275.—GEORGE Z. HOCKENBURY, of Pittsburgh, Pa.—*Improvement in Machines for Dressing Mill Stones*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The main, or power shaft *c*, having the screw *f*, the intermediate shaft *q*, and tubular crank shaft *r*, with the tool holder *k*, and table *h*, as they are arranged and operated for giving the tool the vertical and feeding motions, as set forth.

No. 29,276.—C. E. L. HOLMES, of Waterbury, Conn.—*Improvement in Forming Seamless Tubes*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The process described for making seamless tubes, which consists in casting the metal with a thin metallic strip in its centre and then rolling the same, in the manner and for the purpose shown and described.

No. 29,277.—JOEL W. HOPPER, of New York, N. Y., assignor to E. G. ALLEN, of Boston, Mass.—*Improved Low Water Detector for Steam Boilers*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Forming in the pipe *n*, that communicates with the boiler, an air chamber or space between the water in the said tube and the fusible plug, as set forth and for the purposes specified.

No. 29,278.—ENOCH HIDDEN, of New York, N. Y.—*Improved Portable Water Closet*.—Patent dated July 24, 1860.—This invention consists in the employment, in connection with any suitable vessel, of a sealing impervious removable lid, and also in the use, in connection with both of these devices, of a removable seat piece.

Claim.—The combined arrangement of the hinged lid *D* with the flanch *s*, the rubber packing *a*, and bucket *L*, with the removable seat piece *S*, the whole constructed and operating as specified, for the purposes set forth.

No. 29,279.—JOHN HENRY, of Lynchburg, Va.—*Improvement in Pressing Tobacco*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The construction and arrangement of a series of frames and moulds, so fitted and placed together that a large quantity of tobacco may be flattened or milled between thin boards or plates into bars or plugs, by one set of plungers, as described, for the purposes specified.

No. 29,280.—THOMAS HARVEY and NICHOLAS J. BEEKER, of Amsterdam, N. Y.—*Improved Horse Power Brake*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The self-operating brake of endless chain horse powers, which consists of the knuckle *F* and the trip lever and pulley *G*, worked by the driving belt.

No. 29,281.—CHARLES W. ISBELL, of New Haven, Conn.—*Improved Gas and Water Pipe Joint*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the wedge-shaped cavity, the shoulder *F*, and the upper and lower openings of the socket *A*, with the wedge-formed portion of the pipe *B*, the semi-circular or other projection *D*, the recess formed between the end of the pipe *B* and the shoulder *F*, the whole arranged substantially as specified, for the purpose set forth.

No. 29,282.—E. JACOBS, of Cincinnati, Ohio.—*Improvement in Iron Prisons*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Constructing and arranging plate iron cells in jails separately from each other, with vertical spaces *e* between the cells upon the same level, and horizontal spaces *f* between cells arranged one above the other, substantially as and for the purpose described.

No. 29,283.—BARTON H. JENKS, of Philadelphia, Pa.—*Improved Pattern Chain for Looms*.—Patent dated July 24, 1860.—This invention consists in dispensing with the wheel entirely and operating directly upon the chain itself. This is accomplished by making the outer surface of the chain a series of cogs.

Claim.—The use of a pattern chain *B B*, constructed with teeth upon its outer surface and operated directly by the pawl *D*, the whole being arranged and operating substantially as set forth.

No. 29,284.—W. F. JOHNSON and W. R. JOHNSON, of Wetumka, Ala.—*Improvement in*

Bridle Bits.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A bridle bit, composed of two bars A A crossed and connected by a joint or fulcrum *a*, provided with buttons *c c* and a spring *f*, to operate as and for the purpose set forth.

No. 29,285.—A. M. KARR, of Mount Pleasant, Iowa.—*Improvement in Mole Ploughs.*—Patent dated July 24, 1860.—To remove the mole and coulter from the ground, the bolts *b b* are withdrawn and one of them passed through the hole in the upper end of the coulter B¹, when, as the beam A is drawn forward, the bolt in the end of coulter B¹ will be caught in the ears I I and the mole will then swing back and be easily drawn to the surface of the ground.

The inventor says: I *claim*, first, the combination, with the mole B, of the inclined side pins *c c*, bottom groove *e*, and margin *e*¹, top groove *d*¹, and margins *d*, and rolling heel E, arranged in relation to each other as shown and described.

Second. I claim the combination of the closing scoop C, with the coulter B¹, and the scoop mole D, constructed and arranged in relation to each other as and for the purpose set forth.

No. 29,286.—SAMUEL B. LAWRENCE, of Hookstown, Pa.—*Improvement in Machines for Shocking Corn Stalks.*—Patent dated July 24, 1860.—This invention consists in the use of a peculiarly shaped three legged bench, one of the legs of which is hinged to the bench top, a windlass, hinged brace board, and a movable bar, that is placed transversely through the bench top, with a suitable cord or rope.

Claim.—The combination and substantial arrangement of the movable frame D, roller E, brace arm H, bar J, with the bench A, having one jointed leg C, as set forth, for the purpose specified.

No. 29,287.—JOHN PARKER LINDSAY, of New York, N. Y.—*Improved Cartridge Cases.*—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—As a new article of manufacture, the cartridge case made with its chambers for receiving several charges, in combination with the discharging tubes or passages, when the whole is combined, arranged, and fitted for use, substantially as described.

No. 29,288.—EDWARD LANDIS, of Baltimore, Md.—*Improved Rocking Propeller.*—Patent dated July 24, 1860.—This invention consists in securing a hobby horse upon a carriage with wheels and connecting the two in such a manner that the rocking of the horse will propel the carriage.

Claim.—The arrangement of the rockers E, with the wheels B¹, the connecting rod *c*, the crank F and platform A, so that the motion produced by the rocking is converted into a rotary motion to propel the whole machine, substantially as and for the purpose specified.

No. 29,289.—JOHN McDERMOTT, of Washington, D. C.—*Improvement in Couplings of Thills to Axles.*—Patent dated July 24, 1860.—This invention consists in an improvement in attaching shafts of carriages to the clips.

The inventor says: I *claim* the end washers *e e*, upon the shoulders or sleeves *d d*, of the shaft iron head, as set forth.

I also claim the curved segmental shoulders or guards *m m* on the lugs of the clip, in combination with said end washers and sleeves *d d*, as set forth.

No. 29,290.—HENRY MASON, of Lancaster, Mass.—*Improvement in Cotton Presses.*—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Combining the platen shaft, or any equivalent shaft, with the driving shaft, or any equivalent shaft, by means of increasing and decreasing gears, substantially as and for the purpose specified.

No. 29,291.—JAMES MONTIETH, of New York, N. Y.—*Improvement in Globes.*—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment, in combination with a terrestrial globe, of one or more figures attached to the centre thereof by one or more elastic cords or springs of proper length to pass through the shell of the globe and hold the figure or figures against the external surface thereof, substantially as and for the purpose specified.

No. 29,292.—JAMES MONTIETH, of New York, N. Y.—*Improved Method of Suspending School Globes.*—Patent dated July 24, 1860.—This invention consists in a certain mode of combining a suspended cord with the divided globe, whereby it may be suspended either in an open or a closed condition, and kept in either condition by means of said cord.

Claim.—The combination, with the globe constructed in hemispheres and hinged together, as described, of two rings or staples *a a*, and a suspended cord *b*, applied as specified, for the purpose set forth.

No. 29,293.—JOEL B. MORRIS, Ansonia, Conn.—*Improvement in Machines for Polishing Cabinet Work*.—Patent dated July 24, 1860.—This invention consists in combining with a suitable carriage that is capable of receiving a rectilinear reciprocating motion, a movable frame carrying a roller, over which passes an endless band and a yielding pressure roller that is hung in the movable frame, and constructed in such a way that it will act upon the endless band that has an emery surface and keep the band in contact with the stuff that is passed under it, however uneven may be the varnished substance.

Claim.—The combination of the travelling carriage B, movable roller frames G G, and levers I I, when the same are arranged in the manner and for the purposes set forth.

No. 29,294.—ROBERT MORRISON, of Rahway, N. J.—*Improved Coupling of Thills to Axles*. Patent dated July 24, 1860.—This invention consists in an improved mode of attaching carriage shafts to the clips.

Claim.—The combination of the swivel loop *b*, the spring latch *c*, and the clip *a*, in the manner set forth.

No. 29,295.—CYRUS MARSH, 2d, of Natchez, Miss.—*Improved Cracker Machine*.—Patent dated July 24, 1860.—In this invention the frame A supports, at its upper part, a sloping chute board B, leading to a pair of horizontal rollers C, immediately beneath which are the stamping cylinder D and pressure cylinder E. The stamping cylinder consists of a drum whose periphery is studded with marginal formers or cutters F, having the shape desired for the crackers, and being sharpened on their salient edges. In operating the machine, the dough being placed upon the chute B, it is pushed forward so as to pass between the rollers C, whence it passes in a slab of suitable thickness between the rollers D and E, the roller E acting to press the dough into the forms from which the crackers are afterwards expelled by the followers and fall upon the carrier Q.

Claim.—The described arrangement of the rollers C, stamping cylinder D, pressure cylinder E N O, scraper P, and the carrier Q; the said parts being constructed, combined, and operating in the manner and for the purposes set forth.

No. 29,296.—GEORGE W. MARTIN, of West Morrisania, N. Y.—*Improved Sub-Marine Operator*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of an apparatus for operating under water by means of a tube or well passing through the centre of a vessel, or near it, to the bottom, for the purpose of searching or working on the ground beneath, substantially in the manner and for the purposes set forth.

No. 29,297.—RICHARD MOHLER, of Lancaster, Pa.—*Improvement in Smut Machines*.—Patent dated July 24, 1860.—This invention consists in placing in the upper part of the arch of a smut machine, or rather grain separator, a chamber, so constructed and arranged that the screenings shall be separated from the scourings, dust, and other impurities.

Claim.—Placing in the arches of smut machines or other grain separators, a chamber, constructed as described, and when operating substantially as specified.

No. 29,298.—GEORGE R. MOORE, of Pittsburgh, Pa.—*Improvement in Fire Pokers*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The use of the bars *a a*, or their equivalents, to prevent the poker from clamping.

No. 29,299.—H. W. NORVILLE, of Livingston, Ala.—*Improved Wagon Brake*.—Patent dated July 24, 1860.—This invention relates to an improvement in that class of brakes which are termed self-acting, being connected with the draught pole in such a way as to be acted upon by the momentum, or gravity of the vehicle, or the backing of the team.

Claim.—The combination of the draught pole D, and lever E, the latter being connected with the brake bar G, and all arranged to operate as and for the purpose set forth.

No. 29,300.—DAVID H. NATION, of Albany, N. Y.—*Improvement in Stove Grates*.—Patent dated July 24, 1860.—This invention consists in suspending the spindle, or shaft cast to the grate, in two loops, or elongated bearings, which are secured by means of bolts to a circular frame surrounding said grate, and are made of sufficient length to allow the spindle or shaft to reciprocate freely horizontally, their upper edges being made thin to lessen friction and prevent dirt or cinders from lodging thereon.

The inventor says: I claim, first, the loops or elongated bearings E E, in combination with the reciprocating shaft or spindle D, substantially as and for the purpose specified.

Second. I claim the sliding plate F, when used in combination with the elongated bearings E, and the shaft or spindle D, substantially as and for the purpose specified.

No. 29,301.—DAVID S. NEAL, of Lynn, Mass.—*Improved Fire Escape Attachment of Horse Stalls*.—Patent dated July 24, 1860.—C is a hollow iron pipe running from the outside of the building along the edge of the feeding troughs. D D D D are smaller hollow curved pipes connecting the main pipe C and sliding in and out of two holes in the top of each of the clamps B, for the purpose of securing and loosening the two strings E.

The inventor says: I *claim* the use of the main pipe C, and the pipes D D D D, constructed as described, and operating in connection with the lever F, in the manner and for the purpose set forth.

I also claim the whips I I I I, in connection with and operated by the rod H, and the crank K, in the manner and for the purpose set forth.

No. 29,302.—GEORGE NEILSON, of Boston, Mass.—*Improvement in Coffee Pots*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination and arrangement of the receiving tunnel F, its valve G, and weighted lever H, or its equivalent, with the cafetiere or the cover of its coffee holder, the same being for the purpose and to operate as described.

I also claim the combination and arrangement of the safety valve *b*, and opening *w*, with the tunnel, its valve, and weighted lever, applied to the cafetiere, as stated.

No. 29,303.—JACOB PRINGLE, of Sumner Hill, Pa.—*Improved Mode of Obtaining Motive Power*.—Patent dated July 24, 1860.—This invention consists of a bucket wheel hung within a cistern containing water, a fire place attached to the cistern, and a blowing apparatus, with a pipe, to convey the air to the bucket or wheel.

Claim.—The bucket wheel C, cistern A, fire place D, blowing apparatus G, and the air pipe E, the whole being constructed, arranged, and operating as and for the purposes set forth.

No. 29,304.—WILLIAM S. PRATT, of Williamsburgh, N. Y.—*Improved Compensating Lever Spring*.—Patent dated July 24, 1860.—This invention consists in the production of a spring, which is most sensitive when sensitiveness is most required, that is when the pressure is the least, and which has an increasing sustaining power as the pressure or weight is increased, and which is also simple in construction and not liable to get out of order.

Claim.—The arrangement and combination of the levers A A¹ and B, substantially as and for the purposes set forth.

No. 29,305.—JACOB MARSH PERKINS, of Chicago, Ill.—*Improvement in Water Wheels*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Attaching the buckets *g* to the side piece of the wheel by the pins *x*, and arranging them upon the wheel, as set forth, in combination with the breast and under-shot chutes as described.

No. 29,306.—GEORGE PALMER, of Littlestown, Penn.—*Improvement in Adjustable Carriage Springs*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Placing India rubber, or an equivalent yielding substance, between elliptic springs for vehicles, and a similar substance on the top of the bolster or rocker, or underneath the axletree, in combination with a regulating screw and hand or thumb nut; all arranged substantially as and for the purposes specified.

No. 29,307.—WILLIAM P. PARROTT, of Boston, Mass.—*Improved Steam Pressure Gauge*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the insulation case or chamber B with the compound bar R, and the space chamber or device for generating or holding the steam; the whole being arranged substantially in the manner and to operate as described.

No. 29,308.—CHARLES T. PANGBORN, of Brooklyn, N. Y.—*Improved Alarm Water Gauge for Steam Boilers*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the flange E at the bottom of the float, which slides up and down on the stationary valve rod C, and which operates in combination with the valve B, spring D, and disk *c*, substantially as and for the purpose set forth.

No. 29,309.—BARTON PICKERING, of Dayton, Ohio.—*Improvement in Cocks*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of the hollow stem H, float valve P, and box

L, with concentric partition N, when the whole are constructed to operate substantially as described, for the purposes set forth.

I claim, in combination with a hollow valve stem, a whistle, so arranged as to be operated or sounded by the air issuing from the barrel through the cock, substantially as described.

In combination with the hollow valve stem, I claim the adjustable pipe Q, provided with a packing, so that it may be adjusted higher or lower in the valve stem as specified.

No. 29,310.—E. P. RUSSELL, of Manlius, N. Y.—*Improved Pawl and Ratchet*.—Patent dated July 24, 1860.—On the lower end of the pawl B, where it is attached to the shaft, there is a slot so that it fits down on the shaft, allowing the shaft to revolve in it; where the pawl fits on the wheel there is a catch that fits into the teeth of the wheel A for the purpose of operating it.

Claim.—The pawl B and lever D combined, being composed of one piece of metal, operating substantially as described, and for the purposes set forth, of giving feed or other motion

No. 29,311.—SAMUEL RING, of Cleveland, Ohio.—*Improvement in Straw Cutters*.—Patent dated July 24, 1860.—This invention relates to the peculiar motion of the knife and the manner of feeding the machine.

Claim.—The sash C, crank F, connecting rod G, pin H, guides E, and arm I, as described, the several parts being constructed and arranged in relation to each other and to the feed rollers, and operating in the manner and for the purpose set forth.

No. 29,312.—S. H. RANSOM, of Albany, N. Y.—*Improvement in Stoves*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, combining with the fire chamber and the usual oven at the back thereof, an inclosed roasting chamber, in front of the fire chamber and over what is the usual fire hearth, by extending the top and sides as far forward as the usual hearth plate, and enclosing the front; all substantially as and for the purposes specified.

And I also claim, in combination with the enclosed roasting chamber, and with the main oven back of the fire chamber, and with the flues to heat the same, the forming of flue spaces over the top and under the bottom, connected by diving flues at the sides, substantially as and for the purposes specified.

I also claim the arrangement of the air chamber, to which air is supplied from the room which is interposed between the fire chamber and the enclosed roasting chamber over the fire hearth, in combination with a horizontal perforated partition in the said air chamber and above the apertures for the admission of air, that the air to be heated may be distributed along the whole length of the said air chamber, so that when heated it shall escape from the upper part thereof in a sheet into the roasting chamber, and thence pass down, and thence to the ash pit to supply combustion as described.

And I also claim, in combination with the enclosed roasting chamber and double plates interposed between them, the making of one of the said plates, with apertures governed by a damper or register, to regulate the heat for roasting, substantially as specified.

No. 29,313.—J. M. ROBERTS, of Plaisance, La.—*Improved Mode of Detaching Horses from Vehicles*.—Patent dated July 24, 1860.—This invention consists in the combination and relative arrangement of a swingletree g, vertical cockeyes c, cockeye pins a, lifting bars r, cord f, and tube h, for the purpose of enabling the driver to detach the horse or horses from the swingletree instantaneously whenever it shall be desirable.

The inventor says: I *claim*, first, the combination and relative arrangement of swingletree g, vertical cockeyes c, cockeye pin a, lifting bar r, cord f, and tube h, substantially as and for the purpose set forth.

Second. The combination of a perforated tongue n and perforated crab iron o, crane j, bolt i, cord h¹, and tube t, with the swingletree g, vertical cockeyes c, cockeye pin b, lifting caps or bars r, cord f, and tube h, substantially as and for the purposes set forth.

No. 29,314.—HENRY E. ROGERS, of South Manchester, Conn.—*Improved Candlestick*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The construction and application of an elastic or spring thimble d, secured within the upper end of the candlestick a or cap c, substantially in the manner as and for the purpose described

No. 29,315.—JAMES T. SMITH, of Portsmouth, Va.—*Improvement in Machines for Threshing Peas and Beans*.—Patent dated July 24, 1860.—This invention consists in the employment of rotating beaters, in connection with a stationary slotted plate, and a fan arranged for joint operation to effect the desired end.

Claim.—The rotating beaters f, and stationary slotted plate G, combined with the fan I,

and arranged in a suitable frame A, in relation with the hopper H and box C, to operate conjointly as and for the purpose set forth

No. 29,316.—GERARD SICKELS, of Roxbury, Mass.—*Improvement in Water Meters*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment of the four puppet valves C C D D, arranged upon one shaft within a pipe or chamber having four partitions $e e^1 f f^1$ against the sides of which said valves are alternately seated, in combination with the piston K, all substantially as shown and described for the purpose set forth

No. 29,317.—JAMES SADLER, of Egremont, Mass.—*Improved Coupling for Thills to Axles*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the application, to the bolt connecting the shafts or pole of a carriage with the band or clip attached to the axle, of a pair of hooked clasps, contrived to shut over and encircle such bolt, which bolt may be permanent (allowing sufficient play, merely, for the raising and lowering of the shaft or pole wherewith said clasps are permanently connected) and kept in place by a band and spring, by means of which the whole may be securely held, or, if desired, may be readily detached.

No. 29,318.—ALEXANDER SCHWANINGER, of Milwaukee, Wis.—*Improvement in Apparatus for Generating Gas*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The retort box, constructed with the ribs, and arranged within the retort as described, in combination with the arrangement of the pipes, whereby the retort and pipes are entirely surrounded by heat, the tar allowed to flow down, and the retort box or any one of the pipes can be removed without disturbing the other parts as set forth.

No. 29,319.—ISAAC R. SHANK, of Buffalo, Va.—*Improved Flour Chest*.—Patent dated July 24, 1860.—This invention is an improvement in the combined biscuit board and chest, for which letters patent were granted on the 25th of July, 1859, in which the parts are made more simple and less expensive.

Claim.—The arrangement, as shown and described, of the biscuit board H, movable board H¹, angular supports D, ventilators G, partitions C, box A, and hinged top B.

No. 29,320.—SYLVESTER STEVENS, of Sacramento, Cal.—*Improved Hay Press*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The entire machine, together with the combination and application of the lever and pulleys, as set forth in the specification and the annexed drawings, for the purpose of pressing hay, cotton, and hemp, to be known as "Stevens's compound pulley and lever press."

No. 29,321.—SUMNER SARGENT, of Watertown, Mass.—*Improvement in Lamps*.—Patent dated July 24, 1860.—This invention consists in dividing the air chamber or perforated lamp top, below the deflecting cone, into compartments.

Claim.—The combination of the perforated lamp top A, partition plates b , and deflecting cone B, substantially as and for the purpose set forth.

No. 29,322.—ISAAC S. SAUNDERS, of Trenton, Mich.—*Improved Method of Applying Fusible Metallic Plugs to Steam Boilers*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the conical plug seat j , when formed on an elevated semi-spherical base l , in combination with the hollow screw rod n , in the manner and for the purpose described.

Second. The combination of the cap m with the hollow screw rod n , plug seat j , and semi-spherical base l , in the manner and for the purpose described.

Third. The peculiar mechanism described of arranging and combining the tube t with the plug seat j of semi-spherical base l and screw rod $n m$, for the purpose set forth.

Fourth. The use of the head v and the cap r , for holding a seal to detect any carelessness on the part of the engineer, as set forth.

No. 29,323.—JOHN SCHATT, of Philadelphia, Pa.—*Improvement in Gas Meter*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Making the frame A with a projecting extension $l l$ around the outer edge, substantially in the manner and for the purpose set forth and described.

No. 29,324.—JOHN SCHLEY, of Savannah, Ga.—*Improvement in Lamps*—Patent dated July 24, 1860.—This invention relates to a lamp for burning coal oil, and consists in a combination of parts arranged in such a way as to supply the flame with a requisite quantity of oil and oxygen, so as to obtain a brilliant illuminating flame.

Claim.—The combination and arrangement of the tubes B C D, with the two wicks E K¹, button J, and body A, with or without the shade and chimney L, as and for the purpose set forth.

No. 29,325.—JAMES W. SHIPMAN, of Springfield Centre, N. Y.—*Improvement in Mowing Machines*.—Patent dated July 24, 1860.—The pawl K has a pin *e* attached to it, which pin passes through a curved slot *f*, in the inner side of the drum J, and admits of the pawl being readily adjusted in or out of gear with the ratchet; when the pawl is engaged with the ratchet I, the wheel F will rotate the shaft H, the reverse being the case when the pawl is not engaged with the ratchet.

Claim.—In combination, with the ratchet I, pawl K, and drum J, the intermediate plate *d*, and spring *a*, arranged and operated in the manner described, for the purpose specified.

No. 29,326.—D. E. SOMES, of Biddeford, Me.—*Improved Heel for Boots and Shoes*.—Patent July 24, 1860.—This invention consists in the employment, with a metallic heel, of the stiffener C and the flange D to which the sole is attached, both being formed upon the heel.

Claim.—The combination of the stiffener C and the flange D with the metallic heel A, the same being connected and used substantially as and for the purpose specified.

No. 29,327.—J. C. STODDARD, of Worcester, Mass.—*Improvement in Teeth for Scattering Hay*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the employment of teeth B that are made with a straight tip and a boss or swell in front, which is presented to the grass, as shown and described, thereby preventing the gathering of the grass, and causing it to be thoroughly scattered, all as set forth.

I also claim the employment, in combination with said teeth and the bar *c*, of the grooved angular fastening plates A, provided with eyes *a*, as and for the purpose set forth.

No. 29,328.—CHARLES N. TYLER, of Washington, D. C.—*Improvement in Gas Generators*. Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the generation of illuminating gas by the heat of the burner which consumes the same, when constructed as described, the flame serving the purpose of illumination and at the same time heating the retort or retorts, substantially as set forth, for the purpose specified.

Second. I claim enclosing the retort or retorts within a heater through which the draught passes, for the purpose of concentrating the heat and thus producing a gas generating temperature from the illuminating flame, substantially as set forth.

Third. I claim placing the end of the gas escape tube C at the hottest point of the retort or in the focus of heat, for the purpose of superheating a small jet of gas as it escapes to the burner, substantially in the manner and for the purpose set forth.

Fourth. I claim regulating the heat by the relative adjustment of the flame and heater, for the purpose of controlling the amount of illuminating flame, substantially as described.

Fifth. I claim the combination of stop cock G with the tubes A and C, for the purpose of admitting the flow of fluid directly to the burner, or conducting the same to the heater K, and bringing the gas to the burner, substantially as set forth.

Sixth. I claim the revolving burner D, in combination with the heater K, and the retort or retorts, substantially as set forth, for the purpose specified.

Seventh. I claim the peculiar mode of packing the stop cock B by means of the level or levels compressing the cord or other fibrous packing upon the stem of the cock, substantially as set forth, for the purposes described.

No. 29,329.—LOVIUS D. TOWSLEY, of New York, N. Y., and E. MATTESON, of Brooklyn, N. Y.—*Improved Motive Power*.—Patent dated July 24, 1860.—This invention consists in the construction and operation of a motive power.

The inventors say: We *claim*, first, the weighted lever F, placed in position as shown, in combination with its connections at top and bottom, arranged and operated for the purpose set forth.

Second. The combination of the oscillating frame K, general frame A A A, side levers M M, and pendulum weights N N, when the same shall be arranged and operated as set forth and for the purpose specified.

No. 29,330.—B. W. TABER, of Quaker Street, N. Y.—*Improvement in Chimneys*.—Patent dated July 24, 1860.—The top A is provided with an adjustable cap B, which is simply a plate or an inverted shallow dish, provided with pendants *a*, projecting down within the top and secured therein by pins *b* passing through holes in the pendants and the sides of the top.

Claim.—The arrangement and combination, with the top A, of the internal horizontal portion *c*, vertical pipe *d*, flange *e*, and air space *f*, as and for the purpose shown and described.

No. 29,331.—CYRUS B. THAYER, of Boston, Mass., assignor to CHARLES ROBINSON, of Cambridgeport, Mass.—*Improved Chain Shot Battery*.—Patent dated July 24, 1860.—The object of this invention is to produce a battery of perfectly, equally, and readily adjustable barrels, which will be always sure to be fixed precisely at the same moment.

Claim.—Adjusting the two barrels, in respect to each other, upon a common axis, nearly or exactly in which is located a common vent for firing the two charges exactly at the same moment, substantially as and for the purposes specified.

No. 29,332.—JOHN TIEBOUT, of Brooklyn, N. Y.—*Improvement in Buckles*.—Patent dated July 24, 1860.—This invention consists in the arrangement of a serrated plate, or ratchet, made adjustable on a strap by means of a stationary tongue, in combination with a tooth-edged loop, in such a manner that the strap can be adjusted to any desired length, and its two ends fastened together simply by sliding the loop over the ratchet, which latter prevents the same from sliding back, and retains it the more tenaciously the stronger the strain is on the rack.

Claim.—The arrangement of the adjustable ratchet plate A, in combination with the tooth-edged loop C, constructed and operating in the manner and for the purpose specified.

No. 29,333.—JACOB W. TRUAX, of Richmond, Vt.—*Improvement in Water Wheels*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the auxiliary bucket L, on the inclined rim *f*, in connection with the conical rim A, attached to the flanch C, the parts being arranged relatively with each other, to operate as and for the purpose set forth.

Second. The employment or use, in connection with a draught tube B, of a valve F, placed in such relation with the penstock, to operate as and for the purpose set forth.

Third. The arrangement of the penstock D, flanch C, draught tube B, and cross bars or bridge trees J, as shown and described, to render the wheel and parts pertaining thereto very accessible for repairs.

No. 29,334.—JONATHAN VAILE, of Miami, Ohio.—*Improvement in Steam Boilers*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination and arrangement of the flat vessels C C C, the steam chamber D, the smoke stack B, and the furnace and fire spaces K K; the whole being constructed and used substantially as and for the purpose specified.

No. 29,335.—ANDREW J. VANDERGRIFT, of Saint Louis, Mo.—*Improvement in Grain Separators*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the plates *f* and bearings *f*², forming the perforated and corrugated spiral ledge, with bolts or rods *f*¹, passing through and securing them to the rim or flanch *d*, of concave J, with perforated and corrugated lining *e*, combined to form the revolving cylinder *e*², communicating with opening *o*, arranged relatively with cylinder K¹, and operated in the manner and for the purpose set forth.

Second. The hollow cast iron longitudinal sections *g*, filled with stone *m*, in connection with the longitudinal perforated sections *h*, and loose or movable curbs or sections *g*^{*}, combined and arranged relatively with semicircular flanches *f*^{*} *f*^{*}, all forming a cylinder K¹, and arranged relatively with cylinder *e*, and communicating with chute *n*, and trunks *k k*, to operate as and in the manner set forth.

Third. The hopper and deflector H, and the deflector *a*^{**}, dividing the current in the flues G and M, and throwing half on each side through openings in the side passages *p p*, all being constructed and arranged substantially as and for the purpose specified.

Fourth. The cross bar *e*^{**}, by which the lower end and slip joint of tube I may be adjusted laterally, as well as up and down, as desired, when arranged as set forth.

Fifth. The flues P, chamber L, flues M and G, in connection with side passages *p p*, deflectors H *a*^{**}, and trunks *k k*, arranged relatively with each other, the fan and fan box N, the scouring apparatus, and shafts B E, to operate as and for the purpose set forth.

No. 29,336.—JOHN W. WOOD, of Watertown, N. Y.—*Improved Edge Tool Sharpener*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, as a new article of manufacture, the edge-tool sharpener, produced in the manner substantially as described, the same being made of steel, cast iron, or other suitable metal, in one piece of a prismatical or other form, having three or more faces, such faces presenting different degrees of superficial roughness in the grain or texture of the metal, whereby one and the same instrument may be adapted to the various uses or purposes, as set forth.

No. 29,337.—GEORGE B. ARNOLD, ABBY H. PRICE, and ABBY S. URNER, of New York, N. Y., assignors to themselves and A. and J. S. ARNOLD of the same place.—*Improved Fluting Apparatus*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the fluting device described, consisting of the fluting rods B C C, heating flame *m*, spring *h*, and treadle D *d*, or their equivalents, arranged and operated substantially as set forth.

Second. Adjusting the heat-receiving points *e e e*, relatively to the working surfaces of the iron, substantially in the manner and for the purpose set forth.

No. 29,338.—JAMES BINGHAM, of Philadelphia, Pa., assignor to F. D. BINGHAM, of the same place.—*Improved Surge Reliever for Cables*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—As an improved article of manufacture, a surge reliever, consisting of a chain, having each of its links composed of two stirrup bolts or links *a a*¹, the limbs of which are interposed; their ends passing through heads or plates *b b*, and secured from withdrawal by nuts *c c*, the heads being separated by a block of rubber A, through which the links also pass, all as shown and described.

No. 29,339.—GEORGE C. BARTLETT, of Paris, N. Y., assignor to DAVID M. OSBORN & Co., of Auburn, N. Y.—*Improvement in Potato Diggers*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the shovel or digger and shaker, one arranged immediately in rear of the other, so that the shaker shall receive from the shovel all that the shovel digs up, and sift or riddle it, throwing the potatoes on top, substantially as described.

I also claim suspending and vibrating the shaker from and around a point, pivot, or pin *b*, that is high enough above the ground not to be interfered with by the dirt, vines, weeds, &c., substantially as described.

No. 29,340.—ROSWELL F. COOK, of Potsdam, N. Y., assignor to himself, FRANK G. JOHNSON, of Brooklyn, and M. J. WHITMORE, of Potsdam, N. Y.—*Improvement in Breech Loading Fire Arms*.—Patent dated July 24, 1860.—This invention consists in providing an adjustable attachment of the barrel A of the pistol to the stock or breech B, so as to render it possible and easy to keep the barrel always tightly fitted and firmly held to the stock or breech, however much the contact surfaces may wear away by use.

Claim.—The combination of the prolonged nut G with the screw H, or their equivalents, acting upon each other, substantially in the manner and for the purposes as set forth.

No. 29,341.—HORATIO F. HICKS, of Grand View, Ind., assignor to HICKS BROTHERS, of the same place.—*Improved Cotton and Hay Press*.—Patent dated July 24, 1860.—The claim and engravings explain the nature of these improvements.

The inventor says: I *claim*, first, in combination with the nut screw and piston of a cotton or hay press, the described, or a substantially equivalent arrangement of inclined planes M M¹, operating to elevate and depress the follower N during the retrograde rotation of the screw, substantially as and for the purpose set forth.

Second. The combination of the follower N, and rod O O¹, constructed and operating in connection with the inclined planes M M¹, substantially as set forth.

Third. The flanges T, applied within the box to prevent the return of the cotton, as set forth.

Fourth. The described construction and arrangement of self-supporting L-shaped doors C C¹, for the purpose explained.

No. 29,342.—JOHN B. HAY, of Winslow, N. J., assignor to HAY & Co., of the same place.—*Improvement in Glass Furnaces*.—Patent dated July 24, 1860.—This invention consists of three compartments with inclined bases, certain partitions with openings near the base, and certain inclined side openings; the whole being arranged within the walls of a glass furnace, in respect to its benches, so that the glass which escapes from the crucibles may find its way

into the central compartment, from which it may be withdrawn in a state free from all admixture with ashes and other refuse prior to being again deposited in the crucibles.

Claim.—The three compartments G G¹ and H, with their inclined bases, the partitions I I, with their openings *a a* near the base, and the inclined side openings *i i*, the whole being arranged within the walls of the furnace in respect to the benches D D, as and for the purpose set forth.

No. 29,343.—CHARLES HUGHES, of New Orleans, La., assignor to himself and HENRY FASSMAN, of the same place.—*Improved Punching Machine.*—Patent dated July 24, 1860.—This invention relates to certain improvements in machines for punching metal plates, and is more especially designed for making hook locks for connecting or fastening the ends of metal bale hoops.

Claim.—The arrangement and combination, with the shaft B, in the manner and for the purpose shown and described, of the adjustable wedge K, lever L, wedge R, lever U, eccentrics H H¹, arbor J, wedge M, dies N O, punches P, plate Q, box S, and wedge T, all as set forth.

No. 29,344.—NATHAN C. LEWIS, JR., of Boston, Mass., assignor to himself and EDWIN BRUCE, of the same place.—*Improvement in Boots and Shoes.*—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement and application of separate metallic guards, with respect to the main leather outer sole of a shoe, and a gutta percha or caoutchouc outer sole, substantially in manner as described.

No. 29,345.—MARTIN SHIRK, of Lancaster County, Pa., assignor to himself, S. B. HARTMAN, and WENDEL MARTZALL, of the same place.—*Improvement in Machines for Dressing Millstones.*—Patent dated July 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the open pick shaft A, with its socket R, adjusting screw F, peg E, and spring S, in combination with the shouldered screw burrs D¹ D² on the screw shafts N¹ N², and their pinions 5 and 7, operated by means of the pinion 1 on the cam shaft, and pinions 2 and 4 on the elbowed shifting lever T, substantially as and for the purpose specified.

No. 29,346.—ELIJAH D. WILCOX, of Bellingham, Mass., assignor to himself and G. D. NOURSE, of Cambridgeport, Mass.—*Improvement in Grain Cradles.*—Patent dated July 24, 1860.—This invention consists in so connecting the brace rods D, which hold the fingers in their required position with respect to the distance from the snath, with the snath, that the ends of these rods may not project beyond the back of the snath and incommode the person using the cradle.

Claim.—The bent rod *h* projecting from the snath towards the fingers C, substantially in the manner and for the purpose specified.

No. 29,347.—JAMES ADAIR, of Pittsburgh, Pa.—*Improvement in Lamps.*—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement and combination of the adjustable tube E, wick F, containing the small central tube *g*, tube D, provided with the disk *a*, and valve *b* at its bottom, and perforated below the disk, to communicate with the fountain C, the thimble G, and burner or tube H, substantially as and for the purpose set forth.

Second. The hood L, fitted to the perforated cylinder I, and rendered adjustable by means of the cylinder K, in connection with the deflecting lips M and the peculiar shaped orifice of the burner or tube H, for the purpose specified.

No. 29,348.—HENRY A. ALDEN, of Matteawan, N. Y.—*Improved Lacing for Belts.*—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—As a new and useful article of manufacture, strips of woven material coated with an India rubber, gutta percha, or other suitable cement, that, while scarcely or not at all sticky to handle, is firmly adhesive on being subjected to pressure, substantially as specified, and applied as a belt or band lacing, as described.

No. 29,349.—JOSIAH ASHENFELDER, of Philadelphia, Pa.—*Improved Journal Box for Railroad Cars.*—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, making the bottom of a journal box, whether fixed, movable, or supplementary, to incline downward from the sides and under the axle, for the purpose of reducing the quantity of lubricating material to be employed, and more effectually presenting it to the axle.

Second. The box A, in combination with the adjustable back B, bearing D, loose bottom E, cap F, and collar G, substantially as described, and for the purpose of an easy removal of the parts for inspection, cleaning, and removal.

No. 29,350.—MINER H. BACON, of Mystic, Conn.—*Improvement in Machines for Dressing Millstones*.—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the band wheel G, sliding frame E, sleeve E¹, spring J, and suitable means for adjusting the tension of J and suspending the spindle K, by turning G, substantially as set forth.

Second. Operating the stop T by the pawl N, substantially in the manner shown, for the purpose of seizing and holding up the cutters by a slight motion of the wheel G, whatever may be the tension of the spring.

Third. The slide R, spring U, slide T, and grooved spindle F K, in combination with the shifting device M N *et c.*, or its equivalent, substantially as and for the purpose set forth.

Fourth. The arrangement of the spring U, in connection with the double slide R T and band wheel G, substantially as shown, for the purpose specified.

No. 29,351.—HARMON L. BENNETT, of Long Branch, N. J.—*Improvement in Machines for Covering Potatoes*.—Patent dated July 31, 1860.—This invention consists in the arrangement of a double mould board, adjustable to any desired angle with the beam, so that the earth is gathered into a row from two furrows, and covers the potatoes or other articles planted to any desired depth, according to the inclination of the covering mould boards.

The inventor says: I *claim* the triangular mould board *f*, provided with the shares *k k* and *i*, and adjustable, relatively to the beam *a*, by the bars *g h*, substantially as and for the purposes set forth.

And, in combination with the aforesaid triangular mould board, I claim the harrow *l*, attached to the bar *m* and to said mould board *f*, in the manner and for the purposes specified.

No. 29,352.—CORNELIUS BERGEN, of Farmer, N. Y.—*Improvement in Grain Separators*.—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the fingers 4 4, receiving the grain from the first carrier, the rake 5 6 7, and the carrier 11, substantially as and for the purpose set forth.

Second. The arrangement of the rake 5 6 7, in connection with the vibrating bearings 8 8, and crank shaft 9, in the order and manner described, that is to say, the crank shaft being placed between the rake head 6 and the vibrating bearings, by which a greater and more perfect agitation of the straw and clearance of the rake is secured by means of the greater vertical than horizontal motion given to the rake.

No. 29,353.—LEWIS R. BILLARD, of Norfolk, Va.—*Improvement in Ratchet Drills*.—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the shank B, the box A, the screw D, the ring *c*, the spring *a*, and the handle H, the screw D passing into the shank, a portion of the shank passing into the box, with the spring *a* intervening between them, and the handle H being secured to the box, as represented; the whole being combined, constructed, and operated as and for the purpose specified.

No. 29,354.—WILLIAM H. BISHOP and AUGUSTUS H. LOW, of Warren, Mass.—*Improvement in Devices to Prevent Horses from Cribbing*.—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—So combining the pivotted or hinged guard D with the strikers *l*, through the arms *h* and clutch *r*, as that any attempt to grasp the top of the guard will throw up the strikers, and give the horse a blow on the nose, and thus cause him to desist from any attempt at cribbing, as set forth and explained.

No. 29,355.—J. H. BOARDMAN, of New York, N. Y.—*Improvement in Steam Boilers*.—Patent dated July 31, 1860.—This invention consists in the arrangement of a central neck connecting a horizontal plain cylinder boiler and a vertical tubular boiler, in combination with a flue surrounding said vertical boiler, in such a manner that the vertical cylinder shall be suspended when set, and the heat from the furnace pass under the horizontal boiler, which forms the top, or covering of the furnace; thence down, through, and around the vertical boiler, whereby a large amount of heating surface is obtained.

The inventor says: I *claim*, first, the arrangement and combination of the circular central neck E, horizontal boiler A, vertical tubular boiler F, and surrounding drop flue G, operating substantially as and for the purpose specified.

Second. The combination with the vertical tubular boiler F, of a mud box K, constructed and operating substantially in the manner and for the purpose specified.

No. 29,356.—NATHAN BRASHER, of Green's Fork, Ind.—*Improvement in Bee Hives*.—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the metallic ribs and metallic bottom within the moth drawer, as and for the purpose shown and described.

No. 29,357.—JAMES BROOKS, of Romulus, N. Y.—*Improvement in Ditching Ploughs*.—Patent dated July 31, 1860.—The inventor says: To use this plough I adjust the ground wheel, or pulley, at about four inches above the bottom of the share, and pin it fast; the guide bar I also place above ground at first; I then cut a furrow, and coming back on the opposite side of the ditch already begun, I cut again, follow, and throw out the dirt; I then change the clevis so as to alter the point of traction, and cut deeper, and alternate as before, so going on until the ditch is finished.

Claim.—The combination and arrangement of the guide bar and coulter share, substantially as described and set forth.

No. 29,358.—THOMAS H. BURRIDGE, of St. Louis, Mo.—*Improvement in Steam Ploughs*.—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the gang of ploughs S S S, with the described drum and engine, in the manner described.

No. 29,359.—JOHN H. CLIFF, of Rochester, N. Y.—*Improved Register Point*.—Patent dated July 31, 1860.—This improvement consists of a press point that can be moved with accuracy in any direction within a given space.

Claim.—The application to Adams's printing presses, or any other description of printing presses to which they may be adapted, points that can be moved in any desired direction within a given space, by the means and in the manner described.

No. 29,360.—LORING COES and AURY G. COES, of Worcester, Mass.—*Improved Machine for Heading Screw Wrenches*.—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the combination of the anvil block O, side dies c c, gauge p, and hammer die e, for the purpose of forming and heading the blanks of screw wrenches, substantially as described.

Second. We claim, in combination with the hammer die e, and the anvil block, a gauge for defining the relative positions of these parts, with regard to the blank, for the purpose of "paring" down the thin part of the jaw of the wrench blank, substantially as described.

Third. We claim, in combination with a hinged catch g, the foot lever or treadle K, for catching and holding up the hammer, substantially as described.

Fourth. We claim, in combination with the catch and its sliding piece l, a tripping arm on the cam, so that the hammer, when tripped, will not fall upon the cam, substantially as described.

No. 29,361.—J. U. COVEL, of Bangor, Me.—*Improved Harness Buckle*.—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—As an improved article of manufacture, a buckle having a frame a, loops a c, and tongue d, arranged and constructed as shown and described.

No. 29,362.—FLORIAN DAHIS and FREDERICK DOREMER, of Brooklyn, N. Y.—*Improvement in Catamenial Bandages*.—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A menstrual instrument, composed of a cup B, springs D E, and a main or girding spring A, the parts being made and confined as shown and described.

No. 29,363.—JOHN DAIN, of Utica, Ohio.—*Improvement in Composition for the Preservation of Timber*.—Patent dated July 31, 1860.—This liquid is composed of common salt, ley, and spirits of turpentine.

Claim.—The mode of preserving wood from rotting, by means of the described composition being inserted therein, as described, or in any other way.

No. 29,364.—JOSEPH H. DAVIS, of Woburn, Mass.—*Improvement in Warming Apparatus*.—Patent dated July 31, 1860.—This invention consists in using a series of flues and radiators

so divided by diagonal, horizontal, fixed, swinging and vertical partitions and valves, to be moved by rods, or shackle jointed levers, or their equivalents as to form, when the combined arrangement is in use, a double or reverse draught flue.

Claim.—The combination and use of the horizontal reverse draft flue K K, with the fixed partition H, its swinging partition N, and jointed lever I, and two vertical partitions S S, and their valve U, together with the inclined partition A, as combined with the radiator R, when arranged and combined in the manner and for the purposes specified.

No. 29,365.—JOSEPH DESNOS, of Troy, N. Y.—*Improved Horse Shoe Machine.*—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the segmental roller A, and friction roller A¹, with the cutters B B¹, the whole being arranged and operating together as described, to intermittingly feed in and cut off the heated iron bar.

Second. I also claim the combination of an intermittingly revolving anvil E, provided with a series of equi-distant female shoe dies of moulds *f*, each having a core *g*, which projects beyond the mould, as described, with a vibrating die or hammer D, and a pair of vibrating jaws C C; the whole arranged and operating together substantially as described, to bend and swage the pieces of the heated iron bar into the form of the shoes.

Third. I also claim the reciprocating creasing die H, when arranged and operating in combination with the intermittingly revolving anvil L, the hammer D, and the jaws C C, as described, to successively and automatically forge and crease the shoes.

Fourth. I also claim the combination of the vibrating nail hole punch I, with the intermittingly revolving anvil E, creasing die H, hammer D, and jaws C C, all arranged and operating together substantially as described, for the purpose of successively bending, swaging, creasing, and punching the shoes at one continuous mechanical operation.

Fifth. I also claim the vibrating tongue J, when arranged and operating as described, to discharge the shoes from the moulds of the intermittingly revolving anvil.

No. 29,366.—LEVI DISBROW, of Oswego, N. Y.—*Improvement in Apparatus for Destroying Vermin.*—Patent dated July 31, 1860.—Within the reservoir is the pipe *c*, which at its lower end extends through the rim C to the body of the bellows. By the action of the bellows wind passes through the pipe *c*, as well as through the projecting pipe *d*, and acts upon and forces down the substance in the reservoir.

Claim.—The combination of the pipes *c* and E, with the reservoir B, rim C, valve *a*, and bellows A, as and for the purposes set forth and described.

No. 29,367.—LOCKWOOD DRAKE and ELIAS HEWITT, of Marshall, Mich.—*Improvement in Smut Machines.*—Patent dated July 31, 1860.—This invention consists in the use of an auxiliary suction blast, by means of which the lighter particles of foreign matter are drawn off in advance of the wheat, through a peculiarly formed passage which connects the interior of the scouring cylinder or concave with the interior of an independent blower case; also, of an improved construction of the spiral lips of the beater wings and the use of an additional dropping board in the main farming mill.

Claim.—The use of the auxiliary fan blower P² in combination with the semi-annular passage O, when applied substantially in the manner and for the purposes described.

No. 29,368.—EZRA EMMERT, of Franklin Grove, Ill.—*Improvement in Cultivators.*—Patent dated July 31, 1860.—This invention consists in the combination, with an ordinary shovel plough or cultivator, of a wheel, rotating on the side of the plough, and provided with hoes on its edge, for the purpose of preventing the plough from covering the growing plants as it is drawn forward, and also for the purpose of giving steadiness to the plough and enabling the attendant to guide it more readily, and, at the same time, for the purpose of digging up and pulverizing the soil around the roots of the growing plants.

Claim.—The combination, with an ordinary shovel plough or cultivator A, of the rotary wheel F, furnished with hoes *b*, and operating in the manner and for the purpose specified.

No. 29,369.—BENJAMIN FITTS, of Worcester, Mass.—*Improved Planing Machine.*—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the screw O, the hanger N, the box M, and the spring R, in combination with the dimension planer, when constructed and operating substantially as set forth.

Second. I claim so hanging or fastening the stand by which the pressure roll is attached to the cylinder frame D in such a manner, that the pressure of the roll on the board will serve to hold or bind the cylinder frame more firmly to the sides or posts, substantially as described.

Third. I claim hanging the pressure bar S in such a manner, that its pressure upon the board will cause it to hold the cylinder frame D more firmly to the slides or posts, substantially as set forth.

Fourth. I claim so forming and hanging the pressure bar S, or its mechanical equivalent, that the backward motion of the carriage will raise the cylinder frame D so as not to plane or mark the board while running back.

No. 29,370.—ELISHA FRENCH, of Braintree, Mass.—*Improvement in Apparatus for Rescuing Horses from Fire*.—Patent dated July 31, 1860.—This invention consists in a combination and arrangement of devices, whereby a person standing at the door of a barn or stable, however remote from the stall, by pulling a rope or chain, may instantly not only unhitch a horse but also lead him out.

Claim.—The combination and arrangement of the rope H, spring latch D, connecting chain f, halter ring g, and sliding bolt C, substantially as described and for the objects specified.

No. 29,371.—FREDERICK GARDINER, of Gardiner, Me.—*Improvement in Mowing Machines*. Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of a hollow cutter bar G, set inclined downward from its rear edge, circular plane edged overlapping cutters or shears J J, cogged gearing I I N, for actuating said cutters J, longitudinal shoe K with slotted standards c c, two castor wheels L L, long vertical pinion M for receiving and transmitting the power, vertical guide pins L¹ L¹, swing frame O O¹, toothed driving wheel C¹ D, and intermediate pinions S T, substantially as and for the purposes set forth.

Second. So combining the cutter bar G, with all its attachments, with the main frame A and the gearing thereof by means of vertical pins L¹ L¹ and a swing frame O, having a swivelling bar O¹, or by equivalent devices, that the cutting apparatus may be thrown out of gear, and also, when desirable, the cutter bar, with all its attachments, may be entirely disconnected from the main frame, substantially as set forth.

No. 29,372.—P. W. GATES, of Chicago, Ill.—*Improvement in Casting Stamping Heads*.—Patent dated July 31, 1860.—This invention consists in the use of a hollow central chill in combination with an external chilled metal flask, so that the metal which, with the central chill, forms the stamp head or die, may be cast in and around the central chill, and against the interior surface of the external chilled flask.

Claim.—The use of a hollow central chill in combination with an external chilled metal flask, in the manner substantially as and for the purposes described.

No. 29,373.—JUSTUS GRIGGS, of Utica, N. Y.—*Improved Machine for Making Screws*.—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment of a movable gauge plate, substantially as described, in combination with the transferring fingers, substantially as described, for gauging the screw blanks by the head when the blanks are inserted in the gripping jaws, as set forth.

No. 29,374.—IRA HART, of Clarksburg, Va.—*Improvement in Machines for Threshing and Cleaning Grain*.—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the scrapers k which sweep the lower screen, when constructed with three sides and arranged as shown, for the purpose set forth.

Second. The combination of a stationary adjustable straw arrester N with a swinging one M in the cap O of the machine, as set forth.

No. 29,375.—DAVID HINMAN, of Berea, Ohio.—*Improved Mode of Forming the Centre for the Shaft of Grindstones*.—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—An apparatus for making the eye of a grindstone concentric with its periphery by means of the screws D, studs L, and the pin K, which pin is placed in the rough eye of the stone, and in the centre of the circle formed or bounded by the circumference of the stone, and filling the rough eye around the pin K with some plastic cement, through which the crank shaft is subsequently inserted, substantially as described and for the purposes specified.

No. 29,376.—WILLIAM HOFFMIRE, of San Francisco, Cal.—*Improvement in Apparatus for Boiling and Distilling*.—Patent dated July 31, 1860.—The furnace contains above the fuel grate l another grate k for the reception of sad irons; the cover E of the furnace is made double, so as to contain hollow spaces between its top and bottom, which are to be filled with water; this water space communicates with two pipes V V which may lead to a reservoir in which water may be heated by being in contact with the boiling water in the hollow space of the cover E; the cover E is also provided with suitable holes for the insertion of cooking utensils.

Claim.—The combination of furnace A, water jacket compartments r s, circulating pipes

t u, and regulating cocks *O O*, with two boilers *B C* and double cover *E*, all constructed in the manner and for the purposes set forth.

No. 29,377.—JAMES JACKSON, JR., of Westerly, R. I.—*Improvement in Oil Cans*.—Patent dated July 31, 1860.—A shows the body and *B* the nozzle of the can; the nozzle is divided into two parts *M* and *N* by the partition *C*; the part *M* is open to the oil in *A* at *M*¹; the part *N* is extended by a small tube, which tube is open at each end, and extends down into the body of the can nearly to its bottom.

Claim.—The oil passage *M*, hollow space *N D*, open at each end, and vent tube *E*, combined and arranged substantially as and for the purpose set forth.

No. 29,378.—E. CURTIS JENKINS, JR., of Springfield, Mass.—*Improvement in Skates*.—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

The inventor says; I *claim* the two clamp plates, made to fit within a recess in the upper part of the foot rest, and to clasp the sole of the boot alone, in connection with a leather strap and buckle to pass over the foot and confine it down upon the foot rest, the protecting plate *l*, and the sustaining screws *k k*¹, the particular object of the clamp plates in my invention being to bring the foot of the wearer either to one side or the other of the centre of the iron runner, and to prevent any lateral slipping of the foot on the foot rest, in manner and for the purpose as described.

I also claim the peculiar construction of the underside of the runner *B*, with its narrow groove *m*, on its inner edge, and its wide, flat, or convex bearing surface *n*, essentially in manner and being made to operate as described.

No. 29,379.—JOSEPH E. JOHNSON, of Brockport, N. Y.—*Improved Device for Heating Smoothing Irons*.—Patent dated July 31, 1860.—The bottom board *A* consists of a piece of sheet zinc of the form of the smoothers, and should be a little larger than the stand *C*, with a piece of board one fourth of an inch thick and one inch and a half wide across the broad end on the under side, and another piece of the same thickness and width, lengthwise, through the centre, from the pointed end back to the cross piece in the form of a cross; the object of these pieces is to keep the zinc up from the table.

Claim.—The arrangement of the revolving plate *H* and smoothing irons *K K*, substantially as and for the purposes specified.

No. 29,380.—W. F. JOHNSON and J. DOYLE, of Wetumka, Ala.—*Improved Blind Slat Machine*.—Patent dated June 31, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the adjustable tooth rack *R*, constructed substantially as shown, to wit, the teeth *i* being fitted loosely in a grooved plate *I*, and adjusted through the medium of the eccentric segments *j*¹, bar *K*, and bars *m*¹, or their equivalents, for the purpose of varying the length of the spaces between the mortises and holes of the slides, as set forth.

Second. The combination of the adjustable tooth rack *R*, and the auger arbor *C*, when operated simultaneously through the medium of the sliding bar *F*, slotted plate *H*, pawl *m*, and treadle *G*, arranged substantially as and for the purpose set forth.

Third. The reciprocating arbor *O*, provided withawl *g*², in connection with an adjustable tooth rack *R*, for the purpose specified.

Fourth. The endless belt *T*, arranged relatively with a hopper *S*, and provided with hooks *t*¹, in connection with the curved stripping plate *w*¹, for the purpose of taking the staples from the hopper, and feeding them to the staple driver *W* as described.

Fifth. The arrangement of the bar *X*, to which the driver *W* is attached, cylinder *Z*, provided with arms *x*¹, the stationary projections *x*², in the box *V*, together with the spring *y*¹ *z*¹, to give the lateral motion to the driver, to admit of the staples passing below it to be driven as set forth.

No. 29,381.—WILLIAM JOHNSON and H. WANSBRAUGH, of Cincinnati, Ohio.—*Improvement in Cooking Stoves*.—Patent dated July 31, 1860.—The oven is entirely surrounded by flues, namely, a lower flue *F*, which commences between the plate *A* and *B*, passes back beneath, and ascends to the stack behind the oven, and an upper flue *G*, which passes directly over the oven to the chimney; *H* is a damper which extends entirely across the stove. *I* is a door, by means of which the flue *F* may be cleaned and air admitted thereto when needful to regulate the heat or draft.

Claim.—The arrangement of the grate *C*, arching fire and oven plates *A B*, flues *F G*, and damper *H*, constructed and combined in the manner and for the purposes set forth.

No. 29,382.—JACOB H. KALB, of Charleston, S. C.—*Improvement in Street Lights*.—Patent dated July 31, 1860.—This invention consists in suspending a reflecting lamp in the centre of cross streets by means of rods or bars which extend up from the four corners of the street.

Claim.—The employment of the lamp D, provided with gas burners F F and reflectors G G, when the same is used in connection with the gas pipe E, posts A, and the rods or bars C C, and the whole arranged as and for the purpose specified.

No. 29,383.—WILLIAM A. KEELER, of New York, N. Y.—*Improvement in Preserving Food.*—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The use of two casks with the intermediate filling of plaster, when they are so arranged that the inner cask shall be perfectly insulated by the plaster, substantially as and for the purpose specified.

No. 29,384.—SAMUEL M. KING, of Lancaster, Penn.—*Improved Steam Cross-Cut Sawing Machine.*—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, pivoting the guide frame *a*, which bears the steam cylinder *b* and the cross-head of the saw, at a point intermediate between the steam cylinder and the cross-head of the saw.

Second. In combination with such mode of pivoting the frame, I claim arranging the feed movement so that it shall operate at the point of suspension of frame *a*, as set forth.

Third. Supporting the steam cylinder and the entire framework upon the two uprights *c c*, as set forth.

No. 29,385.—JACOB KINZER, of Pittsburgh, Pa.—*Improved Sausage Stuffer.*—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* constructing a sausage stuffer with a body or box, having its interior the shape of the sector of a cylinder, and having a pressing flap hinged or pivoted at the centre of the cylinder, of which the body is a sector, substantially in the manner and for the purposes described.

I also claim combining with a body and pressing flap, such as described, a nozzle opening into one of the radial sides of the sectional body or box, at an acute angle thereto, so as to present a large opening for the passage of the meat without increasing the diameter of the nozzle substantially as described.

No. 29,386.—ERNST KIRSCH, of New Haven, Conn.—*Improved Carriage Body.*—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The construction of the crooked or curved body, when no more than two pieces are used to compose the two sides of the body and the seat rail, while the fibres of the timber always run in the direction of the curves or sweeps, so that no part is in any degree cut across the grain of the timber, and the whole is constructed and fitted for use substantially as described.

No. 29,387.—HENRY KURTH, FLORIAN DAHIS, and CHARLES ROBITAILLE, of Brooklyn, N. Y.—*Improved Tobacco Box.*—Patent dated July 31, 1860.—This invention consists in arranging the bottom of the box together, with a sweep attached to the same in such a manner that the same rotates around a central pin, and that the tobacco in the box can be compressed between said sweep and a stationary radial partition, which is secured to the body of the box, by a direct positive pressure.

Claim.—The arrangement and combination of the revolving bottom B, sweep *d*, stationary body A, and partition *a*, constructed and operating substantially as and for the purpose specified.

No. 29,388.—E. W. LACY, of Oak Park, Va.—*Improvement in Hemp Brakes.*—Patent dated July 31, 1860.—This invention consists in the novel construction and combination of the parts.

The inventor says: I *claim*, first, the employment, in combination with the crushing rolls C C¹, and striker roll D, of an inclined reciprocating separator F, the whole arranged and operating as specified, for the purpose set forth.

Second. I claim the combined arrangement of the crushing rolls C C¹, striker roll D, guide rest E, inclined separator F, and discharge apron P, the whole constructed to operate as specified, for the purpose set forth.

No. 29,389.—Z. W. LEE and E. D. LEE, of Blakely, Ga.—*Improvement in Cultivators.*—Patent dated July 31, 1860.—This invention consists in combining a plough beam and three angle irons, with a cutter *c*, plough share, and plough brace.

Claim.—The combination of a plough beam *b*, and three angle irons *e e*¹, *e e*¹, *e e*¹, with a cutter *c*, plough share *d*, plough brace *i*, clamps *g*, and wedges *h*, when constructed and arranged in the manner and for the purposes set forth.

No. 29,390.—ARBA C. LEWIS, of Burlington, Mich.—*Improvement in Fruit Drying Apparatus*.—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement and combination, in the manner shown and described, of the elevating platform C, fruit racks J, bars F, endless band I, with the shaft D, pulleys E b b, lifting ropes a c, and house A, so that, by turning the shaft D, the fruit will be raised and carried out of the house and exposed to the sun and air; and on reversing shaft D, the fruit will be again deposited within the house, all as set forth.

No. 29,391.—W. C. LOSTUTTER and S. WOLCOTT, of Rising Sun, Ind.—*Improvement in Cultivators*.—Patent dated July 31, 1860.—The side of the beam A is pivotted to an arm G, which passes through a laterally adjustable stirrup G¹, and projects down at right angles, and is secured to a guard plate K; from the rear of the plate K proceeds back a vertically adjustable wing L, which may be raised or depressed, according to the depth it is desired to plough, and set in its adjusted position by a nut c.

Claim.—The arrangement of the adjustable clamp G¹, swinging arm G, guard K, wing L, beam A, brace rod E, standard B, pivotted handle D D, cross brace D¹, sector plate a, and strap b, as and for the purpose shown and described.

No. 29,392.—AMOS D. LUFKIN, of Cleveland, Ohio.—*Improvement in Preparing Hides*.—Patent dated July 31, 1860.—This invention relates to a compound that acts specifically upon the hair glands, so as to loosen the hairs without injury to the parts of the skin, which is left in such a soft and natural state that, by washing or soaking it in water for a few hours with the usual working of the beam, the ordinary process of bating may be dispensed with.

Claim.—The composition made as set forth, and for the purpose described.

No. 29,393.—P. MARTIN, of New Orleans, La.—*Improvement in Cotton Seed Hullers*.—Patent dated July 31, 1860.—The grooves, or furrows, between the knives a are adapted to give the seed a rolling motion. The concave B is made up of segments for the purpose or more readily adjusting it to the cylinder A.

Claim.—The employment of prismoidal reversible bar knives a, in combination with the scored hulling cylinder A, and scored concave B, as and for the purpose shown and described.

No. 29,394.—MATTHIAS McCONNIGLE, of Alleghany, Pa.—*Improvement in Bee Hives*.—Patent dated July 31, 1860.—This invention consists in an arrangement for removing the side of the inner chamber, or chambers, of the beehives, so that the frames in which the honeycombs are attached may be removed without injury to the bees or honeycombs. And also in the use of a double and perforated cover, for the purpose of ventilating the different compartments of the hive, and for preventing the queen from entering the upper compartment, or compartments, of the hive.

The inventor says: I *claim*, first, the use of the movable sides d, when used in connection with the inner chamber or chambers of the beehives, as described, and for the purpose set forth.

Second. The use of the double and perforated cover, when arranged and constructed as described, and for the purpose set forth.

No. 29,395.—J. P. MENDENHALL, of Farmington, Ill.—*Improved Car Coupling*.—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The stock A, provided with the projections a a, and the cylindrical projection b, having the head c at its end, in connection with the bar B, having the bars C C attached to it by joints d, the spring D being between them, and provided at their outer ends with the jaws e e¹, and projections h h, substantially as and for the purpose set forth.

No. 29,396.—GEORGE MUNCE, of St. Louis, Mo.—*Improved Apparatus for Cleaning Windows*.—Patent dated July 31, 1860.—This invention is used by placing it in a room in front of, and near to, an open window, with the railing outside projecting two feet from the window and resting on the sill, and brought to a horizontal position on section B, and made fast by the screw C, the section E pressed against the ceiling, and made fast by screw G.

Claim.—The adjustable standard E B, in combination with the platform A, or its equivalent, when the same is operated substantially as described, for the purpose set forth.

No. 29,397.—JOHN PARK, of Joliet, Ill.—*Improved Churn*.—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the bars E E, on the under side of the hinged lid of the churn, in combination with the revolving shaft of beaters, in the manner and for the purpose described.

Second. The conical gudgeon C, fitted in a conical seat and acted upon by the spring D, in the manner and for the purpose described.

Third. The hair-catching strips *d*, attached to the bars E, in the manner and for the purpose described.

No. 29,398.—JACOB M. PATTERSON, of Woodbury, N. J.—*Improved Construction of Lightning Rods*.—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Making the lightning rod D, and waterspout or leader B, of one continuous piece of metal, so constructed and arranged that they will perform the double function of conductor and waterspout, as set forth.

No. 29,399.—EDWARD PEACH, of Utica, N. Y.—*Improvement in Awning Fixtures*.—Patent dated July 31, 1860.—Within the box B there is placed longitudinally a roller C, the box being sufficiently long to allow the roller to extend the whole width of the door or window. To this roller the upper end of the awning D is attached, and to one end of the shaft *a* of the roller the inner end of a coil, or barrel spring E is secured; the outer end of said spring being attached to the inner side of a cylinder F, which is fitted on the shaft *a*, and encompasses the spring E.

Claim.—The arrangement of the hinged struts H, plate G, hooks *i*, awning D, roller C, spring F, ratchet *e*, and pawl *f*, as and for the purpose shown and described.

No. 29,400.—JOHN G. PERRY, of South Kingston, R. I.—*Improved Meat Cutter*.—Patent dated July 31, 1860.—To construct this machine a case A is made, which is divided horizontally through its middle into an upper and lower part, for readily removing the knives and other internal parts, for the purpose of cleaning, &c. A shaft B is placed in the centre of the case, and lengthways of it, turning in bearings made in the ends of the case.

Claim.—The employment of the knives and pendants combined substantially as described and for the purposes set forth.

No. 29,401.—ABRAHAM H. PHILLIPS, of Reading, Pa.—*Improvement in Gas Regulators for Railroad Cars*.—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—In combination with the plane disk, spring plates *a a*¹, and their inclosed space, the valve *e*, with its washer *f*, flat space *g*, and openings *h i*, for the purpose of regulating the flow of gas from the receiver to the burners, whatever may be the pressure upon the gas, substantially as herein described and represented.

No. 29,402.—JAMES RADLEY, of New York, N. Y.—*Improvement in Lamps for Locomotives*.—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the division of the oil reservoir, by means of horizontal diaphragms or partitions, into several shallow compartments or sub-divisions, substantially as described.

Second. The wash hole with its closing cap or plug, in combination with the horizontal compartments or sub-divisions of the reservoir, by means of which access is had at once to all the said compartments, substantially as set forth.

Third. In combination with the said horizontal compartments or sub-divisions, the oil duct or tube by which the oil is conveyed into the lowermost sub-division of the reservoir, together with the air vents chamber and its checks, by which the oil is retained while the air is permitted to pass out of or into the reservoir as required, substantially as described.

No. 29,403.—J. C. RAINBOW, of New Brighton, Pa.—*Improvement in Belt Trusses*.—Patent dated July 31, 1860.—This invention consists in a certain novel system of straps, employed in combination with the pads of a truss.

Claim.—The employment, in connection with the pads A A, of the straps *d d h h n k k l o o p p r r*, and connecting and adjusting buckles; the whole combined and arranged substantially as specified, or one pad only, when two are not necessary.

No. 29,404.—JOSIAH RENARD, of Lyons, France.—*Improvement in the Preparation of Aniline Colors*.—Patent dated July 31, 1860.—The inventor says: The preparation of the coloring matter referred to in my description, is based upon the discovery that if aniline be heated to a temperature of from three hundred and eighty to four hundred degrees Fahrenheit, together with certain chemical compounds which are either anhydrous, or perfectly dry or desiccated, the mixture thus produced will be changed into a substance of such dark color that it appears to be almost black, but which, when applied in their layers or diluted, is transparent and of a beautiful red color.

Claim.—Combining with aniline the metallic salts specified, or their equivalents, and treating the same in such a manner as to produce a red, in contradistinction to a purple or bluish coloring matter or dye, substantially as set forth.

No. 29,405.—JAMES ROGERS, of Santa Clara County, Cal.—*Improved Machine for Forming Stove Pipe.*—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—In combination with a stove pipe forming machine, a box G, the diagonal corners $e e^1$ are bevelled, and a slip H, arranged in the manner and for the purpose set forth.

No. 29,406.—FREDERICK ROSS and FR. SPOEHR, of New York, N. Y.—*Improved Padlock.*—Patent dated July 1, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the employment, for the purpose of retaining the padlock to a door, of a hooked pin A, passing through the keyhole of the ordinary lock and catching on the inner side of the same, substantially as and for the purpose specified.

Second. The arrangement and combination of the hooked pin A, sliding barrel C, locking plate E, hollow stem B, and spring catch h , constructed and operating substantially in the manner and for the purpose set forth.

Third. The combination, with the hollow stem B, and spring catch h , of a spring dog i , arranged substantially as and for the purpose described.

Fourth. The arrangement of a pin o , sliding in a hollow tube q , and in combination with the dog i , and catch h , constructed and operating as and for the purpose specified.

No. 29,407.—F. M. RUSCHHAUPT, of New York, N. Y.—*Improvement in Apparatus for the Manufacture of Vinegar.*—Patent dated July 31, 1860.—This invention relates to certain improvements in that class of manufacture of vinegar in which alcohol, by being brought in contact with the oxygen of the atmospheric air, is transformed into hydrous acetic acid or vinegar.

Claim.—The arrangement of the annular passages c , tube e , vessel B, pipe f , cask C, and tube g , in combination with the acidifiers A, constructed and operating substantially in the manner and for the purpose set forth.

No. 29,408.—SAMUEL T. RUSSELL, of Ottawa, Ill.—*Improvement in Rotary Engines.*—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the flanged pistons, the piston boxes, the cavities 10 and $d d$ in the cylinder, and the passages $11, 12, 13, 14, 15$ in the cylinder and wheel, the whole operating substantially as and for the purpose specified.

Second. The plates G G, constructed and applied to the steam wheel substantially as described, and serving the double purpose of securing the same in the cylinder and of cams to operate the cut-off valves.

Third. The system of levers T U T* U*, applied in combination with the plates G G, and with the cut-off valves, substantially as described, to effect the operation of the said valves.

Fourth. In connection with the two sets of induction and eduction ports in the cylinder, the connected reversing valves N N¹ O* O*, constructed, applied, and operated as described.

No. 29,409.—JOHN B. SHAFER, of Grafton, Va.—*Improved Railroad Cattle Car.*—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination, with the car body, of a raising and lowering middle deck proper and suitable hoisting machinery thereto, in such manner as that the car may readily be converted from a double decker into a single floor, cattle, or open space, or freight car, free from division into stall apartments or projecting arrangement of partitions into stalls, substantially as specified.

Also, the combination, with the raising and lowering middle deck to the car, of independent stalls or stall partitions hinged or otherwise equivalently connected to the car on opposite sides of it at opposite ends, and for operation in connection with the adjustable middle deck but distinct therefrom, substantially as and for the purpose or purposes specified.

No. 29,410.—D. L. D. SHELDON, of San Francisco, Cal.—*Improvement in Hernial Spring Trusses.*—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—As a new article of manufacture, an abdominal truss combining, in its construction, a pad with a cushion A, and plate C, a compress or ball B, sliding plate D, and spring H, and applied in the manner and for the purpose set forth and described.

No. 29,411.—RUFUS SIMONDS, of Ludlow, Vt., and G. N. GOODSPEED, of Winchenden, Mass.—*Improvement in Machines for Making Wooden Bowls.*—Patent dated July 31, 1860.—

This invention consists in having the segment carriage to which the cutter is attached connected to an adjustable or sliding centre block, and having a supplemental cutter attached to the segment carriage by which, on adjusting the carriage after each bowl is cut, a flanch or rim may be cut thereon.

Claim.—Attaching the radius arm *G*, of the carriage *F*, to a sliding or adjustable block *H*, in connection with the auxiliary cutter *q*, attached to the carriage; all being arranged in relation with the mandrel *C*, and bolt *D*¹, to operate as and for the purpose set forth.

No. 29,412.—CHRISTOPHER SMITH, of Nauvoo, Ill.—*Improvement in Corn Planters*.—Patent dated July 31, 1860.—This invention relates to corn planters, by means of which a planter can be constructed capable of planting one or two rows at the same time.

Claim.—Operating the feed bar *k*, by means of the handles *d*, clevis *f*, and bent lever *g*, all being constructed and arranged substantially as described for the purposes set forth.

No. 29,413.—JESSE SPEER, of Hazlehurst, Miss.—*Improvement in Cotton Cultivators*.—Patent dated July 31, 1860.—The object of this machine is in the cultivation of cotton and other things that are planted in rows, in that manner known as "drilling," and when the plant is small, from its uses, the rows can be divided and made into hills, leaving the plants to grow in uniformly separated bunches or hills.

Claim.—The combination of the wheel *a*, hoe *h*, and bar *I*, arranged and operated as or substantially as and for the purpose set forth.

No. 29,414.—GEORGE S. G. SPENCE, of Boston, Mass.—*Improved Boiling and Condensing Apparatus*.—Patent dated July 31, 1860.—This invention consists in making a boiler and condenser with parallel double sides, in such a manner that the space between them shall be a capillary space to hold or sustain a liquid between the two sides according to the laws of capillary attraction, and that such capillary space may be maintained continuously charged with a ring of liquid during the operation of the boiler, and that the liquid so maintained may act as a water joint to prevent the escape of steam or other vapors from the boiler through said capillary space.

Claim.—The construction of the water joint by means of the combination of the side *a a*¹, with the side *b b*¹, in the manner and for the purpose substantially as set forth.

No. 29,415.—WALTER W. SPANARD, of Buffalo, N. Y.—*Improved Refrigerator*.—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the air tube *F*, passing through or near the ice box *B*, and through the water tank *D*, and opening into the preserving room at its lower end, for the purposes and substantially as set forth.

No. 29,416.—GEORGE A. STANLEY, of Cleveland, Ohio.—*Improvement in Apparatus for Moulding Candles*.—Patent dated July 31, 1860.—This improvement relates to a circular arrangement of the candle moulds in a frame or box, by which a larger number of moulds can be arranged in a given space than in the ordinary way, and the ease and facility with which this improvement can be worked allows the candles to be made with more rapidity than when done by the ordinary means.

Claim.—The special arrangement of the moulds in a circular form, in combination with a frame or box suitable for the purpose, in the manner and for the purpose substantially as described.

No. 29,417.—HENRY SWEETAPPLE, of Napa, Cal.—*Improvement in Fan Blowers*.—Patent dated July 31, 1860.—The fan is formed of the flanges *B* and the circular centre piece or wheel *C*, with the blades *F*, the whole held together by the bolts *d*.

Claim.—The combination of two rings *e e* of flexible material, with the air chamber *a* and the sides *B B* of a fan blower, constructed as above set forth, in the manner and for the purpose described.

No. 29,418.—EDWIN C. THOMPSON and MILES B. WHEATON, of New York, N. Y.—*Improved Box for Silvering and Albuminizing Photographic Paper*.—Patent dated July 31, 1860. The claim and engravings explain the nature of this invention.

Claim.—Silvering or albumenizing photographic paper by means of a box fitted so as to be revolved or inverted, for the purposes and as set forth.

No. 29,419.—WILLIAM THOMSON, of Buffalo, N. Y.—*Improved Nail Brush*.—Patent dated July 31, 1860.—This invention consists in combining with a shallow flaring mouth cup, of a suitable diameter, a circular brush, which latter will consist of one, two, or more rows of

bristles, arranged in such a manner that the combination will form a neat and efficient article for cleaning the finger nails.

Claim.—The circular brush and cup combined, substantially in the manner and for the purposes set forth.

No. 29,420.—DANIEL J. VAIL, of Industry, Ill.—*Improvement in Seeding Machines.*—Patent dated July 31, 1860.—K K are covering shares, the front ends of which are attached to the upper parts of the coulter J, said shares extending back, one at each side of the furrow shares, and curving upward at their ends, the covering share of each furrow share being connected at their back ends j, and formed of a single piece of metal.

Claim.—The arrangement of the curved connected covering shares K K, furrow shares I I, tube i, coulter J, frame A, and box D, wheels a a, seat B, uprights G G, slide F, pins g, seats E, and bar H, as and for the purpose shown and described.

No. 29,421.—ISAAC VAN BUNSCHATEN, of New York, N. Y.—*Improvement in Vapor Lamps.* Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the relative arrangement of a supply tube V, inclined conducting tube A, inclined return tube B, a heater D a, a tubular burner I, regulating valve H, and air passages U U, substantially as and for the purposes set forth.

Second. The arrangement of the two inclined tubes A B, with respect to the heater D a, and single screw plug C of the heater D a, substantially as and for the purposes set forth.

Third. The arrangement of the conical screw plug or valve H, constructed with the cylindrical screw nut R, in combination with the lower end of the vapor burner, substantially as and for the purposes set forth.

No. 29,422.—AUSBENT H. WAGNER, of Staunton, Va.—*Improvement in Mills.*—Patent dated July 31, 1860.—This improvement consists in the construction and arrangement of devices which comprise a grinding mill.

Claim.—The combination of the hoop b, collar R, and case N¹, the whole being constructed and arranged substantially as described.

No. 29,423.—JOHN B. WANDS, of Memphis, Tenn.—*Improved Fabric for Roofing, Belting, &c.*—Patent dated July 31, 1860.—This improvement consists of a fabric of canvas, or other woven goods, saturated with what is known to manufacturers of stearic acid as residuary gum.

Claim.—As an improved article of manufacture, the within described fabric made of canvas and the residuary gum of stearic acid, as set forth.

No. 29,424.—CHAPMAN WARNER, of Brooklyn, N. Y.—*Improvement in Pumps.*—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Adjusting the pump cylinder A at the proper height by means of the pendants q, slats c, and their attachments, as and for the purposes described.

No. 29,425.—FREDERICK W. WARNER, of East Haddam, Conn.—*Improvement in Mowing Machines.*—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the frame extending in front of the main axle with the draft frame or thills, driver's seat, and cutting apparatus, the front end of the frame D serving as a treadle to elevate the cutting apparatus, and the several parts being constructed and arranged in the manner described.

No. 29,426.—JONATHAN WARREN, of Brooklyn, N. Y.—*Improved Pen Holder.*—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment of an elastic tube C, constructed as described, in combination with the pen holder A, for the purpose of forming a shield for the pen.

No. 29,427.—LUTHER R. WATTLES, of Newton, Mass.—*Improvement in Looms.*—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* my improvement in regulating the tension of the warp of a loom, the same consisting in so combining the yarn beam with friction apparatus, as described, that the gravitating power or weight of the yarn on the beam, as such power or weight may diminish during the unwinding of the yarn on the beam while the weaving process is being carried on, shall operate to decrease the friction on the beam.

I also claim the arrangement of the yarn beam and the lever of the above described friction apparatus, applied by gearing, or its equivalent, to the yarn beam, as described.

No. 29,428.—WILLIAM S. WILLIAMS, of Lynn, Mass.—*Improvement in Machines for Skiving Leather*.—Patent dated July 31, 1860.—This improvement consists in the peculiar arrangement of devices for holding, raising, or lowering the cylinder that rolls and presses on the leather, and regulates the thickness of the same when skived.

Claim.—The combination and arrangement, as described, of the bent wires F F, swinging frame D, slots *g g* and nuts *f f*, for the object specified.

No. 29,429.—HORACE WING, of Buffalo, N. Y.—*Improvement in Machines for Crimping Leather*.—Patent dated July 31, 1860.—This invention relates to the construction and arrangement of the machine, whereby the crimping bar can be operated with great convenience.

Claim.—The arrangement, with the frame A *a b c* and crimping jaws B B, of the pivotted crimping bar E, which has a toothed segment F on its front end, and the continuously revolving cog wheel H, in the manner and for the purpose described.

No. 29,430.—NATHAN AMES, of Saugus Centre, Mass., assignor to himself and EDWIN M. MONTAGUE, of Boston, Mass.—*Improved Index Door Plate*.—Patent dated July 31, 1860. The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the removable plate I, of ivory, porcelain, slate, or other material capable of being written upon with a pencil and the writing readily expunged, in combination with a suitable frame or door plate furnished with a glass protector G, and confining said removable plate by means of a spring bolt D, or its equivalent, passing through the door, substantially as set forth and for the objects specified.

Second. In combination with the above door plate, a rotating disk C, marked with the hours and parts of an hour, as shown in Fig. 2; said disk being confined in the centre to a spindle D, which passes through the door, substantially as and for the purpose described.

Third. The spring S, arranged, combined, and operating substantially as described.

No. 29,431.—THADDEUS FOWLER and DE GRASSE FOWLER, of Northford, Conn., assignors to the UNITED STATES PIN COMPANY, of Seymour, Conn.—*Improved Machine for the Manufacture of Pins*.—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the spring finger *i*, within the clamping jaws, for the purpose and as specified.

Second. The combination of the cutter 7, and toe 8, with the finger *i*, for carrying the headed pin out of the clamping jaws and delivering the same into the notched pin wheels *o o*, as set forth.

Third. A rolling bed, in combination with a stationary, resisting surface and cutter or cutters, when said cutter or cutters act on the same side of the shaft of the pin as the stationary surface against which the pin rolls in being pointed, for the purpose and as set forth.

Fourth. The notched pin wheels *o o*, and revolving and rolling bed *n*, constructed and operating substantially as set forth.

Fifth. The metallic strip *p*, kept at a proper tension by the lever 16, or its equivalent, and pressing the belt 17, on the pins, in combination with the rolling bed and notched plates, as and for the purposes specified.

Sixth. The arrangement of the reciprocating cutters *s s* and *t t*, combined with the rolling bed as described and shown.

No. 29,432.—GEORGE E. FREW, of Brooklyn, N. Y., assignor to WILLIAM RICHARDSON and JOHN RICHARDSON, of New York, N. Y.—*Improved Pen and Pencil Case*.—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement, as shown and described, of the spirally slotted tube C, pencil slide B, upon the inside of tube C, and penholder tube E, upon the outside of tube C, so that the same tube C and the same spiral slot will move both the pen and pencil in either direction, as required, all as set forth.

No. 29,433.—F. A. GODDARD, of Lexington, Ill., assignor to himself and JOHN H. KENNADAY, of the same place.—*Improvement in Corn Planters*.—Patent dated July 31, 1860.—This invention relates to an improved corn planting machine of that class designed for planting either in drills or check rows.

Claim.—The arrangement of the shifting wheel H, on shaft G, with the permanent wheel F, on the axle C, in combination with the removable lever S, in shaft G, as and for the purpose set forth.

No. 29,434.—EPHRAIM L. HARLOW, of Monmouth, Me., assignor to WILLIAM G. BROWN, of the same place.—*Improved Pegging Jack*.—Patent dated July 31, 1860.—The lower end of the lever passes through the arm *c*, of a long spring F, which is arranged on the outside of the

post, and so as to extend beyond the same. The upper end of said spring is fastened to the post, or against a metallic cup, or ferule *d*, placed therein.

Claim.—The application or arrangement of the spring *F*, with respect to the post *A*. and the heel lever *D*, and so as to operate substantially as specified.

No. 29,435.—LEWIS JENNINGS, of Brooklyn, N. Y., assignor to himself and R. DICKINSON, of New York, N. Y.—*Improvement in Cotton Pickers*.—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment of the spur wheel *D*, in combination with belts *E*, which pass between the spurs *a*, so that as the spurs sink between the belts, the cotton will be stripped from the spurs and left upon the belts, all substantially as shown and described.

No. 29,436.—ISAAC LINDSLEY, of Providence, R. I., assignor to himself and DANIEL F. TOMPKINS, of Newark, N. J.—*Improvement in Cigars*.—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The hydraulicizing or condensation of tobacco to the highest possible extent into the form of a segar or other form suitable for smoking, Fig. *D*, when the tobacco so hydraulicized or condensed shall have, running in and through the same, the distinct aperture, a Fig. 2, or its equivalent, formed substantially in the manner and for the purposes described.

No. 29,437.—J. A. MATTHEWS, of St. Louis, Mo., assignor to himself and S. H. HEMP-HILL, of the same place.—*Improvement in Repeating Ordnance*.—Patent dated July 31, 1860.—The centre of the gun stock is of the nature of a plate, in the centre of which a trunnion *P*¹ *P*¹ is made, about which the breech *B* of the gun revolves upon an horizontal plane; and to secure the said breech firmly in its place a hole is made through its centre, through which the centre pin *A* is made to pass and screw into the trunnion, and as the said centre pin has a flange upon its upper end it keeps the breech from rising off the stock, as well as from moving laterally.

The inventor says: I *claim*, first, the use of the revolving breech *B*, when it is arranged horizontally and operated by means of the circular rack *Q*, pinion *Y*, and shaft *r*, arranged as shown and described.

Second. I claim the use of the cartridge receiver *e*, when it is arranged with reference to the revolving breech *B*, in the manner described.

Third. I claim the use of the rammer *f*, when it is arranged and operated with reference to the receiver *e*, and breech *B*, in the manner described.

No. 29,438.—SAMUEL MAN, of Chicago, Ill., assignor to HARRY T. MAN, of the same place. *Improved Ore Separator*.—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The construction and arrangement of the conical elevating and discharging wheel *m*, to which is attached the receiving cylinder *B*, having spiral flanges and longitudinal wings on both the internal and external surfaces, in combination with the stationary cylinder and trough, substantially as and for the purposes specified.

No. 29,439.—SAMUEL MILLS, of New York, N. Y., assignor to himself and F. FRANCK, of San Francisco, Cal.—*Improved Elevator and Lock for Window Sashes*.—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The application and arrangement of the supporting guide *b*, the rack *C*, pinion *E*, and stationery circular plate lock *F*, in combination with the spring crank handle and catch by which the sash is elevated or depressed, and is safely secured in the position it is left from the hand, substantially as specified, for the purposes set forth.

No. 29,440.—SALMON R. PLUMB, of Southington, Conn, assignor to the PECK SMITH MANUFACTURING COMPANY, of the same place.—*Improvement in Casting Cylinders for Meat Cutters*.—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, making a pattern having protuberances or projections extending to different points from the centre, so as to withdraw the same from the mould while the hole is closed in the flask by means of proper mechanism, arranged within the pattern, substantially as set forth and described.

Second. I claim an improved manufacture of meat cutter cylinders, &c., produced by means substantially such as set forth and described.

No. 29,441.—LYMAN PLATT and RUSSELL WILDMAN, of Danbury, Conn., assignors to themselves and JAMES S. TAYLOR, of the same place.—*Improvement in Machinery for forming Hat Bodies*.—Patent dated July 31, 1860.—This invention consists in forming fur hats upon the inside of an inverted perforated or wire cone, lined with a removable lining of grass cloth or

any flexible material pervious to air. The fur is thrown out by the picker, and drawn into and held upon the inside of the cone and its lining by the exhausting fan; after the fur is deposited upon the said cone or lining, a second lining is placed on the inside of the hat by means of an expanding frame.

The inventors say: We *claim*, first, the forming of fur hats on the inner surface of an inverted perforated or wire cone, suspended through a revolving ring into an exhaust chamber, in the manner specified.

Second. We also claim the combination of a picker H, inverted perforated or wire cone C, shield K, and exhaust fan E, the whole combined and operating as described for the purpose as set forth.

Third. We also claim the expanding wire frame, constructed as described, for putting the lining within the formed hat for the purpose described.

No. 29,442.—OLIVER W. PRESTON, JR., and WILLIAM W. FARNHAM, of Corning, N. Y., assignors to themselves and PAYNE OLCOTTS, of said Corning.—*Improvement in Straw and Stalk Cutters*.—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the employment or use, on a cutting wheel C, of a straw and stalk cutter of zigzag ledges *h h*, in connection with a slide bar H, having a pawl *k* attached for the purpose of operating the feed rollers I, substantially as set forth.

Second. Attaching the knives or cutters E E to a sliding bar D, fitted to the wheel C in a way to be operated by the flanch G, attached to frame B, for the purpose of giving a drawing cut to the knives or cutters, substantially as described.

No. 29,443.—REUBEN SHALER, of Madison, Conn., and CALVIN B. ROGERS, of Deep River, Conn., assignors to C. B. and J. ROGERS, of Deep River aforesaid, and T. CHAMPION, of Jersey City, N. J.—*Improved Foot Cleaner*.—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination, with a foot scraper, of the brushes 4 4, or either of them, placed contiguous to the ends or end of the scraper, upon axes or an axis placed crosswise of the line of the edge of the scraper, in such a manner that they or it may be rotated by the action of the foot in the operation of cleaning it substantially as described.

No. 29,444.—THOMAS SHAW, of Philadelphia, Pa., assignor to himself and L. NEY BROGNARD, of the same place.—*Improved Feeding Apparatus for Steam Boilers*.—Patent dated July 31, 1860.—This invention consists in the construction of a feeding apparatus which possesses the following requisite: It has no ground or packed joints that communicate with the outside to cause leaks, &c. A part of this invention is the peculiar construction of the body or stationary part through which the crank shaft passes.

Claim.—The arrangement of the body A, chamber B, disk K, and lap C, substantially as described, and the employment of the exhaust pipe D for the purpose specified.

No. 29,445.—DAVID SHERMAN, of Uniontown, Md., and ROBERT W. FENWICK, of Washington, D. C., assignors to D. SHERMAN and BERNARD MILLS, of said Uniontown.—*Improved Churn*.—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Corrugating the surface of the nearly cylindrical churning chamber, diagonally or spirally, in the peculiar manner described, in combination with the blades *c c* of the dasher, which are set so as to stand across the diagonal or spiral corrugations, substantially as and for the purposes set forth.

No. 29,446.—JOSHUA TURNER, of Cambridgeport, Mass., assignor to himself, CALVIN P. HINDS, of Boston, and WARREN TILTON, of Beverly, Mass.—*Improved Oil Feeder*.—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The improved flexible bottom oil feeder, as made, with the rod D, extended from the flexible bottom and into and through the discharging pipe C, substantially as specified.

No. 29,447.—EDMUND W. TARBELL, of Boston, Mass., assignor to himself and E. A. SIMONDS, of the same place.—*Improved Steering Apparatus*.—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination and arrangement of the two reversed screws I I¹, and their lifting nuts H H¹, supported in guide slots or their equivalents, with leading chains connected with the tiller, and with mechanism for simultaneously rotating the two screws by means of a hand wheel, as described.

No. 29,448.—CHARLES H. WILLCOX, of New York, N. Y., assignor to JAMES WILLCOX, of Brooklyn, N. Y.—*Improvement in Sewing Machines*.—Patent dated July 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The method herein described of securing the proper adjustment of the needle in the socket of its stock or holder, by means of an inner spline or locking guide to the socket, in combination with a needle, grooved or slotted longitudinally at its shank, substantially in the manner and for the purposes set forth.

No. 29,449.—C. M. YOUNG, of Sinclairville, N. Y., assignor to himself and E. BROWN, of said Sinclairville.—*Improvement in Machines for Jointing Staves*.—Patent dated July 31, 1860.—The object of this invention is to obtain a machine by which staves may be jointed with a greater or less bilge, according to their width, or, in other words, have their edges cut with a greater or less degree of taper each way from their centre outward, according to the bilge required, the latter being determined by the width of the stave, the wider the stave the greater the taper, and vice versa.

Claim.—The arrangement of the slide F, curved rod H, rod I, and arms J J, substantially as shown, to admit of the operating and the working of the planers K on the guides L, at varying degrees of obliquity of the latter, for the purpose specified.

No. 29,450.—WALTER AIKEN, of Franklin, N. H.—*Improvement in Knitting Machines*.—Patent dated August 7, 1860.—This invention consists in providing sliding traversing sinkers to push or press the fabric knit off of the needles between which the sinkers are operated, and in supporting the wheel that presses or holds the work or fabric knit back on the needles by an arm bent or curved around to the under side of the wheel, so that the top of the pivot on which the wheel turns may pass freely under the needles.

The inventor says: I *claim* the sliding traversing sinkers, arranged in the manner described, for the purposes set forth.

I claim the sliding traversing sinkers, arranged in the manner described, in combination with stationary needles, as and for the purpose set forth.

I claim supporting the wheel that presses or holds the work or fabric back on the needles by an arm bent or curved around to the under side of the wheel, substantially as described.

No. 29,451.—D. D. ALLEN, of South Adams, Mass.—*Improvement in Tubes for Spinning Frames*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* constructing the barrel of the two pieces of tinned plate iron, fitted together and united by soldering, substantially as described.

And, in combination with the barrel composed of two shells of tinned iron plate, I claim the copper bushings applied and soldered within the inner shell, substantially as described.

No. 29,452.—SAMUEL F. ALLEN, of Chicago, Ill.—*Improved Water Heater for Locomotive Engines*.—Patent dated August 7, 1860.—This invention consists in constructing and arranging the different parts named in the claim.

The inventor says: I *claim*, first, the employment of the heater, constructed in the manner represented, with steam chambers *a* and *c*, and intervening water chamber *b*, said chambers being connected substantially in the manner and for the purpose specified.

Second. In combination with the heater B, I claim the compound exhaust pipes D D, when the same are arranged and used substantially as and for the purpose specified.

Third. And, in combination therewith, I claim the float valve V, substantially as and for the purpose specified.

No. 29,453.—EDWARD BEHR, of New York, N. Y.—*Improvement in Carriage Brakes*.—Patent dated August 7, 1860.—To the upper surface of the axle A a lever E is attached, its fulcrum pin *c* passing through its centre; this lever E has a pin *d* projecting down from each A, and end of it, and these pins fit in the slots *b b* of the slide bars D D.

Claim.—The combination of the slotted sliding bars D and rotary lever E, with the axle spokes of the wheel B, as and for the purpose shown and described.

No. 29,454.—JOHN M. BROOKE, of the United States Navy.—*Improved Deep Sea Sounding Meter*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination, in one frame, of two propeller-shaped wheels, or their equivalents, rotating in opposite directions, thus compensating the errors arising from the rotation of the whole apparatus about its axis, while descending through the water, and the mode of connecting the endless screws of the propeller-shaped wheels, or their equivalents, with the registering trains, by the aid of the weight used to sink the line, in opposition

to any retarding influence on the line above, and of disengaging the same, by the aid of a spring rod and arms, as set forth in the preceding description, when the weight used to sink the line is detached from it.

Also, the mode of clamping the driving wheels of the registering train, when the propellers are disengaged by curved or hooked arms attached to the arms G, as shown in the accompanying drawings.

No. 29,455.—CHARLES H. BROWN, of Fitchburgh, Mass.—*Improved Low Water Alarm Apparatus for Steam Boilers*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this improvement.

Claim.—The arrangement of the connected pipes A and B, the slotted rod E, or other fixed fulcrum, the lever H, and the whistle W, or its equivalent, whereby the expansion of the pipes not only causes the operating valve of the whistle, or equivalent, to move from its seat, but the seat to move simultaneously from the valve, substantially as and for the purpose specified.

No. 29,456.—GEORGE BLANCHARD, of New York, N. Y.—*Improvement in Lamps*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the lamp A with the slide or tube B, when the same is provided with the handle C, so that, when taken hold of, the lamp drops down by its own weight, thus affording a lantern.

No. 29,457.—JOHN BLOCHER, of Williamsville, N. Y.—*Improvement in Water Wheels*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of a number of ratchet toothed wheels, arranged upon one shaft, a chain of buckets hung together by knife-edge joints formed of curved flanges at top and bottom of the buckets, and self-adjusting bearings of a guide roller shaft, substantially as and for the purposes set forth.

No. 29,458.—S. BOURNE, JR., of New York, N. Y.—*Improvement in Trunks*.—Patent dated August 7, 1860.—This invention consists in producing a trunk the body of which, as well as the cover, is formed in such a manner that on the outside no seam is required.

Claim.—As a new article of manufacture, a seamless trunk, as described and set forth.

No. 29,459.—C. P. BUCKINGHAM, of Mount Vernon, Ohio.—*Improvement in Governors for Steam Engines*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the method of attaching the arms to the spindle of the governor, at points beyond the axis, with respect to the balls, whereby the acting portions of the said arms lengthen as the balls rise, carrying up the vortex of the cone described at the same time with its base, and thus maintaining a nearly uniform length of axis, substantially as described.

Second. The method of attaching the balls to the arms and sustaining them by springs which can yield, as may be necessary, to the centrifugal force of the balls, whereby the arms of the governor lengthen at the lower end, and the rising of the base and shortening of the axis is diminished, substantially as described.

No. 29,460.—JOHN M. BUELL, of Zanesville, Ohio.—*Improved Churn*.—Patent dated August 7, 1860.—This invention consists in applying to the common dasher churn a combined bowl and tunnel-shaped device, by which the cream is prevented from spattering out, and any cream brought upon the handle, J being rubbed off, is returned again into the churn; and also, in combination with this device, a spiral spring, which equalizes the motion of the dasher and renders its operation more easy.

Claim.—The device A, constructed as described, in combination with the churn spring B, handle g, and head block C, the whole operating as described and for the purposes set forth.

No. 29,461.—RICHARD B. BURCHELL, of Brooklyn, N. Y.—*Improved Window Shade Fixture*.—Patent dated August 7, 1860.—This invention relates to an improvement in that portion of shade fixtures which is employed to retain in proper position and keep "taut" the roller cord.

Claim.—The rod A, provided with racks a, one or more, and smooth surfaces b, and fitted within the bracket B, which is provided with a pawl or pawls h, all being arranged to operate substantially as and for the purpose set forth.

No. 29,462.—NELSON BERR, of Batavia, N. Y.—*Improvement in Portable Mills*.—Patent dated August 7, 1860.—This invention consists in constructing the revolving and stationary

plates with circular chambers, in order to admit the grinding rings or surfaces; also in the employment and arrangement of other devices.

Claim.—The combination of plates C and D, spiral wings H H, adjustable grinding surfaces E and F, and receiver B, the whole being constructed substantially as and for the purpose specified.

No. 29,463.—DAVID B. CALDWELL, of Cincinnati, Ohio.—*Improvement in Straw Cutters.*—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination and arrangement of the gearing J j M G, for operating the feed rollers, substantially as set forth.

Second. The specific arrangement of shafting I L and gearing J K, by which different speeds can be given to the working parts of the machine by a change of the point of application of power, as described.

No. 29,464.—GEORGE L. CARVER, of Brazil, South America.—*Improved Marine Propeller.*—Patent dated August 7, 1860.—This invention consists in the manner of constructing the piston *aa*, with the reversible lever or brace *b*, revolving on the rod K, and alternating floats, or wings *c c*, for propelling or reversing boats and avoiding the back action of the water.

Claim.—The combined use of the valve, piston-box and reversing apparatus, actuated by the rod *d*, the combined parts being constructed and operating in the manner and for the purposes set forth.

No. 29,465.—MATTHEW CHAPMAN, of Greenfield, Mass.—*Improvement in Handles for Cutlery.*—Patent dated August 7, 1860.—In this invention the bolsters are made separate from the other parts and attached in a peculiar way.

Claim.—The fitting of the bolsters C, in the flat tangs B, by means of the slots D, therein substantially, as shown and described.

No. 29,466.—AMOS COATES, of Marlborough, Ohio.—*Improvement in Chain Pumps.*—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination, with the rubber band E, of the buckets, or water-lifters F, constructed with long wedge or scoop ends *h*, and their cross sections being of a boat or wedge-like form, as shown in Fig. 4, with pieces *d f*, hinges *g*, arms D, and projections *c c*; the whole constructed and operating conjointly, as shown and described.

No. 29,467.—JACOB COOVER, of Chambersburg, Penn.—*Improvement in Wiring Blind Rods.*—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of the eccentric I, and adjustable bar P, with the driving bar B, and slat groove J, as herein shown and described, so that the slat L may be so set and held that the wires will enter at an angle to the axis of the slat, all as set forth.

I also claim the employment of eccentric I, or its equivalent, to compress that portion of the slat which is immediately below the driving bar, so that the slat will not split when the wires are driven into it, substantially as herein shown and described.

I also claim the bevelling of the lower part of the plate F, as shown at *x*, so as to permit the near approach of the slats S to the conducting groove, as and for the purpose set forth.

I also claim the combination of the stop V, with the conducting groove Z, as and for the purpose herein shown and described.

I also claim the arrangement, as herein shown and described, of the spring L, conducting bar D, conducting groove Z, and driving bar B, as and for the purpose herein shown and described.

No. 29,468.—G. W. COTTINGHAM and JOHN S. MENEFEE, of Texana, Texas.—*Improved Ant Trap.*—Patent dated August 7, 1860.—This invention consists in the arrangement of a receptacle, with an inverted conical spout in its bottom; also in the combination of a receptacle and inverted conical spout in its bottom with an inwardly bent rim around the top of the receptacle. It further consists in the combination of a receptacle and conical spout in its bottom, with extension pipes.

Claim.—The combination with the cylindrical reservoir A, which may be protected by an inverted truncated cone B¹, if desired, of a conductor C or C¹, substantially in the manner and for the purpose set forth.

No. 29,469.—EDWARD DANIELS, of Northampton, Mass.—*Improved Case for Indelible Ink Bottles.*—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The hollow conical case A, with the removable bottom B, for the purposes described.

No. 29,470.—JOB C. DAVIS, of San Francisco, Cal.—*Improvement in Quartz Mills*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Arranging a series of grinders E, so as to form a spiral line or spiral lines around the centre shaft, constructed in the manner and for the purposes set forth.

No. 29,471.—F. DECAMPOLORO, of France.—*Improvement in the mode of producing Paper Pulp*.—Patent dated August 7, 1860.—The claim explains the nature of this invention.

The inventor says: I *claim* the employment of the cobs of Indian corn, either alone or with the husks, substantially as described, for the purpose of producing pulp for paper

No. 29,472.—THOMAS B. DEFOREST, of New York, N. Y.—*Improvement in Lanterns*.—Patent dated August 7, 1860.—This invention consists in making the base piece of the lantern separate and detached from the other parts of the apparatus, in order that it may be renewed when necessary, and in order that the detachment of parts of the apparatus for the renewal of the glass may be more readily effected.

The inventor says: I *claim* making the base or stand-piece C of the lantern separate and removable from the other parts of the apparatus, substantially as described, for the purposes set forth.

I also claim the reversible handle d, in combination with a base C, cut out to fit partly round the arm; the whole arranged to operate substantially as and for the purposes described.

No. 29,473.—CORNELIUS DONOVAN, of East Abington, Mass.—*Improvement in Rotary Engines*.—Patent dated August 7, 1860.—This invention consists in a certain mode of applying, in combination with the sliding pistons upon which the steam acts to produce rotary motion, the pistons upon which the steam acts to force out the main pistons from the wheel, to which they are attached, into contact with the stationary cylinder of the engine and hold them out in contact therewith; also in the use, in combination of springs with such pistons.

The inventor says: I *claim* combining the pistons I I¹, with the main pistons F F¹, by means of levers H H¹, applied within the piston wheel, substantially as described.

And, in combination with the pistons F F¹ I I¹, and levers H H¹, I claim the springs J J¹, applied and operating as specified.

No. 29,474.—CHARLES TENNANT DUNLOP, of Glasgow, Scotland.—*Improvement in the Manufacture of the Oxide of Manganese*.—Patent dated August 7, 1860.—The claim explains the nature of this invention.

Claim.—Boiling with carbonate of lime, and at a temperature of about 280° Fahrenheit's thermometer or undue pressure, the chloride of manganese commonly obtained as a waste product in the manufacture of chlorine, and subsequently treating the product thus obtained in the manner substantially as set forth.

No. 29,475.—H. C. EMERY, of Lincoln, Ohio.—*Improvement in Rotary Engines*.—Patent dated August 7, 1860.—This invention consists in arranging and constructing the several parts of this engine.

Claim.—The case A¹ A², cam wheel B, the shaft W, the metallic ring Y, secured in annular grooves in the sides of the case, the springs X X, the packing d and n, and the jointed valves a a, constructed and arranged in the manner and for the purpose specified.

No. 29,476.—JAMES R. ENDER, of Trenton, La.—*Improved Fountain Washstand*.—Patent dated August 7, 1860.—This invention consists in arranging within the cupboard or body of the washstand, and under the basin in the top of said stand, a reservoir of a suitable capacity, containing a suitable water bellows, from which proceeds a tube or pipe which leads to the basin, and is furnished with a suitable stop-cock.

Claim.—Combining with a washstand, as described, the water reservoir or bellows E, and pipe F, leading up to the basin B; the whole being arranged and operated in the manner and for the purposes set forth.

No. 29,477.—ORLANDO FOSTER, of Kenosha, Wis.—*Improved Machine for Upsetting Tire, &c.*—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The jaw A, movable jaw B, toothed cams D D, dies F F, eccentric lever C, swaging block 1, punching block 2, and shears 3, as they are arranged in relation to each other, and operated as set forth.

No. 29,478.—WILLIAM FUZZARD, of Charlestown, Mass.—*Improvement in Machinery for Forming Hat Bodies*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the employment or use of rotating conical rollers *d e*, in connection with pickers *E*, arranged over, and concentric with, a hat former or cone *B*, to operate substantially as and for the purpose set forth.

I further claim the arrangement of the picker cases *F*, connected together and placed relatively with pickers *E*, and rollers *d e*, so as to form a feed table as well as cases for the pickers, as described.

No. 29,479.—LEWIS P. GARNER, of Ashland Borough, Pa.—*Improved Apparatus for Separating Slate from Coal*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment of the screen within the screen, movable, so that the inside screen may be moved or depressed, at the will of the operator, thus increasing or diminishing the width of the spaces or openings between the bars, by reason of the peculiar shape of the bars, so that larger or smaller pieces of slate and other impurities may be separated from the coal and other materials that may be passed over said screens.

No. 29,480.—HENRY GARRETT, of Richmond, Mo.—*Improved Spike for Hinges*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* making the tail end of the spike in the form of a crotch, with the prongs thereof in the form described, that they will turn in the wood as shown; this I claim, not as a principle, but as a new article of manufacture.

No. 29,481.—W. H. GWYNNE, of New York, N. Y.—*Improvement in Apparatus for Compressing Gas*.—Patent dated August 7, 1860.—This invention consists in the arrangement of two drums, which are connected with each other by suitable pipes for introducing and discharging the gas, in combination with a cylinder provided with a piston, in such a manner that by filling the cylinder and a portion of the drums with water, and operating the piston in one direction or the other, the gas contained in one of the drums is forced out by the inflowing water, while at the same time the other drum fills with gas, and that by imparting to the piston a reciprocating motion, said drums alternately fill and discharge, and the gas that is forced out of the drums is compressed in a suitable vessel connected with the discharge pipes.

Claim.—The arrangement, for the purpose of compressing gas, of the drums *A A*¹, supply pipe *C*, and discharge pipe *D*, in combination with the cylinder *B*, constructed and operating substantially as described.

No. 29,482.—STUART GWYNN, of New York, N. Y.—*Improved Method of Generating Steam*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

Claim.—As new in the generation of steam or other vapors, reproducing it after performance of its duty by condensing it in the generator which served to produce it, and employing a regenerator or superheater for operation in concert with the boiler, in the manner described, whereby the latent and sensible heat of the steam is made available to the reproduction of steam, and the latter, though circulated out of and back through the boiler, kept at a proper working tension.

No. 29,483.—WILLIAM HALDERMAN, of Freeport, Ill.—*Improved Device for Bolting Flour*.—Patent dated August 7, 1860.—This improvement consists in the employment of screens having a vibrating motion, and used in connection with endless conveying aprons being placed within a suitable case, and arranged in such relation to each other, and to proper spouts, so that a compact and efficient device is obtained.

Claim.—The employment or use of the vibrating screens *E F*, in connection with the endless apron *H I*, and suitable spouts *J l m o a*¹, arranged relative with each other and within a case or box *A*, as and for the purpose set forth.

No. 29,484.—ORIGIN HALL and TIMOTHY MERRICK, of West Meriden, Conn.—*Improvement in Thread Dressing Machines*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* the arrangement of the threads to pass in tangential lines to the circumference of the brush cylinder *B*, substantially as shown and described, so that each thread, in its passage through the machine, will be simultaneously acted upon by the same brush at some part of each tangent, as and for the purpose set forth.

And we also claim so arranging the grooves *d d*, in the rollers *C C*¹ *C*² *C*³, or so applying the threads in such grooves, that the several places of contact between either thread and the brush cylinder are in different planes of revolution of the latter, substantially as and for the purpose set forth.

No. 29,485.—THOMAS HALL, of St. Louis, Mo.—*Improved Feeding Apparatus for Printing Presses*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the tongued vibrating and reciprocating gripper *u*, in combination with the gridiron plate *d*.

Second. I claim the use of the binding bars *n n*, in combination with the plate *f*.

Third. I claim the manner of adjusting the plate *f*, described.

No. 29,486.—ABRAHAM G. HAMAKER, of Peoria, Ill.—*Improvement in Gas Burners*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, constructing the heating chamber of the burner, substantially as described, or in an equivalent manner, so that the different jets shall act upon the side of the burner, and unite in a single flame above its apex.

Second. Arranging over the jet orifices a deflecting plate, constructed substantially as described, so as to deflect and give the required direction to the jet of flame.

Third. The combination of a chambered burner with a central pipe, so arranged that its orifice or orifices of discharge will be above the jet orifices of the burner.

No. 29,487.—DANIEL S. HEFFRON, of Utica, N. Y.—*Improved Refrigerator*.—Patent dated August 7, 1860.—This improvement consists in the peculiar manner in which the air cooled in the ice box is carried around the provision chamber, and not permitted to enter such chamber to deposit the moisture it carries mechanically from the ice in the chamber; also, in the construction and use of an air-drying and cooling chamber, for drying and cooling another current of air to ventilate said provision chamber; and also in the construction and use of a sloping top, for the provision chamber, to carry down to one side any moisture which may condense on such top.

Claim.—The construction and arrangement of the ice box *E*, the registers *F*¹ *F*² *F*³ *F*⁴, the openings *G*¹ *G*², the spaces *H*¹ *H*² *H*³, and the drying chamber *K*, substantially as and for the purpose specified.

No. 29,488.—ALEXANDER HILL, of Dubuque, Iowa.—*Improvement in Compositions for Tanning*.—Patent dated August 7, 1860.—This invention consists in the employment of a composition of soda, gum tragacanth, terra japonica, alum, common saltpetre, and prussiate of potash, mixed together in a certain proportion and dissolved in water, for the purpose of tanning hides and skins.

Claim.—The employment or use, for the purpose of tanning hides or skins, of a composition prepared by dissolving in water the above-named ingredients, mixed together in about the proportion set forth and described.

No. 29,489.—CARL HINRICHS, of New York, N. Y.—*Improvement in Obtaining Coloring Matter from Oak Bark*.—Patent dated August 7, 1860.—The inventor says: I extract the dying properties from the coarsely ground bark by the application of steam, in the proportion of half the weight above the weight of the atmospheric pressure—say about eight pounds; when the operation is finished, the liquid is placed in another vessel and mixed in proportion to the weight of the bark which I have used, with ten per cent. of the following acids: $\frac{2}{3}$ of the ten per cent., sulphuric acid, 66 per cent.; $\frac{1}{3}$ muriatic acid, 20 per cent.

Claim.—The process of concentrating dying extracts to such a high degree by boiling and treating them as described in the foregoing specification.

No. 29,490.—CHARLES B. HUTCHINSON, of Auburn, N. Y.—*Improved Mill for Grinding Grain and Apples*.—Patent dated August 7, 1860.—This invention consists of a peculiar combination of a cider mill, grain mill, and a corn sheller.

The inventor says: I *claim*, first, the above described combination of a cider and grain mill and corn sheller, substantially as specified, for the purposes set forth.

Second. I claim the peculiar construction and arrangement of the crushing teeth *M* and *Q*, operating substantially as set forth, for the purposes specified.

No. 29,491.—WILLIAM HYDE, of Emery, Ohio.—*Improvement in Beehives*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the box *E* with the box *A*, when said box *E* is arranged as specified, for the purpose of increasing the capacity of the hives.

Second. I claim, in combination with my extension hive, the use of cloth or other suitable material combined with galvanic plates, when applied in the manner and for the purposes described and represented.

No. 29,492.—LEWIS S. INGRAHAM, of Grafton, Ohio.—*Improved Butter Worker*.—Patent dated August 7, 1860.—In operating this machine the butter is laid upon its bed at *m*; the roller *A* is rolled over it, backwards and forwards; the ribs *r r* pressing into the butter and working the milk out, make gutters in the butter, down which the fluid pressed from the butter descends to the gutters *y y*, thence passing through the slot *x x*, and into the metallic gutter *H*, which conveys it away. This process is repeated until the butter is clean.

Claim.—The bed, made of two parts *F* and *S*, conical roller *A*, unequally fluted on half or more of its periphery, button *C*, metallic gutter *H*, hinges *N* and *m*², turn table *m*, grooved gutters *y y*, and slots *x x*, the whole constructed and used as and for the purposes described.

No. 29,493.—ANTHONY ISKE, of Lancaster, Pa.—*Improved Cupboard and Sink*.—Patent dated August 7, 1860.—The object of this invention is to economize space in kitchens, so that two indispensable articles of furniture may occupy the space of one.

Claim.—The combination and arrangement of the sliding sink board *B*, and the hinged wings *A*, when attached to a cupboard or closet, substantially as and for the purpose specified.

No. 29,494.—BENJAMIN W. JEWETT, of Gilford N. H.—*Improvement in Artificial Legs*.—Patent dated August 7, 1860.—This improvement consists, first, of an improved knee spring to be used in all cases where the amputation is above, and, in certain cases, where the amputation is below the knee; secondly, in an improved knee joint, to be used only in cases of amputation below the knee.

The inventor says: I *claim*, first, the construction and operation of the guide *b*¹, connected by a suitable joint to the thigh piece *A*, the guide *b*¹ being free to move through the slotted bar *E*, and being enclosed by the spring *e*, as set forth.

Second. The flanges *q q*¹, and the lips *x x*¹, in combination with the bolt *M*, constructed and operating as set forth.

No. 29,495.—WILLIAM H. KIMBALL, of Augusta, Me.—*Improved Hand Cuff*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the cuff, so formed as to open opposite the rule joint in equal parts.

Second. The ratchet 2, as applied to the cuff.

Third. The connection of the draw screw 3, to the ratchet 2, by a vibrating joint.

No. 29,496.—WILLIAM F. KUBLER, of New York, N. Y.—*Improved Shirt Stud*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A stud with a screw shank and point, in combination with a spring clamp, substantially as described.

No. 29,497.—WILLIAM S. LAWYER, of Gratiot, Ohio.—*Improvement in Seeding Machines*.—Patent dated August 7, 1860.—This invention consists in distributing seed by means of a fluted roller, working under the rising and falling bottom of a flexible hopper, so that by rotating said fluted roller the seed is discharged, and at the same time the bottom of the hopper closes down on the top of the distributing roller, so as to prevent any discharge of seed when the roller is at rest.

Claim.—The combination of the suspended yielding hopper bottom *G* with the fluted roller; the same being arranged and operated substantially as described.

No. 29,498.—JOHN LEIGH, of Edgefield, S. C.—*Improved Bedstead*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment of the rail caps, composed of arms *D D*¹, straps *E*, bar *a*^{*}, made in one piece, with pins *a c*, in combination with the rails *B C*, eyes *b d*, and posts *A*, as shown and described.

No. 29,499.—B. F. LEMMON, of New Albany, Ind.—*Improvement in Condensers for Steam Engines*.—Patent dated August 7, 1860.—This invention consists in constructing and arranging the different parts.

The inventor says: I *claim*, first, the arrangement of the jacket *C*, covering the steam pipe *D*, with the pipes *a* and *d*, the casing *B*, and the condensing chamber *A*, provided with the perforated head *e*, substantially as and for the purpose specified.

Second. The arrangement of the water trap *E*, and the valve *F*, with the condensing chamber *A*; the whole being combined and used substantially as and for the purpose specified.

No. 29,500.—N. C. LEWIS, of Boston, Mass.—*Improved Machine for Rolling File Blanks*.—Patent dated August 7, 1860.—This invention consists in the use of four eccentric rolls, the axis of one pair being placed at right angles to the axis of the other pair; the whole being arranged with respect to each other so as to act simultaneously upon the metal.

Claim.—The combination of four eccentric rolls, constructed and arranged with respect to each other, as described, and of appropriate form to roll file blanks, as set forth.

No. 29,501.—ADOLPHUS LIND, of San Francisco, Cal.—*Improvement in Water Wheels*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Providing the buckets G of a water wheel with a series of slots K, in combination with dividing plates L L, and the slots and set screws m m, for the purpose of regulating the size of the buckets.

No. 29,502.—HERMAN LINDEMAN, of New York, N. Y.—*Improved Piano Forte*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement and construction of a curved or arched structure, as a substitute for the long and cross blocks now in use, in the manner and for the purpose substantially as described.

No. 29,503.—ISAAC LINDSLEY, of Providence, R. I.—*Improvement in Making Gold Chains*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Forming the arms of the links convexo-concave in the operation of cutting the said link from the sheet or strip of metal, substantially in the manner and to the end specified.

No. 29,504.—JAMES H. MAYDOLE, of Eaton, N. Y.—*Improvement in Harvesting Machines*.—Patent dated August 7, 1860.—This invention consists in the use of two adjustable wheels M and L, so combined with the frame of a harvester and in such relative relation to each other and the frame and finger bar, as that, by the use of the levers P and T, and the parts in connection with them, or their equivalents, either end of the finger bar may be elevated from the ground independent of the other, or the entire finger bar, as the circumstances may require.

Claim.—The combination and arrangement of mechanism, substantially as described, whereby either end of the finger bar may be elevated from the ground independent of the other, or the entire finger bar by an attendant, substantially as described and for the purpose set forth.

No. 29,505.—ALEXANDER McELROY and JOHN H. KIMBLE, of Fox Lake, Wis.—*Improvement in Seeding Machines*.—Patent dated August 7, 1860.—This invention consists in the construction and arrangement of the different parts of the machine.

The inventors say: We claim, first, the arrangement of the adjustable plate a, and vibrating lever F, with the cam wheel G, distributing bar H, and slides e e, substantially in the manner and for the purpose specified.

Second. The arrangement of the seed box B, and the seed bar H, as constructed with the converging box I, and the triangular dividing bars d and e; the same being used substantially as and for the purpose specified.

No. 29,506.—FERDINARD MEYROSE, of St. Louis, Mo.—*Improvement in Machinery for Moulding Candles*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, the combination of candle moulds k, and hollow pistons J, which latter have a reciprocating motion, and serve the double purpose of guiding the wick h, and of pushing the candles, when finished, out of the moulds, substantially as and for the purposes set forth.

Second. The combination of candle moulds k, open at the bottom, with two frames l m lⁿ m¹, and two pairs of cams p q p¹ q¹, or their equivalents, for the double purpose of clamping the wicks between the two frames while the candles are being cast, and of opening the frames wide enough when the candles are finished, and allowing them to be pushed down through the opening at the bottom of the moulds and between the said frame, substantially as and for the purposes set forth.

No. 29,507.—JAMES L. MIDDLEBROOKS, of Salem, Ga.—*Improvement in Cotton Cultivators*.—Patent dated August 7, 1860.—In the operation of this machine the cutters prepare the ground for the ploughs d d, which follow to turn and loosen the earth; after these come the revolving hoes, which thoroughly chop the weeds from between the rows of cotton; the ploughs f f, following in the rear, leave a furrow on each side for drainage.

Claim.—The revolving hoes *a a*, secured upon the shaft *b*, and operated as shown, in combination with cutters *c c*, and ploughs *d d* and *f f*; the whole being constructed and arranged substantially as and for the purpose set forth.

No. 29,508.—SAMUEL MILLS, of New York, N. Y.—*Improved Life Boat*.—Patent dated August 7, 1860.—This invention relates to the construction and arrangement of life boats that cannot be swamped, capsized, or rendered useless, or lost, and which carry stores of fresh water and provisions.

The inventor says: I *claim*, first, the arrangement of the several compartments to reversible life boats, the same being protected by the outside section in the manner as described and for the purposes set forth.

Second. The application to reversible life boats of screw seats, the same being constructed and arranged substantially as and for the purpose specified.

No. 29,509.—EVARISTE MIRE, of New Orleans, La.—*Improvement in Mills for Cutting and Grinding the Corn, Cob and Husk Together*.—Patent dated August 7, 1860.—The principle feature of this invention is the arrangement, acting upon the husks in such a manner as first to cut them into particles, and by the same action force them downwards so they can pass through the mill with the other particles and come out a uniformly mixed article.

Claim.—The combination of the knives *K* and *f*, when used in conjunction with the teeth *O* and *V*, arranged and operated as, or substantially as, and for the purpose, set forth.

No. 29,510.—RICHARD MONTGOMERY, of New York, N. Y.—*Improvement in Iron Cars*.—Patent dated August 7, 1860.—The nature of this improvement is explained by the claim and engravings.

Claim.—The combination of the curved, corrugated top pieces *B*, with the corrugated side or base pieces *A*, and coupling pieces *H* and *G*; the whole arranged in relation to each other as and for the purposes set forth.

No. 29,511.—HIRAM NASH, of Maysville, Ky.—*Improvement in Water Elevators*.—Patent dated August 7, 1860.—This invention consists in suspending the bucket by means of a flat metal strip from a flanged metal drum that has its bearings on the crank shaft, which drum is clutched with the shaft by a clutch block fixed in the crank shaft, giving to the crank shaft a movement in the direction with its axis, and at the same time by causing a wedge to act upon a pawl that allows the flanged drum to rotate freely on its shaft. A lever and brake block are employed and made to act upon the flanged drum so as to give a perfect control of the descent of the bucket.

Claim.—The loose drum *G*, its toothed flange and pawl *K*, and clutch plate *H*, with the crank shaft *E*, lever *F*, wedge *J*, and plate *I*, for giving to the shaft an end play, in combination with band *b*, and bucket *D*; when the whole is arranged, constructed, and operated substantially in the manner and for the purposes set forth.

No. 29,512.—EBENEZER W. NICHOLS, of Worcester, Mass.—*Improved Holder for Polishing Wheels*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the arrangement of the bar *L*, screw *J*, roller *H*, and gauge *K*, in combination with shaft *D*, clamp *G*, rollers *J*, and the handles *E*² and *F*, when employed substantially as and for the purpose specified.

I also claim the clamping device for holding articles by their edges, consisting of the handle piece *P*, lever jaw *Q*, stationary jaw *O*, and hook *S*, when arranged and employed substantially as specified.

No. 29,513.—JOSEPH OLMSTEAD and WILLIAM A. WALKER, of Victoria, Ill.—*Improved Machine for Upsetting Tire*.—Patent dated August 7, 1860.—This invention consists in the employment of a horizontal, stationary, and movable bed plate, on each of which is a fixed jaw and a pointed dog or clamp, which latter are operated by a pointed lever and connecting rod, moving them up to the tire simultaneously, and causing each of them to clamp the tire with an equal pressure.

Claim.—The combination with the stationary and movable plates *C C*¹, and their blocks *a a*¹, and jointed dogs *D D*, with the lever and connecting rod *E E*¹, and the hand lever and toggle-jointed levers *J G G*¹, all arranged and operating conjointly in the manner and for the purposes set forth.

No. 29,514.—WILLIAM H. PAINE, of Sheboygan, Wis.—*Improved Surveyors' Measure*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

The inventor says : I *claim*, first, a continuous sheet metal measure for surveyors' purposes, substantially as set forth.

Second. The combination of the jointless metal strip, or tape, expansion indicating gauge, or scale and circular scale ; the whole constructed, arranged, and operating in the manner and for the purposes described.

No. 29,515.—ED. PARKER, BENJAMIN PARKER, and THOMAS S. PARKER, of Schenectady, N. Y.—*Improved Lubricator*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

The inventors say : We *claim* the combination of the oil cup, having a perforated bottom, with the perforated plug B, arranged substantially as set forth, and made to operate automatically in the manner and for the purposes mentioned.

We further claim, in combination with the oil cup A, when said cup A is constructed and arranged substantially as described, the friction wheel G, for transmitting motion from the shafting to the oil cup, as and for the purposes set forth.

No. 29,516.—JOHN PARSONS, of Cleveland, Ohio.—*Improvement in Bottom Plates for Drain Tiles*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

The inventor says : I *claim* the two ridges *a a*, on the bottom A, substantially as described and for the purposes set forth ; but—

I do not claim a bottom without the ridges as my invention, neither do I confine myself to the bottoms and ridges being made of any particular material.

No. 29,517.—JOHN S. PECKHAM and MERRITT PECKHAM, of Utica, N. Y.—*Improvement in Stoves*.—Patent dated August 7, 1860.—This invention consists in adding to coal stoves, and to wood stoves having a grate for the burning of wood therein, a flat iron heater formed of the guard plate or fire plate, and a holder, the making of the said guard or fire plate in two parts, and perforating the doors which enclose or cover such guard or fire plate, and attaching a swinging cover to the bottom, or under side of the grate or fire box, by means of which last attachment such fire box may be made air tight when desired.

Claim.—The guard plate B, the holder C, and the under grate cover F^2 , constructed and operating substantially as described, in combination ; the said guard plate B, holder C, perforated doors H, and under grate cover F^2 , constructed and operating substantially as described, in combination.

No. 29,518.—A. W. PORTER, of St. Johnsville, N. Y.—*Improvement in Machines for Digging Post Holes*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

The inventor says : I *claim* the slotted spades or shovels A, as secured by the shackle bar B, and operated by the toggle joint C, substantially as set forth and for the purpose specified.

No. 29,519.—CHARLES A. PRIEST, of Winslow, Me.—*Improved Shoe Peg Machine*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

The inventor says : I *claim* my improved feeding and holding apparatus, the same consisting of the two blades G H, their slotted carriers K K L L, and a common stationary or adjustable fulcrum shaft M, such carriers being operated by bell cranks, as specified.

I also claim the mode of applying each blade to its carriers, viz : by means of the slides, ears, springs, and adjusting screws, operating together and with the blade and carriers, substantially as described.

I also claim the application of the adjusting sliders and screws to the opposite ends and fulcrum of the knife, as specified.

No. 29,520.—G. K. PROCTOR, of Beverly, Mass.—*Combined Clock and Burglar's Alarm*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The attaching of the lever E of the clock alarm to the lever F, which has springs G H connected to it, and also a rod and cord *d e*, by which said lever E is connected to the slide J, on the door frame I, which slide is arranged with the projection *k*, on the door J, as and for the purpose set forth.

No. 29,521.—DANIEL READ, of Hamilton, N. Y.—*Improved Grinding Mill*.—Patent dated August 7, 1860.—This invention consists in the employment of a rotating cutting cylinder, in connection with a reciprocating, toothed, concave and rotating feeder, arranged for joint operation.

The inventor says : I *claim* the rotating, cutting cylinder D, in connection with the vibrating, toothed concave G, as and for the purpose set forth.

I further claim the combination of the cutting cylinder D, concave G, and feeding or toothed cylinder F, arranged for joint operation, as and for the purpose set forth.

No. 29,522.—C. J. SCHOENEMANN, of New York, N. Y.—*Improvement in Piano Forte Keys*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement, in front of the ordinary key board, of an additional series of keys equal in number to the keys of the ordinary key board, and so placed that their upper surfaces are all on the same level, and that each key of the additional series connects with one of the keys of the ordinary key board, as and for the purpose set forth.

No. 29,523.—AUGUST SEMMENDINGER, of New York, N. Y.—*Improved Photographic Camera*. Patent dated August 7, 1860.—This improvement consists in moving the extensional part of the camera on wheels, in attaching to the camera a movable frame, on which the board containing the original may be attached, and in providing the movable and fixed frames with stands hinged thereon.

The inventor says: I *claim*, first, the wheels *m m*, in combination with the extensional parts *C C*, for the purpose of sliding the same in the grooves *n n*, substantially as described.

Second. Attaching the sliding frame *D D*, and the board *E*, to the camera, substantially in the manner described.

Third. The foot *E¹*, and the stand *F F*, hinged to their respective frames, in the manner and for the purpose substantially as described.

No. 29,524.—C. SEWERKROP, of Louisville, Ky.—*Improvement in Cutting Boxes*.—Patent dated August 7, 1860.—This invention consists in so arranging the attachments of the knife to the balance wheel that the knife can be securely connected thereto; also in connecting the rods and levers, by which the feed motion is operated, to the shaft from which they derive their motion by means of a slotted crank, so that the feed motion may be easily adjusted.

Claim.—The slotted crank *J*, on the shaft *E*, in combination with the pitman *L*, rocking shaft *M*, and devices for imparting the feed motion *O Q R*, all arranged substantially as and for the purposes described.

No. 29,525.—GEORGE SHERMAN, of Memphis, Tenn.—*Improved Metallic Alloy for Journal Bearings and Boxes*.—Patent dated August 7, 1860.—The component parts of this metallic alloy are one and a half pound of tin, one and a half pound of the regulus of antimony, and fourteen pounds of lead.

Claim.—The alloy of the aforesaid metallic materials, made in the manner and proportions set forth.

No. 29,526.—LEWIS H. SHULAR, of Crawfordsville, Ind.—*Improved Car Couplings*.—Patent dated August 7, 1860.—This invention consists in the ordinary case or buffer piece of a vibratable spring catch bar, in combination with a guiding spring and connecting link bar and foot piece.

Claim.—The combination of the vibrating catch bar *c*, elevating spring *D*, presser bar *E*, or its equivalent, depressing and guide spring *G*, and connecting link *B*, the whole constructed and operating substantially as described for the purpose set forth.

No. 29,527.—NORMAN H. SLADE and JOHN N. SCRANTON, of Bennington, Vt.—*Improvement in Driving Bands for Spinning Frames*.—Patent dated August 7, 1860.—The corresponding band *e¹* runs around the guide pulley *g¹*, over *m¹*, under the loaded pulley *t*, over the guide pulley *n¹*, around the whirls *f* of the end spindles *a¹*, between the inner sides of the under whirls *f¹ f¹*, and outer sides of the guide pulleys *w w*, and back to the pulley *D*. These bands drive the whole of the spindles, each driving those on one side of the frame.

Claim.—The arrangement of the guide pulleys *g g¹*, adjustable guide pulleys *n n¹ m m¹ i j*, bands *e e¹*, pulley *D*, and loaded tightening pulleys *s s¹*, as and for the purpose shown and described.

No. 29,528.—ELIZABETH M. SMITH, of Burlington, N. J.—*Improved Reaping and Mowing Machine*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Operating the devices for putting the cutters of reaping and mowing machines in and out of gear, by the agency of the driver's seat, substantially as set forth.

No. 29,529.—CASPER V. STATLER, of Wataga, Ill.—*Improved Machine for Upsetting Tire*.—Patent dated August 7, 1860.—This invention consists in the employment of two levers, jointed together like a pair of large pincers, and operated so as to open and close by screw

power applied to the longer arms of the levers; and it also consists in combining with the jaws of these levers four jointed toothed dogs and an adjustable bar, the dogs holding the tire firmly, and the adjustable bar confining the tire between the two pairs of dogs in its proper place.

Claim.—The dogs D D¹ and E E¹, with adjustable bar G and its springs *d d*, in combination with the jointed levers A A, operated by the screw and link C C¹, and arranged substantially in the manner and for the purposes set forth.

No. 29,530.—JAKOB STUBER, FREDERICK FRANK, and PETER D. DOBIE, of Utica, N. Y.—*Improvement in Stoves.*—Patent dated August 7, 1860.—This invention consists in a coal stove, so constructed as to consume all the gas generated from the ignited coal.

Claim.—The arrangement of the perforated plate with smaller hollow cone A attached, larger hollow cone B, and flues C C, in connection with the revolving damper, Fig. 4; the whole being constructed and operated in the manner and for the purposes set forth.

No. 29,531.—LORENZO P. TEED, of White Deer Mills, Pa.—*Improved Arrangement for Disposing of the Sparks from Locomotive Engines.*—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The conducting pipe F, with its openings *m m* and hinged shield G, when the latter are connected to bar H for simultaneous movement, and when the whole is arranged on the top of a railway car, and combined with the conducting pipe D and chimney *a* of the locomotive, as and for the purpose set forth.

No. 29,532.—GABRIEL UTLEY, of Chapel Hill, N. C.—*Improved Machine for Trimming Books and Paper.*—Patent dated August 7, 1860.—This invention consists in three reciprocating knives and a three armed slotted lever, in combination with a follower, for the purpose of trimming paper.

The inventor says: I *claim*, first, the reciprocating knives A B C, and a three armed slotted lever J K, in combination with a follower M P, substantially as and for the purposes set forth.

Second. Operating the knives substantially as described.

No. 29,533.—DAVID F. S. WAYS, of Baltimore, Md.—*Improved Lightning Arrester for Telegraphs.*—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Effecting the suspension and renewal of electrical communication between the main wires and the interior of a telegraph office, or building in which such office is placed, by the use of an electric current, independent of the main line, substantially as described

No. 29,534.—BAXTER D. WHITNEY, of Winchendon, Mass.—*Improved Lathe.*—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* a finishing tool F, in combination with a forming cutter *o* and a sliding rest *m*, so arranged that the different portions of the finishing tool shall be brought to bear successively upon corresponding portions of the article being turned immediately adjacent to the sliding rest as set forth.

I also claim the spring bearing S, within the annular rest *m*, operating as described for the purpose specified.

No. 29,535.—JOHN M. WOOD, of Seneca, N. Y.—*Improved Willow Peeler.*—Patent dated August 7, 1860.—This invention consists in providing a circular revolving disk, with a superincumbent cylindrical roller with a graduating screw on its surface, and so arranged in reference to the disk that when they are both in motion twigs of willow or other twigs of the same nature will pass between them and be speedily stripped of their bark.

The inventor says: I *claim*, first, the circular friction disk, as described, and for the purposes set forth, with its suitable covering of leather or other material.

Second. The screw cylinder, with its cone-shaped plain end, its variable screw, and its groove.

Third. The combination of the disk and screw cylinder, with adjustable facilities, as described and set forth.

No. 29,536.—JOHN H. WYGANT, of Hackensack, N. J.—*Improvement in Stopping and Starting City Railroad Cars.*—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of the inclined planes, arranged on a car body having an end play, or on the truck frame, with the friction rollers G G, or their equivalents, arranged substantially as and for the purposes set forth.

I further claim, in combination with a car body hung in such a manner, on rollers, as to ride on inclined planes, the chain brake operating upon the car axles and attached to both ends of the car body, as and for the purposes set forth.

No. 29,537.—WALTER YOUNG, of Waterford, N. Y.—*Improvement in Car Wheels*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A car or carriage wheel, having a wooden felloe, spokes, and hub, and two metallic tires D E, with one tire overlying the other, as specified and represented in the annexed drawings, and the outer tire removable without disarranging the inner one.

No. 29,538.—CHARLES R. ALSOP, of Middletown, Ct., assignor to JOSEPH W. ALSOP, of New York, N. Y.—*Improvement in Rammers for Revolving Fire Arms*.—Patent dated August 7, 1860.—This invention consists in combining the plunger of the rammer with its operating lever, and with a rammer frame that is detachable from the stock by means of a fixed fulcrum pin in the frame; a transverse pin is secured in the rammer, and two slots arranged in the lever.

Claim.—Combining the plunger C with the lever D, and the frame A by means of the two pins *f g*, and the two slots *d e*, substantially as specified.

No. 29,539.—CHARLES ALEXANDER, of Washington, D. C., assignor to himself and W. C. CHOATE, of said Washington.—*Improved Cork Drawer*.—Patent dated August 7, 1860.—In the engravings A represents a rod which is provided at one end with a handle B, the other end being made pointed. Near the pointed end of the rod is a mortise *x*, and through this mortise a bar D is put, and pivoted about its centre to the rod.

Claim.—The within-described cork drawer, as an article of manufacture, consisting of a pointed rod, a handle, and a reversible cross bar, operating substantially as specified.

No. 29,540.—LEVI W. BUXTON, of Nashua, N. H., assignor to himself and R. B. CRAM, of said Nashua.—*Improved Bed Bottom*.—Patent dated August 7, 1860.—This invention consists of a bed bottom composed of four rods, to each of which a series of small pulleys is attached for the bed cord to reeve through, each rod being connected to its respective bedstead rail.

Claim.—The rods *c*, with their pulleys *f*, in combination with the elastic loops or bands C, and cords *g h*, operating substantially as described.

No. 29,541.—THOMAS BROWN, JR., of South Danvers, Mass., assignor to himself and WILLIAM H. BROWN, of said South Danvers.—*Improvement in Machines for Cutting Glue*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim the above-described glue-cutting machine, consisting of the glue box or receiver A, the reciprocating separator or wire C, and an elevator D, arranged and combined together, and with mechanism for operating such separator and raising such elevator, substantially in the manner as described.

And, in combination therewith, I not only claim the bars *v w*, arranged with respect to the box A, and the separator C, for the purpose hereinbefore set forth, but I claim the mechanism or levers L M, for lifting the pawls *t u*, out of action with the racks, for the purpose specified.

No. 29,542.—O. F. BURTON, of New York, N. Y., assignor to himself and M. H. HOVEY, of said New York.—*Improved Fire Escape*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, combining the ladders A A¹ with each other, and with the trucks C C¹, substantially in the manner herein described, so that, by pulling the trucks close up together, the ladders are elevated, and by pushing the trucks apart the ladders are lowered.

Second. The arrangement of the rings B B¹, in combination with the hinged ladders A A¹, constructed and operating substantially as and for the purpose set forth.

Third. The combination of the circular platforms *c c*¹ of the trucks with the rings B B¹, substantially as and for the purpose specified.

No. 29,543.—ABRAHAM BAKER, of Shenandoah County, Va., assignor to himself, G. A. BROWN, and JOHN PIRKY, of said Shenandoah County.—*Improved Instrument for Paring Horses' Hoofs*.—Patent dated August 7, 1860.—This improved instrument is somewhat in the shape of a pair of nippers, or cutting clams, and applied to the animal's hoof differently from the manner in which the "buttress" is applied: it is applied to the hoof first, and the buttress used to smooth it off afterwards.

Claim.—The construction of the beak-shaped cutting instrument arranged with the guard,

adjusting set screw, as represented in figures 1, 2, 3, 4, substantially as herein set forth and described.

No. 29,544.—JOHN M. COOPER, of Chambersburg, and WILLIAM L. HALLER, of Carlisle, Pa.—*Improvement in Sealing Fruit Cans*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the ring, the gasket, the cap or plate, and the vertical presser when arranged and applied upon the outside of the neck of a fruit jar or can, for sealing it, as herein set forth and explained.

No. 29,545.—WILLIAM GLUYAS, of San Francisco, Cal., assignor to himself and WILLIAM K. O'NEILL, of said San Francisco.—*Improved Amalgamator*.—Patent dated August 7, 1860. The claim and engravings explain the nature of this invention.

Claim.—The relative arrangement of alkali trough No 1, water trough No. 3, quicksilver troughs No. 2 and No. 4, and revolving amalgamator *d*, upon a furnace (containing three fire flues A A¹ B,) the four troughs and the amalgamator relatively communicating with each other by means of nozzles *a a a*, and pipes *k l*, so as to operate in conjunction with each other, as and for the purposes set forth.

No. 29,546.—T. C. HENDRY, of Conyers, Ga., assignor to himself, J. DILLWORTH, S. H. DEAN, T. J. HUTSON, E. H. PATTERSON, and A. J. HENDRY, of said Conyers.—*Improvement in Wheels for Vehicles*.—Patent dated August 7, 1860.—This invention consists in constructing a hub of metal, and of two parts, the interior of the hub being provided with screws and nuts, and the inner ends of the hubs bearing on the latter; all being arranged whereby the desired end is obtained.

Claim.—The hub A, constructed of two parts *a z*, the former having radial recesses to receive the inner ends of the spokes, in combination with the screws *h*, fitted in the annular recess *g* of the part *a*, provided with nuts *i*, so arranged as to form the bearings of the inner ends of the spokes, as and for the purpose herein set forth.

No. 29,547.—GEORGE F. HEBARD, GEORGE J. HILL, and S. D. ROCKWELL, of Buffalo, N. Y., assignors to SANFORD, WARREN & HAROUN, and GEORGE J. HILL, of said Buffalo.—*Improved Printing Press*.—Patent dated August 7, 1860.—This invention consists, first, in the construction, application, and use of an intermittent feed, so that cards, circulars, railroad tickets, and the like, can be printed on long sheets, or continued rolls of paper. Second In so arranging and combining the mechanism that each card or ticket may be printed and separated, or cut from the continuous roll of paper by a simultaneous operation of the machine.

The inventors say: We *claim* an intermittent feed, constructed, arranged, and operating for the purposes and substantially as described. We also claim, in combination therewith, the cutters R S, for the purposes and substantially as set forth.

No. 29,548.—GEORGE HANCOCK, of Providence, R. I., assignor to himself and JAMES M. RUTHERFORD, of said Providence.—*Improvement in Hose Coupling*.—Patent dated August 7, 1860.—The several catches are withdrawn in uncoupling, by means of the metallic sleeve G, which surrounds the opposite ends *n n n* of the latches or levers *h h h*, and turns loosely upon the neck *c* of the socket.

The inventor says: I *claim* the combination of the lever catches *h h h* with the elastic band I, or its equivalent, substantially as described, for the purpose specified.

I also claim the sleeve G, in combination therewith, constructed and operating as described, for the purpose specified.

No. 29,549.—MICHAEL OFFLEY, of Baltimore, Md., assignor to himself and WILLIAM COLTON, of said Baltimore.—*Improved Self-locking Device for Omnibus Registers*.—Patent dated August 7, 1860.—As the pin *m*¹ continues its motion, it slips past the end of the arm *n*³, and the ratchet pinion N being held fast by the pawl *n*², the index N¹ remains at the point 25, no matter how often the register may be operated after the pin *m*¹ has once passed the arm *n*³.

Claim.—The combination of the pin *m*¹ with the arm *n*³, when arranged for joint operation, substantially as herein described, for the purpose set forth.

No. 29,550.—JOHN PALMER, of Fort Scott, Kansas, assignor to himself and JAMES F. DRAPER, of Chicago, Ill.—*Improvement in the Manufacture of Vinegar*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this improvement.

Claim.—The discovery of a material for filling vinegar apparatus—"The Corn Cob."

No. 29,551.—HARVEY RICE, of Concord, N. H., assignor to JAMES H. DEMING and T. H.

JENKINS, of New York, N. Y.—*Improvement in Journal Boxes for Railroad Cars*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Combining with the end bearings of the journal and box, oil lifting projections on the journal, and the channel way for receiving the oil, and leading to, and discharging it at, or near, the centre of the end face of the journal, substantially as and for the purpose specified.

No. 29,552.—JOHN B. ROWELL, of Lynn, Mass., assignor to JONATHAN BUFFUM, of said Lynn.—*Improved Composition for Covering Black Boards*.—Patent dated August 7, 1860.—The composition is composed of alcohol, shellac, linseed or other oil, lampblack or other coloring matter, flour of emory, and black oxyde of magnesia or sulphate of zinc, or other equivalent oil dryer.

Claim.—The combination of the herein before-mentioned ingredients, for the purpose set forth, substantially in the proportions described.

No. 29,553.—VOLNEY STOCKTON, of Williamsburgh, Ohio, assignor to himself and MITCHELL & RAMMELSBERG, of Cincinnati, Ohio.—*Improved Metallic Chair Bottom*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

Claim.—As a new article of manufacture, a chair bottom of corrugated sheet metal, as herein shown and described.

No. 29,554.—CHARLES WELLS and HENRY BARTH, of Cincinnati, Ohio, assignors to the CINCINNATI TYPE FOUNDRY, of said Cincinnati.—*Improvement in Printing Presses*.—Patent dated August 7, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, in printing presses having a vibrating platen or a vibrating bed, seizing the sheet of paper while upon the platen by nippers T S.

Second. We claim the fly R for properly disposing of the sheet of paper after it is printed, in combination with a vibrating platen or a vibrating bed and nippers T S, arranged and operating substantially as described.

Third. We claim carrying the fly R and nippers T S by the same frame X, that operates the ink rolls in printing presses, which employ a vibrating platen or vibrating bed.

Fourth. We claim the stationary nipper S, the nipper T, and the spring U, constructed, arranged, and operating as described, in combination with the hook Y, or its equivalent, upon the vibrating platen or bed C, for the purpose described.

Fifth. We claim the bar Q, vibrated by frame X, but pivotted eccentrically thereto, having rack p giving motion to pinion P, substantially as and for the purpose described.

No. 29,555.—JOHN P. ALLEN, of Dover, Ga.—*Improvement in Seed Planters*.—Patent dated August 14, 1860.—The operation of this invention is as follows: As the implement is drawn along, the legs of the animal communicate a vibrating motion to the bar K, and the latter, through the medium of the rod J and arm I, give an oscillating movement to the shaft H and arms i i, the latter causing the seed in the hopper G to pass out through the space h in a uniform manner, the arms i preventing the choking or clogging of the space h. The seed passes down through the box E and opening h, drops into the furrow, and is covered by the covering share N or N¹, the latter being preferable in rough ground, as it is more likely to pass over obstacles, the bar M being allowed to rise or remain self-adjusting.

Claim.—The arrangement of the two halves of the hopper g g, adjustable bars d d, oscillating shaft H, arm I, rod j, bar K, and straps k k, as and for the purpose shown and described.

No. 29,556.—WILLIAM BAILEY, of London Grove, Pa.—*Improved Machine for Bending Tire*.—Patent dated August 14, 1860.—This invention consists in bending the tire upon the wheel, the circumference of which is continuous and unbroken, of a bridle for securing the tire to the wheel, and an adjustable frame carrying the pressure roller.

Claim.—The roller F, when adjusted vertically through the medium of the frame E and double inclined plane G, and the bridle D, with its hooked legs d d, and screw c, when they are arranged in respect to, and in combination with, the continuous wheel C, substantially as described and for the purpose specified.

No. 29,557.—JOHN C. BAKER, of Mechanicsburgh, Ohio.—*Improvement in Fruit Jars*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The peculiar conical form of the cap C, with a depression in the apex for the pivot e, and a groove around the base for the gasket a, when employed in combination with the clamp D, and inclines B B¹, as and for the purpose set forth.

No. 29,558.—LEVI W. BAKER, of Marlboro', Mass.—*Improved Bread Slicer*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: My improvement and what I *claim* consists not only in constructing the knife with the stud pins *b*, made to project from its opposite sides, but in constructing the standard or carrier B, of two vertical plates *d d*, made with two curved slots *c c*, and an opening *e* leading out of each, in the manner explained and represented.

No. 29,559.—J. G. BARKER, of Watertown, Mass.—*Improved Cheese Cutter*.—Patent dated August 14, 1860.—This invention consists in supporting the knife on both sides, (one side being supported in a groove in the frame, and the other side in a groove in a pin which passes down through the centre of the cheese,) so as to enable the operator to use a very thin knife, which is less liable to break the cheese.

Claim.—The above described cheese cutter, having its knife K guided by the grooved rod M, and operating in the manner substantially as described.

No. 29,560.—PATRICK M. BELTON, of Brooklyn, N. Y.—*Improvement in Compounds used as Decolorizers*.—Patent dated August 14, 1860.—The claim explains the nature of this invention.

Claim.—The composition, substantially as specified, by combining chalk, or its equivalent, with peat, so as to form, after carbonization, a mass which may be used as a substitute for animal charcoal in sugar refining, essentially as set forth, and for other analogous purposes or uses.

No. 29,561.—LYMAN R. BLAKE, of Abington, Mass.—*Improvement in the Manufacture of Boots and Shoes*.—Patent dated August 14, 1860.—The claim and engravings explain the nature this invention.

Claim.—Uniting the bottoms and vamps of boots or shoes with stitches, made without passing the end and length of the unused thread through the parts united, by interlocking one loop of the thread with another, and extending through the said parts substantially as shown and described.

No. 29,562.—LYMAN R. BLAKE, of Abington, Mass.—*Improvement in Boots and Shoes*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—As a new article of manufacture, a boot or shoe in which the bottoms and uppers are united with stitches, made without passing the length and end of the unused thread through the parts united, by interlocking one loop of the thread with another, and extending through the said parts.

No. 29,563.—J. N. BODINE, of Bridgeton, N. J.—*Improvement in Bottles*.—Patent dated August 14, 1860.—This invention consists in forming on the interior of the neck of the bottle, and on opposite sides, vertical grooves, in connection with horizontal grooves extending laterally on either side from the bottom of the vertical grooves, for the purpose of receiving a small independent block, or wedge of wood, or other material, which, after the bottle is corked, is driven into the vertical groove and slid around into the horizontal.

The inventor says: I *claim*, first, a bottle constructed with vertical and short horizontal grooves on the interior of the neck, substantially as described for the purpose set forth.

Second. The method of fastening the cork in the bottle, by means of vertical and horizontal grooves, in combination with an independent plug or block.

No. 29,564.—JOHN P. BOND, of Greenwood, S. C.—*Improvement in Ploughs*.—Patent dated August 14, 1860.—The object of this invention is to construct the ordinary single shovel plough in such a manner, that it will not need the usual diagonal brace, which greatly obstructs the forward movement of the plough through the ground on account of its gathering weeds, grass, &c., and it will be firmly and rigidly braced and secured against backward pressure.

Claim.—The arrangement of the curved brace G, beam A, with its clevises C C, stock E, cross bar D, and stilts B B, as and for the purpose shown and described.

No. 29,565.—SAMUEL G. BRETT, of Newport, N. H.—*Improved Machine for Pointing Shoe Pegs*.—Patent dated August 14, 1860.—The inventor says: Between the two driving rollers F F¹, and the driving rollers opposite them, is another roller X, which I make with angular or screw-like projections around the circumference. The office of this roller is to hold the block up to the pointing tool and to aid in conducting the block through the machine.

The inventor says: I *claim*, first, the elastic pressure rollers G G, the fluted rollers F F, or any equivalent substitute for the latter, and the angular or screw-like roller X, in combination with the tool stock H, arranged and operating as set forth.

Second. The improved tool stock H, with two or more pointing tools *a a*, running in the same groove, arranged as above set forth.

No. 29,566.—B. W. BRUEL, of Beloit, Wis.—*Improved Mop Holder*.—Patent dated August 14, 1860.—This invention consists in the use of two swivel clamping jaws, arranged on the ends of a bifurcated handle, furnished with the usual clasp or securing band.

Claim.—The slotted hole and pin by which the jaws $B^1 B^2$ are rendered self-adjusting, in combination with the bifurcated handle A and retaining clasp; the whole arranged and operating as described, for the purpose set forth.

No. 29,567.—LYMAN D. BURCH, of Sherburne, N. Y.—*Improvement in Ploughs*.—Patent dated August 14, 1860.—H represents a clevis of ordinary construction; *i* a bolt; *j* a slot extending the entire length of the cross head F, connected at each end only; K represents notches into which the bolt *i* may be dropped to increase or diminish the side draft. When the mould board A is shifted to the opposite side of beam B, the clevis H can be instantly changed to the opposite side by the attendant; this is accomplished by taking hold of the cord L.

Claim.—The combination and arrangement of arms D, rods E, slotted cross head F, clevis H, cord L, or its equivalent, substantially as set forth, for the purpose shown and described.

No. 29,568.—EDWARD G. BURGER, of Ypsilanti, Mich.—*Improved Foot Scraper*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this improvement.

Claim.—The arrangement of the inclined plate D, provided with plane and convex surfaces *b c*, and the uprights B B, having curved flanches, the above parts being used with or without the brushes C, as and for the purpose set forth.

No. 29,569.—SAMUEL CANTERBERRY, of Holmes County, Miss.—*Improvement in Ploughs*.—Patent dated August 14, 1860.—The helve *a* is so constructed, that, being united with the bar *b*, it forms a perfect shape for a turning plough, and, being detached from the bar, forms a shovel stock, the upper end of the helve being confined to the wooden beam *z* by two bolts *c* and *d*. The rod *e* serves for the triple purpose of supporting the beam and the helve, and extends behind the helve to which the lower ends of the handle *f* are made fast by a small bolt. The bar *b* is so constructed that it may be easily attached to the helve by one of the bolts, which screws the mould board on, and replaced by a new one.

Claim.—The arrangement of the beam Z, helve *a*, rod *e*, bolt *c* and *d*, hands *f*, bar *b*, piece *h*, and mould board *g*; the whole being constructed and combined in the manner and for the purposes set forth.

No. 29,570.—DANIEL S. CHASE, of Augusta, Ga.—*Improved Anti-friction Rollers for Propeller Shafts*.—Patent dated August 14, 1860.—This invention consists in the use of balls upon axles or arms attached to a ring fitting the shaft loosely so as to move around it, the balls running in grooves in the disk or permanent collar of the shaft.

Claim.—The combined use of the two sets of anti-fiction rollers, constructed substantially as described, one set on each side of the disk or collar of the shaft.

No. 29,571.—WILLIAM H. CHURCHMAN, of Janesville, Wis.—*Improvement in Furnaces for Heating Buildings*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination and arrangement of the fire space with or without the grate *s*, central flue *d*, smoke damper T, return flues *b b*, covering plates *v v v*, openings in plates *x x*, and exit opening *a*, with or without the T-pipe for returning the smoke to the chimney, substantially as described, whereby the heat is economized and diffused over the surfaces of the rarefiers C *c* C¹.

Second. The arrangement of the hot air chambers A, cold air chambers B, and connecting flues A¹ B¹, in the walls of the furnace, with or without the stop dampers M N O O¹, substantially as described, whereby all or any number of the rarefiers C *c* C¹, may be connected at pleasure.

Third. The combination and arrangement of the evaporating pans P B, flues R R, and registered openings 2 2, substantially as set forth, whereby any required degree of heat may be imparted to the water in the pans, and all of the warmed air made to pass directly over the surface of the same in its passage from the furnace.

Fourth. The combination and arrangement of the rarefiers C *c* C¹, hot air chambers A, cold air chambers B, connecting flues A¹ B¹, stop dampers M N O O¹, ventiducts D F E G, registers H I J K, and dampers L, above the registers, substantially as described, whereby the warming and ventilating currents may be perfectly controlled, as set forth.

No. 29,572.—P. S. CLINGER, of Conestoga Centre, Pa.—*Improved Machine for Cutting*

Fodder.—Patent dated August 14, 1860.—In the engravings, Fig. 1 shows the convertible bar K M, enlarged with its bevelled grooved side K up, and one of the vice-jawed knife holders I, with its knife H in the groove L. Fig. 2, is a view of the machine ready for cutting and crushing corn stalks into fodder, supported on its frame F Y, the ends A and front B being closed up. The sliding table D is drawn out to show the knives and cutter bar, as also the binding rod with its screw end and burr *r r* in the cap.

Claim.—The combination of the bar K L, sliding chairs I, with their slotted semi-circular knives H, square-ended and slit screws C C², sliding table D, in the cap *c*, with its binding rod and screw *r r*, when combined as set forth for the purpose specified.

No. 29,573.—RICHMOND CRANSTON and HENRY BATES, of New London, Conn.—*Improvement in Projectiles for Fire-Arms.*—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment of the washer *e*, in combination with the tube C, or its equivalent, and chamber *d*, so that the pitch, while in a plastic state, may be compressed around the fuse rope and the surplus pitch be allowed to escape, substantially as and for the purpose shown and described.

No. 29,574.—JOHN S. DAVIS, of Tiffin, Ohio.—*Improved Washing Machine.*—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the grooves *b* in the sides of the tub A, and furnished with steps *c*, in combination with the pawl or pawls *d* and ratchet teeth *e*, substantially as described, for the purpose of adjusting the washboard to the height of the operator.

Second. The arrangement of the adjustable washboard B with a roller surface *e*¹, in combination with the reciprocating hinged rubber D, being guided in its motions by grooves in the side flanges *f* of the washboard, and operating in the manner set forth.

Third. The combination, with the washboard B and reciprocating rubber D, of a hook F, constructed and operating substantially as and for the purpose specified.

No. 29,575.—JOHN DEVLIN, of Philadelphia, Penn.—*Improved Lever Escapement for Watches.*—Patent dated August 14, 1860.—This invention consists in the substitution, for the banking pins commonly applied to lever escapements to control the movements of the lever, of banking springs, peculiarly constructed and applied.

Claim.—The application to the lever of the banking springs *f f*¹, constructed and arranged to operate in the peculiar manner described.

No. 29,576.—HENRY D. DUNBAR, of Memphis, Tenn.—*Improvement in Pistons for Steam Engines.*—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—In combination with the solid or uncut ring A, the segmental or cut rings *e i*, the latter fitting into the angle of the former, and both breaking joint with each other, said rings *e i* being held out by the action of the steam in the cylinder, mainly to pack the piston, as represented.

No. 29,577.—JACOB EDSON, of Boston, Mass.—*Improved Street Sweeping Machine.*—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, forming the rim of the driving wheel with a series of sectional projections, teeth, or cogs, that are susceptible of being removed and replaced, when worn, at pleasure, substantially as described.

Second. Arranging the broom shaft *b b* diagonally with and across the line of the driving wheel *w w* and supporting wheel *a*¹ *a*¹, as described and represented in the drawings, so as to easily balance the apparatus, however heavy the brooms and their shafts may be, with the use of but two wheels, permit the greatest possible width of broom being obtained, and enable the brooms to sweep close up to the edge stone, as set forth.

Third. Attaching the brooms directly to their shaft by means of the volute springs *c c*, so that they will bear with an elastic, yielding pressure upon and adapt themselves to the inequalities of the surface to be swept.

Fourth. The arrangement of the dish-shaped driving wheel and gear attached to the same, in the manner and for the purpose described.

Fifth. The arrangement of the swinging bar *k*, playing in the vertical standard *l* and forming a bearing for the broom shaft, as described.

Sixth. The use of the elastic band and strap *v*, operating as described, with the swinging bar, for the purpose set forth.

Seventh. Hanging the supporting wheel *a*¹ *a*¹ in the hinged frame work, as described, and for the purpose specified.

No. 29,578.—JAMES S. FOWLER, of Peoria, Ill.—*Improvement in Corn Planters*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A seeding cylinder, arranged with its axis parallel to the line of motion of the machine, and having an alternate rocking motion in opposite directions, in order to scatter the seed laterally, in combination with a sled-runner drill plough, constructed and arranged substantially as described, for the purpose as set forth.

No. 29,579.—ROBERT W. GARDNER, of Quincy, Ill.—*Improvement in Governors for Steam Engines*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Supporting the spindle of a governor on the head of a valve stem, but unconnected therewith, in combination with an adjustable weighted lever, tending to keep the several parts in close contact, and partly balancing the weight of the moving parts of the governor, substantially in the manner and for the purposes described.

No. 29,580.—R. M. GARRETTSON, of Rhinebeck, New York.—*Improved Camp Stool*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Pivoting the arms B B B B and the legs E E E E to the slotted block A, and connecting these arms and these legs together by the peculiar joint described, so that the ends of said arms will act upon the ends of said legs in the block A in opening or closing the arms.

No. 29,581.—WILLIAM L. GEBBY, of New Richland, Ohio.—*Improvement in Seed Planters*.—Patent dated August 14, 1860.—This invention consists in the combination and relative arrangement of a plough share, harrow coverers, seed box, semi-circular valve, curved bar, connecting rod, spring, and levers.

Claim.—The combination and relative arrangement of plough share R, harrow U U S, coverers T T, seed box B, semi-circular valve I, curved bar L, and connecting rod C, spring H, and levers D H, substantially as and for the purposes set forth.

No. 29,582.—W. Y. GILL, of Henderson, Ky.—*Improvement in Air Pumps for Exhausting and Sealing Cans*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, constructing and combining the plunger and air pump substantially as described, so that one plunger may be used for the double purpose of exhausting the air and driving the stopper firmly into the mouth of the can or jar, as set forth.

Second. Suspending the lower end of the main cylinder a suitable distance above the mouth of the can or jar by means of an enlarged cylinder cup attached to said end of the main cylinder, substantially as and for the purposes set forth.

No. 29,583.—SCHUYLER GOLDSMITH, of Wataga, Ill.—*Improvement in Cultivators*.—Patent dated August 14, 1860.—The object of this invention is to obtain a cultivator that will admit of being adjusted or raised and lowered bodily, while the operator is seated on the implement, and also admit of having its front part raised or lowered as circumstances may require.

Claim.—The combination and arrangement of the seat G, draft pole I, racks J K, and axle E, applied to the frame A, substantially as and for the purposes set forth.

No. 29,584.—BARDWELL A. GOODELL, of Millbury, Mass.—*Improved Rotary Engine*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement, in combination with the hollow piston wheel E H, and the pistons F F, of the cam *b c d*, attached to the journal box I, which receives the inner end of the shaft, and enclosed within the piston wheel, substantially as described.

Second. The arrangement of the valves *n u u¹*, and their connections *w v v¹*, in combination with the single induction passage *q*, and its branches *r r¹*, and the two exhaust pipes or passages *t t*, substantially as and for the purpose specified.

No. 29,585.—CHARLES FRANZ GRABO, of Boston, Mass.—*Improved Copying Press*.—Patent dated August 14, 1860.—This invention consists in the combination of levers acting upon the top and bottom platen of the press, so as to operate both platens simultaneously; and secondly, in the manner of attaching the upright bolt to the top platen to be easily detached for the purpose of using the same as a seal press.

The inventor says: I *claim*, first, the combination of the rod G with the levers N and M, acting simultaneously upon the top and bottom platen of a press, in the manner and for the purpose substantially as described.

Second. I claim the manner of attaching the upright bolt E to the top platen, as described, and for the purpose substantially as specified.

No. 29,586.—GOTTLIEB GRAESSLE, of Hamilton, Ohio.—*Improvement in Drain Tile Machines*.—Patent dated August 14, 1860.—A is the frame of the machine, B is the tempering tub provided with the vertical shaft *c*, having attached the tempering blades D and forcing screw blade E, these, by a rotation in the direction of the arrow, being adapted to temper and force the clay through the apertures of the gratings F F into the tubes or passages G G.

The inventor says: I *claim*, first, the oil-boiled wooden moulds *g g*¹, constructed and applied in the manner and for the purpose set forth.

Second. The combination and arrangement of the tempering tub B C D E, grated sides F H, sliding frame I I¹, valves *b*, and moulding tubes G, constructed and operating in the manner and for the purposes set forth.

No. 29,587.—JOHN C. GOAR, of Monterey, Cal.—*Improved Belt Shipper*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the pivotted locks or stops E E¹, and their spring G, upon the face of the belt shipper or slide B, in the manner shown and described, so that pressure upon either of the cords H H¹, will first unlock the corresponding stop and then move the slide, all as set forth.

No. 29,588.—WILLIAM H. GREENWOOD, of Galva, Ill.—*Improved Lock*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The general form and arrangement of the plungers P of the key, as described, so that all the changes can be made in the key, thereby making it a "mental" lock or not, as wished; together with the general form and arrangement of the bolts A and B, the rack and pinions D and C, with the frame and lever E and F, in the manner described, so that the lock will accommodate itself to the key.

No. 29,589.—ASA GREENWOOD, of Toulon, Ill.—*Improved Tenoning Frame*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, the combination and arrangement of the two bearers E E¹, the shoulder gauges D D¹, the holding recess B, and the back gauge M; such being for the formation of rebates on opposite sides of "stuff" by a plane, so as to make a tenon on such stuff, as described.

I also claim the combination of the adjustable bars L K¹ with the tool bearers E E¹, the shoulder gauges D D¹, the holding recess B, and the stop bar M, arranged and applied together substantially as specified.

No. 29,590.—JOHN S. HALL, of West Manchester, Pa.—*Improvement in Ploughs*.—Patent dated August 14, 1860.—This invention consists in uniting the standard of a plough to the beam by means of a ratchet and flanged plates, which admit of several adjustments that are very advantageous in implements of this kind.

Claim.—Uniting a plough standard to a plough beam by means of ratchet and flanged plates arranged on the sides of the beam and standard, so as to admit of folding up, substantially such as described.

No. 29,591.—JOHN S. HALL, of West Manchester, Pa.—*Improvement in Ploughs*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A shoe or support as a device for fitting a straight handle to the back of a mould board of a plough, when said shoe is made as described, of cast or wrought iron or of steel, and bolted or rivetted to the mould board, as stated.

No. 29,592.—LYMAN E. HAWKINS, of Sangamon, Ill.—*Improvement in Cultivators*.—Patent dated August 14, 1860.—In using this machine, the wheels run in furrows on each side of a row of plants, which row is cultivated by the two conveying shovels J J; the shovels I I at the same time loosen the earth on one side of each adjacent row; then, in returning the machine over the field again, these unfinished rows will be completely cultivated.

Claim.—The arrangement of the oblique stocks J¹, ploughs J, vertically inclined stocks I¹, ploughs I, rods *a b*, frame A, axletree B, wheels C C, pole D, lever E, and seat G, as and for the purpose shown and described.

No. 29,593.—ANDREW A. HENDERSON, of Philadelphia, Pa.—*Improvement in Reaping and Mowing Machines*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The rake 4, having an upright part and obliquely descending prongs, in combination with the endless chain or rope, arranged and operating as described, for the purpose of discharging the grain in gavels at intervals.

No. 29,594.—ANDREW A. HENDERSON, of Huntingdon County, Pa.—*Improvement in Machines for Reaping and Raking Grain and Mowing Grass*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the rake e and horizontally travelling endless belt or chain, to which it is attached, with the platform K^1 and sideboards $a b$, or their equivalents, substantially as described, for discharging the grain in gavels at intervals.

No. 29,595.—JASON G. HOWARD, of South Braintree, Mass.—*Improved Machine for Applying Washers to Tacks*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, the combination and arrangement of the lifter O and vibrating hopper M , or their equivalents, with the tack adjusting chute L , the same being made to operate together substantially as explained.

Also, the combination of the agitators $T T$, or their equivalents, with the lifter O and the vibrating hopper M , the said agitators being made to operate therewith substantially as and for the purpose specified.

Also, the combination of the notched tack-receiving and carrying wheel K^1 , and the lever u , or the tack-separating mechanism, as described, with the adjustable chute L , receiving tube I , and its mechanism for driving the tack into the leather as described.

Also, arranging and combining, with the tack-adjusting chute L , mechanism for agitating the same laterally in the manner and for the purpose set forth.

Also, combining the nippers or jaws $a^2 a^2$ with the punch plate carrier c^2 , so as to be movable therewith substantially as described.

Also, the combination of a spring presser g^2 , as described, with the tack-receiver I and its operating arm or lifter bar G .

Also, the combination of the auxiliary discharger z^1 , with the carrying wheel K^1 , and the receiving tube I .

Also, the combination of the lever plate l^1 and its spring m^1 , or equivalent mechanism, with the chute L and the carrying wheel K^1 , the said lever plate being arranged in the manner and to operate with the chute and wheel as explained.

No. 29,596.—JOHN MORRISON HUNTER, of New York, N. Y.—*Improvement in the Preparation of Glue*.—Patent dated August 14, 1860.—This invention consists in manufacturing glue from ordinary refuse scraps of whale blubber.

Claim.—The above described glue as a new article of manufacture, the same being made from whale blubber scraps substantially as described.

No. 29,597.—SABIN HUTCHINS and JOSEPH D. LEACH, of Penobscot, Me.—*Improved Churn*.—Patent dated August 14, 1860.—The dasher of the churn C may be operated independently of the pump, and the pump may be operated independently of the churn, as circumstances may require. The cover of the churn has a large central aperture through which the dasher rod plays, and this aperture has a funnel shaped curb s rising from its periphery, which prevents any waste of cream, while the size of the aperture, which it encloses, allows the air to freely enter the body of the churn and perform its legitimate assistance in the churning process.

Claim.—The arrangement of the churn C , the pump D , the sink B , the lever k , the pitman g , the actuating shafts r and t , the toothed wheels e and f , and the hand crank h , substantially in the manner and for the purpose set forth.

No. 29,598.—NICHOLAS JENKINS, of New York, N. Y.—*Improvement in Wagons*.—Patent dated August 14, 1860.—This invention consists in combining the springs with friction plates and set screws in such a manner that their action can be regulated according to the load on the wagon; and, also, in arranging each spring with a separate tension nut, so that its action can be regulated, and that its tension can be increased if the load in the wagon requires it.

Claim.—The combination, with the springs $A A$, of friction plates G , springs g , and set screws h , constructed and operating substantially as and for the purpose described.

No. 29,599.—JOSEF JOHNSON, of New York, N. Y.—*Improved Clothes Dryer*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—In combination, with the hinged frame or rods $A B C$, and suspending cords $F G H$,

the straining cords L M or N, operating to secure and release the rods, and the whole being arranged for action together substantially as specified.

No. 29,600.—HERMANN JURY, of New York, N. Y.—*Improved Spring Mattress*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of wire frame cells and springs A, in combination with smooth fastening plates D D, in the manner described, and for the double purpose of increasing the flexibility of the wire frame, and obviating the necessity of cord or wire bindings, as set forth.

No. 29,601.—LATHROP KAZAR, of Leroy, Ill.—*Improvement in Adjustable Mole for Mole Ploughs*.—Patent dated August 14, 1860.—This improvement consists in a new mode of constructing the mole or drain plough, by means of which, whilst the upper part of the underground or ditch is left in a solid and compact form, the sides and bottom will be left uncompressed that the water may percolate freely through them.

Claim.—The peculiar arrangement of the landsides A, with respect to the adjustable apron C, as operated, and inclined plane D, the whole being constructed in the manner and for the purposes set forth.

No. 29,602.—WILLIAM KENYON, of Steubenville, Ohio.—*Improvement in Gas Pipe Cutters*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of a chisel D of a gas pipe cutter, with a stationary and a revolving chuck F and A, a crank shaft U, bevel gearing I H, cog wheels B C, and screw shaft J, or their equivalents, for the purpose of revolving the chuck F and feeding the cutting tool D forward by the automatic action of the parts of the implement, substantially as set forth.

No. 29,603.—WILLIAM KIMMELL and DANIEL KIMMELL, of Cambridge City, Mass.—*Improvement in Stump Extractors*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination and arrangement of the capstan B, lever D, and shiftable roller C, for applying the power at different speeds, substantially as set forth.

No. 29,604.—PATRICK KENNEY, of Providence, R. I.—*Improvement in Valve Gear for Steam Engines*.—Patent dated August 14, 1860.—This invention consists in the arrangement of two tripping bars connected with the rock shafts, which carry or operate two induction valves, admitting steam to opposite ends of the engine cylinder, in combination with a single rocker having an adjustable toe, whereby the induction of steam is enabled to be effected in a positive manner at the commencement of the stroke of the piston, and the cutting off is enabled to be effected at various points in the stroke of the piston, under the control of the governor, by the hand of the engineer.

Claim.—The arrangement of the two tripping bars L L, jointed to arms of the valve rock shafts, and working on guides or stops M M, in combination with the single rocker N and its adjustable toe d, the whole operating substantially as described.

No. 29,605.—G. H. LAUB, of Newark, Mo.—*Improvement in Carriage Springs*.—Patent dated August 14, 1860.—This invention consists in the arrangement and combination of compound flat and curved springs, with curved lever arms controlled by segment gear and a spiral spring.

Claim.—The arrangement and combination of flat curved springs C C, and arms A A¹, when said arms are controlled by the segment gear on the contiguous portion of said arms, and by the action of the spiral spring K, as described and represented.

No. 29,606.—JAMES B. LYONS, of Milton, Conn.—*Improvement in Stump Extractor*.—Patent dated August 14, 1860.—This invention consists in the employment of a jointed tripod frame work, constructed of strong timber, and suitably braced, to which are applied pulleys, a block and tackle, grapple hooks, a capstan, and two large hand wheels, which answer the purpose of carriage wheels for moving the frame about from place to place.

Claim.—The combination, with a jointed frame A A and B, as described, of the wheels F F, serving a twofold purpose, gear wheels p G, drum H, pulleys c c c, and block and tackle I J, all arranged and made to operate in the manner and for the purposes described and represented.

No. 29,607.—R. M. LYTHER, of Triune, France.—*Improvement in Portable Scaffolds*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, connecting the posts by means of transverse girders,

arranged substantially as described, so that one or more may be taken out or put in without displacing the other parts of the frame.

Second. Arranging the bands confining the girders to the posts, so as to form splicing sockets to receive the two ends of the post at the point where it is spliced.

Third. The combination of a double wedge, with two bands for strengthening the splicing of the post, when arranged substantially as described for the purpose set forth.

No. 29,608.—JOHN MAGEE, of Lawrence, and WILLIAM J. TOWNE, of Newton, Mass.—*Improvement in Stoves*.—Patent dated August 14, 1860.—This invention consists in the peculiar arrangement of the valve box and valve, and their leading and discharging conduits relatively to the mouth of the furnace and the smoke escape passage in rear of the fire-pot.

Claim.—The described arrangement of the valve box, its valve and leading and discharging conduits relatively to the mouth of a furnace, and a discharge opening situated in the rear of the fire-pot, as specified.

No. 29,609.—ROBERT MARCHER, of New York, N. Y.—*Improvement in Enamelling Picture Frames, &c.*—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of a movable tool, mounted substantially as described, for laying enamel or composition on curvilinear frames, with a face plate carrying the frame to be enamelled, and a pattern of the form required to move the tool, substantially as and for the purpose specified.

And I also claim the combination of two or more movable tools, mounted substantially as described, so that each shall be capable of independent motions, with the face plate carrying the frame to be enamelled, and two or more patterns, one for imparting the required motion to each tool, substantially as and for the purpose specified.

No. 29,610.—CHARLES MARSTON, of Viroqua, Wis.—*Improvement in Grain Harvesters*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, operating the two sickles *G G* through the medium of the levers *k k*, reciprocating slotted plate *F*, vibrating lever *g*, actuated by the crank *c* of the shaft *E*, which derives its motion from the wheel *C*, substantially as set forth.

Second. Operating the rake *K*¹, intermittingly through the medium of the teeth *w*, arranged in sections on wheel *D*, and the pinion *v* on shaft *M*; and also the crank pulley *L*, connected by the pitman *u* with the sweep or bar *I*, having the slide *J* with the pendant *s*, and the rake bar *j* attached; all being arranged substantially as described.

Third. The arrangement of the endless bands *a*¹ *c*¹, in connection with the binding clamps *f*¹ *g*¹ and their operating mechanism, substantially as shown, whereby the gavels are conveyed to the clamps, bound, and the sheaves conveyed to the platform *T*, for the purpose of being discharged in shocks.

Fourth. The platform *T* attached to the shaft *U*, as shown and described, and provided with the bars *X V*¹, the bar *X* having a pin *p*¹ attached, and also a cord *l* and the weight *o*¹ connected to it, the cord being arranged with bar *V*¹, and the latter provided with the catch *k*¹, to operate as set forth.

Fifth. The arrangement of the shafts *B*¹ *B*² with the castor wheel arbor *r*, and the cam *C*¹, as shown, for the purpose of elevating the front part of the machine when required.

Sixth. The arrangement of the castor wheel *Y* with the pinion *s*¹ on its arbor *r*¹, the segment *t*¹, and lever *z*, connected with the neck yoke of the team or with the mechanism of any motor, to operate as set forth.

No. 29,611.—JOHN MAURER, of New York, N. Y.—*Improvement in Bottles*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the doubly inclined channel *a*, around the spout *B* of a bottle, in combination with an opening *b*, in the side of said spout and at the lowest point of said channel, substantially as and for the purpose specified.

Second. The combination of the doubly inclined channel *a* with the packing ring, substantially as described, so that, by the action of the channel, the packing ring is protected against the injurious influence of such portions of the contents of the bottle which, in pouring out, may run down on the outside of the spout.

No. 29,612.—P. G. McCULLA, of Philadelphia, Pa.—*Improvement in Grinding Mills*.—Patent dated August 14, 1860.—This invention relates to certain improvements in that class of grinding mills in which a conical, rotating grinder is placed within a correspondingly shaped stationary shell, and which mills have crushing devices attached.

Claim.—The arrangement for operation together of the conical chamber *B*, egg-shaped chamber *C*, conical grinder *E*, having scalloped or concave terminals *f*, and cylinders *F G*, armed with cutters *g h*, in the manner and for the purposes described.

No. 29,613.—WILLIAM RILEY, JR., of Reading, Pa.—*Improvement in Nail Plate Feeders*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the plate box in such a position that the plate shall be delivered from the box for reception by the nippers, by a lateral movement, to a position in front of the nippers, or between the nippers and the cutters, substantially as described.

Second. The means of operating the plate I^1 , by which the nail plates are forced from the box to be received by the nippers, consisting of the pinion J^1 , shaft J , pinion J^2 , toothed sector J^3 , arm J^4 , stud x , rod J^5 , lever Y^1 , and cam Y ; the whole combined and arranged substantially as specified.

Third. The described mechanism for drawing back the nippers to withdraw the plate from the cutters, preparatory to turning it over and for feeding it up to the cutters, consisting of the oscillating friction sector X^1 , the friction wheel X^2 , the spur wheel X^3 , and the rack v , applied and operating substantially as described.

Fourth. The described mechanism for raising and turning the nipper shaft, consisting of the plane lifters W^4 and V^2 , the rod F^4 and bearing F^2 , the rods V^3 and V^7 , the sector R , the loose pinion f and its pawl f^2 , and the fast toothed collar F^5 , on the nipper shaft; the whole applied, arranged, and operating substantially as specified.

Fifth. The combination of the chain sector S , the sleeve U , with its cams V W X , and the clutch Z ; the whole applied substantially as described, upon the same rock shaft, and in connection with the carriage E , which carries the nippers, substantially as and for the purposes specified.

Sixth. The mechanism for operating the clutch Z , consisting of the reverse cam T , the lever 25 , the rock shaft 21 , with its several arms, and the tappet 28 , attached to the carriage; the whole applied and combined substantially as set forth.

No. 29,614.—E. H. PLANT, of Plantsville, Ct.—*Improvement in Attaching Thills to Carriages*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment of the wedge E , screw e , and nut H , in combination with the axle A , slotted plate G , strap D , bar F , and pintle G , as shown and described, so that, by depressing the wedge E , the strap D , with the pintle G , will be carried towards the plate C , and the bearing of the pintle G , between the strap D and the end of plate C , will be tightened, all as set forth.

No. 29,615.—GEORGE W. RAINS, of Newbury, N. Y.—*Improvement in Steam Boilers*.—Patent dated August 14, 1860.—This invention consists of a boiler composed of a lower annular water chamber and an upper annular water and steam chamber, connected by two or more concentric circular series of upright water tubes, the inner series of which have bars arranged between them, extending from their bottoms, where the grate is placed, nearly to the top thereof, to form a central circular fire box; and the outer series of which are surrounded by a curtain-like cylinder, extending from the bottom of the upper steam and water chamber nearly to the lower water chamber; the whole being surrounded by an iron casting with which the chimney is connected.

Claim.—The combination of the upper and lower annular chambers A B , connected by two or more series of water tubes C C D D , the bars F F , or other filling between the inner tubes, the curtain-like cylinder G , and the outer casing H ; the whole arranged substantially as specified.

No. 29,616.—GRAFTON I. RICE, of Frederick City, Md.—*Improved Sugar Grinding Mill*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement and combination of two cylinder rollers, having pins or projecting points on the surface of each, both revolving together at different degrees of speed, in combination with the movable bottom J , which extends over and protects cylinder F from the pressing weight of the sugar and jarring mechanism, substantially as and for the purposes specified.

No. 29,617.—O. L. RICHARDSON, of Athens, Ga.—*Improved Curb for Mill Stones*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment of a curb C , composed of two parts a b , the upper part b being provided with a flange c , and the two parts a b being separated by the interposed ribs or fans D , leaving an air space d , and an air escape orifice at the upper edge of the part a , over which the edge of the part b projects; all as shown and described, for the purpose set forth.

No. 29,618.—MARK RIGELL, of Dawson, Ga.—*Improvement in Cultivators*.—Patent dated August 14, 1860.—The stocks B B are pivotted or hinged to the beams A, so that, by means of the rods F and the nuts *e*, they can be set at different angles with the beams A. The shackle G performs the office of a self-adjusting connection to the beams A, that of a draft piece to the machine, and also that of a safety draft spring, to prevent sudden strains on the machine.

Claim.—The combination of the spring shackle G, and adjusting bar E, with the beams A A, and stocks B B, arranged and operating in relation to each other, as and for the purpose set forth.

No. 29,619.—JOHN MERRY, of Eldorado County, Cal.—*Improved Mode of Marking Stock*. Patent dated August 14, 1860.—This invention consists in providing a self-advertising brand for stock, by stamping upon suitably shaped buttons the name and location of the owner, and fastening them upon the horn and ear by means of a lock.

Claim.—The application of the owner's name with address, by stamping or otherwise, and the mode of locking or securing the brand.

No. 29,620.—EZRA RIPLEY, of Troy, N. Y.—*Improved Wrench and Pincers*.—Patent dated August 14, 1860.—This invention consists in the arrangement of two wrench jaws A B, on the handle C of a pair of pincers jaws D E, the outer wrench jaw A being filed, and the inner one B fitted upon that of the handle C.

Claim.—The arrangement of the fixed and sliding wrench jaws A B, upon one handle C, of a pair of pincers, substantially as represented; the other handle F, of the pincers, and the sliding wrench jaw being formed to engage together, substantially as herein described.

No. 29,621.—JOHN K. ROBINSON and JOHN M. CLARK, Bellair, Ohio.—*Improvement in Pistons for Steam Engines*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, a piston, composed of a series of solid disks or plates of varying diameter, united by bolts, substantially as described, and for the purpose set forth.

Second. Perforating the bolts which hold the piston plates together, substantially as and for the purpose described.

Third. Adjusting the pressure of the steam upon the packing rings by turning the screw bolts, substantially as described.

Fourth. The combination of the guard plate I, and the tongue piece *i*, with the ring, when arranged substantially in the manner described.

No. 29,622.—JOHN G. ROGERS, of San Francisco, Cal.—*Improvement in Tool Handles*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The attaching of the handle C, to the pick A, or other tool, by means of the straps B B, bands D D, and the steel rod *d*, placed transversely in the handle C, and having its ends projecting from the handle and fitting in the holes *e*, in the straps, substantially as described.

No. 29,623.—WILLIAM RUSSELL, of Stoughton, Mass.—*Improved Wrench and Vise*.—Patent dated August 14, 1860.—This invention consists in having a jaw attached permanently to a bar at right angles, and having a screw pass through said jaw, which screw also has a jaw fitted on it, the above parts being used in connection with a detachable handle and socket.

Claim.—The combination of the bar A, jaws B C, screw D, provided with a detachable handle E, and the socket F, arranged as shown to form a new and useful article of manufacture, for the purpose specified.

No. 29,624.—WILLIAM F. SCHROEDER, of Laporte, Ind.—*Improvement in Seed Planters*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the manner of connecting and operating the spades for the purpose of regulating the depth the holes are to be dug, or to throw them out of operation when desired.

Second. The arrangement of the conducting pipes, in combination with the spades and feeding cups, operated in the manner and for the purpose substantially as described.

Third. The arrangement of scrapers, when connected with levers operated by the spades, in the manner and for the purpose substantially as set forth.

No. 29,625.—JOHN SEIBERLING, of Philadelphia, Pa.—*Improvement in the Preservation of Caustic Alkalies*.—Patent dated August 14, 1860.—This invention consists in providing a wooden box, coated or glazed on the inner side with a varnish, or japan, of coal tar or asphaltum.

Claim.—Putting up caustic potash, or soda, in small quantities, in wooden boxes previously prepared or coated on their inner sides, and subsequently sealed hermetically, substantially in the manner and for the purposes set forth and described.

No. 29,626.—JACKSON SHANNON, of Dakota, Wis.—*Improvement in Cultivators.*—Patent dated August 14, 1860.—The object of this invention is to obtain an implement which may be used as a seeding machine, to plant seed, either in hills or drills, and also used as an expanding cultivator, the implement operating in either capacity as well as if it were designed especially for each.

Claim.—The traverse bars C C, attached to the bars *a a*, as shown, and used in connection with the planks E E, and seat D, and the axle G, on which the bars *a* are fitted loosely, substantially as and for the purpose set forth.

No. 29,627.—GEORGE SLUSSER, of Hillsboro', Ohio.—*Improvement in Animal Traps.*—Patent dated August 14, 1860.—Over the inner edge of the portion B of the base of the frame of the trap, there is pivotted, either at the top E of the trap box, or to the sides D D thereof, a strip H, which has a series of wires or rods *c c c*, descending vertically from its lower edge and forming a grating. There also descends, in an outwardly inclining direction from the strip H, a bait holder *b*.

Claim.—Combining the rollers *d d*, with the rear portion B, of the base frame of said trap, in the manner and for the purpose set forth.

No. 29,628.—HENRY T. SMITH, of Washington, D. C.—*Improved Bedstead Fastening.*—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A face plate, constructed substantially as described, with a projecting flange arranged to form a straining to the fastening key, and with a double pointed revolving hook arranged to enter a bolt either side, and also with a cup projecting over and forming a guide and guard to the curved hook.

No. 29,629.—JAMES SMITH, of Norfolk, Va.—*Improvement in Ploughs.*—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the peculiar mould board C, herein described, straight edged point or cutter A, and inclined land side bar B, with its movable heel piece D, when said mould board extends down beyond the front end of the land side bar, and the curve of the same is formed by a straight line moving parallel to the edge of the cutter in the path of a cycloid, as and for the purposes set forth.

No. 29,630.—NATHANIEL SNOW, JR., of Boston, Mass.—*Improved Steering Apparatus.*—Patent dated August 14, 1860.—By means of the two plain toothed racks S S, the pinion R, the auxiliary shaft P, the bevel wheel O, and the bevel pinion N, arranged and applied to the shaft K, and the two slides C C, the two right and left screws and nuts are dispensed with.

Claim.—The arrangement of the two racks S S¹, the pinion R, the auxiliary shaft P, the bevel wheel O, its pinion N, the steering wheel shaft K, and the slides C C, applied to and for operating the rudder head, as specified.

No. 29,631.—M. MESSER and A. STEINBRENER, of Cleveland, Ohio.—*Improvement in Hanging Sash of Railroad Car Windows.*—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Securing the sash E¹, in railroad cars, by means of the notch N¹, spring P¹, and dowels G¹, when these several parts are arranged and operated substantially as and for the purpose set forth.

No. 29,632.—W. S. STETSON, of Baltimore, Md.—*Improvement in Harvesters.*—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, supporting the platform *a*, over the axle *d*, of the carriage wheels, and on the shaft *a*¹, by means of the uprights *b*, in such manner that by withdrawing the rods *f f*, and the lever pin *p*¹, the platform can be removed at once from the body of the machine.

Second. Combining the reversible spring lever *k*, with reversible and adjusting lever *j*, as set forth.

Third. So constructing the lever J, and combining with it the axle *d*, and reversible lever *h*, that the said lever J may be readily adapted to raise and lower the cutters, whether the cutters are operating in front or in rear of the carriage wheels, as set forth.

Fourth. Arranging the pawl *u*, and spring *v*, and ratchet *w*, all within an open cylindrical rim *x*, projecting inward from the hub of the driving wheel, whereby the parts are not only protected from rising dust and dirt falling from the driving wheels and disturbance from other

sources, but are convenient to the driver to operate them directly with his hand without the aid of rods or levers.

Fifth. Providing the pawl *u* with a notch *z*, the spring *v*, and the ratchet *w*, so that said parts may operate and be operated as set forth.

Sixth. Changing the position of the cutter bar from rear to front of the carriage wheels, substantially in the manner set forth.

No. 29,633.—HENRY D. STOVER, of New York, N. Y.—*Improved Cutter Head for Rotary Planing*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the conical or cone-graduating feed, whereby the operator and stock are both secure when the latter is being entered to the cutters, essentially as set forth.

Second. Such graduating cone feed and revolving, adjustable guard with cutter head, essentially in the manner and for the purposes fully set forth.

Third. Placing and clamping the cutters at an angle with and above each other essentially in the manner and for the purposes set forth.

Fourth. Combining a guide ring *F* with the cutter head, so that the ring shall remain stationary while the cutter head revolves with great velocity within, when such ring and cutter head are kept lubricated by a spiral channel in cutter head or ring to force the oil to every part of the working surface, essentially as set forth.

Fifth. Constructing curved grooves in collars *C* and *X*, and imparting a corresponding reversed shape to the ends of clamp pieces *G* for securely holding them from flying out, even if they should, by any reason, become loose, essentially in the manner and for the purposes fully set forth.

Sixth. Constructing the cutters *K L M* and *Q*, and blanks *O S* and *U*, with dovetail pieces *R P T* and *V*, fitting to corresponding dovetail grooves, formed in main part *B*, to prevent the cutters or blanks from flying out under any circumstances, essentially in the manner and for the purposes fully set forth.

No. 29,634.—HUGH M. STREET, of Denmark, Tenn.—*Improvement in Gearing*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—So connecting the friction rollers to the cogs of gear wheels by means of journals and slots, or their mechanical substitutes, as that the entire pressure, by which the wheel is driven, shall be exerted on the circumference of the rollers which directly bear on the cogs and on the wheel itself, and that no strain shall rest on the pivots of said rollers, substantially in the manner and for the purposes described.

No. 29,635.—J. B. SUTHERLAND, of Detroit, Mich.—*Improvement in Sleeping Cars*.—Patent dated August 14, 1860.—In this improvement, pins or studs, hooks and grooved plates, on the ends of the platform, are used in connection with bearings or brackets attached to the transverse partitions of the car; the above-named parts being so arranged as to admit of the folding and unfolding of the platforms of the upper berths.

Claim.—The employment or use of the bearings or brackets *D D¹ F F¹ G G¹*, secured to the transverse partitions *E* of the car, in connection with the pins or studs *a* attached to platform *b*, and the pins *b*, hooks *c*, and grooves *d*, in the plates attached to the platform *C*; all being arranged substantially as and for the purpose set forth.

No. 29,636.—JOSEPH F. TANNEHILL, of Staunton, Va.—*Improvement in Seed Planters*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A driving and carrying wheel, provided with segments having radial arms for varying its circumference, in combination with a seed-delivering apparatus, substantially such as described or its equivalent.

No. 29, 637.—W. A. TAYLOR and W. W. GRAVES, of Fort Adams, Miss.—*Improvement in Cultivators*.—Patent dated August 14, 1860.—This invention consists in the use of a quadrangular frame capable of being adjusted laterally to adapt the machine to rows of different widths, two ploughs for hill ploughing attached to standards that are secured to the adjustable beams of the frame, said standards being braced to the frame in a peculiar manner, and two scrapers placed in the rear of the ploughs and braced in a novel way.

Claim.—The adjustable beams *E E*, ploughs *d d*, brace rods *b¹*, and the scrapers *G G*, with their standard braces *b b*, and the brace rods *g g*; all combined and arranged in the manner herein set forth.

No. 29,638.—A. THRELKELD, of Boone County, Ind.—*Improved Washing Machine*.—Patent dated August 14, 1860.—The rollers are placed in a straight line, so that when the machine

is put in motion the clothes descend an inclined plane, thus avoiding friction as they move in alternate directions.

Claim.—The arrangement of the roller C, on a straight line with the bottom of box A, in combination with balls D, and corrugated ends E, the whole arranged on rockers B, operating as described and for the purposes set forth.

No. 29,639.—NATHANIEL TUFTS, JR., of Boston, Mass.—*Improvement in Gas Meters.*—Patent dated August 14, 1869.—This invention relates to that class of apparatus for measuring gas, called dry gas meters, in which the gas passing through the same is caused to be registered by the operation of two diaphragms, or chambers having rigid heads and flexible sides like a bellows—for instance, the movements of which diaphragms or chambers by their alternate inflation and collapse impart, by means of suitable devices, a continuous motion to suitable indicating hands.

Claim.—In combination with the supplying pipe *p p*, the double-headed independent bellows connected at its rear head or plate with the said pipe by a screw joint or otherwise, as set forth.

No. 29,640.—ISAAC C. TWINING, of Wrightstown, Pa.—*Improvement in Automatic Rakes for Harvesters.*—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the wheels I K G, toothed at their peripheries in sections, in connection with the bent bar O, cam H, and rake bar L, attached to the upper surface of the wheel K, substantially as and for the purpose set forth.

Second. The arrangement with the wheel I, of the pinions *d e*, cam *g*, and lever G¹, and spring *c*, substantially as shown, for the purpose of giving the necessary dwells or cessations of movement to the rake, as and for the purpose set forth.

No. 29,641.—WILLIAM VAN ANDEN, of Poughkeepsie, N. Y.—*Improvement in Machines for Cutting Files.*—Patent dated August 14, 1869.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, striking a series of blows on a chisel in combination with the file blank while in a state of rest and in the same tooth, for the purposes as heretofore set forth and described.

Second. The formation of the self-adjustable chisel holder, viz: by the combination of the shell X¹, the yielding or loose back X², the nut or slide X³, the chisel X⁴, spring X⁵, or their equivalents, for the purposes heretofore set forth and described.

No. 29,642.—G. W. VAN DEREN, of Big Flats, N. Y.—*Improvement in Steam Engines.*—Patent dated August 14, 1869.—This invention consists in arranging in the interior of a semi-circular cylinder, to which the steam is admitted through passages in its end, two pistons, connected by a curved piston rod, so that the steam acts alternately on the two pistons with its full force, and an oscillating motion of said pistons is produced, which, by connecting a pin that projects from the middle of the piston rod with the crank pin of the fly wheel shaft, is converted into rotary motion.

Claim.—The arrangement of the two pistons B B¹, connected by a curved piston rod C in the interior of the semi-circular cylinder A, with steam passages *a a*¹ in the ends, constructed and operating substantially as and for the purpose set forth.

No. 29,643.—AMOS WHITTEMORE, of Cambridgeport, Mass.—*Improved Machine for Making Horse Shoe Nails.*—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the mode of operating the shears or cutters, the same being made to advance at the proper moment to sever the nail from the rod, and then to fall out of the way, substantially as and for the purpose described.

Second. The various parts which constitute the feeding apparatus, consisting of the upright 5, levers S and C, spiral spring *a*, and rod *b*, the whole operating in the manner and for the purpose specified.

Third. The levers *m* and *e*, acting in conjunction to hold the rod while the nail is undergoing its formation, substantially as and for the purpose specified.

Fourth. The sliding frame D, in combination with the chambers H H, each being operated upon substantially as and for the purpose described.

No. 29,644.—FERDINAND WOLF, of Brooklyn, N. Y.—*Improvement in Cultivators.*—Patent dated August 14, 1860.—This invention consists in arranging in a frame work of suitable construction a rotary cylinder or roller, provided with teeth for tearing up the ground, and operating so as to transmit motion to the other devices; and in combining a gang of ploughs,

having a peculiar motion, with rising and falling plates placed transversely to the machine thereby effecting the formation of the hills.

The inventor says: I *claim*, first, the roller B, provided with teeth *a*, in combination with the harrow C, ploughs D, plates E E¹, and the gearing through which motion is given to the several parts, all arranged and operating substantially as and for the purpose set forth.

Second. The combination of the ploughs D with the plates E E¹, operating so as to lay out the ground in regular hills, substantially as described.

Third. The plates E E¹, operated by means of lazy tongs *l*, substantially as and for the purpose specified.

No. 29,645.—WILLIAM WOOD, of Hartford, Conn.—*Improvement in Brick Machines*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the construction and arrangement of the spring lever E, for throwing out the mould attached to the rock shaft F, and actuated by the direct action of the arms *c* from the main shaft D, in the manner described.

Second. The arrangement of the two levers A and B, one for pressing down the piston and plate for filling the mould, and the other to lift up the same after the mould is filled, in the manner described, being operated by the direct action of the arms *c* from the main shaft D, as specified.

Third. The adjusting arrangement of the slot, sliding ring, and pins G, attached to the piston rod H, and lever B to regulate the pressure of the piston and press plate, all in the manner and for the purpose as set forth.

No. 29,646.—ALBERT J. ALLEN, of Buffalo, N. Y., assignor to R. ALLEN, of Rock Stream, N. Y.—*Improvement in Steam Gauges*.—Patent dated August 14, 1860.—This invention consists in a certain arrangement of parts and machinery by which the pressure of any steam boiler or other vessel may be accurately determined, if the steam or other fluid from such boiler or vessel be properly applied.

The inventor says: I *claim*, first, the combination of lever E with capsule C, the said lever being so constructed and arranged as to have a bearing upon the capsule upon one side of its fulcrum *e*, and a bearing upon a spring upon the other side of its fulcrum, for the purposes and substantially as described.

Second. The combination and arrangement of spring F with lever E and capsule C, substantially as set forth.

Third. The combination and arrangement of lever E, fulcrum block D, capsule C, spring F, and stop G, substantially as shown and described.

No. 29,647.—ALLEN S. BALLARD, of Mount Pleasant, Iowa, assignor to himself and JOSEPH HOWE, of the same place.—*Improvement in Ditching Machines*.—Patent dated August 14, 1860. This invention consists in constructing a plough with an inclined bottom, and furnishing it with a series of cutters and wings, arranged in such a way, and combined with two carriage wheels and an adjustable mechanism, that the plough will dig into the earth any desired depth to form a ditch or trench, and elevate the earth as rapidly as it is loosened by the cutters, which, after being elevated to the surface, will be thrown off from each side of the ditch by the wings of the plough and a scraper that follows in the rear of the machine.

Claim.—The plough G G¹, constructed substantially as described, with or without the movable bottom, in combination with the horizontal cutters *k k k*, cutters *e e*, and carriage A B, the whole being arranged and operating in the manner and for the purposes set forth.

No. 29,648.—FREDERICK H. DRAKE, of Middletown, Conn., assignor to himself and JONATHAN S. CHRISTIE, of New York, N. Y.—*Improvement in Sewing Machine Needles*.—Patent dated August 14, 1860.—This invention consists in making two or more eyes in the needle near its point, or where the eye of a sewing machine needle is ordinarily made, through which eyes the needle thread is passed.

Claim.—Making a perforated sewing machine needle substantially as described and represented.

No. 29,649.—J. F. FLANDERS, of Boston, Mass., assignor to himself and E. G. ALLEN, of the same place.—*Improvement in Leather Splitting Machines*.—Patent dated August 14, 1860. The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of sectional rollers for the direct or immediate support of the hide or leather at the delivery of the same to the edge of the circulating knife, in combination with a roller located below the sectional roller and constructed as described, with elastic surface and fixed bearings.

Second. Placing the sectional roll to one side of the vertical axis of the elastic roll, as described.

Third. Holding the leather and controlling its progress while passing through the machine by means of a brake operating substantially as described.

No. 29,650.—H. M. JACOBS, of Hartford, Conn., assignor to THOMAS J. VAIL, of the same place.—*Improved Machine for Burnishing Spoons*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the burnishers K attached to the arms J, the screw rod L, connected with the burnishers by the nuts j, the ratchet l, pawl N, and the lever M, actuated substantially as shown, for the purpose of feeding the burnishers laterally across their work as described.

Second. The adjustable rod Q, provided with springs R R, fitted in the upright H, having its springs R resting on the arm J of the burnishers, for the purpose of graduating the pressure of the burnishers on the bowls of the spoons, as set forth.

Third. The curved plate S when combined with the rod Q, having the springs $b^1 b^1$ attached and arranged relatively with each other as shown, for the purpose of causing the burnishers, while moving back and forth, to conform to the longitudinal profile of the bowls.

No. 29,651.—EDWIN A. LELAND, of Brooklyn, N. Y., assignor to himself and JOHN BENSON, of the same place.—*Improved Paint Can*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The construction of the can with two lips, as shown, one of which is formed into a shoulder a or e to support the cover C, while the other lip A, composed of soft, flexible metal, is bent over upon and made to seal the cover C, when the latter is to be closed, but when the can is to be opened the said lip A is bent up to a perpendicular position, so that the cover may be removed, all without any soldering or cutting, as and for the purpose specified.

No. 29,652.—DOUGLASS F. MALTBY, of Waterbury, Conn., assignor to the WATERBURY BUTTON COMPANY, of same place.—*Photographic Medal*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The article which I have described and termed a "photographic medal," composed of a ring or plate of solid metal, constituting a frame or rim of a medallion character surrounding one or more pictures produced by photography.

No. 29,653.—AARON MILLER, of Brockport, N. Y., assignor to himself, GEORGE B. WHITESIDE, GEORGE F. BARNETT, and JOSIAH M. LANE, of the same place.—*Improvement in Corn Planters*.—Patent dated August 14, 1860.—As the rear end of the lever a is pressed up to the handle the slides V V are drawn forward and the seed discharged through the teeth. When the distributors are operated by the wheel E, the discharge of the seed can be suspended by grasping the handle and lever a and pressing them together.

Claim.—The arrangement of the slide V, rollers P, levers $a r j j$, rods $c c d d$, and wheel E, as described, and for the purposes specified.

No. 29,654.—BRADFORD STETSON, of Uxbridge, Mass., assignor to himself and ELMER TOWNSEND, of Boston, Mass.—*Improvement in Turbine Water Wheels*.—Patent dated August 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Arranging the slotted plate E and its shaft C with the wheel A and its shaft B, joining the two shafts B and C by the disks $m n$ and screw o , connected as described, and applying the plate E to the buckets and the latter to the wheel heads, as specified.

No. 29,655.—SAMUEL T. ADAMS and DAVID ADAMS, of Medina, Ohio.—*Improved Washing Machine*.—Patent dated August 21, 1860.—A is the box with elevated ends, to prevent the water from being thrown out by the action of the machine; B B are legs which support the machine; C is an upright secured on the outside of box A; D is a concave wash bottom formed of the cross pieces $d d$; said wash bottom is supported by the springs $D^1 D^1$; E is a rubber, the rubbing portion of which is composed of the spiral fluted rollers $e e$; $E^1 E^1$ are rounds which are made fast to the sides of the rubber to keep them together, and also to furnish handles for operating the rubber.

Claim.—The arrangement of the spiral fluted rollers d , yielding concave bottom D, springs $D^1 m$ and L, box A, upright C, rubber suspension arms F F, shaft G, crank H, slide boxes I I, the whole being constructed and arranged for operation conjointly as and for the purposes set forth.

No. 29,656.—DENNIS ALDRICH, of St. Louis, Mo.—*Improvement in the Construction of Tanning Apparatus*.—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination in the manner shown and described of air-tank X, with air-pump attached, air-pipes E E, tan liquor tanks L L, lime tanks O, and bate tanks N, so that the liquid may be changed or moved by atmospheric pressure, to and from each and every tank thus combined, all as set forth.

Second. Providing the leeches with inclined bottoms, in connexion with false bottoms, which have their central portions perforated, when the said inclined portions extend upward from the said perforated portions toward the walls of the vats, as and for the purposes set forth.

Third. The combination, with the frames G G, of rockers *e e*, attached to rock shaft *d*, for the purpose of imparting a reciprocating motion to the frames G G, substantially as described.

Fourth. The construction of the reels F, with radial slotted partitions forming several compartments, and with a hinged door to each compartment, substantially as and for the purpose specified.

Fifth. The employment in the pipes 6 of three way cocks 2, when applied so as to open communication at either the upper or lower part of said pipes, as described.

No. 29,657.—DANIEL ARGERBRIGHT, of Gratis, Ohio.—*Improved Combined Chuck and Counter Sink*.—Patent dated August 21, 1860.—This invention consists in the combination and arrangement of the different parts.

Claim.—The circular piece B, in combination with clamps *b b b b*, knives *d d*, adjusting screws *i i i i*, and guide pins *a a a a*, when the whole shall be constructed and operated substantially as and for the purpose set forth.

No. 29,658.—DANIEL ARNDT, of Zanesville, Ohio.—*Improved Bee Hives*.—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment or use of sand paper or ground glass B, applied to the exterior of a bee hive around its entrance, or within a hive, at suitable places, for the purpose specified.

Second. The water tank or reservoir C, provided with necessary eduction and induction pipes *e g*, placed within a hive A, substantially as and for the purpose set forth.

No. 29,659.—JACOB B. ASHE, of Elkton, Md.—*Improvement in Grubbing Machines*.—Patent dated August 21, 1860.—This invention consists in the combination and relative arrangement of the hooks A, slots B, rollers C, and hand levers D.

Claim.—The combination and relative arrangement of hooks A, slots B, rollers C, and hand levers D, substantially as and for the purposes set forth.

No. 29,660.—EDWARD BACKUS, of Rochester, N. Y.—*Improved Propeller for Canal Boats*. Patent dated August 21, 1860.—Steam may be conveyed from the boiler to the engines through any flexible pipe. The wheel B may be ten feet in diameter, more or less, with ribs on its periphery, and is raised by the windlass E. By placing the wheel in the rear of the axis of the frame C, the power is applied more directly, and the wheel less liable to slip than when it is located in front or even beneath.

Claim.—The arrangement of the engines D, frame C, wheel B, and windlass E, the whole constructed and operated substantially as and for the purposes specified.

No. 29,661.—CHARLES L. BARRITT, of New York, N. Y.—*Improvement in Scythe Fasteners*. Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The plate *b*, as described, for adjusting and holding the shank of a scythe, by means of adjustable wood or other wedges, in combination with the cap plate *h*, and ring and wedge *j* and *k*, or their equivalents, when used for the purposes set forth.

No. 29,662.—JOHN H. BEADLE, of New York, N. Y.—*Improvement in the Construction of Breast Pumps*.—Patent dated August 21, 1860.—This invention consists in combining the pump barrel with the glass tube leading from the cup in such a manner that said tube forms the piston rod, and that by imparting a reciprocating motion to the barrel the operation of pumping is effected.

Claim.—A breast pump, having in combination the reciprocating barrel D, tube C, packing *c*, and valves *b* and *e*, constructed and operating substantially as and for the purpose specified.

No. 29,663.—WILLIAM BLAKE, of Boston, Mass.—*Improvement in Cleansing Galvanized Iron Pipes*.—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A new process, substantially as specified, for effecting the removal of the surplus zinc from a galvanized or zinc coated screw, the essential element of such process being the heating of the tube, or rod, and the putting it in revolution by means substantially as described, against a brush, or equivalent, for producing friction.

No. 29,664.—WILLIAM BLAKE, of Boston, Mass.—*Improvement in Cleansing and Separating Galvanized Nails*.—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* my mode or process, substantially as described, of treating galvanized or zinc coated nails, on their removal in mass from the coating bath or furnace, such process involving the use of gravitation, or a tube, on inclined plane, or slab, and a water bath, in manner as specified.

And I also claim the combination and arrangement of the tube, the inclined plane and the water bath, for the purpose specified.

No. 29,665.—LUDWIG BRUMLEU, of Hoboken, N. J.—*Improvement in the Mode of Making Oxychloride of Lead*.—Patent dated August 21, 1860.—The nature of this invention is shown by the claim.

Claim.—The process, as set forth, in the description of manufacturing oxychloride of lead from chloride of lead and subacetate of lead, leaving in solution neutral acetate of lead free to be used over and over for the same purpose.

No. 29,666.—ROBERT D. BRYCE, of East Birmingham, Pa.—*Improved Attachment of Covers to Glass Vessels*.—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Attaching metallic covers to mugs, pitchers, or other vessels of glass or earthenware, by hinging the upper hinge piece of the cover immediately to the handle of the vessel, or to a knob or projection on or near its rim, thus dispensing with a lower hinge piece of metal, substantially in the manner and for the purpose set forth.

No. 29,667.—A. M. BURNHAM, of Montpelier, Vt.—*Improvement in Machines for Sawing Stone*.—Patent dated August 21, 1860.—This invention consists in the peculiar arrangement of means employed for giving the saws a lateral vibrating motion while working in the usual reciprocating manner to produce the cuts, the lateral movement of the saws admitting of their oblique position relatively to each other, and enabling them to cut simultaneously the two opposite sides of a polygonal taper block.

Claim.—The arrangement of the bar *g*, arms *f*, rock bars *b b*¹, bent lever *E*, the frame *C*, and with the saws *D*, and frame *B*; the whole constructed and operating as shown and described, for the purpose set forth.

No. 29,668.—J. CARL and JAMES W. HEATH, of Grenada, Miss.—*Improvement in Casting Screw Augers*.—Patent dated August 21, 1860.—This invention is chiefly designed to facilitate the construction of augers adapted for boring earth or for analogous uses. Its novelty consists in a peculiar construction and combination of patterns and in the mode of their application to form the moulds.

Claim.—The combination of the shaft pattern *A*, and the segmental spirals *H*¹, constructed, arranged, and applied in the manner set forth, for the formation of moulds for casting spiral augers.

No. 29,669.—DAVID P. CHAMBERLIN, of Hudson, Mich.—*Improvement in Instruments for Pruning Trees*.—Patent dated August 21, 1860.—This invention consists in an arrangement of a cutting hook, in combination with an oblique edged cutting chisel, the two parts operating together.

Claim.—The combination of the oblique cutting blade, with the cutting hook, the parts being arranged and operated substantially as and for the purpose set forth.

No. 29,670.—WILLIAM CLEMSON, of Middletown, N. Y.—*Improved Saw Set*.—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the cam *E*, and the spring or trip hammer *H*, with a suitable anvil *I*, arranged for joint operation, substantially as and for the purpose set forth.

Second. Having the cam *E*, slotted radially, and provided with a bar *c*, and screw *d*, substantially as shown, for the purpose of rendering the cam adjustable, to move the saw a greater or less distance, according to the size of its teeth.

Third. The arrangement of the gauge K, formed of the lips *ff*, at the end of the plate L, and the slide M, in connection with the cam E, hammer H, and anvil I, for the purpose specified.

No. 29,671.—WILLIAM CLEMSON, of Middletown, New York.—*Improvement in Tempering Saws*.—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The fixed metal bed A, placed over a suitable furnace, in connection with a suspended pressure metal block D, operated by the inclined plane G, and eccentric I, or other suitable means, to give the block an oblique downward movement towards the bed, as and for the purpose set forth.

No. 29,672.—EPHRAIM CUSHMAN and JOHN R. CUSHMAN, of Amherst, Mass.—*Improvement in the Manufacture of Leather Paper Stock*.—Patent dated August 21, 1860.—The claim explains the nature of this invention.

Claim.—Heating the stock while it is in the beating engine, and removing the impurities as they rise, as set forth, for the purpose specified.

No. 29,673.—GEORGE DANFORTH, of Friendsville, Ill.—*Improvement in Corn Shellers*.—Patent dated August 21, 1860.—Centrally within the box B a series of springs, or elastic bars I, are placed. Their lower ends are bent in a horizontal position, and are secured to the top of the bench by bolts, and have a radial position around an opening *d* in the bench. The other portions are slightly inclined and form a frustrum of a hollow cone.

Claim.—The arrangement together of the short and long springs I, in the manner shown, for the purpose specified.

No. 29,674.—L. B. DARLING, of Providence, R. I.—*Improvement in the Construction of Stone Tanks*.—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A tank or vessel, the bottom and sides of which each consist of one or more pieces or slabs of stone arranged and combined in the manner shown and described, with the plates *c*, horizontal rods *d*, plates B B¹, perpendicular rods C, and rubber packing *a*, all as set forth for the purpose specified.

No. 29,675.—JACOB DAVID, of New York, N. Y.—*Improvement in Combined Shutter and Awning for Windows*.—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

Claim.—I claim hanging blinds or shutters by a pivotted or swivel hinge at the top, using the ordinary hinge at the bottom, and applying hooks *g g*, or their equivalents, to the shutters inside, and a suitable locking bolt to them, so that the shutters will serve either as such or as an awning, in the manner substantially as described.

I also claim, in combination with the above, the side canvas, as described.

No. 29,676.—ARMENIUS DAVIS, of Shelbyville, Ind.—*Improvement in Cane Guns*.—Patent dated August 21, 1860.—This invention consists in providing a self-cocking secret lock, with the cap tube also concealed in the upper end of the cane, so that nothing is to be seen but the finger bolt of the trigger.

Claim.—The arrangement and combination of straight, percussion bar F, and trigger bar D, when these are made with their various peculiarities as shown, and operated as described.

No. 29,677.—JAMES DAYKEN, of Cleveland, Ohio.—*Improved Mode of Elevating and Delivering Water from Wells*.—Patent dated August 21, 1860.—This invention relates to a water drawer, constructed with a bucket, weight, and pulley.

Claim.—The inclined board K, performing the several functions described, in combination with the spouts A¹ and E¹, bucket E, valve M, rod I, rope S, and counterbalance weight F; the whole being constructed, arranged, and operated, in the manner and for the purpose set forth.

No. 29,678.—WILLIAM DECKMANN, of Canton, Ohio.—*Improved Bedstead*.—Patent dated August 21, 1860.—This invention consists in the combination of certain peculiar castings, connecting posts and rails with securing bolts, holding these parts firmly together.

Claim.—The castings A and B, as described, in combination with slides D, and parts operating the same, as applied to bedstead fastenings.

No. 29,679.—JOHN N. DENNETT, of Bath, Me.—*Improved Bed Bottom Slat*.—Patent dated August 21, 1860.—By placing the slat *c* so that the ends only are supported, and at the same

time pressing down gently on the centre, the blocks *a* and *b* slide between the thin strips *g* and *h*, and the slat *c*, each very near its respective end, and when the pressure is removed, the spring of the slat *c* gives the required elasticity and flexibility to the thin strips *g* and *h*.

Claim.—The combination and arrangement of the blocks *a b*, the slat *c*, the blocks *d e*, and the strips *g h*, substantially as and for the purpose specified.

No. 29,680.—HENRY DISSTON, of Philadelphia, Pa.—*Improved Machine for Grinding Saw Blades.*—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, grinding saw blades by placing them on concave or curved plates, and causing the plates to traverse in such a direction, in respect to a revolving grindstone, that the latter shall bend the blades into the concavity of the plates during or prior to the operation of grinding, for the purpose specified.

Second. Combining an endless chain of concave plates *G* with a revolving grindstone, substantially in the manner set forth, so that a continuous succession of blades may be submitted to the action of the stone, as specified.

Third. The combination, with the endless chain, of plates *G*, the adjustable guides *M M*¹, or their equivalents; the whole being arranged and operating substantially as and for the purpose herein set forth.

Fourth. Causing the plates *G*, as they pass beneath the grindstone, to be tilted by means of an inclination in one of the guides, or any equivalent device.

No. 29,681.—AARON DOUGLASS, of Paterson, N. J.—*Improved Lock Joint for Railway Bars.* Patent dated August 21, 1860.—The object of this invention is to obtain a simple and more efficient means for producing the compound lap-joint for railroad rails than that resorted to at present.

Claim.—The process shown and described of making the lock joint, in patent No. 14,868, as set forth.

No. 29,682.—ELBRIDGE G. DYER, of Hamilton, Ohio.—*Improved Feed Motion for Saw Mills.* Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the sheaves or pulleys *F*, reversing sheaves or pulleys *H* and *I*, disk *J*, and reversing lever *f*, link *e*, and bars *b b*¹, or their equivalents, whereby motion is communicated to the feed gear of a log carriage in either direction, substantially in the manner described.

No. 29,683.—JAMES W. EVANS, of New York, N. Y.—*Improvement in Fastenings for Cotton Bales.*—Patent dated August 21, 1860.—This invention consists of a piece of wire bent in the shape of the letter *S*, and in such a manner that, in the cross section, the centre part 2 shall be either above or below the plane of the end pieces 3 3, and so much out of the line that two thicknesses of the hoops may be easily passed between the bottom of the centre piece 2 and the top surfaces of the centre pieces 3 3. When the tie is applied for fastening the hoop, one end of the hoop *B* is passed above one end 3 of the tie *A*, below the centre part 2, and over the other end of said tie, around which latter end it is then bent so as to hold fast.

Claim.—The application and use of the metal piece *A*, bent in the shape of the letter *S*, and operating on the hoop in the manner and for the purpose substantially as described.

No. 29,684.—CHARLES FAIRFAX, JR., of Cincinnati, Ohio.—*Improvement in Couplings for Belts.*—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The belt coupling described, consisting of two frames *A A*, jointed together by rods *a a*, and furnished with pins *b b*, substantially as described.

No. 29,685.—GEORGE FARMER, of Oseola, Ill.—*Improvement in Harvesters.*—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the arrangement, as shown and described, of the rack bar *P*, driving wheel *Q*, rake head *J*, shaft *R*, pinion *S*, and section cog wheels *m n*, so that the section wheels will rotate the shaft *R*, first in one direction and then in the opposite, thus causing the rack bar *P* to reciprocate and carry the rake, and also cause the latter to open and close, all as set forth.

Also, the making of the cutters, with their rear ends bent up to fit the back part or edge of the cutter bar, and with their sides bevelled and notched as shown when fastened by the hooked bolts or nuts *d*, in the manner shown and described, one edge of each cutter being held up by a hook, and the opposite end being held up by the overlapping bevel of the edge of the adjoining cutter, all arranged as set forth.

No. 29,686.—DAVID FLANERY, of Jackson, Miss.—*Improvement in Telegraph Instruments.*—Patent dated August 21, 1860.—This invention consists in the arrangement of an electro-magnet and armature, a clock movement and escapement, and a resonance box, to constitute an instrument for the production of sounds alone, or sounds and marks at long and short distances without the aid of a local battery.

Claim.—The arrangement of an electro-magnet and armature, a clock movement and escapement, and a resonance box, substantially as described.

No. 29,687.—WILLIAM F. GEORGE, of Cincinnati, Ohio.—*Improvement in Stoves.*—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, in combination with the outer casing A, the oven H of the herein described peculiar shape and form, the same being made to present a gradually increasing sectional area, in the manner and for the purpose set forth.

Second. Gradually diminishing the area of the annular flue J, between the outer casing A and the oven H, in proportion as the sectional area of the latter is made to increase, in the manner as and for the purpose set forth.

No. 29,688.—CHRISTIAN GERMANN, of Camden, Mich.—*Improved Reciprocating Saw.*—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Varying the pitch of saw teeth as they approach the middle of the blade, and also diminishing their distance apart as they approach the middle of the blade, as and for the purposes set forth.

No. 29,689.—THOMAS M. GREEN, of Milledgeville, Ga.—*Improvement in Seed Planters.*—Patent dated August 21, 1860.—This invention consists in the arrangement of sliding bars and serrated strips and stirrers, fastened to the sliding bars, connecting rods, and driving shaft cranks.

Claim.—The arrangement of the sliding bars C C, and serrated strips G G, stirrers I I, fastened to the sliding bars, connecting rods D D, and driving shaft cranks F F, substantially as and for the purposes set forth.

No. 29,690 —ORIGIN HALL and TIMOTHY MERRICK, of West Willington, Conn.—*Improvement in Machines for Dressing and Finishing Thread.*—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the employment of grooves *e*, upon the hot polishing cylinder I, so that an increased extent of thread surface will be exposed to the heat of the cylinder as set forth.

Second. The combination of the four adjustable grooved conducting rollers C C¹ C² C³, with the brush cylinder B, as and for the purpose shown and described.

Third. The combination of the adjustable rack-toothed slides R R, pinions T, roller Q, standards S, and cylinder I, as and for the purpose shown and described.

No. 29,691.—LEONARD HARIMAN, of Anderson, Ind.—*Improvement in Seed Planters.*—Patent dated August 21, 1860.—A represents a suitable frame, in which is journaled a hollow cylinder B, composed of staves, each provided with a number of external apertures *b*. C is a casing of sheet metal, applied to the inner face of each stave, and provided with apertures *c*, corresponding in longitudinal position with the apertures *b*, but differing latitudinally.

The inventor says: I *claim*, first, the construction and arrangement of the teeth E, when combined with a rotary seed planter, as and for the purposes set forth.

Second. The combination of the carriage A, levers I, rod J, catch K, and wheels H, in the manner and for the purposes set forth.

Third. The arrangement of the slides D, springs G, and segmental cam F, constructed and operating in the manner and for the purposes set forth.

No. 29,692.—JOHN M. HATHAWAY, of New York, N. Y.—*Improvement in Handle Fastenings for Augers.*—Patent dated August 21, 1860.—This invention consists in the use of a slotted or notched key, which is movable and slides in or out through the socket part of the handle of the auger or bit transversely to its tang and in proper notches cut therein, so as to firmly fasten it in its place for use, or as readily be made to release it.

Claim.—The application of the slotted or notched key, in combination with the correspondingly notched auger or bit tang, both tang and key being provided with metal bearings, by means of the metal ferule, or its equivalent, the whole being constructed and operating substantially as described, for the purpose stated.

No. 29,693.—ALEXANDER HAY, of Philadelphia, Pa.—*Improvement in the Construction of Railroads*.—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* a railroad chair, constructed substantially as described, for the purpose of holding the rails in place, and, at the same time, supporting a railroad track, and so formed as to be screwed or driven into the foundation, substantially as set forth.

I also claim the groove in the chair, in combination with the groove in the rail, for the purpose of wedging the rail in place, when constructed substantially as described.

No. 29,694.—D. K. HICKOK, of Morrisville, Vt.—*Improved Clothes Dryer*.—Patent dated August 21, 1860.—In using this clothes dryer the standard A being provided with a heavy base fitted in a socket, or held in position by any desired means, the operator, by pulling down the rope G, causes the dryer to expand and have the position, as shown in the engraving; the pins $h h^1$ being in position as shown.

Claim.—The arrangement of the grooved headed standard A, closed cap hub B, pins $h h^1$, and cord G, combined with arms D, braces E, and lower hub c, as and for the purpose set forth.

No. 29,695.—THOMAS HOPKINS, of Newport, Ky.—*Improved Sack Fastener*.—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A sack fastener consisting of two pins or buttons A and A^1 , and a connecting link B, constructed and combined in the manner and for the purposes set forth.

No. 29,696.—HENRY A. HOUSE, of Brooklyn, N. Y.—*Improved Gate*.—Patent dated August 21, 1860.—This invention consists in arranging a knee or toggle joint and two pendulum levers, in combination with two hand levers, in such relation to the gate or gates which are suspended from said pendulum levers, that by depressing either one or the other the levers are forced apart by the action of the toggle joint, and the gate opened and kept open until the toggle joint is brought within a horizontal line drawn through its centre.

The inventor says: I *claim*, first, the arrangement and combination of the toggle arms D D^1 , hand levers E E^1 , pendulum levers B B^1 , and gates A A^1 , constructed and operating substantially in the manner and for the purposes set forth.

Second. The combination with the toggles D D^1 , and hand levers E E^1 , of the weighted hinged dogs F F^1 , arranged substantially as and for the purpose specified.

No. 29,697.—R. B. HUGUNIN, of Cleveland, and G. W. WHITNEY, of Berea, Ohio.—*Improved Washing Machine*.—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* the arrangement of the grooves or corrugations of the surfaces C D, to run in contrary directions, as and for the purposes shown and described.

We also claim the arrangement and combination of the adjustable pressing lever K, with the shaft B, yoke E^1 , uprights E, disk D, and bottom C, as and for the purposes shown and described.

No. 29,698.—JOHN H. IRWIN, of Beardstown, Ill.—*Improvement in Harvesters*.—Patent dated August 21, 1860.—This invention relates to an improvement in the cutting devices of harvesters, whereby it is believed the sickle is made to work with an even or more regular movement than the ordinary reciprocating ones, with less wear and tear of the parts connected with it, and also to cut with less expenditure of power without being liable to choke.

Claim.—The fingers J, in combination with the sickles K K^1 , and the mechanism for operating them, arranged in the manner described, for the purpose set forth.

No. 29,699.—ADOLPH ISAACSEN, of New York, N. Y.—*Improvement in Construction of Apparatus for Destroying Insects*.—Patent dated August 21, 1860.—This invention consists in the particular arrangement of parts.

Claim.—The new article of manufacture described, composed of the rubber bag or ball A, the nozzle B C, and strainer b , arranged to operate together in the manner set forth.

No. 29,700.—F. C. KUTT, of Hackensack, N. J.—*Improvement in Stopping and Starting Railroad Cars*.—Patent dated August 21, 1860.—This invention consists in arranging on the body a series of double inclined planes, resting on friction rollers, which have their bearings in lugs or standards, projecting up from the truck frame in such manner that when the car is suddenly stopped by applying a chain brake to the axles, the body of the car will be moved backwards and up the inclined planes, where it is held until the car is to start, and on releasing the brakes again the body of the car will move forward down the inclined planes and

impart its momentum to the wheels, so as to start them and enable the horses to proceed with comparative ease.

The inventor says: I *claim*, first, the arrangement of inclined planes *b b* on a car body, in combination with friction rollers *D*, or their equivalents, constructed and operating substantially as and for the purpose specified.

Second. The combination with the car body *E*, upon inclined planes *b b* and rollers *D*, of a chain brake *G*, constructed and operating substantially as and for the purpose set forth.

No. 29,701.—SAMUEL K. LANDES, of West Cocalico, Pa.—*Improvement in Machines for Dressing Mill Stones*.—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the movable frame carrying the band wheels, springs, and cutters, the whole being arranged so as to move from right to left, or the reverse, by the shifting mechanism, substantially as described.

No. 29,702.—BERNARD LAUTH, of Pittsburgh, Pa.—*Improvement in Rolling Iron Bars, &c.* Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Holding plates, rods, or bars of iron and steel under tension, longitudinally, by mechanical means, whilst they are being reduced or compressed between rollers, substantially as described.

No. 29,703.—LORENZO LEA, of Jackson, Tenn.—*Improvement in Surveyors' Levelling Instruments*.—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Connecting the bubble block and telescope of a levelling instrument with the tripod or supporting staff by means of a curved spring, in combination with a single set screw, for the purpose of adjusting the position of the level in relation to the supporting staff or tripod, substantially in the manner described.

No. 29,704.—LEWIS LEBER, of Springfield, Ill.—*Improvement in Cultivators*.—Patent dated August 21, 1860.—By operating the hand lever, the cross bars *C¹ C¹* can be raised, and together with them the rear ends of the plough beams, the universal joint at their forward ends serving as the centres of such motion of the plough beams. By this arrangement the ploughs can be adjusted vertically at any required height above the ground.

The inventor says: I *claim*, first, the arrangement of the ploughs *K L* and the cultivator frame, substantially as and for the purposes set forth.

Second. The combination with a cultivator of the swingletree *U*, the crossbar *W*, at the top of an elevated draught pole, two vertical levers *V V*, and an arched yoke *Y*, substantially as and for the purposes set forth.

No. 29,705.—JOHN R. MARSHALL, of Marine, Ill.—*Improvement in Corn Stalk Cutters*.—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the use of the three rollers *A A A*, with knives set longitudinally on their peripheries, in combination with each other; and this I *claim*, not as a combination except when the said rollers are arranged in separate frames, and the said frames are united in relation to each other in the manner shown, and by means of flexible joints, so that the said rollers can follow the uneven surface of the ground, and thus cut the stalks and litter that lie in the hollows and holes thereof.

No. 29,706.—WILLIAM McAFEE, of Summerville, Mich.—*Improved Gate*.—Patent dated August 21, 1860.—The lower part of the post or shaft *A* is of smaller diameter than the upper part, and the former passes through the cylinder *F* and through a hole in the sill, and is allowed to work freely up and down therein. Through the lower part *e*, of the post or shaft *A*, a pin *G* passes transversely and projects a suitable distance from said part and rests on the inclined planes *c c*. The shoulder *f*, formed by the smaller diameter of the part *e* of the shaft has an annular recess *g* made in it to receive the flanch *a* of the cylinder *E*, when the gate is closed. *H H* are two levers, which are attached by fulcrum pins *k k*, to the vertical rods *l l*, which are fitted loosely in the proper guides *m* attached to the gate *B*.

Claim.—The combination, with the central swinging and vertically moving post *A*, in the manner shown and described, of the lifting levers *H H*, rods *l l*, cylinder *E*, inclined edged cylinder within *E*, and pin *G*, for the purpose set forth.

No. 29,707.—T. W. McDILL, of Oquawka, Ill.—*Improvement in Cultivators*.—Patent dated August 21, 1860.—This invention consists of a novel arrangement of adjustable shares.

Claim.—The arrangement of the axle A, and bars *b b k k*, and cross-piece *c*, with the loose connection of the draught pole B¹, to the machine, substantially as and for the purposes set forth.

No. 29,708.—GEORGE C. MILLER and RICHARD HENRY, of Cincinnati, Ohio.—*Improvement in Hillside Ploughs*.—Patent dated August 21, 1860.—This invention consists of a share constructed of one entire piece of steel or wrought iron, in combination with a cast swivel bolted to its underside and intended to supersede the present cast iron shares of this kind of ploughs; also, in a combination, with the reversible mould board, of an adjustable segmental bracket.

The inventors say: We *claim*, first, the described combination of the reversible share and mould board E when formed entire of steel or wrought iron, and the separate cast swivel F, the said parts being constructed, arranged, and connected, in the manner and for the purposes set forth.

Second. The combination of the segmental bracket H, slot *i*, clamp screw G, and mould board E, when constructed, arranged, and operating in the manner and for the purposes set forth.

No. 29,709.—JOHN A. NAYLOR, of Rahway, N. J.—*Improvement in Extension Seats for Carriages*.—Patent dated August 21, 1860.—This invention consists in a new combination and arrangement of parts, whereby the supplemental seat is folded under the other in a novel manner.

Claim.—The arrangement of the removable seat B, supplemental seat C, and hinged braces D, operating together in the manner and so as to produce the effect set forth.

No. 29,710.—LEWIS NEWSOM, of Gallipolis, Ohio.—*Improved Device for Heating Rooms*.—Patent dated August 21, 1860.—This invention consists in so constructing a metallic flue, and letting the same into a chimney, as to close up the flue thereof, so as to require but little of anything else to turn the entire current of smoke and waste heat through said metallic flue.

Claim.—The arrangement of the radiator, constructed as specified in the particular manner described, in relation to the fire-place and chimney.

No. 29,711.—ELON G. NILES, of Cincinnati, Ohio.—*Improved Cooking Range*.—Patent dated August 21, 1860.—This invention consists in a peculiar arrangement of fire-place, oven, and flues, in connection with a small supplementary oven in the main stove or range and a small detachable supplementary furnace, employed for the exclusive heating of the said supplementary oven.

Claim.—The arrangement of the small supplementary oven F, flues H, and damper I, in the described connection with and relation to the detachable supplementary furnace K and flues G of the main furnace B and oven E, the said parts being constructed and combined and operating in the manner and for the purposes set forth.

No. 29,712.—H. W. NORVILL, of Livingston, Alabama.—*Improvement in Car Brakes*.—Patent dated August 21, 1860.—This invention relates to an improvement in that class of car brakes in which the power is applied through the momentum of the cars, as the speed of the latter is checked by the engineer.

Claim.—The employment of the levers H, the bars B, lock bars M, and buffer rods I, arranged to operate substantially as and for the purpose set forth.

No. 29,713.—DAVID P. PATTERSON, of Fayette County, Pa.—*Improvement in the Construction of Distillers' Mash Tubs*.—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination, with the stirring rake of a mash tub, of the perforated steam arms A A¹, constructed, arranged, and operating substantially in the manner described.

No. 29,714.—N. A. PATTERSON and WILLIAM L. RAMSEY, of Kingston, Tenn.—*Improved Washing Machine*.—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The circular perforated and dish-shaped pressure plate E, placed within a tub A, and having the upper end of its shaft *j* fitted in a crank *f*, of a shaft D; all being arranged as and for the purpose set forth.

No. 29,715.—SAMUEL J. PERRY, of Columbia, S. C.—*Improvement in Drawing Boiler Tubes*.—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The instrument composed principally of a screw B, and attached cone or circular

wedge A, a set of connected clamps G G, and a swivel D E F; the whole combined and operating substantially as specified.

No. 29,716.—DAVID RALSTON, of Carlisle, Pa.—*Improvement in Rock Drills*.—Patent dated August 21, 1860.—The frame B consists of two vertical bars C C, and two horizontal bars H, which are framed together in a substantial manner between the two vertical bars. The drill D is secured, passing through guides H, near the top and bottom of said bars. C represents a strong spring which is secured between the two bars running parallel to them. This spring has its fulcrum at the set screw J, and is provided with an opening near its vibrating end through which the drill D passes.

Claim.—The arrangement of the adjustable frame B, the spring C, the drill D, the cross-head E, and guides F, with the connecting rod *a*, the bell-crank *b*, the ratchet *c*, and the ratchet wheel *d*; the several parts being constructed and connected substantially as and for the purpose specified.

No. 29,717.—ALBERT C. RICHARD, of New York, N. Y.—*Improvement in Devulcanizing Waste Rubber*.—Patent dated August 21, 1860.—In this invention the waste rubber, before being subjected to the devulcanizing process, is ground to powder between rollers, and having been made in the fire-place B to heat vessel A, and under the boiler to generate steam. The vessel A is charged and closed up, and steam admitted freely thereinto, in a properly regulated stream, by opening a cock in the pipe H, while its interior is kept heated by the fire to a temperature of over 600°. The steam circulates freely through the vessel A, and escapes by the outlet D, to the chimney along with the sulphureous vapors which are extracted from the rubber by the heat.

Claim.—The described process by which waste vulcanized rubber is devulcanized, all as set forth.

No. 29,718.—JACOB H. REIGHARD and C. L. KNECHT, of Birmingham, Pa.—*Improved Attachment for Hinged Covers of Glass Vessels*.—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We claim attaching caps or covers to mugs, or other articles of glassware, by means of a hole pressed through the glass handle of the vessel, through which is passed a metallic pin attached to or forming part of the hinge of the cover, constructed and secured in the manner described.

No. 29,719.—A. RODEN, of Talladega, Ala.—*Improvement in Presses*.—Patent dated August 21, 1860.—This invention consists in the arrangement of two levers and toggle joints in combination with the follower of a press.

Claim.—The arrangement of two levers K N, and toggle joints G H, in combination with the follower of a press, substantially as and for the purposes set forth.

No. 29,720.—JOSEPH B. SARGENT, of New Britain, Ct.—*Improved Picture Nail Head*.—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A head or knob made in three parts, substantially as described.

No. 29,721.—JOHN P. SCHENKL, of Boston, Mass.—*Improvement in Umbrellas*.—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim not only applying the slider or runner to the joint ring of the rib struts in such manner as to enable such slider to carry such joint ring and be turned or revolved therein and on the stick, but in constructing such slider and the stick with the bayonet studs and catches, or equivalent latching devices, applied to them, substantially in manner and to operate as described.

And in combination with the joint ring and the slider applied to it, and furnished with bayonet catches, as described, I claim constructing both bayonet catches with inclines or cams, and applying a retractive spring to the joint ring and the slider, so as to turn such slider in a direction contrary to that in which it may be moved by either cam, in order to effect the latching of a bayonet catch on its stud at either the opening or the closing of the umbrella.

I also claim the application of the rib cap and its retractive spring directly to the slider or the slider and its catches, so as to enable the rib cap to be moved with the slider, and operated relatively to the outer ends of the ribs or the ferules thereon, essentially as above explained.

No. 29,722.—GEORGE SCRIMSHAW, of Milesburg, Pa.—*Improved Composition for Pavements, &c.*—Patent dated August 21, 1860.—The claim explains the nature of this invention.

Claim.—The mixing of broken stone or cinder, coal ashes, gravel and coal tar, in the pro-

portions substantially as mentioned, for the purpose of forming a composition for pavement, as described and set forth.

No. 29,723.—WILLIAM SHEARER, of Atlanta, Ga.—*Improvement in Pumps*.—Patent dated August 21, 1860.—By taking off the bottom A and unscrewing the journal J, the piston rod H, together with the parts connected therewith, can be slid out of the chamber B¹. Again, when desired, the journal J can be unscrewed, so as to be withdrawn, and then the piston rod H turned half way round so as to cause the piston heads to wear even and true.

The inventor says: I *claim*, first, the combination of the screw piston rod H, openings O, with journal J, and nut plates *b b*, substantially as set forth.

Second I claim the combination of the screw piston rod H, with its piston heads *i i*, packings *j j*, and plates *k k l l*, with chambers B B¹, and water passages *d e*, arranged to operate in relation to each other, as and for the purposes set forth.

No. 29,724.—JAMES S. SMITH, of New York, N. Y.—*Improvement in Military Caps*.—Patent dated August 21, 1860.—The object of this invention is to arrange the ventilating channels and openings in such a manner as to allow a free circulation of the air, and that they exclude the rain.

The inventor says: I *claim*, first, the arrangement of the annular channel *a*, in combination with the tip B, of a cap or hat, constructed and operating substantially as and for the purpose set forth.

Second. The combination, with the annular channel *a*, of a perforated false bottom D, substantially as and for the purpose specified.

Third. The arrangement of the annular flange or lip *h*, in combination with the ordinary ventilator C, constructed and operating substantially as and for the purpose described.

No. 29,725.—WALTER SOMERVILLE, JR., of Mitchell Station, Va.—*Improved Railroad Car Brake*.—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement for compressing air upon cars, in combination with the brakes, for the purpose of operating them, whether applied to one car or to a train of cars, substantially as described.

Second. I also claim the arrangement of the cover Z² for the purpose of excluding dust and cinder, and of admitting pure air into said pump, in combination with the tub Z¹, substantially as described.

No. 29,726 —P. H. STARKE, of Richmond, Va.—*Improvement in Ploughs*.—Patent dated August 21, 1860.—The frame of this plough consists of an upright standard *b*, provided with a curved flange or wing *c c*, and with a recess *r p l m*, in the lower part of its side.

Claim.—The construction and relative arrangement of the wing *c c* and mould board *a g i j k* (fastened together by means of bolt *n*, and hooks *f f*, and slots *h h*,) the plough standard *b t s r*, the point *d g i j k l m*, and the land side *e r l m*, all as shown and described.

No. 29,727.—HENRY D. STOVER, of New York, N. Y.—*Improved Shaping and Moulding Machine*.—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, so constructing and arranging the several parts of my machine that the same arbor and cutter head may be used vertically or horizontally, or any intermediate angle, and be moved to any such position with great celerity, and firmly secured therein to shape the various mouldings or substances with the same head and cutters, essentially in the manner as described.

Second. Combining the laterally adjustable pressure rolls with the feed rolls and cutter head, so that the axes of the former shall lie between planes perpendicular to the bed of the carriage, and passing through the axes of feed rolls and cutter head, substantially as and for the purpose set forth.

Third. The vertically moving carriage U, with its slides C¹, in combination with the slotted plate F¹, arms G¹, and cams F², upon feed roll shaft, arranged and operating substantially as specified.

Fourth. Forming the recesses of the cutters in a cylindrical cutter head, with their beds obliquely or angularly inclined to the axis of the shaft.

Fifth. The longitudinally adjustable guides R¹ upon the table C, when combined with the described cutter head, operating as and for the purpose set forth.

No. 29,728.—HENRY D. STOVER, of New York, N. Y.—*Improved Planing Machine*.—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* constructing and applying an adjustable elastic or flexible wiper K and L, to effectually clean or wipe the finished board or surface of material being planed

after leaving the cutting blades and before reaching the back rigid pressure roll J, for holding down the board and not mar its surface, substantially in the manner and for the purposes set forth.

I also claim the combination of wiper K and L, the front yielding pressure roll I, the cutting cylinder F, and the back adjustable but rigid pressure roll J, for firmly holding down the board front and back of cutter and beautifully finishing the surface, essentially in the manner and for the purposes set forth.

No. 29,729.—JOEL HAYWOOD TATUM, of New York, N. Y.—*Improvement in Candle Wick*. Patent dated August 21, 1860.—The claim and engravings explain the nature of the invention.

Claim.—The plaited wick for candles, composed of five strands, so arranged that the strands on either side of the wick run from both edges towards the centre in an upward direction, or from the centre toward both edges in an upward direction, as described.

No. 29,730.—WILLIAM W. TAYLOR, of South Dartmouth, Mass.—*Improved Tree Protector*.—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* making the tree-protecting trough in two parts, prepared and put together substantially as set forth in the specification.

I also claim the use of the cloth screen, or its equivalent, for the purpose of guiding the insects climbing over the trough, in place of the packing now used as a receptacle for salt, or its equivalent, all in the manner and for the purposes set forth.

I also claim arranging the dome of a tree protector, so as to throw the drip towards the tree and between the trough and the tree, substantially as set forth.

No. 29,731.—THOMAS SEAVILLE TRUSS, of Darlington, England.—*Improvement in the Construction and Joining of Pipes*.—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the making of an expansive or contractile joint, by which pipes, for the transmission of gas, water, steam, or other fluid, are to be secured together by means of a compressing or nut coupling strap, in two or more parts, with packing material upon, between, or around the ends of the pipes embraced by the strap.

I also claim as my invention the making of the junctures of coupling straps, with recesses and corresponding projections or loose blocks.

I also claim as my invention the making of pipes, with flanges at or adjoining their ends, to be used with or operated upon by a compressing or nut coupling strap, with packing material upon, between, or around the same, and embraced by the strap. I wish it, however, to be distinctly understood that I do not claim pipes with flanges at their ends, secured together by bolts, pins, or coulters passing through the same.

No. 29,732.—GREENLEAF L. TURNER, of New York, N. Y.—*Improvement in Railroad Car Springs*.—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment or use of India rubber or other similar elastic material, in connection with air chambers between said rubber and suitable metal plates, when said air chambers communicate directly with the external air, either by means of perforations *p*, or by valves *t*, or when said chambers are provided with bearing plates *D* to prevent the eventual filling and permanent occupation of the air chambers by the rubber under compression, substantially as and for the purpose set forth.

I also claim the construction of the plates, with protuberances *l*, or concaves *d j* upon them, and distributed over the faces of the plates at intervals, substantially as shown, for the purpose of graduating the strength or resistance of the springs when they are compressed as set forth.

No. 29,733.—JAMES VAN VALKINBURGH, of Binghamton, N. Y.—*Improved Machine for Cleaning Rice*.—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment of the device *E*, when constructed with spiral flanches *f*, which are set tangentially on a hub *g*, which is provided with steep inclines, all in the manner and for the purpose set forth.

Second. The deflecting step *h*, when made conical or concave round its circumference, and without spiral projections or ledges, in combination with a screw *E*, as and for the purposes described.

No. 29,734.—C. L. WAFFLE, of Sharon, Ohio.—*Improvement in Corn Planters*.—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The disk *S*, pin *T*, and notches *a e i*, when these are arranged substantially as

described in relation to other parts, for depositing and covering the grain immediately beneath the periphery of the main wheel, or for scattering the grain before or behind its track as specified.

No. 29,735.—MILLER WARNER, of West Middleburgh, Ohio.—*Improvement in Seed Planters*. Patent dated August 21, 1860.—This invention consists in the arrangement of the different devices.

Claim.—The arrangement of the levers K K¹, rods V V, rake U, delivering slide H, and seed box M, the whole being constructed to operate as described, for the purposes set forth.

No. 29,736.—PICKENS B. WEVER, of Scarborough, Ga.—*Improved Cotton Press*.—Patent dated August 21, 1860.—This invention relates to certain improvements in that class of presses in which a right and left screw is used, in connection with toggles, for applying the pressure to the substance to be pressed.

Claim.—The combination, with the hinged parts k, of the springs n, rods o, pulleys p, and ropes q, as and for the purpose shown and described.

No. 29,737.—LEWIS B. WHITE, of Moscow, N. Y.—*Improvement in the Construction of Hernial Trusses*.—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The connection or combination of the spring S, by means of the hook, immediately with the lever of the truss herein described.

No. 29,738.—LUTHER WHITMAN, of Winthrop, Maine, and EZRA WHITMAN, of Baltimore, Md.—*Improvement in Casting Cylinders for Threshing Machines*.—Patent dated August 21, 1860.—This invention consists in casting the cylinders of threshing machines, with rectangular tapering holes in them, for the reception of the teeth.

Claim.—The method described of casting threshing machine cylinders in a single piece, and having rectangular tapering holes in them for the reception of the threshing teeth, as set forth.

No. 29,739.—J. D. WILLOUGHBY, of Petersburg, Va.—*Improvement in Machines for Forming Grooves in the Necks of Cans, &c.*—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the mouth piece A, the springs B and C, and the pins a a, when the same are so arranged as to form grooves in the necks of cans, jars, and bottles, when the material is plastic, substantially as specified.

No. 29,740.—GILE J. WILLSON and DAVID H. FOX, of Reading, Pa.—*Improvement in Gas Meters*—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the application of tube V, of any convenient length, size, shape, or form, and located at any convenient place in or on the meter, with one end open inside of the meter at or about the working water level of a wet gas meter, with the other or outer end opened or closed by a screw or otherwise, at or about the water level of the water.

Second. The application and combination with tube V, and the other general arrangement of a wet gas meter, of a filling tube W, of any convenient size, shape, or form, with the lower end passing below the water level of the meter, and the upper end passing high enough to overcome the pressure of gas in the meter, to prevent an overflow of water, with an open filling tube, also, to admit of water being filled into the meter without turning off the gas.

No. 29,741.—BANCROFT WOODCOCK, of Williamsburg, Pa.—*Improvement in Ploughs*.—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the cutter C, as set forth, in combination with the corresponding fitting part in the face side of the land side L, and the upper part of the land side made sharp, that when it and the cutter are united, they form one continuous cutter, as substantially described, when said parts are combined with the mould board M.

Second. The arrangement of the movable point P, with its sections, as set forth, and the share S, with its upper and lower sections, as stated, and the knob p, on the lower edge of the land side L, for the purpose named, in combination with the point and share, as specified above.

Third. In combination with the above, I also claim the arrangement of the clevis D and circular saw A; the whole being constructed as and for the purpose set forth.

No. 29,742.—CHARLES WORDEN, of Ypsilanti, Mich.—*Improved Apparatus for Regulating the Flow of Water from Cisterns*.—Patent dated August 21, 1860.—C is a circular opening in the partition D, through which the water passes on entering the machine, while the cistern is but partially full. F and G are openings in the inner wall W, through which the water readily passes, falling through the unclosed part of the bottom, marked H, into the cistern below. E is a square piston head, attached to the rod L, and moving freely up and down in the space between the partition D and the bottom S. J is a rim or flange inserted in the orifice C, in the partition D, and extending a small distance below.

Claim.—The combination of the float, piston, and box, with partitions B and W, having openings J G F, and pipes A and K; the whole constructed, arranged, and operated in the manner and for the purpose set forth.

No. 29,743.—JOHN BIRD, of Birmingham, Pa., assignor to BAKEWELL, PEARS & Co., of Pittsburgh, Pa.—*Improved Fastening of Metallic Covers for Glass Vessels*.—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Attaching the metallic hinged cover to lager beer glasses and other vessels made of glass or earthenware, by means of a lug or lugs pressed on the rim of a vessel, having a suitable cavity in it, if there be one lug only, or between them, if there be two lugs, in combination with a hinged cover, having a tenon or pin to fit into said cavity attached to the lower hinge piece; the whole being arranged and constructed and attached substantially as described.

No. 29,744.—HENRY A. CHAPIN, of Springfield, Mass., assignor to WILLIAM L. SCHOENER & Co., of New York, N. Y.—*Improvement in Stop Cocks*.—Patent dated August 21, 1860.—This invention relates to a kind of water stop known as a "compression stop and waste."

Claim.—In combination with the valve B, and its seat and opening in the shell C, the valve G, and its seat and opening F, in the shell A; the several parts being arranged to operate as set forth and described.

No. 29,745.—HENRY DEMMICK, of New York, N. Y., assignor to himself and PETER H. JACKSON, of the same place.—*Improvement in Flasks for Casting Iron Columns*.—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim the flask for casting columns, composed of two cheek pieces *b b*, hinged to the knowl *a*, and provided with the sand cleats *g*¹, as and for the purposes set forth.

I also claim the movable metallic sand flanges *h h*, formed with dovetail bases entering between the ribs cast on the inside faces of the cheeks *b b*, so as to be removable at pleasure, as set forth.

I claim the divided cheek pieces *b b*, and clamps *f f*, fitted in the manner specified, so that the flask can be enlarged by separating said cheek pieces and introducing a bar between said parts, as specified.

No. 29,746.—ISAAC ROGERS, of North Haverstraw, N. Y., assignor to SAMUEL DASKAL, of New York, N. Y.—*Improvement in Deoxydizing Ores*.—Patent dated August 21, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim the revolving cylinder *e*, fitted with the helical or screw-formed divisions 16, to receive the metallic ore in a pulverized state, and to submit the same to heat and constant agitation by the revolution of the cylinder, while the ore is gradually passed from one end of the cylinder to the other by the division 16, as specified; the metallic ore being supplied through the hollow journal 11, or its equivalent.

I also claim the arrangement of the flues 7 7, in the chamber *d*, with the flues 3 and 14, to heat the cylinder *e*, when combined with the dampers 4 and 15, or their equivalents, to regulate the direction of the draft and the consequent heat of the cylinder *e*, as specified.

No. 29,747.—EDWIN F. REYNOLDS, of West Farms, N. Y., assignor to himself and G. E. SHERWOOD, of Morrisania, N. Y.—*Improved Telegraphic Instrument*.—Patent dated August 21, 1860.—The improvements are described by the claim and engravings.

The inventor says: I claim, first, the employment of one and the same type wheel B, when the same has a continuous rotary motion, as described, for the purpose of transmitting and receiving messages; but this I only claim when constructed, operated, and operating as set forth.

Second. The arrangement of the series of cogs *g g*^{*}, on the under side of the type wheel B, in combination with a corresponding series of movable pins *e*, operated by keys E, and with a stop *s*, on the lever I, which carries the armature, constructed and operating substantially as and for the purpose specified.

Third. Arranging a stationary ring *d*, forming the guide for a series of pins *l*, in combination with a hooked cog *g*^{*}, on the under side of the rotary type wheel B, substantially as and for the purpose described.

Fourth. The arrangement of the vibrating lever *l*, and flaring teeth *k*, in combination with the wheel *i*, springs *n*¹, and regulating screws *n*², constructed and operating substantially as and for the purpose set forth.

No. 29,748.—JOHN KELLY, of West Milton, Ohio, assignor to himself and T. COATE, of the same place.—*Improvement in Machines for Picking Mill Stones*.—Patent dated August 21, 1860.—This invention relates to a machine for forming the small grooves between the large furrows of a mill stone, an operation which is generally termed "cracking," and which gives a "tooth" or grinding capacity to the stone.

Claim.—The combination of the right and left hand screw *E*, with the reciprocating carriage *D*, carrying the pick arms *G*, bars *L*, springs *K*, and tappet cylinder *O*, operating in the manner and for the purpose described.

No. 29,749.—JEREMIAH H. STORY, of Cincinnati, Ohio, assignor to CAMERON, STORY & MALONE, of the same place.—*Improved Machine for Dressing Joists*.—Patent dated August 21, 1860.—The pressure rollers *H H*¹, one on each side of the cutters *E E*¹, serve to hold the joists firmly to the carriage. *I* is a vertical circular saw journalled in a carriage *J*, which, by means of a rod *K*, can be drawn to and fro in a horizontal swing frame *L*, capable of vibrating upon a vertical pivot *M*.

Claim.—The combination of the saw *I*, carriage *J*, and pivotted swing frame *L*, constructed, arranged, and operating substantially as and for the purposes set forth.

No. 29,750.—JAMES H. SWAN, of New York, N. Y., assignor to ARAS G. WILLIAMS, of Brooklyn, N. Y.—*Improved Folding Chair*.—Patent dated August 21, 1860.—The object of this invention is to obtain a chair which may be folded within a very small compass and still have a back capable of being inclined more or less at the option of the occupant.

Claim.—The combination of the legs *A A B B*, jointed arms *G*, and the back *F*, attached by joints *a a* to the legs *A*, all being arranged substantially as and for the purpose set forth.

No. 29,751.—W. H. ALLEN, of Brooklyn, N. Y.—*Improvement in Elevators for Store Houses*.—Patent dated August 28, 1860.—The extreme upper levers have on their upper ends friction rollers *g g*, acting against the bottom of the platform bars *B*, upon which the platform rests. The screw threads on each shaft *D* may be made very fine for heavy work, but for all ordinary purposes quite a coarse thread will serve.

Claim.—The arrangement and combination of the two double threaded screw shafts *D D*, sliding blocks *c c*, bars *B*, platform *C*, and guide frame *A*, with the jointed bars *J J*¹, as and for the purpose set forth and described.

No. 29,752.—JAMES ALSOP, of Clinton, Ill.—*Improvement in Seeding Machines*.—Patent dated August 23, 1860.—If designed to sow broadcast, the slides *o* are closed and the boxes *W* may be removed, and the hopper *R* filled with the seed to be sown. As the machine is drawn along, the cylinder *S*, while rotating, sows the seed in a broadcast manner, the cells *f* filling with the seed as they pass underneath the slot *d* in the bottom of the hopper *R*.

The inventor says: *I claim*, first, the arrangement of the wheels *S*¹ *U* with the tubes *X* and boxes *V*, provided with the valves *q*, and actuated through the medium of the arms *r*, levers *t*, weighted arm *Y*, and the pins *w* on the wheels *U*, as and for the purpose set forth.

Second. In combination with the wheels *S*¹ *U* and boxes *V*, the cylinder *S* and hopper *R*, when arranged as shown, to admit of the sowing of the seed either in hills, or drills, or broadcast, as may be desired.

No. 29,753.—E. S. BACON, of Albion, N. Y.—*Improvement in Bee Hives*.—Patent dated August 28, 1860.—The object of this invention is to obtain a hive that will allow the bees to remain in a compact state within the hive and still have access to all parts thereof without materially spreading themselves or becoming detached from a general mass.

The inventor says: *I claim* a bee hive constructed of cylindrical form, when provided with comb frames *E*, constructed substantially as shown, to conform to the interior of the hive, for the purpose specified.

I further claim the flanches *a*, when grooved at their under sides and attached to the base *C*, as and for the purpose specified.

No. 29,754.—EDWARD BADLAM, of Ogdensburgh, N. Y.—*Improvement in Seeding Machines*.—Patent dated August 28, 1860.—*A* is a quadrangular frame supported at its rear end on two wheels *A*¹ *A*¹, which have a ring *a a* of cogged gearing on their outer sides, between which wheels a provision is made to attach a cylinder *B*, that operates as a coverer and

roller for the scattered seed. The side gearing *a a* on the wheels A gives rotary motion to two shafts B¹ B¹, which have cranks on their ends.

Claim.—The combination and arrangement of harrow teeth, operating as described, with the shaking seed hopper G, all receiving their motion from the two driving wheels A¹ A¹, as used for the purposes set forth

No. 29,755.—FREDERICK S. BARNARD, of New York, N. Y.—*Improved Automatic Terrestrial Time Globe.*—Patent dated August 28, 1860.—The object of this invention is to illustrate the position of the globe in relation to the sun in all its variations during the twenty-four hours of a day and during the course of a year.

The inventor says: I *claim*, first, the arrangement, in combination with the clock movement D, of a revolving terrestrial globe A on an inclined axle C, and encircled by a bow F, constructed and operating substantially as and for the purpose set forth.

Second. The arrangement of the indicator H, in combination with the revolving globe A and with the bow F, constructed and operating substantially in the manner and for the purpose specified.

Third. The arrangement of the fixed hand or pointer J on the toothed ring G, in combination with the rotary rings L and M, or their equivalents, constructed and operating substantially as and for the purpose set forth.

No. 29,756.—H. M. BEARCE, of North Auburn, and LEWIS C. PECK, of Lewiston, Me.—*Improved Machine for Cutting and Swaging Shoe Tips.*—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* the die I, constructed in the manner described, and in combination with plunger K, operated by cam L, gravity or adjustable percussive force, or both, the latter being imparted to the plunger by screw E and helical spring Q, or otherwise, for swaging the tip, essentially in the manner and for the purposes fully set forth.

We also claim the cutter J², stamp K², and die N², constructed and arranged as described, for cutting the blank, when combined with die I, for swaging the tip, essentially as set forth.

We also claim the combination of the tube P², stand Q², and slide bar R², operated by cam or otherwise, to receive and feed the blanks direct from the cutting die to the swaging die, essentially as set forth.

We also claim the rod R and its plate T, guide plate S, and helical spring U, combined with die I, the rod R being operated by percussive force to throw the swaged tip from the die, essentially in the manner and for the purposes fully set forth.

No. 29,757.—DANIEL BISSELL, of Detroit, Mich.—*Improvement in Crimping Machines.*—Patent dated August 28, 1860.—This invention is an improved machine for crimping or shaping the fronts of boots before they are stitched up, in which the leather while wet is stretched over a former of the proper shape, and the former is drawn down between the clamping jaws, smoothing and crimping the leather, and giving it the proper shape.

Claim.—The supplemental jaws E E, with their lugs, as described, in combination with the jaws B B, levers G G, and treadle H, arranged, combined, and operating in the manner set forth.

No. 29,758.—THOMAS BLACK, of Princeville, Ill.—*Improvement in Cultivators.*—Patent dated August 28, 1860.—The object of this invention is to obtain a cultivator for ploughing or operating among plants of various heights without injuring the same, due provision being made against the breaking down of large plants by passing along the implement, and suitable protection being afforded small plants against clods, stones, &c., which may be cast towards them by the action of the shares. It has also for its object the equalizing of the draught so as to insure an equal pull on each beam of the implement and a perfect operation of the same.

Claim.—The arrangement of the elastic traverse bow bar C, adjustable rods *c*, bow bar B, beams A A, double trees K, chain I, pulleys H J J, beam A, guards G G, standards E, and shares D F, all as shown and described for the purpose set forth.

No. 29,759.—THOMAS BOARD, of Ripley, Va.—*Improved Shoe Cleaner.*—Patent dated August 28, 1860.—This invention consists in arranging a rising and falling slide, in combination with two spring side jaws in a suitable frame fastened to the door-step, or to any other convenient place, in such a manner that if a boot or shoe is placed between the spring jaws, and the vertical slide is depressed on the instep and the foot is drawn backwards, the mud adhering to the boot or shoe is cleaned off on the top as well as on the soles and sides.

Claim.—The arrangement of the rising and falling slide C, in combination with the side jaws B B, constructed and operating substantially as and for the purpose set forth.

No. 29,760.—REINHOLD BOEKLEN, of Brooklyn, N. Y.—*Improvement in Hammers*.—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, so magnetizing or applying magnetism in connection with a hammer that it may be capable of picking up tacks or nails, and inserting them in wood or other material, substantially as described.

Second. Coating the whole head of the hammer, so magnetized or rendered magnetic, with the exception of the face and opposite end, with poorly conducting materials, substantially as and for the purpose specified.

No. 29,761.—L. BRADLEY, of New York, N. Y.—*Improvement in Telegraphic Apparatus*.—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of a helix with a core arranged to pass through its centre and around and in close proximity to its surface, with the poles also in near proximity to each other, for the purpose set forth.

Second. The combination of a magnet, constructed substantially as described, with a keeper arranged parallel to the legs of the magnet, and in close proximity to the periphery of the helix, for the purpose set forth.

Third. The combination of the armature, or its equivalent, for breaking and closing the circuit, with two springs arranged to act on each other in opposite directions, for the purpose set forth.

Fourth. The combination of a sectional helix with a double switch, arranged substantially as described, for the purpose set forth.

Fifth. The combination of a vibrating armature, or its equivalent, in closing and breaking circuits with a sounding board and tension wires, arranged substantially as described, for the purpose set forth.

Sixth. The combination of an electro-magnet, with an armature suspended by its centre between the poles of the magnet, so as to come in contact with both poles at the same time.

No. 29,762.—GEORGE W. BROWN, of Galesburgh, Ill.—*Improvement in Cultivators*.—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, so combining the frame, wheels, and ploughs with the levers L M, as that the driver or operator, from his seat, may turn or cramp said frame, wheels, and ploughs, on the tongue, to cause the ploughs to follow the crooks in the rows of plants, substantially as described.

I also claim so combining the seat and tongue with the frame, and with an axle set in advance of its supports in the wheels, as that the driver or operator in his seat, by shifting his weight, may raise, hold up, and lower the ploughs, substantially as described.

I also claim, in combination with the ploughs, the convex cutters or shields N N, when constructed, arranged, and operating as set forth.

No. 29,763.—THOMAS S. BROWN, of Philadelphia, Pa.—*Improved Oscillating Ships Berths*.—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of a rock shaft D, cross bars E, and suspension rods H, in combination with a boat berth, for the purpose of neutralizing the motion of a ship, substantially as set forth.

Second. The arrangement of hinged boards 3 4 1 2 U L L, corks 9 10 11 12, and air-tight tubes J, forming a berth and life-boat, substantially as set forth.

No. 29,764.—GEORGE BUCHANAN, of Hickory, Pa.—*Improvement in Self-acting Wagon Brakes*.—Patent dated August 28, 1860.—This invention consists in an arrangement of brake, bar, cords or chains, springs, pulleys, and operating rods, when used in connection with cars, wagons, and carriages.

Claim.—The arrangement of the brake *e*, bar *g*, rods *x* and *m*, strap *Y*, springs *q* and *v*, and cords or chains *d*, when used in combination with cars, wagons, and carriages; the whole being arranged, combined, constructed, and operated, as described and for the purpose set forth.

No. 29,765.—A. H. BURDINE, of Chulahoma, Miss.—*Improvement in Cotton Gins*.—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Cutting away a part of the upper portion of the breast of a cotton saw gin, in the manner and for the purpose described, so that there shall be a horizontal opening across the breast the full width of the saws, and of less depth than the size of a cotton seed, and so that the teeth of the saws shall extend a short distance beyond the upper end of the ribs of the breast and into the horizontal opening, substantially as and for the purposes described.

No. 29,766.—LEWIS S. CHICHESTER, of New York, N. Y.—*Improved Meat and Vegetable Chopper*.—Patent dated August 28, 1860.—The object of this invention is to obtain a simple and economical implement for the purpose of chopping meat and vegetables in a small way for family use, the device being intended for the kitchen, to occupy but little space, and to require but little labor to manipulate it.

The inventor says: I *claim* the combination of the bowl A, of circular or semicircular form, and the radius knife frame D, so applied as to admit of a rising and falling movement and also a lateral one, as and for the purpose set forth.

I further claim, in combination with the bowl A and knife frame D, the plate C, applied to the bowl, and arranged relatively with the knife frame D, to operate as and for the purpose set forth.

No. 29,767.—ALEXANDER M. CHISHOLM, of Antigonish, Nova Scotia.—*Improvement in Sinecal Quadrants*.—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A mathematical mechanical scale, composed of the graduated plane square A B C D E, divided and subdivided into less squares of tenths each way, and having a graduated quadrant E, in one of the four corners, the radius of which quadrant extends to 60 of the subdivisions or sixteenths of the sides of the square, and also provided with an index F, marked as described, and pivotted to the square in the vertex of the angle, agreeing with the quadrant, and otherwise made as shown and described.

No. 29,768.—THEODORE CHRISTIAN, of New York, N. Y.—*Improved Rotary Cutter Head for Planing Machines*.—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of a rotary cutter and planing iron with an adjusting screw and nut, arranged to pass through the iron, substantially as described, whereby the cutters may be drawn out or thrown in, as required to adjust them to each other.

Second. The combination of a rotary cutter head, a planing iron, and a clamping iron, arranged as described, to hold the iron to the head, and prevent its springing.

Third. The combination of a series of cutter heads and a series of cutters, constructed and arranged on one shaft, substantially as described, so as to abut and form a continuous line of cutters; and also so that the position of the heads and cutters may be changed in relation to each other on the shaft, in order to produce a great variety of perfect compound mouldings with a few varieties of cutters.

Fourth. The combination of a cutter head with a cruciform dividing saw arranged on the same shaft, so that it can be turned, and the position of its arms, in relation to the cutter knives, changed as required, for the purpose as set forth.

No. 29,769.—EDWARD CONWAY, of Dayton, Ohio.—*Improvement in Heating and Cooking Apparatus*.—Patent dated August 28, 1860.—This invention consists in a peculiar construction and arrangement of alcoholic lamps and generators, for cooking and heating purposes.

The inventor says: I *claim*, first, the arrangement of valved compound burners C E e, in the described combination, with a cooking stove A, for the purposes set forth.

Second. The compound burner, composed of a wick t, and circular series of jets u, communicating with the alcohol boiler, as set forth.

No. 29,770.—ARTHUR DE WITZLEBEN, of Washington, D. C.—*Improvement in Holding Doors Open*.—Patent dated August 28, 1860.—The box A is intended to be of metal, and to be cast in two parts, the main box containing the apartment B making one portion, and the bottom H the other. The bottom H is detached and screwed on the machine. The feet m m are cast with the bottom H, and are made sharp pointed, so as to sink into the floor or carpeting deep enough to prevent the machine from sliding.

Claim.—The box A, apartment B, shank C, knob D, spiral spring E, bottom H, feet m m, and plate n, when used for the purposes specified.

No. 29,771.—JULIUS C. DICKEY, of Saratoga Springs, N. Y.—*Improved Gold Washer and Amalgamator*.—Patent dated August 28, 1860.—This invention consists in the employment of a hollow revolving cone, or shell, made with one or more projections on the base and under side of the same, in combination with a stationary cone, made with one or more channels, one below the other, on the base of the same. The revolving cone works on the stationary cone, and the projections work in the channels, for the purpose of washing and amalgamating gold.

Claim.—The projections c, made on the base and under side of the revolving cone E, working in one or more channels made on the base of the stationary cone D, for the purposes set forth.

No. 29,772.—THOMAS S. DISSTON and HENRY DISSTON, of Philadelphia, Pa.—*Improved*

Machine for Setting Saw Teeth.—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, causing the saw blade to traverse over the anvil by means of the rotating cog wheels S and S¹, the same being rendered adjustable in respect to the platform P by the devices described, or by any other equivalent mechanism, for the purpose specified.

Second. We claim, in combination with the said conical cog wheel, two or more hammers moving simultaneously, and being so arranged and furnished with such adjusting appliances that the heads of the hammer may be adjusted in respect to each other, and to the said conical cog wheels, as and for the purpose set forth.

Third. We claim the platform P, secured to the permanent frame, and rendered adjustable thereon, substantially in the manner and for the purpose set forth.

Fourth. The guide plates *p p*¹, arranged in respect to the platform P, and rendered adjustable in respect to the conical cog wheels, substantially as set forth, for the purpose specified.

Fifth. The combination of the adjustable anvil with the conical cog wheels and the hammer.

No. 29,773.—HUGH THOMAS DOUGLAS, of Zanesville, Ohio.—*Improvement in Sugar Cane Mills.*—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, constructing on the top and bottom plates of a sugar mill V-shaped inclined planes which come between the rollers and prevent the cane from working between the ends of the rollers and the plates, and thereby obstructing the working of the mill, substantially as set forth.

Second. The combination, in a sugar mill, of the inclined projections *r r*, elliptical boxes *g*, with shoulders *l*, and the feed plate S, the whole constructed, arranged, and operating substantially as described, for the purposes set forth.

No. 29,774.—D. E. FENN, of Tallmadge, Ohio.—*Improved Gate.*—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the inclined planes H L, extending across the open space between the posts of the frame A A¹, the gate C, posts K, rod J, arms G, and ropes M N, as shown and described, so that the front end of the gate will rise and fall upon the inclined planes H L, while the rear end of the gate will ride upon the horizontal rod I, and so that by pulling upon either of the ropes the gate will be opened or closed, being moved partly by the force applied, and partly by its own gravity, in descending the inclined planes, all as specified.

No. 29,775.—FREDERICK FIDLER, of Batavia, N. Y.—*Improvement in Stalk and Root Cutters.*—Patent dated August 28, 1860.—This invention relates to certain improvements in that class of stalk and root cutting machines in which knives are attached to the side of a wheel.

The inventor says: I *claim*, first, in connection with the knives E E, the scorers G, for the purpose specified.

Second. The serrated, reciprocating plates *l l*, operated through the medium of the treadle H, link *j*, lever J, and arms K K, for the purpose of feeding the substance to be cut to the cutters.

No. 29,776.—J. F. FINGER, of Marion, S. C.—*Improved Circular Table.*—Patent dated August 28, 1860.—This invention consists in hanging a circular top table, having drawers in it, in such a manner that the top will be firm and steady under ordinary circumstances, and whenever desired, it may, by firmly placing the foot on certain levers, be rotated.

Claim.—A circular pedestal table furnished with a rod G, step bearing G¹, and foot levers E E E E, and otherwise constructed in the manner and for the purposes set forth.

No. 29,777.—F. G. FLOYD and E. A. FLOYD, of Macomb, Ill.—*Improvement in Corn Planters.*—Patent dated August 28, 1860.—This invention is an improved corn planter for opening the furrow, dropping the corn, and covering two rows at the same operation. The machine is provided with adjustable ploughs or shares, which open the furrows for regulating the depth required to plant, and are controlled by the driver.

Claim.—The combination with a seed planting frame, constructed as described, of the seed slide *a*, vibrating arm *c*, receiving its motion from arm *d*, the wheels *g g*¹, and shaft *h*¹, arranged in the manner and for the purpose set forth.

No. 29,778.—LEWIS H. FRENCH, of Philadelphia, Pa.—*Improved Car Register.*—Patent dated August 28, 1860.—This invention consists in combining with a stile gate placed on the

platform of a car, and surrounded by a suitable railing, so that an entrance or exit can only be through the gate, a number of strikers which act upon a spring bar so connected to certain wheel work, pawls, stops, &c., that each passenger entering the car will be registered by an index hand.

Claim.—The combination with the turn stile, arranged substantially as set forth, of the strikers *a*, spring bar *H*, slotted arm *I*, pawl bar *G*¹, with its spring pawl *c*, and ratchet wheel *G*, combined with a suitable registering apparatus, and arranged and operating in the manner and for the purposes set forth.

No. 29,779.—RANSOM GILBERT, of Morrisville, Vt.—*Improved Clothes Dryer*.—Patent dated August 28, 1860.—This invention consists in providing an elastic connection between the hubs when the dryer is expanded, in order to furnish a self-adjustment to admit of the contraction of line which takes place when wet clothing is hung thereon.

Claim.—The arrangement of the India rubber straps *D D*, and pins *f f*, with the hubs *H H*¹, and standard, arms, braces, and cords, as and for the purpose set forth.

No. 29,780.—JOHN GOULDING, of North Wilbraham, Mass.—*Improvement in Cotton Gins*.—Patent dated August 28, 1860.—The object of this invention is to obtain a machine by which cotton may be ginned or separated from its seed, and the burrs also separated from the wool.

The inventor says: I *claim*, first, the concave or apron *O*, in connection with the toothed plates *L* and wheel *C*, said parts being constructed, as shown, for the purpose described.

Second. The combination of the toothed plates *L*, comb wheel *C*, concave apron *O*, stripper *F*, and beater wheel *H*, said parts being constructed as shown, for the purpose set forth.

No. 29,781.—CHARLES A. GREGORY, of Poughkeepsie, N. Y.—*Improved Apparatus for Filling Bottles*.—Patent dated August 28, 1860.—This invention consists in the construction of a machine for filling any number of vessels with a measured quantity of liquid without spilling or wasting.

Claim.—A machine for filling bottles and other vessels, constructed and operating substantially in the manner described, whereby any required number of vessels may simultaneously receive a measured quantity of liquid from a reservoir with rapidity, precision, and safety, as set forth.

No. 29,782.—STUART GWYNN, of New York, N. Y.—*Improvement in Spading Machines*.—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* first, the employment, in combination with the spades, and for operating them, of double cranks, arranged to move in reverse directions, and giving a compound action to the spade or spades, essentially as specified.

Second. Providing the spade stock or holder with a spring stop or stops, so constructed and arranged as to be capable of being thrust away or to one side of the spade in its descent or digging stroke, to avoid striking a stone or other intervening obstacle calculated to injure it, and permitting of the yield or rise of the spade therefrom, substantially as shown and described.

Third. Constructing and arranging the spade stock or holder, as shown and described, with a twist screw or helical groove, or the equivalent thereof, so that the spade, in its reciprocating or longitudinal travel, shall, at a certain point or points thereof, be turned and made to assume different positions relatively to the line of cut, essentially as set forth.

Fourth. Causing the spade, after it has been pushed into its stock or holder by meeting with an obstacle in its descent, to be automatically returned to its proper position for further work, during the retreat of the holder, by means of the same device or pin which, in connection with the helical slot in the stock, serves to turn and alter the position of the blade of the spade relatively to the line of cut, essentially as described.

Fifth. Constructing the spade or spade blade with an articulation joint, for action when in the soil or when freeing itself therefrom, and, during the backward thrust or throw of the spade, to avoid injury or breakage from stones or other like obstacles in the soil.

No. 29,783.—L. W. HARRIS, of Waterville, N. Y.—*Improvement in Presses*.—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the employment of the open follower bars *l l*, in combination with the hinged rack *C C*, attached to the bed, as shown and described, so that the said racks will serve as guides to the follower, and so that they can be readily turned down to a horizontal position away from the press, when not required for operation, all as set forth.

Also, the combination of the pawls *m n*, when connected by jointed arms *o*, with cylinder *e*¹, hinged rack *C*, and open follower bars *l l*, as shown and described, so that one of said pawls will be operated at each movement of either of the levers *E*, and so that the cylinders *e*¹ may be removed, together with the pawls and levers *E*, whenever desired, as set forth.

Also, the arrangement of the axes of the pawls m n , within the circumference of the hollow cylinders e^1 , as and for the purpose shown and described.

No. 29,784.—JAMES HARRISON, of Troy, N. Y.—*Improved Apparatus for Ringing Bells*.—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Distributing the blows of the hammer or clapper of a bell along or around the sound bow or circumference of the bell, substantially as described, by turning the bell, or its clapper or hammer, by the action of the bell ringing mechanism in sounding the bell, substantially as described.

No. 29,785.—DAVID HASKELL, of Georgetown, Mass.—*Improvement in Sewing Machines*.—Patent dated August 28, 1860.—The inventor says: In order that the same machine may be adapted for straight forward flat work, I provide a movable plate F , with a recess b , to fit around the post C , with its opposite side straight, to fit the part A , the plate being formed with a bevelled edge to fit and rest in a half dovetail recess c , in the part A , and having a shoulder d provided for its support in the post A .

Claim.—The arrangement of the isolated upright post C , with the notched movable plate F , in the manner and for the purpose shown and described.

No. 29,786.—SIMEON HEYWOOD, of Claremont, N. H.—*Improvement in Operating Railroad Switches*.—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of a pivotted slotted knee or tumbler, with a traversing bar and stud, for the purpose of operating the switches of railroads substantially as described.

No. 29,787.—P. B. HOLMES, of Cincinnati, Ohio.—*Improvement in Rotary Engines*.—Patent dated August 28, 1860.—The piston head B is of the exact length of the bore of the cylinder, and the collars H are of the same diameter with said bore, and form on the outside, in connection with the casing A , packing chambers I , which are closed by the casing heads K and screws k . The plates E cause the pistons C to close and open gradually in passing the abutment D .

Claim.—The described combination of collars H , heads K , and packing chambers I , constructed, arranged, and operating in connection with the packing d d^1 d^2 , in the manner and for the purpose explained.

No. 29,788.—CHASE B. HORTON, of Elmira, N. Y.—*Improvement in Machines for Hulling and Polishing Rice*.—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, constructing the concaves of hulling machines of flexible steel plates, having a flexible lining, constructed as described, in combination with elastic springs, in the manner and for the purpose specified.

Second. The combination of the hopper b , cylinder B , and screen C , or its equivalent, when so constructed and arranged in relation to each other that the motion of the cylinder shall cause a circulation of the grains in the manner and for the purpose set forth.

No. 29,789.—ENOCH S. HUFF, of Zanesville, Ohio.—*Improvement in Cultivators*.—Patent dated August 28, 1860.—The arms e e^1 are perforated with numerous holes, which pass across a hole in the beam b , and as these arms are shifted by turning them around the first pivot i , they are secured in place by the key k . The arms c c^1 are also pivotted to cross beams h h^1 , which beams are also pivotted to the main beam b . By virtue of the two pivotted connections with the main frame b , the beams c c^1 and ploughs may be shifted into a great variety of positions in relation to the centre beam b .

Claim.—The combination of the segmental arcs e e^1 , plough beams b c c^1 , and pivotted cross beams h h^1 , substantially in the manner and for the purposes set forth.

No. 29,790.—GEORGE HULL, of Port Crane, N. Y.—*Improvement in Cattle Ties*.—Patent dated August 28, 1860.—The snap A is, or may be, lashed to the one end of a rope, while the clasp B is, or may be, secured on the rope at a suitable distance from said end to admit of a holding loop being formed round the head or neck of the animal, and locking the same by the union of the snap with the clasp. The other end of the rope may be permanently, or otherwise, secured to a post or wall.

The inventor says: I *claim* imbedding the spring a , in the body of the snap, by forming the latter with side guards b b , constructed and arranged substantially as shown and described.

Also, constructing the clasp body of curvilinear, or other equivalent form, in direction of its length, and providing its interior with spiral grooves or ribs f , substantially as set forth.

No. 29,791.—SOLOMON HUNT, of Danville, Ind.—*Improved Washing Machine*.—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the tension roller G, weight I, and rollers *b b*, with the endless belts E K, and drums D-D¹, and J J, whereby one weight answers for producing friction or tension on all the belts and upon the clothes, as set forth.

No. 29,792.—GORDIAN K. HYDE, of Brooklyn, N. Y.—*Improvement in Operating Railroad Switches*.—Patent dated August 28, 1860.—This invention is designed for city and other railroads, on which the cars are drawn by animals. Its object is to place the operating of the switches under the complete control of the driver.

Claim.—The combination of the slotted cylinder H, treadle *j*, rod *g*, spring *h*, with the laterally moving slide G, lever *e*, and truck A, as and for the purpose shown and described.

No. 29,793.—W. A. IVES, of New Haven, Ct.—*Improved Auger*.—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the double twist with two cutting horizontal or floor lips, with side cutters *a a*, attached to one of said floor lips only, in the manner and for the purpose substantially as specified.

No. 29,794.—SAMUEL KENNEDY, of Hibbets, Ohio.—*Improved Apparatus for Feeding Sawdust to Furnaces*.—Patent dated August 28, 1860.—This invention is designed to be applied to the furnaces of the boilers of steam saw mills, and to afford an automatic feeding device which will cause the dust to be consumed as fast as it is produced during the sawing operation.

The inventor says: I *claim* the combination of the stepped plunger B, cylinder A, and hopper *f*, with the box D, scatterer D¹, and shaft C E, as and for the purpose shown and described.

I also claim the arrangement of the bearing of the lower end of shaft E, within a stirrup L, below the box D, and upon a screw J, which also connects the stirrup and the frame K, together; all as set forth, for the purpose specified.

No. 29,795.—G. S. KINSEY, of Reading, Pa.—*Improvement in Horse Rakes*.—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the stationary mortised cleaners 4 4, when used for the double purpose as cleaners and tooth guides, as described and set forth.

Second. The combination and arrangement of the hand lever *h*, spring latch 6, semi-circular slotted rack *e*, and connecting bar 8, when constructed and operated as and for the purpose specified.

No. 29,796.—W. M. KNIGHT, of Buffalo, N. Y.—*Improved Sad Iron*.—Patent dated August 28, 1860.—This invention consists in jointing one of the legs to the horizontal or holding part of the handle, and in operating this jointed leg by a supplemental, rotating handle, having a ferule on its end with an oblique slot cut in it in such a manner that the ends of the legs will be distended or made to approach each other, and locked in recesses formed in flats, or detached from the flat at pleasure.

Claim.—The jointed leg B¹, and the slotted, locking handle portion G, with the recesses *a a*, in the body of the iron, arranged substantially as and for the purposes described, represented, and specified.

No. 29,797.—E. D. LADY, of Nashville, Tenn.—*Improvement in Straw Cutters*.—Patent dated August 28, 1860.—This invention consists in providing an ordinary straw cutter frame with an upright movable box, with a door on one side to receive the bundle to be cut, and close under this box passes the horizontal knife and travelling bottom just below it, moved along in the same frame in which the knife is fastened, and this bottom has a slit or hole just under the knife, through which the cut straw or material will fall into the shoe.

Claim.—The perpendicular feeding box D, with its doors F, pin X, standard E, and tongue *e*, for the purpose described, or any substantially the same, as set forth.

No. 29,798.—R. LITTLE, of Middle Branch, Ohio.—*Improved Coffee Roaster*.—Patent dated August 28, 1860.—A represents the shell of the roaster, which is of an oval form, divided at the centre. To the one half of the shell are attached projections *a a*, while to the other half are projections *b b*, so that when the two parts of the shell are placed together, the projections *a a* and *b b* form the journals or bearings upon which the shell A rotates.

Claim.—The combination, with the oval and divided shell A, of the series of endless, reversed, inclined ribs *e e*, arranged and operating as shown and described.

No. 29,799.—SAMUEL MAITLAND, of Fort Wayne, Ind.—*Improvement in Bee Hives*.—

Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the swarming pole G, provided with the ball or hub H, and attached to the hive, for the purpose specified.

Second. The queen cells *h*, attached to the hive, substantially as and for the purpose set forth.

Third. The feed drawer D, fitted within the box C, on which the main portion A of the hive rests, and is made to communicate with the part A when desired by the slide E, substantially as described.

No. 29,800.—FREDERICK H. MANNY, of Rockford, Ill.—*Improvement in Harvesters*.—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the hinged cap or bonnet D, and shoe C, in relation to each other and to the mechanism operating the cutter of the harvester, substantially as and for the purpose described.

No. 29,801.—MARTIN H. MANSFIELD, of Ashland, Ohio.—*Improvement in Seeding Machines*.—Patent dated August 28, 1860.—This invention relates to the especial arrangement of the teeth and in making the deflectors of some elastic substance, for the purpose of scattering the seed broadcast.

Claim.—The described special arrangement of the teeth and deflectors G, when these latter are composed of an elastic substance and operating substantially as set forth.

No. 29,802.—ELISHA MATTESON, of Brooklyn, N. Y.—*Improvement in Converting Reciprocating into Rotary Motion*.—Patent dated August 28, 1860.—This invention consists in the construction and operation of the machine.

The inventor says: I *claim*, first, the reciprocating ratchets G and H, in combination with the ratchet wheel E, when the same shall be arranged in conjunction with and operated by the lever B and cam guides I and J, or by means substantially the same and for the purpose specified.

Second. In combination with the same, I claim the lever M, pawl L, rod N, and pins *j f k*, for the purpose set forth.

Third. In combination with the ratchets G and H and ratchet wheel E, I claim the friction wheel O, handle P, and spring Q, arranged and operated for the purpose described.

No. 29,803.—JAMES McLAUGHLIN, of Duncannon, Pa.—*Improvement in Seed Planters*.—Patent dated August 28, 1860.—This invention consists in the arrangement of a seed dropping and distributing plug valve, with a vertical sliding frame and cam; also in the arrangement of the slotted standards of the furrow opener and coverers, in combination with a lever, rod, and latch, for the purpose of adjusting the furrow opener and coverers; and also in the arrangement of double ratchet wheels upon the shaft of the driving wheels, in combination with pawls, cross bars, and lever, for the purpose of stopping the process of planting either during the forward or backward motion of the machine.

The inventor says: I *claim*, first, the arrangement of a seed dropping and distributing plug valve L, with a vertical sliding frame F F and cams E, substantially as and for the purposes set forth.

Second. The arrangement of slotted standards N and R R of the furrow opener M and coverers D¹, in combination with a lever P, rod Q, and latch S, substantially as and for the purposes set forth.

Third. The arrangement of double ratchet wheels V W upon the shaft of the driving wheels in combination with pawls T X, cross bar Y, and lever Z, substantially as and for the purposes set forth.

No. 29,804.—MATTHIAS D. MERRIWETHER, of Denmark, Tenn.—*Improvement in Harrows*.—Patent dated August 28, 1860.—This invention relates to the particular manner of connecting two or more harrows to one slotted and arched transverse beam, whereby the distance of said harrows from each other may be adjusted according to the different widths of the rows or drills, the seeds of which are to be covered.

Claim.—In combination with a slotted transverse arched beam A, two or more adjustable harrows and harrow blocks, when constructed and arranged substantially in the manner and for the purpose described.

No. 29,805.—JOHN MIDDLETON, of New York, N. Y.—*Improved Window Washer*.—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The window washer described, as a new article of manufacture, the same consisting of a brush B, a reservoir of changeable capacity C, on or near the same level as B, the opening D between C and the front of B, and the rod G, or its equivalent, whereby C is made to change its capacity, substantially as and for the purposes set forth.

No. 29,806.—W. H. H. MILLER, of Williamsport, Pa.—*Improvement in Railroad Car Couplings*.—Patent dated August 28, 1860.—The inventor says: The nature and operation of my invention will be more fully understood by supposing that the truck is thrown out of line with the car, when it is evident the knees I, or one of them, will come in contact with one of the levers D, and, by forcing it towards the centre of the car, open the jaws; it is also evident that either truck being thrown from the track will throw the car out of line with the trucks and uncouple the car.

Claim.—The employment of hooked levers D H D H, centred at K K, and the connecting links E E between them on the truck, and the adjustable knee I I on the body of the car, arranged to operate together substantially as described.

No. 29,807.—JAMES R. MILLS, of Bloomfield, Iowa.—*Improvement in Seed Planters*.—Patent dated August 28, 1860.—This invention consists in the relative arrangement of a detachable hopper, slides, seed distributor, square shaft, and lever.

Claim.—The relative arrangement of a detachable hopper D, slides G and N, seed distributor I, square shaft B, and lever L L¹, constructed in the manner and for the purposes set forth.

No. 29,808.—GEORGE RODNEY MOORE, of Pittsburgh, Pa.—*Improved Gauge for Double Seaming Machine*.—Patent dated August 28, 1860.—This gauge is attached to the frame of the double seamer just below the lower roller, and when adjusted to the work, is tightened by a thumb screw.

Claim.—The rotary disk *r*, face of the gauge *m*, also the adjustable arbor *i*, or any other equivalents.

No. 29,809.—ALEXANDER MORTON, of New York, N. Y.—*Improved Machine for Rolling Gold Pens*.—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the connecting of the axes of the rolls C D by means of the couplings *f*, when said rolls are arranged substantially as and for the purpose specified.

Second. The forming of the eccentric portions *b*, on the lower rolls D, in such a way or in such positions, relatively with each other, that the bite of the rolls may act consecutively at different points on the blanks and produce the differential pressure, as set forth.

Third. In connection with the train of rolls C D, the guides or rests E, placed relatively with the rolls, as and for the purpose specified.

No. 29,810.—HENRY G. NELSON, of Lockport, N. Y.—*Improvement in Water Wheels*.—Patent dated August 28, 1860.—A shows the scroll of the wheel, B the water induction passage, and C a central discharge opening; D is the shaft of the wheel, having its lower end stepped at *a*, in a framing E which supports the scroll A; on the shaft D a polygonal hub F is placed and secured thereto by screw bolts *b*; the flanges *c* serve to increase the bearing surface to which the buckets are to be attached and render the point of attachment firm, without increasing the weight of the wheel, only very slightly.

Claim.—The arrangement of the gates I I, shafts H H, and sectors J J, with the shaft D, vent C, and case A, all as shown and described, for the purpose set forth.

No. 29,811.—J. L. NEWTON, of Black Brook, N. Y.—*Improved Quilting Frame*.—Patent dated August 28, 1860.—This invention consists in jointing the arms and bars to which the quilt is attached to the top of two upright standards, in such a manner that the frame may be folded up when not in use, or so that it may be locked rigidly in place in a horizontal position; and it also consists in furnishing the quilting frame with rollers and adjustable arms, arranged in such a manner that it may be extended or contracted.

Claim.—The combination, with standards A A, of the quilting frame, composed of bars B B and B¹ B¹, with their rollers E E and F and G G and H, furnished with straps and hooks and ratchets and pawls, and otherwise constructed and keyed to the standards A A, as and for the purposes set forth.

No. 29,812.—A. A. PATTERSON, of Kingston, Tenn.—*Improvement in Grain Separators*.—Patent dated August 28, 1860.—The end of each shaft *m* of the fans E has a pinion *n* on it, and these pinions gear into a double toothed spur wheel J which is placed on a driving shaft, said wheel having teeth on its outer and inner periphery, and being at one side of the case or box; to the spur wheel J a pulley L is attached, from which motion is communicated to the apron D by a belt *o*.

Claim.—The arrangement, as shown and described, of the double-toothed spur wheel J, pinions *n*, shafts *m*, and fans E E, with the feeding apron D, bar H, eccentric I, and screens F¹ G, all as set forth, for the purpose specified.

No. 29,813.—DAVID PENNOYER, of North East, N. Y.—*Improvement in Car Seats and Couches*.—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination, with each other and with the seat A, back E, and slotted pronged bar C, of the bars *a a*, in the manner and for the purpose shown and described.

Second. The arrangement of the folding boards G, rods F, pivots *h*, curved guides *j*, vertical strips H, adjustable platform E, and cords *k k*, as shown and described, so that by pulling the cords the boards G will fold inward and the platform E will rise to the roof of the car, and by releasing the cords the platform will descend to its place, all as set forth.

No. 29,814.—JOHN G. PERRY, of South Kingston, R. I.—*Improved Sausage Filler*.—Patent dated August 28, 1860.—The operation of this invention is as follows: When the shaft and vanes are turned by the crank J, the vane that is leaving the widest part of the case and approaching the narrowest part, is turned around edgewise by the shape of the plates or sides of the cavity; and as this vane is turned edgewise, it turns the other, which is leaving the narrow part of the cavity, by the spindle which connects them, around, across the cavity, so as to present a broadside forward, and sweep the cavity clear of whatever may be put in, so that when meat is thrown in the hopper it is carried down by the vanes D D, and as they leave the widest part and turn edgewise they press it out of the orifice F through the tube into the cases placed upon it.

Claim.—The combination of the vanes and case, substantially as described and for the purposes set forth.

No. 29,815.—RANSOM S. POTTER, of Chicago, Ill.—*Improvement in Car Couplings*.—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement for coupling cars from the side, by means of two links *k k*, and the projections F F on the draw bar, in combination with the bolts *h h*, and the pins *i i*.

Second. The arrangement for connecting a wrought iron hasp B, to the cast iron draw bar A, by means of the hooks or projections *f*, the shoulders *g*, and the bolt *a*.

Third. The arrangement for inserting the bolt or bar *b*, and holding it in place without nut or screw, by means of the bolt *a*, substantially as set forth and specified.

No. 29,816.—J. E. PRIEST, of St. Louis, Mo.—*Improvement in Printing Presses*.—Patent dated August 28, 1860.—The machine being put in motion, the card is placed upon the platen G, and against the receiver U, which holds it in the proper position until, by the action of the cam N, the platen has been pressed forward against the type so as to make the impression; the cam then commences to recede and the platen to fall away from the type, and, at the same time, the pin H, in the wheel B, strikes the upper end of the lever E, and raises the receiver off the platen, and thus releases the card that it may fall.

Claim.—The use of the stationary cylinder P, when it is arranged and operated with reference to the inkling rollers I I I, and distributing rollers L, in the manner shown and described.

No. 29,817.—MONTGOMERY QUEEN, of Brooklyn, N. Y.—*Improvement in Journal Boxes*.—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the self-adjusting key D, with the check plate C, as and for the purpose set forth and described.

Second. The employment of the lip *m*, in combination with the end piece *n*, journal F, and check plate C, as and for the purposes set forth and described.

No. 29,818.—JOSIAH M. READ, of Boston, Mass.—*Improvement in Ovens*.—Patent dated August 28, 1860.—The object of this invention is to produce a portable oven, which can not only be used in connection with an ordinary cooking range or stove, but which can be set in brick work in the ordinary manner when desirable.

Claim.—My improved oven, having the several parts constructed and arranged in relation to each other, and so as to operate in the manner substantially as described.

No. 29,819.—EZRA REID, of Bazetta, Ohio.—*Improvement in Paddle Wheels*.—Patent dated August 28, 1860.—This invention relates to the arrangement of tangential arms and other devices for feathering buckets, that is, causing them to preserve a vertical position during the entire revolution of the shaft.

Claim.—The arrangement of the stationary wheel A, rods C, with their pinions B and D,

the buckets F, and wheels E, in their relation to each other and to the tangential arms H, operating in the manner and for the purposes specified.

No. 29,820.—HORATIO N. RHODES, of Richmond, Vt.—*Improvement in Sliding Switches for Railroads*.—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A solid sliding switch, with rails, or equivalents for rails, for directing a train upon either of two side tracks, as desired, and with grooves affording a safe passage to the single track to a train coming upon one side track when the switch is adjusted for the other, the whole constructed and operated as described.

No. 29,821.—HORATIO N. RHODES, of Richmond, Vt.—*Improved Safety Railroad Switch*.—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The use of a switch upon one side of a railroad track, constructed as described, and which, combined with rails, constructed and arranged as described, will insure a train taking the desired branch, and at the same time, however it is adjusted, will furnish a safe passage to the single track for the train coming on either of the branch tracks.

No. 29,822.—L. P. RICE, of Adrian, Mich.—*Improvement in Slide Valves for Steam Engines*.—Patent dated August 28, 1860.—When the box A is in its place, and the plates B C are adjusted by means of the screw rods c and nuts c¹, the opening f, in the plate C, is right over the aperture b, in the top of the box, and this latter aperture is made long enough, so that in moving the box in a longitudinal direction the steam is always freely admitted to the interior of the box.

Claim.—The employment of a box valve A, that has its bottom elevated in the middle as shown, when said box is arranged between two plates A B; and the whole constructed so as to operate as represented and described for the purpose set forth.

No. 29,823.—A. RODEN, of Talladega, Ga.—*Improvement in Ploughs*.—Patent dated August 28, 1860.—This invention consists of a sliding loop brace, in combination with a wedge, slotted swinging plate, mould board retaining hook, and standard.

Claim.—A sliding loop brace B C M, in combination with a wedge V W, slotted swinging plate L, mould board retaining hook O P N, and standard G; the whole constructed substantially as and for the purposes set forth.

No. 29,824.—HENRY A. ROE, of Madison, Ohio.—*Improvement in Cheese Hoops*.—Patent dated August 28, 1860.—When the plate G is attached some distance from the edge of the end B of the hoop, so as to contract the same, the washers b may be fitted on the bolt F at the inner side of the arm E, so as to compensate for the outward position of the arm E; the more the hoop is contracted, the more will the arm E extend out, or project from the hoop. This varying position of the arm may be fully compensated for by properly adjusting the washers b.

Claim.—The arrangement and combination, in the manner shown and described, of the plate G, eccentric H, and bolt F with the slotted arm E, yoke D, guides c c, and plate A, for the purpose set forth.

No. 29,825.—JOHN A. ROEBLING, of Trenton, N. J.—*Improvement in Trussed Compound Girders*.—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A trussed compound girder, consisting of an iron girder filled in with wood, combined with tension rods, having their strain directly sustained by the wood.

No. 29,826.—ELIPHALET S. SCRIPTURE, of New York, N. Y.—*Improvement in Wrenches*.—Patent dated August 28, 1860.—This invention consists in the use, with a wrench, of a roller hung eccentrically within the sliding jaw of the same.

Claim.—The serrated roller I, hung eccentrically within the movable jaw E, in combination with the spring catch l, arranged and operated in the manner described and for the purpose set forth.

No. 29,827.—J. C. SELLERS, of Woodville, Miss.—*Improvement in Cotton Presses*.—Patent dated August 28, 1860.—This invention consists in the combination of one or two press boxes and two followers with two rack bars and a centre cog wheel, when the followers are connected to said rack bars by means of cam levers, links, and inclined planes.

Claim.—The combination of one or two press boxes A A¹ and two followers B B¹ with two rack bars M m N n and centre cog wheel O, when the followers are connected to said

rack bars by means of cam levers E G H I F J E¹ G¹ H¹ I¹ F¹ J¹, links D C K L D¹ C¹ K¹ L¹, and inclined planes R S R¹ S¹, as and for the purposes described.

No. 29,828.—JAMES SHAW, of Manayunk, Pa.—*Improvement in Gig Mills*.—Patent dated August 28, 1860.—This invention consists in reversing the usual mode of raising the wool, nap, or pile on woven or felted goods. The cloth is worked and the cylinder raised both in same direction.

Claim.—The employment of a card cylinder or cylinders, arranged and operated as described, for the purpose set forth.

No. 29,829.—ANDREW L. SIMPSON, of Durham, N. H.—*Improvement in Working Ship's Sails*.—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination and arrangement of devices applied to the yard A and the studding sail boom B, for the purpose of supporting such boom, and enabling it to run out and in, under circumstances and in manner as described, such devices being the hanger, the foot rope, the runner, the ropes K¹ L, and the stop hook and eye, as specified.

I also claim the arrangement of the screw F and the guide arm G with respect to the boom hanger and rolling yard A.

I also claim the arrangement of the topgallant sheet sheave *a* in or on the boom hanger, as specified.

No. 29,830.—HAMILTON E. SMITH, of Philadelphia, Pa.—*Improved Washing Machine*.—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The vibrating box B, having its centre of vibration situated below its centre of gravity, as described, when the momentum of said boxes is arrested by its pins or projections *e* and *e*¹ striking against the springs *d* and *d*¹, or their equivalents, as and for the purpose set forth.

No. 29,831.—T. BRIGGS SMITH, of Marietta, Ohio.—*Improvement in Lamps*.—Patent dated August 28, 1860.—This invention consists in giving to a lamp a burner of peculiar construction, and capable of saving and conducting heat down into the illuminating material so as to melt it and keep it in a state of fusion; also in surrounding the oil chamber of a lamp with a confined stratum of air, to act as a non-conductor of heat and prevent the temperature of said chamber and its contents from being materially lowered by contact with a colder medium.

The inventor says: I *claim* first, the peculiarly constructed burner described, consisting of the wick tube T and cup C, constructed and united in the manner set forth.

Second. The shade S, formed and operating as described.

No. 29,832.—W. H. TENDLER and JOHN F. MOESHLIN, of Cambridge, Mass.—*Improved Sofa Bedstead*.—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The described mode of arranging the mattress frames and applying them together and to the sofa frame, viz: by means of a link or connecting bar C and a post D, arranged at each end of the sofa, and with respect to the parts *a b*, the sofa and its seat, and connected therewith substantially as specified.

No. 29,833.—NEHEMIAH UPHAM, of Norwich, Ct.—*Improved Steam Trap*.—Patent dated August 28, 1860.—This invention is designed to facilitate the escape of the water which accumulates by condensation and remains in steam pipes that are used to warm buildings, or for other purposes.

The inventor says: I *claim* the combination of a valve chamber C, having valve seats *a*, and that has one of its extremities C¹ fixed while the remainder of the chamber is allowed to expand and contract longitudinally, with an adjustable valve stem H, and valves *b*, substantially as shown and described.

I also claim the arrangement, as shown and described, of the movable carriage or plate E, chamber C, valve stem H, and bed plate G, for the purpose set forth.

No. 29,834.—WILLIAM S. WALLACE, of Americus, Georgia.—*Improvement in Brick Machines*.—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the pressing mechanism, consisting of the cams and eccentrics upon the central vertical shaft H, with the lever slides and plungers, in relation to each other, the hoppers, screens, and frame, and operating in the manner and for the purposes described.

No. 29,835.—ABEL WARE, of Athens, Me.—*Improved Surveyor's Instrument*.—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of a single graduated limb, vernier telescope or sights, with substantially the means described for changing the position of the aforesaid parts 90°, all operating together substantially in the manner described.

No. 29,836.—EPHRAIM WELLS, of Auburn, Miss.—*Improvement in Cultivators*.—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

Claim.—So connecting and arranging the sole piece of a plough in regard to the frame, beam, and handles, as that its lower side shall assume an oblique position when the sole is secured to the vertical standard of the plough, for the purpose of retaining the plough in a vertical position when it is passed over the inclined sides of ridges, substantially in the manner and for the purpose described.

No. 29,837.—JAMES WHITE, of Bangor, Me.—*Improved Amalgamator*.—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment of a mercury-tight cylinder, provided with conical ends and lifting buckets, with hooks arranged longitudinally upon the inside of the cylinder, as shown and described, so that while the quartz, dirt, and water, are allowed to pass through the machine, the mercury will be hindered, and will be lifted from the bottom to the top of the machine, and then discharged in showers upon and through the ore and other contents of the cylinder, and thus, by amalgamation, effecting the separation of the gold from the quartz, dirt, and water, all as set forth.

No. 29,838.—JOHN THOMAS WILLIAMS, of York, Pa.—*Improvement in Lamps*.—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment, in combination with a lamp that is supplied from an elevated reservoir, of a transparent section F, when said section is arranged between the lamp and the oil supply on a line horizontal to the proper oil level of the lamp, so as to facilitate the replenishing of the lamp without extinguishing the flame and without overflow, all as shown and described.

No. 29,839.—D. WOLF and H. WOLF, of Lebanon, Pa.—*Improvement in Corn Planters*.—Patent dated August 28, 1860.—This invention relates to an improved seed distributing device, whereby the corn may be dropped or discharged from the hopper with regularity, or in a uniform manner, and the device rendered capable of being adjusted to suit kernels of different sizes and forms.

Claim.—The arrangement of the conical cap M, flanged, perforated, toothed plate K, bar N, adjustable plate O, tube R, notched share S, shaft Q, axle D, and beam A, all as shown and described, for the purpose set forth.

No. 29,840.—DAVID T. WOODROW, of Cincinnati, Ohio.—*Improvement in Furnaces*.—Patent dated August 28, 1860.—This invention consists in the construction and arrangement of the parts constituting an improved air heating furnace.

Claim.—In combination with an outer casing A, the fire box B, air tube J, air chamber K, and cylindrical chambers or radiators F G, the latter containing the deflector H; the whole being arranged in relation to each other and within the outer casing A, as set forth.

No. 29,841.—W. E. WORMELL, of Germantown, Tenn.—*Improvement in Ploughs*.—Patent dated August 28, 1860.—The object of this invention is to effect a more thorough pulverizing, or working of the soil, than hitherto; and also to obtain a self-sharpening instrument, and one of great durability.

Claim.—The arrangement of the tri-lateral surface a^* , inclined shares C, mould boards A, and standard B, as and for the purpose shown and described.

No. 29,842.—E. H. ANGAMAR, of New Orleans, Louisiana, assignor to himself and TOBIAS MARCUS, of New York, N. Y.—*Improvement in Cane Coverers*.—Patent dated August 28, 1860.—This invention consists in arranging on the two sides of the frame of a plough two mould boards, with adjustable wings for throwing the earth towards the centre line of the plough, and following them by an adjustable scraper to regulate and render equal the depth of earth applied by the covering mould boards.

Claim.—The combination and arrangement of the twin adjustable covering ploughs P P, with the adjustable scraper S, substantially as and for the purpose specified.

No. 29,843.—JOSEPH HARDEY, of Moline, Ill., assignor to O. CHAMBERLAIN and W. H. BABCOCK, of the same place.—*Improvement in Ploughs*.—Patent dated August 28, 1860.—G is a

plough which is secured to a curved metal beam H. The front end of this beam is slotted, and has two saws *k k* passing transversely through it, between which a vertical guide bar I is fitted. This guide bar I is permanently attached to the axle B. To the front end of the beam H the lower end of a rack J is secured, the upper part of said rack passing between the plates *l l*, which are secured to the upper part of the guide bar I and a bar *m* attached to the axle B. Between the plates *l l* there is also placed a roller *n*, against which the back of the rack bears, and there is also between the plates *l l* a geared sector K which meshes into the rack J.

Claim.—The arrangement of the axle B, plough G, beam H, guide bar I, rack J, sector K, standard M, castor wheel F, arbor E, and frame A, all as shown and described, for the purpose set forth.

No. 29,844.—PETER LOUIS, of New York, N. Y., assignor to himself and HARAM WANDEL, of Castleton, N. Y.—*Improved Valve Gear for Steam Engines.*—Patent dated August 28, 1860.—This invention consists principally in the combination with a yoke connected with the valve, or valves, employed for the induction and the cutting off of the steam, and with a rocker deriving motions from the main shaft of the engine, and operating within and upon the said yoke to open the valve, or valves, at the proper time for the induction of steam, of two adjustable tappet pieces fitted to the yoke for the purpose of being operated upon by an arm of the rocker to effect the closing of the valve, or valves, and consequently the cutting off of the steam at such points in the stroke of the piston as may be desirable.

The inventor says: I *claim* the arrangement of the two connected adjustable tappet pieces *I I n n*¹, in connection with the valve yoke C and rocker F G H, substantially as and for the purpose described.

And I also claim, in combination with the above described arrangement of tappet pieces, the spring *j*, applied in connection with the yoke and the rocker, substantially as and for the purpose specified.

No. 29,845.—JACOB W. TRUAX, of Richford, Vt., assignor to himself and O. J. SMITH, of the same place.—*Improved Head Block for Saw Mills.*—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The toothed segment K, and arm L, provided with the wheels H and G, bar I, provided with the swinging or adjustable pendant J, the wheels H G being attached permanently to the shaft F, and the segment fitted loosely thereon, substantially as and for the purpose set forth.

No. 29,846.—LEWIS WHITEHEAD and SAMUEL P. KITTLE, of New York, N. Y., assignors to SAMUEL P. KITTLE, of the same place.—*Improved Spring Mattress.*—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the combination of the brace 2, constructed as described, with the spring 1, substantially as and for the purpose set forth.

Second. The combination, with the slats 5, (upon which the springs are secured,) of the bevelled intermediate block 6, and the hinges by which the said blocks and slats are connected, substantially as and for the purpose set forth.

Third. The combination of the head blocks or raising blocks *g g*, with the slats to which they are attached, and with the intermediate blocks which connect the lower one of these slats to the next one below it, when the head pieces *g g* are so bevelled as to underlie this intermediate block and thus relieve the hinge, as described and specified.

No. 29,847.—SYLVENUS WALKER, of Boston, Mass., assignor to himself and S. S. HEMENWAY, of the same place.—*Improved Trace Fastener.*—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Covering and protecting the projecting head D of the whiffletree on the outside of the tug, by shield piece C, in the manner and for the purpose set forth.

No. 29,848.—C. WILLIAMS, of Weston, Mo., assignor to himself and J. F. DEFFENBACHER, of the same place.—*Improvement in Bee Hives.*—Patent dated August 28, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Constructing the feed apparatus so that a uniform quantity of food will always flow into the trough, said trough having a perforated cover for the bees to feed through, in the manner and for the purposes set forth.

No. 29,849.—G. W. N. YOST, of Yellow Springs, Ohio, assignor to himself and JOHN F. WATSON, of Edwards Depot, Miss.—*Improvement in Cultivators.*—Patent dated August 28, 1860.—The object of this invention is to save labor during the busy part of the year, and also to modify the machine so as to be able to adapt it to barring off and scraping both sides

of the row at once, also to hilling both sides of the row at the same time, with two furrows on each side, and cultivating the whole middle of the row at once.

Claim.—The arrangement and combination of the two beams A, cross braces K and L, movable shares D, and wheels G; the whole being constructed as and for the purposes described.

No. 29,850.—HENRY N. BAKER, of Binghamton, N. Y.—*Improved Electro-Magnetic Apparatus.*—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment in a magneto-electric machine of a number of helices in each wheel, or circular series, proportioned to the number of magnetic poles in each circular series of magnets, as described, for the purpose specified.

Second. The arrangement of helices of two or more wheels, in spiral relation to each other, as and for the purpose set forth.

Third. The construction of the helices with thin flat cores, arranged radially to the centre of motion, substantially as and for the purpose specified.

Fourth. The intensity regulator, consisting of the wheel F, plates G G, coupling straps m m, and screws j j, or their equivalents, combined, substantially as described.

Fifth. Arranging the terminal wires of the helices to pass through the hollow rotary main shaft, on their way to the intensity regulator and pole changer, as described.

No. 29,851.—JONATHAN BALL, of Elmira, N. Y.—*Improvement in the Mode of Preparing Wood for Umbrella Sticks.*—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the process of curing, consisting of the operations of curing, drying, digesting in hot water, drying again, soaking in hot oil, and drying in hot air, performed in the order specified.

Second. I *claim*, in combination with the described process of curing, the dying of the wood simultaneously with, or by the same operation as the removal of the sap, substantially as described.

No. 29,852.—IRA S. BARBER, of New York, N. Y.—*Improvement in Machines for Turning Ovals.*—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, supporting the cutter shafts in radial self-adjusting arms in combination with the pattern, arranged substantially as shown; and this I *claim* whether the driving pulley have the same axis with the said arms or not.

Second. I *claim* the movable and adjustable pattern guides, whereby various sizes, shapes, and widths can be cut from one and the same pattern.

No. 29,853.—W. H. BARBER, of Wolcottsville, Ct.—*Improvement in Seed Planters.*—Patent dated September 4, 1860.—The motion from the driving axle is transmitted to the seed slide E by means of the teeth a b of the ratchet wheels F G, which are rigidly attached to the axle C, and which, in rotating with the said axle, actuate the rock shaft c, from which an arm d connects with the seed slide.

Claim.—The arrangement of the wheel B, ratchets F G, clicks f g, shaft C, rock shaft c, spring e, hopper H, spring h, slide E, and shares I J, as and for the purpose shown and described.

No. 29,854.—THOMAS BEACH, of Freeport, Pa.—*Improvement in Steam Hammers.*—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—So constructing and arranging the piston rod and hammer shaft of steam and atmospheric hammers as that the hammer shaft shall pass into or through the piston rod made hollow to receive it, in order that the length of the hammer shaft, below the cylinder, may thereby be capable of adjustment, without interfering with the length of the stroke of the piston, substantially in the manner and for the purposes set forth.

No. 29,855.—BENJAMIN BOGUE, of Trenton, Iowa.—*Improvement in Horse Power.*—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the frame A and the wheel B, the internal lead bars a a and the external lead and division bars d and e, substantially in the manner specified, for the purpose of applying horse power internally and externally to the wheel, as is set forth.

No. 29,856.—REUBEN BRADY, of New York, N. Y.—*Improvement in Tuck and Plait Folders.*—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the construction of the confining plate H, when hinged to the lower plate A, for the purpose and in the manner shown and described

I also claim the ledge i on the plate F, when arranged to operate as and for the purpose set forth.

I also claim the arrangement of the plate A with the plates F H, in the manner shown and described, whereby the said plate A serves to furnish an even bearing for the tuck being sewed, and also serves as a guide to the tuck last sewed, all as set forth.

No. 29,857.—CHARLES D. BREWER, of Lewisburgh, Pa.—*Improvement in Machines for Dressing Mill Stones*.—Patent dated September 4, 1860.—This invention consists in the arrangement and construction of certain parts of the machine, whereby the force of the pick is varied, while the feed may be either kept the same or varied at pleasure.

Claim.—The use of the plate N, when the same is made adjustable on the pick carrier D, by means of the slot u, and screw bolt V, or their equivalents, as described, and to operate in combination with the adjustable pawl I, and lever arm l, to enable the operator to vary the force of the pick without varying the feed of the carriage B, as set forth and described.

No. 29,858.—T. E. C. BRINLEY, of Louisville, Ky.—*Improvement in Ploughs*.—Patent dated September 4, 1860.—This invention consists in a novel way of attaching the standard of the plough to the mould board and land side, whereby a very firm and durable attachment is obtained.

Claim.—The arrangement, on the standard D and beam A, of the ledges a b and shoulder h, to admit of the attaching of the standard to the land side, mould board, and beam, as shown, in connection with the brace or rod E, applied substantially as and for the purpose set forth.

No. 29,859.—THOMAS BYRNE, of Baton Rouge, La.—*Improvement in the Preparation of Flour*.—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The bringing of flour of wheat and other grains in contact with carbonic acid gas, artificially manufactured.

No. 29,860.—THOMAS BYRNE, of Baton Rouge, La.—*Improvement in the Mode of Applying Sulphurous Acid to Cane Juices*.—Patent dated September 4, 1860.—The claim explains the nature of this invention.

Claim.—A method by which I treat cane juices with sulphurous acid gas and lime, or sulphurous acid gas and either of the earths, viz., baryta, magnesia, or strontia, so that no sulphite of lime or sulphite of any of the above mentioned bases shall be formed in said cane juices, as set forth.

No. 29,861.—SHARON CASE, of Lumpkin, Ga.—*Improved Machine for Thinning Boards*.—Patent dated September 4, 1860.—This invention consists in combining, with a guide and gauge box, a plane stock carrying a curved plane iron, and a feed roller for carrying the stuff up to the cutter, and an adjustable board by which the stuff may be nicely gauged, so as to be cut as thin as desirable.

Claim.—The combination, with a box D having an adjustable bottom operated by set screws a a a a, of the feed roller G¹, arranged and made to operate as set forth, plane A J, and pressure roller G, the whole being combined and arranged substantially as and for the purposes set forth

No. 29,862.—CHARLES T. CHESTER, of New York, N. Y.—*Improvement in Electro-Magnets*.—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, in combination with cores confined so as to prevent the action of the current through a surrounding helix from imparting motion to them, helices wound on spools of hard rubber or other suitable material surrounding the cores, and so arranged that the cores may be removed from them, when requisite, substantially for the purposes set forth.

Second. I claim holding, moving, and adjusting the cores by means of the screw and spring, substantially as described.

Third. Coupling and supporting the helical spools by the double rings, substantially as described.

No. 29,863.—LEWIS S. CHICHESTER, of New York, N. Y.—*Improved Sad Iron*.—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A smoothing iron having a hollow spiral self-ventilating handle, and the edges of its rubbing surface provided with a groove, and otherwise constructed as shown and described.

No. 29,864.—J. MASLIN COOPER, of Pittsburgh, Pa.—*Improvement in Revolving Fire Arms.*—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the use of a locking bolt, such as described, operated by the trigger spring, and trigger working on a collar on the trigger around the trigger pin, so as to prevent its action being interfered with by the pressure of the sides of the lock frame.

The use of a projection at the front end of the trigger, projecting through the lock frame, and pressing against the circumference of the rotating breech, in combination with suitable recesses in the circumference of the rotating cylinder, whereby when the trigger is not drawn back, and the parts are at rest, the cylinder will be secured from rotation in such a position that the end of the hammer will be situated between two of the nipples, and not upon or in front of any of them, thus avoiding, in a great measure, the danger of a premature or accidental discharge.

Also the arrangement of the trigger, hammer, and vibrating tooth, constructed as described, for the purposes described.

No. 29,865.—A. B. CRAWFORD, of Piqua, Ohio.—*Improvement in Threshing Machines.*—Patent dated September 4, 1860.—The belt H is formed of canvas, or any belting material, as a bottom, and plays around pulleys like any ordinary endless belt, the cross strips containing the cells are formed by taking strips of board one and a half inch thick by three inches wide.

Claim.—The cellular belt H, as arranged, in combination with the vibrating belt I, with the projections or fingers *f*, teeth *g*, and pins *h*, and arms *I*¹, and stacker S, all operating as set forth and for the purposes described.

No. 29,866.—G. W. EFNER and SAMUEL A. SPERRY, of Ann Arbor, Mich.—*Improvement in Carriages.*—Patent dated September 4, 1860.—This invention consists in providing, in connection with hollow tubular axles, a new and useful carriage spring, and also, in connection with such, a new and useful mode of attaching and detaching the wheels of vehicles.

The inventors say: We *claim* the hollow axle B, in combination with the double spring catch D, and the manner of operating the same by turning the spring within the elliptical opening at the outer end of the axle, as a mode of attaching and detaching the wheel.

We also claim the hollow axle B, in combination with spiral spring K, spring lever I, and thorough brace M, operating together in the manner described, as a carriage spring.

No. 29,867.—HORACE L. EMERY, of Albany, N. Y.—*Improvement in Cotton Gins.*—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the employment or use, within the saw chamber A of a cotton gin, of a rotating cylinder or shaft C, provided with spikes or teeth *c*, for the purpose specified, substantially as set forth.

I also claim the arrangement, as shown, of the cylinder or shaft C, within the saw chamber A, to wit: providing the shaft with journals *a*, which are fitted to openings *b*, of sufficient diameter to admit of a necessary degree of lateral play or movement of the shaft, as and for the purpose specified.

I further claim, in connection with the journal opening *b*, the disks or circular plates D, attached to the shaft, for the purpose set forth.

No. 29,868.—DANIEL FASIG, of Rowsburg, Ohio.—*Improved Feeder for Straw Cutters.*—Patent dated September 4, 1860.—This invention consists in operating a rake by a novel arrangement, so as to give it an advancing movement up to the cutters at each revolution of the crank shaft that operates the knife—said movement of the rake being regulated at pleasure to cut straw longer or shorter.

Claim.—The combination, with shaft F, of the flanges *c c*, tooth *e*, rack handle H, and rake I, arranged and made to operate in the manner and for the purpose set forth.

No. 29,869.—D. FELLENBAUM, of Lancaster, Pa.—*Improvement in Balancing Mill Stones.*—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Applying the weight E to the side of the revolving stone or runner A, and in or about in a horizontal plane with its point of suspension, by means of a metal strap or band D, or other suitable device, for the purpose specified.

No. 29,870.—H. E. FICKETT, of Glenn's Falls, N. Y.—*Improved Clothes Dryer.*—Patent dated September 4, 1860.—This invention consists in the construction and operation of a clothes dryer.

Claim.—The dryer, constructed substantially as described, in combination with the stand-

ard F, and ribbed socket G, the whole arranged and operated as described, and for the purpose specified.

No. 29,871.—LUTHER FOGG, of Boston, Mass.—*Improvement in Skates*.—Patent dated September 4, 1860.—This invention consists in constructing a skate with a broad oscillating runner, hinged to the stock in such a manner as to admit of its lying flat on the ice, whether the foot is canted upon an angle or otherwise; also, with extension plates attached to the straps, by which the skates can be readily fitted to feet of different sizes.

The inventor says: I *claim*, first, the oscillating runner, being hinged to the stands projecting from the stock, substantially in the manner and for the purpose described.

Second. I claim the extension plate connected to the strap, substantially in the manner and for the purpose set forth.

No. 29,872.—ALBERT FULLER, of Cincinnati, Ohio.—*Improvement in Hydrants*.—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the yielding valve H, and waste valve M, when combined, arranged, and connected substantially as set forth, so as to permit the waste valve to operate alternately with the main valve or remain inactive, at the option of the operator.

Second. The described combination of pipe or barrel E, screw nozzle F, guides e, and casing D; the said parts being constructed, arranged, and operated as set forth, so that the hydrant may be removed bodily by unscrewing from above, and again replaced, without disturbance of the ground, and without undue exposure of its base.

No. 29,873.—M. A. FURBISH and GEORGE CROMPTON, of Worcester, Mass.—*Improvement in Power Looms*.—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* connecting the two hand levers of the belt shipper, one on each side of the frame, by combining therewith the sliding rod connected with one, so as to move therewith, and provided with shoulders on each side of the spring handle, and with a bevel or inclined plane, substantially as described, so as to enable the operator to stop or start the loom by one motion from either side of the frame.

We also claim the single lever under the breast beam, and passing through and working in a mortise in the side frame, substantially as described, in combination with the trip lever and spring lever of the shipper, substantially as described and for the purpose set forth.

And, finally, we claim giving support to the warp beam by means of one or more intermediate wheel or wheels, or equivalent thereof, in combination with a standard or standards, fitted thereto, substantially as described.

No. 29,874.—PERRY G. GARDINER, of New York, N. Y.—*Improvement in Cotton Presses*.—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement and combination of toggle joints and pawls, acting alternately on teeth, or their equivalent, provided on a rod connected to the movable platen of a cotton press, and operating so as to move and supply alternately said rod and platen at stated intervals, whether the motion of the platen be upwards or downwards, in the manner and for the purpose substantially as described.

Second. I claim the guide plate M, provided with slots or guides, and operating the ends of the toggle joints and of the pawls, in the manner and for the purposes substantially as specified.

Third. I claim the lever V, in combination with the fork piece X, operated by the lever Z, acting on eccentric grooves Y, attached to a wheel W, in the manner and for the purpose specified.

Fourth. I claim the arrangement of the upper part B¹ of the cotton box, with its movable sides and ends, for the purpose and in the manner substantially as described.

Fifth. I claim the combination of double toggle joints, working in reverse motion to each other, on teeth or notches attached to a rod fast to the movable platen, in combination with a guiding plate operated by a grooved cam wheel, and in combination with pawls; the whole being arranged and combined to work together, in the manner and for the purpose substantially as set forth and described.

No. 29,875.—RICHARD J. GATLING, of Indianapolis, Ind.—*Improvement in Hemp Brakes*.—Patent dated September 4, 1860.—This invention consists in providing a frame to which is attached a suitable arrangement of shafts, levers, connecting rods, and beaters, whereby hemp may be broken in a better manner than at present.

The inventor says: I *claim*, first, the oscillating beaters B and C, (as shown in Figs. 1 and 2,) when constructed, arranged, and operating in the manner and for the purpose substantially as specified.

Second. I claim the cam D, cam yoke F, curved lever G, connecting rod H, crank S, rock shaft K, lever I, and connecting rods L and R, treadle P, and cord attached thereto, or their equivalents, when arranged and constructed, substantially in the manner and for the purpose set forth.

No. 29,876.—JAMES R. GILBERT, of Starkville, and STEPHEN R. WESTON, of Dawson, Ga.—*Improvement in Cultivators*.—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the handles, beams, hinged standards, and hinged curved and notched braces, by which we are enabled to change the plough from a double beam adjustable cultivator plough to two single beam ploughs, substantially in the manner described.

No. 29,877.—W. W. GOLSAN, of Autaugaville, Ala.—*Improvement in Cotton Cultivators*.—Patent dated September 4, 1860.—A rectangular frame, composed of the parallel longitudinal beams B B, and the transverse end beams C D, forms the main portion of the frame work of this implement. The ends of the hindmost transverse beam D of said frame project a short distance beyond the side beams B B thereof, and those ends are securely combined with the central portion of the uprights F F.

Claim.—The arrangement of the cultivator point L, and the central driving wheel A, with the crank shafts *a a*, the laterally acting hose *h h*, and the uprights F F, substantially in the manner and for the purpose set forth.

No. 29,878.—W. W. GOLSAN, of Autaugaville, Ala.—*Improvement in Seed Planters*.—Patent dated September 4, 1860.—On the the axle *c* there is a belt G, which passes around a drum on the shaft *g*. This shaft revolves in boxes, secured to the bottom of the hopper E. On the centre of this shaft there is an agitating wheel H, with blades; this wheel passes through the slide *d* into the hopper, equi-distant, and, at the action of the axle, revolves, and the blades stir up and force the manure from the hopper through the slots in the hopper and slide, in which the wheel revolves, into the furrow in the rear of the seed planted.

Claim.—The combination of the cam wheel *c*, agitating wheel H, spring *e*, and slide *d*; the whole being constructed and arranged in the manner and for the purpose described.

No. 29,879.—ALEXANDER J. GRAHAM, of Portland, Oregon.—*Improvement in Locomotive Engines*.—Patent dated September 4, 1860.—When the axle G is rotated, the foot pieces F, on each side of the frame A, receive a reciprocating motion in opposite directions, so that one of the foot pieces on each side of the machine serves to propel the same, while the other two foot pieces are drawn forward ready for a fresh hold.

The inventor says: I *claim* the arrangement of the yielding feet F and slides E E, in combination with the double cranks *j j*¹, rods *k k*¹, and central shaft G, as and for the purpose shown and described.

I also claim the employment of the double bevelled collar *m*, in combination with the shaft G and sliding pulleys H H¹, as and for the purpose shown and described.

No. 29,880.—JOHN GREACEN, JR., of New York, N. Y.—*Improved Device for Discharging the Smoke, Cinders, &c., from Locomotive Engines*.—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination, with the smoke pipes or tubes, arranged to convey the smoke from the rear to the front of the train, of reversible funnel connections, constructed and operating substantially as and for the purposes set forth.

No. 29,881.—T. H. GREEN, of Fond du Lac, Wis.—*Improvement in Grain Elevators*.—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the employment of the horizontally revolving distributing spout G, in combination with the bins J, when the axis of rotation of said spout is arranged beneath the discharging mouth of the elevator, so that the grain may be conducted to any of the bins that are within the radius of the circle described by the outer end of the spout G, all as shown and described.

I also claim the combination of the revolving spout G, shaft F, and index lever H, with the elevating device B, substantially as shown and described.

No. 29,882.—JOSEPH HARRIS, JR., of Roxbury, Mass.—*Improvement in City Railroad Cars*.—Patent dated September 4, 1860.—The doors of this car are controlled by the driver, by means of foot straps extending from the door, through the car, and under his foot. The greater portion of the platforms are enclosed, as represented by letters *c c*.

Claim.—The arrangement and construction of a car, when made in the manner and for the purposes described.

No. 29,883.—JOHN M. HATHAWAY, of New York, N. Y.—*Improvement in Augers.*—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the eccentrically adjustable cutter, sliding on and held by dovetail groove and tenon, as described.

Second. I claim, in combination therewith, giving a solid shaft or centre to the auger, thus affording solid and sufficient metal upon which to form said tenon.

Third. I claim extending the spiral upon such solid shaft the entire length, and making the edge of said spirals sharp for the reason given.

Fourth. I claim, in combination, making the centre screw or worm removable, as described, for the reason given.

No. 29,884.—HOMER HECOX, of Rutland, Vt.—*Improvement in Sap Conductors.*—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—As an improved article of manufacture, a metallic sap conducting tube, when made tapering in form and provided with a centrally placed nose *b*, and otherwise made as shown and described.

No. 29,885.—MARK W. HOUSE, of Cleveland, Ohio.—*Improvement in Harrows.*—Patent dated September 4, 1860.—The rim portion *g* of each section of this improved harrow overlaps the adjoining section of the same a sufficient distance to enable each tooth *d* to be combined with two of said sections by means of a clamp *f* and a wedge or key *h*.

Claim.—Constructing a harrow of the respective parts represented in the accompanying drawings, when the said parts are combined with each other substantially in the manner set forth.

No. 29,886.—MICHAEL HAUSMAN, of Huntington, Ind.—*Improvement in Corn Shellers.*—Patent dated September 4, 1860.—This invention consists of two blades or jaws of iron or other suitable metal, united at one extremity, so as to be parallel, or nearly so, by a hinge joint, through which is passed an axis projecting both ways so as to serve as a handle; the other ends of these jaws or blades being spread out in a broad paddle-like shape, having a number of thin shells or flanges projecting inwardly from them at right angles, their directions being oblique to the length of the blades, and their edges being bevelled off and hollowed out.

Claim.—The jaws 1 and 2, the hinge joint by which they are united, the handle 3, the broad extremities of the jaws or blades, with the flange projections 4 5 6 7, and the corresponding flanges on the opposite blade, the spring 10, and the separating studs 9; the whole being constructed and arranged in the manner before described, and operated and operating as set forth and for the purpose stated.

No. 29,887.—SIDNEY HUDSON, of Milford, Mich.—*Improvement in Self-Acting Waste Gates for Mill Dams.*—Patent dated September 4, 1860.—This invention has for its object the preventing of the washing away of mill dams by freshets, and by such means as will be automatic in its operation.

Claim.—The combination of the pivotted gates B C, of the adjustable counterpiece G, bent lever F, rod E, and connecting link D, when the parts are arranged and constructed to operate together as and for the purpose shown and described.

No. 29,888.—JAMES J. JOHNSTON, of Alleghany, Pa.—*Improved Device for Teaching Children.*—Patent dated September 4, 1860.—This invention consists in an arrangement of a letter board, letter case, copy chamber, and hexagonal blocks, with figures and the letters of the alphabet impressed on them.

Claim.—The arrangement of the copy chamber *b*, letter board *c*, letter case *a*, and hexagonal blocks, with the letters of the alphabet, punctuation points, and figures impressed upon them; the whole being arranged and constructed in the manner described, and for the purpose set forth.

No. 29,889.—WILLIAM S. KIMBALL, of Rochester, N. Y.—*Improvement in Wine Presses.*—Patent dated September 4, 1860.—This invention consists in passing the fruit between two rollers, by means of a perforated and elastic or compressible apron, the distance of the rollers apart, and the compressibility of the apron, being so adjusted that while all juice of the fruit will be expressed and forced through the perforations in the apron, none of the seeds or stems will be crushed or expressed, they being much firmer or harder than the fruit.

The inventor says: I *claim*, first, the use of the perforated elastic apron A, in combination with the rollers $R^1 R^2 R^3$, in the manner and for the purpose substantially as described.

Second. I claim the use of the corded or enlarged edges of the apron A, in combination with the grooved rollers as shown in Fig. 4; the whole being arranged and operating in the manner and for the purpose substantially as set forth.

No. 29,890.—J. W. KNAPP, of Chester, N. Y.—*Improved Window Shutter and Stand*.—Patent dated September 4, 1860.—This invention consists in the employment of two upright posts of sufficient height, with spikes projecting from the inside of each, and placed near the top of the posts, one of which posts is fixed and braced in a stationary state, and the other is jointed or hinged to a sliding block, by which the posts may be adjusted at any desirable distance apart for shutters of different lengths or widths, and fixed rigidly by a set screw, while the jointed post will be fixed, after receiving the blind, by an extension prop and rack.

Claim.—The two posts, with thin spikes $b b^1$, one post being stationary and the other post jointed to a sliding piece E, and prepared by an adjustable jointed piece G; the whole constructed substantially as described and considered in combination, for the purposes set forth.

No. 29,891.—JULIUS KOCH, of South Adams, Mass.—*Improved Apparatus for Trimming Paper*.—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the box E, provided with a flap a , with the adjustable rotating cutting board H, and with or without the gauge G, substantially as and for the purpose set forth.

No. 29,892.—D. R. LIGHTNER, of Bucyrus, Ohio.—*Improved Spring Bedstead*.—Patent dated September 4, 1860.—This invention consists in having a system of slats, and an elevating rack unconnected with the frame work of the bedstead, supported by two springs, which are also unconnected with the bedstead, except by a support across the middle.

Claim.—The arrangement of springs C, batten E, side rail F, and elevating rack, the whole resting on the plank A across the middle of the bedstead.

No. 29,893.—DANIEL LOMBARD, of Boston, Mass.—*Improvement in Machines for Polishing Rice*.—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the surfaces $a b$ and c with stirrers f , when all of these are covered with buckskin, or other equivalent yielding material, and are of the form and relative arrangement described, operating together, as specified, to polish the grains of rice.

No. 29,894.—DANIEL LOMBARD, of Boston, Mass.—*Improvement in Machines for Scouring Rice*.—Patent dated September 4, 1860.—The object of this invention is the removal of the colored skin or inner cuticle from the grains after the shell or husk has been separated therefrom.

Claim.—The described arrangement and combination of stirrers and stationary surfaces, of the form described, acting together, in the specified manner.

No. 29,895.—HENRY MARCELLUS, of Amsterdam, N. Y.—*Improvement in Mowing Machines*.—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of levers F and H, or their equivalents, a castor, or its equivalent, and a double hinged main frame, for the purpose of raising, lowering, and holding up both ends of the finger beam, substantially as set forth.

Second. In a mowing machine, whose main frame and finger beam are rigidly connected, and are free to vibrate up and down transversely to and parallel with the path of the machine, supporting the driver's seat on the axle of the driving wheel in such manner that it will be unaffected by the lateral vibratory movements of the main frame or the turning of the main axle, substantially as described.

No. 29,896.—GEORGE B. MARKHAM, of Mead's Mills, Mich.—*Improvement in Self-Acting Flood Gates*.—Patent dated September 4, 1860.—This invention consists in arranging the gate to swing on a bar, which is adjustable in two flanges, so that the discharge opening, which is formed as the water rises beyond a certain height, can be made larger or smaller, as may be desired.

Claim.—The arrangement of the flanges b and adjustable bar a , substantially as specified, so that the size of the discharge opening can be regulated at pleasure.

No. 29,897.—W. D. MASON, of Jarratt's Depot, Va.—*Improvement in Sowing Machines*.—

Patent dated September 4, 1860.—This invention consists in the use of a peculiarly constructed hopper and screws, arranged with a working fan and inclined distributing board.

The inventor says: I *claim* the combination of the rotating screws F with the hoppers D E, when the latter are divided at their lower part into compartments *c* and chambers *d*, substantially as and for the purpose specified.

I further claim, in connection with the hoppers D E, the rotating fan L and inclined board M, as and for the purposes set forth.

No. 29,898.—T. J. MAYALL, of Roxbury, Mass.—*Improvement in the Manufacture of Flexible Gas Tubes*.—Patent dated September 4, 1860.—The claim explains the nature of this invention.

The inventor says: In the manufacture of flexible tubes and other articles which are used for the purpose of conducting or retaining illuminating gas or other gaseous fluids, I *claim* the use of a vulcanizable soft India rubber compound, containing gum shellac as an essential ingredient.

No. 29,899.—WILLIAM McALLISTER, of Gerry, N. Y.—*Improvement in Pressing Cheese*.—Patent dated September 4, 1860.—This invention consists of a crevice hoop, which is placed around the upper corner of the cheese, under the follower, for the purpose of preventing the cheese cloths and band and cheese or curd from pressing up in the crevice between the follower and the hoop, and, in connection with the crevice hoop, to use head cloths, placed at the top and bottom of the cheese, which are used instead of a large single cloth to envelope the whole cheese, as is now used in pressing.

The inventor says: I *claim*, first, the application and use of the crevice hoop, Fig. 1, constructed and used as and for the purposes specified.

Second. I claim the application and use of the head cloths specified, the same being made and used as and for the purposes described.

No. 29,900.—JOHN McKINNEY, of Lansing, Mich.—*Improvement in Railroad Car Couplings*.—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* giving such a shape to the head of the spring actuated shaft P, and such a degree of strength to its spring, that the flat head of the link L, when placed within the buffer frame, will be so closely embraced between the said spring actuated head and the draught pin as to retain said link in a horizontal position when unemployed, substantially as set forth.

When the head of the spring actuated shaft P and the draught pin I bear the described relation to each other and the buffer frame, I also claim the vertical tube G, which rises from the draught pin aperture in the upper plate of the buffer frame, and serves the purpose set forth.

No. 29,901.—ALBERT MOFFET, of Bristol, Ohio.—*Improved Machine for Marking Waving Patterns*.—Patent dated September 4, 1860.—This invention relates to an arrangement of devices, by means of which a regular vine scroll can be laid off, or be caused to vary in its depth by changing continually and gradually.

The inventor says: I *claim* the lever M, sliding bar O, and arm S, arranged and operated in the manner and for the purpose specified.

I also claim the moving fulcrum N, in combination with the connecting rod P¹ and wheel P, operated as and for the purpose specified.

No. 29,902.—JOHN A. NAYLOR, of Rahway, N. J.—*Improvement in Extension Carriages*.—Patent dated September 4, 1860.—A is the main body of the carriage; B is a draw front fitted to slide out and in therein; it is fitted in grooves within the body of the carriage, and is adapted to slide inward and outward to a certain limited extent.

Claim.—The arrangement of the draw front B, folding seat G, and seat F, substantially as described and for the purposes set forth.

No. 29,903.—STEWART NEILL, of Chillicothe, Ill.—*Improvement in Harrows*.—Patent dated September 4, 1860.—This invention consists in the arrangement and combination of parts forming a harrow, in which the weight is thrown upon the revolving cylinder, thus rendering it easy of draught, and by which the soil is pulverized between the fixed and the revolving teeth, and the ground marked off for planting by the markers.

Claim.—The combination and arrangement of the teeth E, toothed roller C, and markers D, substantially in the manner specified and shown.

No. 29,904.—W. T. OPIE, of Scarboro, Ga.—*Improvement in Cotton Presses*.—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of toggle levers applied to the follower, and having friction rollers at their joints, as set forth, when these levers are acted upon by the arm I pressing against their rollers and extending them as described, and when said arm is itself operated by arm J, connecting rods K K, link and lever M, as described and represented.

No. 29,905.—ELHANAN W. ORMSBEE, of Montpelier, Vt.—*Improvement in Apparatus for Collecting Sap from Trees.*—Patent dated September 4, 1860.—This invention consists in providing a cover which, by means of a spring, passed through two ledges on its upper surface and bent at its extremities into a hooked form, and also by means of two projecting points on one of the edges of the said cover, is fastened to the tree.

Claim.—The cover 1, the ledges 2 2, the spring 3, hooked or bent at the ends, as described, and the points 4 4, when the whole are combined and arranged with each other in the manner described and for the purpose stated

No. 29,906.—JOHN OSBORN, of Mt. Carmel, Conn.—*Improvement in Aqueducts.*—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the valve chest E, with valves $e e^1$, in combination with the reservoir A B, pipes C D, and pipe F, constructed and operating substantially as and for the purpose set forth.

Second. The arrangement of the swinging box G, in combination with the valve stem f , valves $e e^1$, and reservoirs A B, constructed and operating substantially as for the purpose specified

Third. The arrangement of the float l , lever m , valve k , aperture n , and valve o , in combination with the two chambers $j j^1$, of the box G, constructed and operating substantially as and for the purposes described.

Fourth. The combination, with the box G, reservoirs A B, and pipe F, of the faucets M and O, operating substantially as and for the purposes set forth.

No. 29,907.—A. R. PARK, of Columbia, Texas.—*Improvement in Seeding Machines.*—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A rotary seed distributor, composed of drums $c c$ and longitudinal spiral strips $e e$, for distributing different kinds of seed, in combination with the reciprocating yielding apron D and a seed hopper, substantially as and for the purposes set forth

No. 29,908.—HOMER PARMELEE, of Philadelphia, Pa.—*Improvement in Moulding Metal Pipes.*—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Forming moulds and cores for the casting of cylindrical objects of metal by means of the pipe D, with its flange e , when the said pipe and flange are caused to revolve in a chamber around any desired object to rise as the mould or core is being formed, and to impart, by its weight, the desired solidity and uniformity to the mould or core, as set forth.

No. 29,909.—EBENEZER G. POMEROY, of New York, N. Y.—*Improved Method of Converting Iron into Steel.*—Patent dated September 4, 1860.—The claim explains the nature of this invention.

Claim.—The conversion of iron into steel by its treatment in the molten state with the compound of potash, or other alkali, carbonate of lime, oxyde of manganese, and charcoal, substantially in the manner specified.

No. 29,910.—MILO PECK and CHARLES PECK, of New Haven, Conn.—*Improvement in Drop Presses.*—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The making and constructing of puppet heads, to drop and other presses, with cylindrical shanks, and fitting the same to anvils between raised ledges, or their equivalents, substantially as described and set forth.

No. 29,911.—AUGUST PERNOT, of Chilton, Wis.—*Improved Machine for Sawing Shingles.*—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the reciprocating frames B B, provided with rack bars F F and operated by means of the shaft G and bar K, when used in connection with rocking tables H H, the saw J, plate a , the clamp c , and the bar d , the whole being constructed, combined, and operating in the manner and for the purpose specified.

No. 29,912.—S. L. PIONNIER, of New York, N. Y.—*Improvement in Ship Building*—

Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A ship or vessel, constructed with the timbers in close contact, in combination with the wire or metallic supports running fore and aft and athwart ships, substantially as and for the purposes shown and described.

No. 29,913.—BARTON S. PRINGLE, of Barnesville, Ga.—*Improved Bedstead.*—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Attaching the four feet to their respective legs by a rack and pawl, in the manner described, and pivoting these legs to the rails of the bedstead frame, as and for the purposes set forth.

No. 29,914.—J. W. RAMSAY and DANIEL WILSON, of Grafton, Va.—*Improvement in Portable India Rubber Bathing Tubs.*—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—An India rubber bathing tub, provided with double sides, in connection with the screw valve *a*, or its equivalent, and arranged substantially as and for the purpose set forth.

No. 29,915.—GEORGE G. RAY, of Boston, Mass.—*Improved Steam Reed Instrument.*—Patent dated September 4, 1860.—This invention consists of a vessel or chamber communicating with a steam boiler and having one or more orifices for the escape of the steam which is admitted to it, each orifice being covered by a reed, so that the escaping steam will produce a musical sound, which may be used for an alarm or a signal, or by a combination of a number of such chambers and reed-covered openings a musical instrument may be produced.

Claim.—The chamber *D* communicating with a steam boiler, and furnished with one or more orifices or slots *i* and corresponding reeds *m*, substantially as described, for the purpose specified.

No. 29,916.—JOHN REVERE, of Boston, Mass.—*Improvement in Sheathing Ships, &c.*—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the application, to the inner surface of metallic sheathing of a ship, or other vessel, and with respect to the bottom of the vessel, as described and for the purpose set forth, of an insulating material or composition of the character specified.

I also claim, in combination with such an application of such an insulating composition, extending it between the laps of the metallic sheets of sheathing, as and for the purpose explained.

No. 29,917.—LOUIS SCHNEIDER and J. A. MONTGOMERY, of Williamsport, Pa.—*Improvement in Self-Acting Draw Bridges.*—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The self-acting draw bridge, described, capable of being turned in either direction by a passing vessel and closing itself with a constant force from any position, in the manner substantially as set forth.

No. 29,918.—GEORGE C. SELFRIDGE, of North Greenfield, N. Y.—*Improvement in Pumps.*—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* a pump constituted of an upper and lower chamber, the upper chamber being of one half the area of the lower one in diameter, placed one above the other, having a solid piston moving in the upper and a valved piston moving in the lower chamber, both attached to the same rod and operating in combination with a fixed valve seat and its valves below the discharge orifice lying between the pistons, the whole arranged and working together in the manner and for the purposes set forth in the above specification.

No. 29,919.—THOMAS SHEEHAN, of Dunkirk, N. Y.—*Improved Method of Converting Iron into Steel.*—Patent dated September 4, 1860.—This invention consists of two parts; the first being a liquid composition, and the second a compound of flour and said liquid composition.

The inventor says: I *claim*, first, the liquid composition consisting of the ingredients used, compounded in or in about the proportions specified and described.

Second. The compound for steelifying wrought iron, made of the liquid composition and flour, in the manner and for the purposes set forth.

No. 29,920.—HENRY C. SMITH, of Clarksville, Ohio.—*Improvement in Mortising Machines.*—Patent dated September 4, 1860.—This invention consists of peculiar devices for operating and feeding a circular cutter head.

Claim.—The pitman H e, link I, and pin d, operating in connection with a reciprocating rotary cutter head F, in manner substantially as and for the purposes set forth.

No. 29,921.—WILLIAM S. SMITH, of Trenton, N. J.—*Improvement in Driving Piles by Atmospheric Pressure.*—Patent dated September 4, 1860.—This invention consists in furnishing the air lock, which is employed to form the cap of the pile in driving, with a supplementary air lock, so applied as to permit the discharge through it of solid matters which may have been taken from within the pile, while water is excluded by an artificial pressure of air within the main air lock and pile, without the necessity of opening the main air lock to the external atmosphere.

Claim.—The supplementary air lock D, applied substantially as described, in combination with the main air lock, and serving the purpose specified

No. 29,922.—JOHN M. SPENCER, of Enfield, Me.—*Improvement in Hand Mowing Machine.*—Patent dated September 4, 1860.—This machine is intended to be put in operation by an individual laying hold of the handles and pressing the machine onward in front.

Claim.—The arrangement of the serrated cutter F, two sets of gears K L, two cranked shafts I I, and the belts G G, (applied to such cutter and cranks,) substantially in manner and to operate as described.

No. 29,923.—HENRY D. STOVER, of New York, N. Y.—*Improved Planing Machine.*—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, constructing that part of the dogging apparatus E¹, carrying the dogs F¹, with adjustable and variable inclined planes J¹, pressing against pins or surfaces A⁴, attached to the platen B, so that any desired pressure by the adjustable planes J⁴ may be given, both to press the dogs forward into the lumber and hold them securely down to the platen by the turning of a single screw H¹, essentially in the manner described.

Second. The combination of the downward drawn guide bar C⁷, with the dogs F¹, cross-bar L¹, and revolving nut G¹, substantially in the manner and for the purpose set forth.

Third. The employment of flat cutters, bevelled on their outer surface and parallel to the axis of the cutter head; the cutting edges being in the surface of a cylinder whose axis is coincident with the axis of motion, so as to impart a drawing stroke, substantially as set forth.

Fourth. The combination of the cutting cylinder U², formed with recesses r, and pressure edge v, with the peculiarly constructed cutters V², and the devices by which they are adjusted upon the cutter head and secured thereto, substantially as specified.

Fifth. So constructing, arranging, and combining the parts constituting the roll feed, i. e. the shaft X¹, the pinions A², B², C², and Z¹, or their equivalents, and the platen feed, i. e. shaft X¹, lever sleeve P², arms R⁴ and S², and pinions P⁵ and Q², that, by the act of lowering the rolls to be used, its feed is connected and the platen feed disconnected; and by the raising of the rolls the feed is connected with the platen, substantially as set forth.

Sixth. Making the platen in two parts B and C, with a ball F between, so that the top part may be tipped universally and secured by straps n, or otherwise, in any position, so that a piece may be planed level and parallel in thickness or tapering, as set forth.

Seventh. So constructing the feed roll boxes R¹, that they carry the pressure within them, so as to be invariable under any elevation of feed roll, substantially as described.

Eighth. I also claim the feed rolls O¹ and O², their frame Q¹, and the platen or rest B⁶, firmly affixed thereto, and to come under the cutting cylinder when in use, if desired, so as to always be level and on a line with top of the lower feed roll O², with or without matching cutters J², as set forth.

Ninth. I also claim rollers B⁴, connected adjustably to the bedpiece A, to wholly sustain and guide the movable platen B and C, or in connection with tracks N¹, so as to receive the weight of the timber on the rollers B⁴, and its guidance from the tracks for the easy movement of platen when carrying loads, as set forth.

Tenth. I also claim so combining friction feed apparatus, consisting of lever L, having its fulcrum at Q, and its belt wheels N A¹ and B¹, and its friction rolls O and P, and wheel G, on shaft X¹, with the platen B and C, that a heavy piece of timber may be gradually and easily started into motion, stopped suddenly and reversed, and obviate the shock and destruction of parts consequent on starting suddenly, as described.

Eleventh. I also claim so constructing and combining matching cutters X and W, with the movable platen B and J², with feed rolls O¹ and O², that a cutter will automatically find and correctly match the entire length of each edge of a board or piece regardless of its taper, width or the direction it passes through the machine, as described.

Twelfth. I also claim forming mouth pieces or openings e, between the teeth c, of the solid dogging racks B¹⁰, to prevent shavings and chips lodging and clogging therein, all substantially as described and for the purposes fully set forth.

No. 29,924.—JAMES C. TEAGUE, of Centre Hill, Miss.—*Improvement in Cotton Scrapers.*—

Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

The inventor says : I *claim* the arrangement and combination of the cast iron box G, with inclined bottom and balanced sides, bar C, for attaching to the beam and movable weights, to increase or diminish the weight of the scraper and keep it balanced, substantially as specified.

No. 29,925.—WILLIAM D. THOMAS, of Morristown, Vt.—*Improvement in Furnaces*.—Patent dated September 4, 1860.—The part lettered A is the body of the furnace ; B is the flange surmounting the sides of the furnace ; C C are the openings for the escape of the gases and smoke from the fire to the flues ; D is the aperture leading to the smoke chimney ; E and F F are the dampers, one open and the other closed ; P represents the evaporating pan when in position for use.

Claim.—The arrangement of the side flues and dampers relatively to the pan, as and for the purpose set forth.

No. 29,926.—WILLIAM H. TOWERS, of New York, N. Y.—*Improved Broom*.—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The broom constructed of broom corn and strips of cane or reeds, substantially as described, as a new article of manufacture.

No. 29,927.—NICHOLAS K. WADE and JOSEPH KAYE, of Pittsburg, Pa.—*Improvement in Car Wheels*.—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The use of arms or spokes of wrought iron, or other flexible material, of single or double curvature, and so placed in the hub and rim as to afford a lateral brace, substantially as set forth and shown in the accompanying drawings.

No. 29,928.—MAXIMILIAN WAPPICH, of Sacramento, Cal.—*Improvement in Cotton Presses*.—Patent dated September 4, 1860.—This invention consists of pawls acted on by a cross shaft and revolving inclines, giving motion to the platen that compresses the goods ; and the operation of the parts is resisted by yielding journal boxes, so that the parts are more reliable, as they are not subjected to a sudden and unyielding strain.

Claim.—The ratchet frames *ff*, and pawls 6 6, acted on by the roller *e*, and fluted wheel *c*, as and for the purposes specified.

No. 29,929.—EDWARD P. WHITNEY, of Westfield, N. Y.—*Improvement in Locks*.—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The construction of the latch C, with double projections *d* and *f*, so that the lock may be used as a right or left hand lock, as desired, by merely turning the latch C ; all as shown and described.

No. 29,930.—DAVID H. WHITTEMORE, of Lynchburg, Va.—*Improvement in Hay and Straw Cutters*.—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, so arranging the feed teeth M M, &c., upon a revolving cylinder or flanges that said cylinder or flanges will, while revolving with the half of said teeth, both draw the feed forward and, in passing by a stationary knife, cause it to be cut off, substantially as described.

Second. I claim combining, with said cylinder, the spring board G, in the manner and for the purpose substantially set forth.

Third. I claim combining, with said cylinder and spring board, the stationary knife O, substantially as described.

No. 29,931.—E. S. WICKLIN and J. D. WEAVER, of Carlinville, Ill.—*Improvement in Carriages*.—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A buggy seat, divided or not, hinged to the back end of the floor of the buggy, and furnished with stepping boards on its under side, substantially as set forth, so as to serve the twofold purpose of a seat and as steps by which to enter or leave the buggy from behind.

No. 29,932.—CHARLES A. WILSON, of Cincinnati, Ohio.—*Improvement in Steam Heating Apparatus*.—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A tubular radiator communicating at bottom with a steam pipe A, and its upper

and free end discharging into the atmosphere through an aperture guarded by an automatic valve; the whole being constructed and operating substantially as and for the purposes set forth.

No. 29,933.—DAVID WOOSTER, of Seymour, Conn.—*Improvement in Lightning Rods*.—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, firmly securing together the ends of the rod A, and the sleeve B, by means of the grooves *c c*, as described.

Second. I claim the treble jointed piece F, when made out of sheet metal, substantially as described.

No. 29,934.—G. W. N. YOST, of Yellow Springs, Ohio.—*Improvement in Cultivators*.—Patent dated September 4, 1860.—This invention consists in the manner of arranging the sockets with the beam and standards, and the combination of the various parts.

Claim.—The arrangement of the sockets *b*, with beam A, and standards *a*; the whole being constructed as and for the purpose described.

No. 29,935.—JOSEPH F. HALL, of Bangor, Me., assignor to himself and G. L. KELTY, of New York, N. Y.—*Improved Curtain Fixture*.—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Constructing the spool in two parts, one of which is affixed to the roll, and the stem of the other plays into the end of the roll, and is acted upon by a spring to push it out, thus keeping one of the flanges always in contact with the end of the roll, as set forth.

No. 29,936.—JUSTUS ASK, of Lyons, N. Y., assignor to JAMES H. CASE, of the same place. *Improvement in the Construction of Dental Chairs*.—Patent dated September 4, 1860.—The movable seat is provided with supplementary arms S, which, when the seat is down, fit the inner form of the permanent arms T, and serve as cushions thereto; but which, being fixed to the seat, rise with it, and always remain at the same height above its surface.

The inventor says: I *claim* the combination of the fixed screw F, nut wheel G, and its appurtenances, movable seat D, and frame A, arranged and operating substantially in the manner and for the purposes shown and described.

I also claim the arched supporting frame A, with the seat frame B, hinged thereto, in combination with the adjusting lever J, and bail *k*, arranged and operating substantially as and for the purposes set forth.

I also claim the supplementary seat arms S, substantially as and for the purpose described.

I also claim the bellows formed diaphragm R, in combination with the movable seat and frame B, substantially as set forth.

No. 29,937.—A. F. HINES, of Washington, D. C., assignor to himself and B. A. KIDDER, of the same place.—*Improvement in Seed Planters*.—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of two reciprocating valve slides D F, the surfaces of which are smooth and without recesses or perforations, in combination with an arm E, lever L, and spout B, one valve working through an aperture C in the side of the spout, while the other valve F works in contact with the under face of the spout, constructed in the manner and for the purposes set forth.

No. 29,938.—JOHN M. LONG, of Hamilton, Ohio, assignor to himself, PETER BLACK, and R. ALLSTATTER, of the same place.—*Improvement in Harvesters*.—Patent dated September 4, 1860.—This improvement consists in an arrangement for elevating the cutter bar and for lowering the same readily.

Claim.—Lever I, tooth slide *c*, bar *f*, band *e*, and braces *g g*, constructed, arranged, and operating substantially as described, in connection with draft pole A.

No. 29,939.—FRANCIS A. PRATT, of Hartford, Ct., assignor to himself and GEORGE S. LINCOLN & Co., of the same place.—*Improvement in Devices for Stopping and Changing Motion*.—Patent dated September 4, 1860.—This invention consists in the construction and arrangement of a proper clamp or friction device for the purpose of stopping or changing the back and forward motion of a counter shaft for lathes, &c., where two loose driving pulleys are used on the counter shaft and one driven by a straight or open belt, and the other by a cross belt.

The inventor says: I *claim*, first, the combination of the levers or clamps *e*, disk or collar *j*, substantially as and for the purpose described.

Second. I claim the application of a wedge collar *l*, or its mechanical equivalent, for the purpose of operating the said levers or clamps *e*, as described.

No. 29,940.—JOHN H. REED, of Penn Township, Pa., assignor to himself and L. J. CRANS, of Clearfield, Pa.—*Improvement in Machines for Cleaning Buckwheat, &c.*—Patent dated September 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—One cylinder revolving in another, the inner or revolving cylinder so grooved that, while conducting the buckwheat or other grain from the place of feeding to the place of discharge, the grain shall pass through a regularly diminishing space and thus be scoured or cleaned, as above set forth.

No. 29,941.—AUGUST SCHMIDT, of New York, N. Y., assignor to himself, CHARLES SCHMIDT, EDWARD SCHMIDT, and HERMAN SCHMIDT, of the same place.—*Improvement in the Mode of Making Gas from Wood.*—Patent dated September 4, 1860.—This invention consists in the process of making gas from wood by the introduction of steam into the retort among the incandescent charcoal immediately after the gas has ceased, or almost ceased, to pass off from the wood, whereby a combination is effected between the water and carbon in consequence of the peculiar condition of the carbon, so that the gas resulting is of a character adapted to lighting purposes.

Claim.—The manufacture of illuminating gas from wood by the successive processes set forth.

No. 29,942.—GEORGE WILLIAMSON, of Newark, N. J., assignor to L. S. GOBLE and H. E. RICHARDS, of the same place.—*Improved Machine for Chamfering Veneers.*—Patent dated September 4, 1860.—B B are the ways, and B¹ is a plate of metal connecting them together; C is the frame table attached to, and constructed to slide upon, the ways, upon which is placed the material E to be chamfered; D is a spring clamp attached to the frame or table C, and adjusted on hinges.

Claim.—The combination of the adjustable ways B B, the frame C, spring clamp D, and spring m, substantially in the manner and for the purposes described.

No. 29,943.—O. P. ALLEN, of Rindge, N. H.—*Improved Clothes Dryer.*—Patent dated September 11, 1860.—When the arms A are spread as far as the cords or lines f which unite the same will permit, the upper bracket D passes over the stem, and two ropes g which are firmly secured to the flange of the upper bracket serve to depress said bracket and to spread the arms until the lines f are taut. The ropes g extend through holes in the lower bracket B, close down by the sides of the post E, so that they can be easily reached from the ground.

Claim.—A clothes dryer, having in combination the metallic brackets B D, with sleeves c, and flanges d, rivets or wires a b, ropes g g, arms A, braces C, and post E, and operating as and for the purpose set forth.

No. 29,944.—SAMPSON AMERICAN, of Chicago, Ill.—*Composition for Toilet.*—Patent dated September 11, 1860.—The claim explains the nature of this invention.

Claim.—A compound formed by the admixture of oil of turpentine, alkanet root, alum, the oil of roses, and the oil of neroli, substantially in the manner and for the purposes specified.

No. 29,945.—S. C. AMES, of Washington, Arkansas.—*Improvement in Cotton Cleaners.*—Patent dated September 11, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim the employment or use of a screen C, divided into two or more compartments communicating with each other, and provided with beaters f, and one or more of them provided with oblique deflecting blocks i, the latter being arranged relatively with the opening or openings h, to give the cotton a lateral movement from one compartment to the other, substantially as and for the purpose set forth.

I further claim, in connection with the screen C, the case or box A, provided with the ledge or projection l at its upper part, the case being so arranged over the screen as to allow spaces j j at each side of it, for the purpose set forth.

No. 29,946.—DAVID BARGER, of Columbia, N. Y.—*Improvement in Threshing Machines.*—Patent dated September 11, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination and arrangement of the adjustable blast board m¹, hook l¹, staples n¹ n² n³, upper shoe s¹, lower shoe u¹, furnished with sieves numbered 1, 2, 3 and 4, operated by the two connecting bars m and h, working on opposite sides of the winnower and from the same shaft, as specified.

No. 29,947.—EVERETT BASS, of Calhoun County, Georgia.—*Improvement in Tightening Tire on Wheels*.—Patent dated September 11, 1860.—This invention consists in lapping the ends of the tire in such a manner as that they may be tightened by inserting a clasp and key perpendicularly through the lap in the tire, constructing the hole through which the clasp and key is inserted, so that the forcing the key through will draw the tire, regaining the drawing effect of the key by adding a slip or slips to the clasps.

Claim.—The arrangement of the clasp H, slips X, key F, plate bolt head B, and inner plate S, when used for the purposes described.

No. 29,948.—LEVI A. BEARDSLEY, of South Edmeston, N. Y.—*Improvement in Hay Elevating Forks*.—Patent dated September 11, 1860.—This invention consists in constructing a device for elevating hay by a rope, or chain and pulleys, in such a manner that the bundle of hay to be elevated will be grasped tightly by four curved teeth and held compactly by said teeth while it is elevated, and when the hay is to be discharged a latch and chain are so applied to the teeth by jerking a string attached to the latch, that the teeth will open and allow the bundle to fall.

Claim.—The gang forks A A jointed together, as set forth, with the chains c and B B attached to them, in combination with the tripping latch e, tripping plate g, and loop C, arranged and operating substantially in the manner and for the purposes set forth.

No. 29,949.—LEONARD BRICKER, of Springfield, Ill.—*Improved Combination of Smoothing Iron and Lamp*.—Patent dated September 11, 1860.—The inventor says: I construct my irons in any of the known forms of the rotary or two-faced smoothing irons, and then I make my lamp in any desirable form, and construct the tube in such a form that the end of the wick be as high as the top of the fluid in the body of the lamp, the object to be attained being the use of a loose wick, and thus avoiding the great inconvenience of using the tight wick necessary in a lamp of any other form, for the purpose described.

Claim.—The arrangement and combination of the lamp with elevated tube B, and guard C C, dovetail A A, and smoothing iron, all in the manner and for the purpose described.

No. 29,950.—H. R. BURGER, of Richmond, Va.—*Improved Machine for Grinding Saws*.—Patent dated September 11, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, so arranging the saw supporting disk, shaft I, the feed carriage and the gearing, that said shaft is moved laterally independently of the carriage and simultaneously therewith, the shaft and carriage moved together longitudinally, substantially as and for the purposes set forth.

Second. The combination of the gauge stop R, and its adjusting screws, with the sliding shaft I, and the mechanism by which it is controlled and actuated, substantially as and for the purposes set forth.

No. 29,951.—ELISHA W. CADY, of Tomah, Wis.—*Improvement in Self-adjusting Braces for Jack Screws or other Hoisting Apparatus*.—Patent dated September 11, 1860.—The superiority of this invention consists in the simplicity of its construction and the ease with which it can be attached to anything needing a brace of this description, and the facility with which a machine to which it is attached can be adapted to even or uneven ground, and the relief from strain which it gives to those parts of the uprights which are the most likely to yield. So says the inventor.

Claim.—The combination of a self-adjusting brace, composed of the arms D D F F, and the evener E, and constructed substantially as set forth.

No. 29,952.—M. C. CHAMBERLIN, of Johnsonsburgh, N. Y.—*Improvement in Self-detachable Whiffletrees for Vehicles*.—Patent dated September 11, 1860.—A represents the thills, which are constructed in the usual manner and connected together at their rear by means of the cross piece E. To this cross piece are secured two bell cranks a a, being pivotted to said piece near its extremities, as seen at x x; d d represent two rods with one of each of their ends connected to one of the arms of the bell cranks. The other ends of said rods pass into a sleeve c.

Claim.—The combination of the bell cranks a a, with the rods d d, and the sleeve c, when the same are used, substantially as and for the purpose specified.

No. 29,953.—D. W. CLARK, of Stratford, Ct.—*Improvement in Stirrups*.—Patent dated September 11, 1860.—This improvement consists in the employment within the stirrup of a laterally adjustable bar B, whereby the open space between the side pieces of the stirrup may be contracted at pleasure, and thus be fitted to the size of any rider's foot, so as to prevent the foot from passing too far through the stirrup.

Claim.—The employment, within the stirrup A, of a laterally adjustable bar B, substantially in the manner and for the purpose shown and described.

No. 29,954.—GEORGE COLLYER, of Appoquinimink Hundred, Del., and A. H. PATTERSON, of Philadelphia, Pa.—*Improvement in Car Couplings for City Railways*.—Patent dated September 11, 1860.—The attachment D is of cast iron, so made that the overhanging part *d* and the bed plate or bottom part *d*¹ shall form a socket for the projection *a*¹ of the box; it is secured firmly, by means of bolts *e*, to the top of the platform of the car, at the edge of the platform, which is rounded so as to conform with the shape of the bed plate.

The inventors say: We *claim*, first, the shoulder *a*, constructed and arranged in the manner and for the purpose substantially as set forth.

Second. The attachment D for joining the box to the car, constructed and arranged substantially as set forth.

No. 29,955.—SAMUEL L. DONNELL, of South Carroll, Tenn.—*Improved Grading Instrument*. Patent dated September 11, 1860.—This invention relates to the arrangement of a suspended bubble block with a plumb, sliding weights, and a stand to which the block is suspended, by means of which the adjustments for levelling and grading can be made with facility and accuracy.

Claim.—The arrangement of the suspended bubble block N with the sliding weights *d*, plumb I, turning table H, and supporting rod R, substantially in the manner and for the purpose described.

No. 29,956.—JOHN H. DUNBAR, of Plymouth, Conn.—*Improved Saw Clamp*.—Patent dated September 11, 1860.—This improvement consists in providing properly formed clamps, which may be secured to any desirable place or position for use by any ordinary fastenings, and in forming in the said clamps an adjustable fulcrum on which the eye of the saw is placed and turns, and its toothed edge is kept in its proper relation to the edge of the clamps while the filing is being performed; and also in making the fulcrum so that it may be readily adjusted to receive and hold a saw of any diameter, and also to receive and remove a saw nearly or quite as quick as though it were placed in the jaws of an ordinary vise.

Claim.—An improved article of manufacture, viz: the slotted jaws *a*, fulcrum pin or bolt *d*, having the collar *e*, nut *g*, in combination with the lever cam *i*, substantially as and for the purpose described.

No. 29,957.—WRIGHT DURYEA, of New York, N. Y.—*Improved Device for Jointing Boxes*. Patent dated September 11, 1860.—This improvement consists in the use of angular strips of metal to be inserted endwise into slots cut into the bevelled ends of the box stuff, by sawing or otherwise, so that these strips, when inserted, will bind and secure the corners tightly together.

Claim.—The joining of the ends of boxes by the insertion of the angular strips of metal into the corners of the box, substantially as set forth.

No. 29,958.—MATTHEW ELDER, of Lansing, Mich.—*Improvement in Brick Moulds*.—Patent dated September 11, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the compartment frame and the respective followers G G with the pairs of rods *a a* and *b b*, the cross heads F F, the short bolts *c c*, the longitudinal bars E E, and the connecting arms *d d*, in such a manner that the said compartment frame can be entirely withdrawn from the sides and ends of the moulded bricks, whilst the followers remained stationary, substantially in the manner set forth.

I also claim the interposition of the springs *e e*, or their equivalents, between the cross heads F F and the ends of the longitudinal bars E E, when the said parts bear such a relation to the other parts of my improved brick mould that the followers G G will remain stationary whilst the compartment frame is being drawn past them, and then the said followers and frame may be simultaneously elevated a short distance, whilst the cross heads E F remain in a stationary position upon the rods *a a*, by which I effect a clear and clean separation of the compartment frame and the followers from the moulded bricks, substantially in the manner set forth.

No. 29,959.—E. G. ELLIOTT, of Elk Horn, Wis.—*Improvement in Watches*.—Patent dated September 11, 1860.—The object of this invention is to obtain for the balance wheel a very high speed and a great range of vibration, of so positive a character that no shaking can change it.

Claim.—The combination of the revolving piece *e*, the pin or projection K on the balance wheel or staff, and the stationary banking pin *l*, substantially as and for the purpose specified.

No. 29,960.—A. H. EMERY, of New York, N. Y.—*Improvement in Anti-Friction Presses*. Patent dated September 11, 1860.—This invention consists in constructing a press for pack-

ing cotton, hay, or any other similar material, by means of an arrangement of cams or eccentrics in combination with lifting rods, pawls, wheels, plateaus, and other parts.

Claim.—The combination and arrangement of the described press, constructed and operating substantially as described.

No. 29,961.—M. H. FERGUSON, of Sunfish, Ohio.—*Improvement in Feeding Grain to Mills.* Patent dated September 11, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the cup M, adjusting tube K, block O, and pipes or tubes P, leading far down into the eye of the runner, and used in connection with the draught of air, the whole forming a feeding device and operating substantially in the manner and for the purpose set forth.

No. 29,962.—CHARLES FLEMING, of Ypsilanti, Mich.—*Improvement in Moulding Planes.* Patent dated September 11, 1860.—The inventor says: To use the tools, either one fourth or ogee, attach the gauge D; let the iron be so ground and set in the tool that it shall cut a fair shaving at the face E and scarcely cut at all at the side F; set the board on edge in the vise of the workman and apply the tool in the ordinary way; and when the work is complete the gauge D will arrest the further working of the tool without thought or care on the part of the workman.

Claim.—The combination of the guide strip D, with one fourth round and ogee moulding planes, for the purpose set forth.

No. 29,963.—GEORGE FREEMAN, of New York, N. Y.—*Improvement in Wood Screws.*—Patent dated September 11, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination, with a wood screw, of a counter-sinking tool or cutter, by providing or forming the head of a screw with a cutter or cutters, for operation substantially in the manner described.

No. 29,964.—OLIVER L. GIBSON, of Fort Bend County, Texas.—*Improvement in Cotton Seed Planters.*—Patent dated September 11, 1860.—This invention consists of a machine for planting seed with the entire bottom of the box, which contains the seed, movable, for the purpose of conveying the seed in the box to that part of the box from which they are to be dropped, and partly changeable, for the purpose of making it applicable to the kind and quantity of seed to be planted in a given place or space.

Claim.—The seed box, with its movable and changeable parts, in connection with the balance of the machine, when the same is so constructed and arranged as to plant seed in the manner described.

No. 29,965.—EDMUND GREENLEE, of Summerhill Township, Pa.—*Improved Stave Jointer.* Patent dated September 11, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the planes B B¹, stocks C¹, united by the links C, guide rods K, guides D, and bow strings R, when arranged together for joint operation, substantially in the manner and for the purpose described.

Second. The combination of the adjustable frame F with the guides D which carry the reciprocating planes, when arranged relatively to the bed upon which the stave rests while being jointed, as described.

Third. The combination of the reversible follower M with the spring Z and dogs x x¹, when arranged and operated as described, for the purpose set forth.

No. 29,966.—C. P. GRONBERG, of Aurora, Ill.—*Improvement in Raking Attachments for Harvesters.*—Patent dated September 11, 1860.—This invention relates to an improvement in that class of raking devices for harvesters in which the rake moves in the arc of a horizontal circle over the platform and has a rising and falling movement, a falling at the rear end of the platform, so as to work in close proximity to the latter while moving towards its front end in order to rake the cut grain therefrom, and a rising one at the front part of the platform, so that the rake may pass above or over the grain on the platform to the back end thereof.

Claim.—The bent rake shaft E fitted in the vibrating frame D, in connection with the projection q and chains m p, attached respectively to the lever j and arm o, all being arranged for joint operation as and for the purpose set forth.

No. 29,967.—J. R. HALL, of Brunswick, Me.—*Improved Machine for Sawing Shingles.* Patent dated September 11, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the loaded lever L, connected with shaft J, the shafts C H E, the loaded arm N, rod M, provided with catch K, lever O, and the pendant *p* and projection *q* on the bolt carriage, as and for the purpose set forth.

Second. The rods Z A¹ fitted in the carriage B, provided with the cam projection *b*¹ *c*¹, in connection with the uprights *d*¹ attached to the frame A, and the bent levers V Y, palls U X, and ratchets T W, provided with the alternate long and short teeth, all being arranged to operate substantially as and for the purpose set forth.

Third. The application of the spring *e* and the cam shaft B¹ to the frame S of the bolt carriage, as shown and described, for the purpose of facilitating the adjustment of the bolt in the carriage, and the retaining of the same within the carriage, as set forth.

No. 29,968.—S. Z. HALL, of Seguin, Texas.—*Improvement in Feeders for Cotton Gins*.—Patent dated September 11, 1860.—This invention consists in the relative arrangement of the endless apron, toothed roller, and adjustable cut-off board of the hopper, whereby the quantity of cotton introduced to the roller by the belt can be controlled, and thus a greater or less quantity be delivered into the gin stand in a given time, as the necessity of the case may demand.

Claim.—The combination of the feed apron D, delivering roller C, swinging frame M, with its attached gearing and rocking lever I, with its actuating gearing, substantially as and for the purposes set forth.

No. 29,969.—A. E. HARDING, of Middletown, Ohio.—*Improved Marine Propeller*.—Patent dated September 11, 1860.—This invention relates to propellers which have a horizontal reciprocating motion, and which act upon water by a plane vertical surface.

Claim.—The frame B, vertical supports *c*, dead wood extension B, and horizontal guiding bars *l*, in combination with the reciprocating folding propellers C C, the whole being constructed and arranged in the manner and for the purposes substantially as set forth.

No. 29,970.—JOHN R. HARRINGTON, of New York, N. Y.—*Improvement in Machines for Making Carpet Lining*.—Patent dated September 11, 1860.—This invention consists in the use, in combination with the other parts of the machine, of the frame work I, upon which are placed the endless apron K and rollers L L, employed in the face of a spindle, or rollers previously used, resting in oblique slots, and around which is wound a cotton bat or lap.

The inventor says: In combination with the spindles *b* *b*¹, on which the outer sheets or rolls of paper, or other material employed are wound, I *claim* the feed table I, endless apron *k*, and rollers L L¹ L, when the same shall be arranged and operated as described, and for the purpose specified.

No. 29,971.—ISAAC HAYDEN, of Lawrence, Mass.—*Improvement in Cotton Cleaners*.—Patent dated September 11, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A trunk for cleaning cotton and other substances, dividing it horizontally or centrally with a screen of woven wire or twine, with cells or compartments under said screen, so small as to prevent or break the current of air under said screen, substantially as described, in combination with a machine substantially such as is described in this specification, or its equivalent, for opening the cotton and blowing it through said trunk over the screen, substantially as described.

No. 29,972.—A. HOAGLAND, of Jersey City, N. J.—*Improved Wash Board*.—Patent dated September 11, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The pivoting of a vibrating frame A at *x*, when such vibration is controlled by the springs B, and the frame A is enclosed within a common hand washboard, all in the manner and for the purpose set forth.

No. 29,973.—ANSEL HOLMAN and OLIVER A. KELLY, of Slaterville, R. I.—*Improved Machine for Hardening Scythes*.—Patent dated September 11, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* the combination of clamps of suitable size and form to hold the blade to be tempered, with ribs arranged upon the faces of the clamps next the blade to be hardened, in directions crosswise to each other, substantially as set forth.

We also claim the combination of a set of clamps curved in a direction the reverse of that in which the blade warps in hardening, with mechanism for closing the clamps upon the blade and immersing them in the hardening liquid, substantially as set forth.

We also claim the combination of clamps for holding the blade, with mechanism that immerses them rapidly in the hardening liquid and then moves them slowly therein, substantially as set forth.

We also claim the combination of clamps for holding the blade during immersion, with mechanism that moves the clamps laterally in the hardening liquid, substantially as set forth.

We also claim the combination of clamps for holding the blade during immersion with mechanism that reverses and opens the clamps, so that the blade is delivered automatically from the clamps, substantially as set forth.

We also claim mounting a receiving table in such manner, with reference to the clamps, the mechanism for operating the same, and the vat of hardening liquid, that the hardened blade is received upon said table after hardening is effected.

We also claim the combination of a shaft, to which an intermittent rotary motion is to be imparted, with a continuously revolving shaft, by means of ratchet wheel having teeth of different size and a reciprocating pawl, substantially as set forth.

We also claim the combination of the next preceding combination with a second pawl, substantially as set forth.

No. 29,974.—F. A. HULL, of Belvidere, Ill.—*Improvement in Grates for Steam Boilers*.—Patent dated September 11, 1860.—This invention consists in arranging a grate with two or more sections, which are hinged at one end and supported by separate crank levers or links, in such a manner that each of the sections can be raised or dropped independent of the other section or sections, and that the fireman is enabled to clean one section after the other without putting out the fire.

Claim.—The arrangement of the crank levers D E, in combination with the hinged sections B C of a grate, constructed and operating as and for the purpose set forth.

No. 29,975.—CHARLES F. JOHNSON, CHARLES F. JOHNSON, JR., and WILLIAM W. JOHNSON, of Owego, N. Y.—*Improved Lock*.—Patent dated September 11, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The travelling carriage *f*, arranged substantially as specified, to move forward with the bolt and leave it projected, or move forward and connect to said bolt and draw the same back, as set forth, in combination with tumblers *o* moving with said carriage and acting between the tumblers *m* and *p*, as specified.

No. 29,976.—WILLIAM W. JUSTIS, of Genito, Va.—*Improvement in Machines for Straightening and Pressing Tobacco*.—Patent dated September 11, 1860.—This invention consists in passing the bundles of leaves between adjustable parallel clamps, vertical guide rollers and guides, and horizontal yielding rollers.

Claim.—The clamping bars D D¹, sash frame E, treadle F, perpendicular guide rollers H H, and guides or tongues N N, with the movable drums J¹ and yielding drums J, the whole being combined, arranged, and operating in the manner and for the purposes set forth.

No. 29,977.—DANIEL LASHER, of Brooklyn, N. Y.—*Improvement in Grate Bars*.—Patent dated September 11, 1860.—This invention consists of a series of alternately connected parallelograms, upon a cross bar or support, whereby a larger air space is obtained than in the ordinary grate bars, and at the same time the surface is such that the scraper or stirrer will not catch therein, and the weight of the grate bars, with a corresponding strength, can be reduced one third.

Claim.—Forming grate bars with the alternately connected parallelograms *b b*, in combination with the bar *a* beneath, and connecting the same, as and for the purposes specified.

No. 29,978.—BENJAMIN F. LEE, of New York, N. Y.—*Improvement in Railroads*.—Patent dated September 11, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Studding the track of a line of railroad, or exposed portions of it, with upper projecting spikes, or their equivalents, substantially as and for the purpose set forth.

No. 29,979.—PIERRE A. LETOURNEUR, of New Orleans, La.—*Improved Cement*.—Patent dated September 11, 1860.—This cement consists of the following ingredients: Red oxyde of iron, one gallon; white zinc paint, one gallon; plaster of Paris, one half gallon; linseed oil, boiled, one gallon.

The inventor says: I claim a cement which I call indestructible cement, composed of the above substances, prepared as aforesaid, which will make the roofs and other places covered with it both fire and water proof.

No. 29,980.—CALVIN A. LITTLEFIELD, of Covington, Ky., assignor to himself and DAVID BOYLE, of said Covington.—*Improvement in Fire Places*.—Patent dated September 11, 1860. This invention consists in an arrangement of hollow crown and hot and cold air passages.

Claim.—The arrangement of the bonnet B, hollow crown E, partition *e*, tube H, flues B B¹, apertures K F G, and doors *f* and *k*, constructed, combined, and operating in the manner and for the purposes set forth.

No. 29,981.—JULIUS LOEB, of New York, N. Y.—*Improvement in Thread Dressing Machines.* Patent dated September 11, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The diagonally grooved flanges or ribs *e e*, on the revolving brush, to separate, loosen, and spread the threads composing the skeins, so that the brushes *b* may act equally on all sides of said threads to glaze the same, as set forth.

No. 29,982.—IRA MASON, of Berlin, N. H.—*Improvement in Saw Teeth.*—Patent dated September 11, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, shaping saw teeth, substantially as described, so that the edges 2 2 operate with a drawing cut, and leave the boundary of the kerf square with the sides thereof.

Second. The peculiar set given to the teeth, herein shown and described.

Third. Giving to the teeth of a saw, in combination, the form and set as above claimed.

No. 29,983.—GEORGE MARLOW, of Cincinnati, Ohio.—*Improvement in Apparatus for Heating Buildings.*—Patent dated September 11, 1860.—The fire pot A is arranged on top of the ash pit B, which extends through the several casings, being closed on the outside by a door *a*. The bottom of the fire pot is formed by a grate *b*, which turns on an axle *c*, and this axle extends to the outside of the outer casing, so that said grate can be turned up by means of a suitable handle: the fuel is introduced to the fire pot through a passage *d*, which is closed by a door *e*.

Claim.—The arrangement of the fire pot A, ash pit B, sloping topped heater C, and escape pipe *g*, with the radiator D, air flues E E, and cold air casing F, as and for the purpose shown and described.

No. 29,984.—ARTHUR MAGINNIS, of Philadelphia, Pa.—*Improved Method of Ventilating Hats.*—Patent dated September 11, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Providing the hat with a recess at the junction of the brim with the body, and filling said recess with a perforated India rubber tube, the tube being covered by a perforated sweat leather, substantially as and for the purpose fully specified.

No. 29,985.—BERNHARD MERTZ, of Burlington, Iowa.—*Improvement in Harvesting Machines.*—Patent dated September 11, 1860.—This invention consists in hinging the front end of the tongue to the back of the machine by means of a joint, in combination with a universal joint, toothed arc and pawl, for the purpose of throwing the machine in an oblique position in relation to the guide wheel, whenever the operator desires to turn the machine.

Claim.—Hinging the front end of the tongue N¹ to the back of the machine by means of a joint O¹, in combination with the universal joint K¹ L¹ M¹, toothed arc Q¹, and pawl P¹, substantially as and for the purposes set forth.

No. 29,986.—S. H. MILLER, of Hanoverton, Ohio.—*Improvement in Governors for Steam Engines.*—Patent dated September 11, 1860.—This invention consists in the balancing bar and springs, in combination with a governor; also, in the arrangement of a sliding top collar, linked arms and rods, and governor balls, in combination with a balancing bar and springs.

The inventor says: I *claim*, first, the balancing bar I, and springs J J, in combination with a governor, substantially as and for the purposes set forth.

Second. The arranging of a sliding top collar B, linked arms C D, and rods E, and governor balls F, in combination with a balancing bar I, and springs J, substantially as and for the purposes set forth.

No. 29,987.—C. D. OBER and S. M. OBER, of Morrisville, Vt.—*Improved Washing Machine.*—Patent dated September 11, 1860.—This invention consists in the arrangement of the different parts.

Claim.—The arrangement of rubber R, constructed as described, with the corrugated board C, yielding roller G, dogs *r*, standards E E, shafts D and I, arms *m n* and *e*, and rods *p* and *f*, as and for the purposes set forth.

No. 29,988.—J. J. PARKER, of Marietta, Ohio.—*Improved Apple Parer, Corer, and Slicer.*—Patent dated September 11, 1860.—This invention consists in improvements in the apple machine, patented by this inventor July 6, 1858, which relate to the construction of the

adjustable head or knife stock, and the addition of a slicing knife for slicing the apples after passing the quartering blades.

The inventor says: I *claim*, first, the combination, with paring knife S, of the movable guide K, in the manner and for the purposes specified

Second. The combination, with the knife S, of the trough T, as and for the purpose specified.

Third. The slicing knife N, arranged and operating as described.

No. 29,989.—HENRY PEASE, of Brockport, N. Y.—*Improvement in Pumps*.—Patent dated September 11, 1860.—This invention consists in the improved mode of constructing the cylinder E, pistons F, bridges R, and governing passage T.

Claim.—The combination of the cylinder E, wings *b b*, supports *d d*, bevelled pistons F, graduated grooves *n o*, and governing passage T; the whole being constructed, arranged, and operated in the manner and for the purpose set forth.

No. 29,990.—CHARLES PERLEY, of New York, N. Y.—*Improved Vertical Ship's Windlass*.—Patent dated September 11, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the brake sockets *m n*, pawls 1 2, and wheels *d f g* and *l*, substantially as specified, whereby the shaft *a* can be rotated by the double brakes in either direction, as set forth.

Second. I claim the sleeve *t*, and heaver *q*, arranged in the manner and for the purposes specified.

Third. I claim the heavers *q* and *r*, fitted on a vertical shaft, and arranged substantially as specified, so that either or both heavers can be connected to, or disconnected from, said shaft, and thereby allow for raising or giving out either or both chain cables, or using the said shaft for a capstan, independent of the chain heavers, as set forth.

Fourth. I claim the vertical guard *s*, and flange 5, constructed and arranged as specified, to separate and guide the respective chains and keep them in place, as set forth.

No. 29,991.—AUGUSTUS PRUYN, of Albany, N. Y.—*Improvement in Wood Saws*.—Patent dated September 11, 1860.—This invention consists in having the outer end piece of the frame formed of metal, with a socket at its upper end, in which one end of a bar is fitted, the opposite end of the bar being provided with a screw, which is fitted within a recess at the centre of the inner end piece of the frame, and provided with a nut, the upper ends of the two end pieces being connected by a rod.

Claim.—The arrangement of the short end piece B, long end piece C, straining bar D, and rod F, substantially as shown, to form a frame for the saw A, and an improved article of manufacture, for the purposes specified.

No. 29,992.—WILLIAM RANKIN, of Richmond, Va.—*Improved Machine for Planing Mouldings*.—Patent dated September 11, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the skewed feed rolls and adjustable guides for guiding or directing the stick in a straight or curved line as it passes the cutters, substantially as described.

No. 29,993.—JOSEPH RAUB, of Highland, Pa.—*Improved Hoop Sawing Machine*.—Patent dated September 11, 1860.—This invention relates to certain improvements in machines for sawing hoops from poles, so that two hoops may be sawed from a pole at one operation, and may be fed both ways to the saw.

The inventor says: I *claim*, first, the conical feed rollers actuated by levers *G G G¹ G¹* and rods *b b*, in combination with the pressure rollers *N N¹*, arranged, combined, and operating substantially in the manner set forth.

Second. The levers *D D*, connecting rods *R R¹*, levers *E¹ E²*, connecting rod K, with the pressure roller rods *L L*, in combination, as and for the purpose set forth.

Third. The gauge roller *e¹ e¹*, in combination with the saws *e*, for the purpose of keeping the sawed work an even thickness throughout, as set forth.

No. 29,994.—ALFRED A. RAYMOND, of Salem, Mass.—*Improvement in Treadle Connection for Machinery*.—Patent dated September 11, 1860.—This invention consists in a novel connection of a spring, a rocking bar, a lever, and two connecting rods, for transmitting motion from a treadle to its crank.

Claim.—The combination with the treadle and crank pin of the rod E, rocking bar or lever D, spring G, and rod F, the whole applied and operating substantially as and for the purpose set forth.

No. 29,995.—WILLIAM RICE, of Philadelphia, Pa.—*Improvement in Bomb Shells*.—Patent dated September 11, 1860.—This invention consists in charging an oblong or spherical shell with a system of partially severed rings or strips of cast iron arranged within the shell round a chamber containing powder and adapted to each other.

Claim.—Charging a shell with a series of partially severed metallic rings or strips, arranged substantially as and for the purpose set forth.

No. 29,996.—WILLIAM ROBINSON, of Augusta, Ga.—*Improved Machine for Jointing Staves*. Patent dated September 11, 1860.—This invention consists in the combination of devices.

The inventor says: I *claim* the combination of the bed B with the carriage A and cutter shafts I I, the whole constructed, arranged, and operating substantially as and for the purposes set forth.

I also claim, in combination with the foregoing, the pressure roller c^1 , arranged and operating as and for the purpose specified.

No. 29,997.—WILLIAM ROBINSON, of Augusta, Ga.—*Improved Machine for Riving and Dressing Staves*.—Patent dated September 11, 1860.—This invention consists in the combination of devices for cutting and dressing staves.

Claim.—The laterally adjustable dogging carriage, in combination with the reciprocating bed B, carrying the riving knife E, and the arrangement of these parts with the dressing mechanism, substantially as set forth.

No. 29,998.—BERNARD T. ROE, of Nebraska City, Nebr.—*Improvement in Tanning Mills*. Patent dated September 11, 1860.—This invention consists in the combination and arrangement of a toothed scouring cylinder, a toothed concave and a smooth concave, apertures being between the two concaves.

Claim.—The combination and arrangement of a toothed scouring cylinder H, a toothed concave a c , and a smooth concave b , with apertures i and x between the two concaves, substantially as and for the purpose set forth.

No. 29,999.—BENJAMIN F. RONEY, of Philadelphia, Pa.—*Improvement in Harvester Cutters*. Patent dated September 11, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the upper knives C, so connected to the cutter beam that they can tilt laterally to a limited extent, and having the rods J and J^1 , or their equivalents, arranged in respect to the cutting edges of the said upper knives, as set forth, in combination with the lower reciprocating knives I, for the purpose specified.

I also claim the peculiar arrangement of the vibrating upper knives C and their rods J and J^1 in respect to the cutter bar G and guard finger B, whereby an open space is afforded for allowing the vibrating rods to discharge the clogged grain or grass from the cutters, as set forth.

No. 30,000.—WILLIAM H. SEYMOUR and LOTHROP SEYMOUR, of Weymouth, Ohio.—*Improvement in Cultivators*.—Patent dated September 11, 1860.—This invention relates to the special arrangement of the swinging or adjustable frames in combination with the hinged arms and adjustable teeth.

Claim.—The special arrangement of the swinging or adjustable frames Q in combination with the hinged arms M N and adjustable teeth, when constructed and operating as described.

No. 30,001.—WILLIAM SHAFER, of Ripon, Wis.—*Improved Washing Machine*.—Patent dated September 11, 1860.—This invention consists in combining with a curved and yielding washboard, arranged within the washbox or tub, which is of a quadrangular shape, a vibrating rubber with a rolling surface, which is made to act upon the surface of the washboard, or upon the clothes placed thereon, with a rolling and squeezing pressure instead of a rubbing pressure.

Claim.—The combination of spur rods C C, concave washboard B, buttons c c , and vibrating rubber, composed of rollers g g , arranged and operating conjointly as and for the purposes set forth.

No. 30,002.—HENRY W. SHIPLEY, of Mount Vernon, Ohio.—*Improvement in Smut Machines*.—Patent dated September 11, 1860.—A is a cone-like cylinder, concave above and horizontal beneath, attached to the shaft N, with which it revolves. B B are beaters formed of iron rods, bent at right angles at the ends, and driven into the inclined sides of the cylinder A. Z Z represent the same form of beaters driven into the inclined side of the cylinder. C C represents a case, which incloses the parts A B Z.

Claim.—The concave cone-like cylinder A A, the corresponding shaped case C C, and beaters B Z, in combination, and operating as described.

No. 30,003.—CHARLES SMITH, of Knoxville, Texas.—*Improvement in Cotton Cleaners.*—Patent dated September 11, 1860.—The claim and engravings explain the nature of this improvement.

The inventor says: I *claim*, first, the employment of a conical shaft C, provided with spiral fans *d d* at one of its ends, and with teeth *e* set in spiral lines round its circumference and along the remainder of its length, in combination with a cylinder B, surrounding the same, constructed partly of wire work and partly of sheet metal, and an exterior case A, which is constructed with an air supply passage G and a cotton discharge passage J y Z, substantially as and for the purposes set forth.

Second. The combination of the passage H, in the circumference and near the discharge end of the interior wire gauze cylinder, with the slotted hinge valve *f*, substantially as and for the purposes set forth.

No. 30,004.—AMOS P. SPALDING and ELISHA PIERCE, of Westminster, Mass.—*Improvement in Machines for Bending Wood.*—Patent dated September 11, 1860.—This invention consists in the arrangement and combination of vises, or their equivalents, with the bearing strip of the mechanism for bending and holding the wood.

Claim.—The combination and arrangement of the vises U U, or their equivalents, with the bearing strip T of the mechanism, for holding and bending the wood, as specified.

No. 30,005.—STEPHEN STEWART, of Philadelphia, Pa.—*Improvement in Closing Doors and Gates.*—Patent dated September 11, 1860.—A is the door frame, and B is the door which is hung in the same by the hinges *a a*. C is a lever for closing the door. It is hung on the fulcrum *b*, in the plate D, which is attached to the door frame A. The cord E is attached at one end to the short arm of the lever C, and at its other end to the upper end of the carrier F, which is fastened to the door B by means of the screw *c*. The cord E passes over the grooved pulleys G G, which are placed at right angles to each other in the openings *d d* of the supporting piece H, is made fast to the frame A by means of the screws *e e*.

Claim.—The combination and arrangement of the lever C, with the cord E, pulleys G G, and carrier F, or their equivalents, and the door B, substantially as and for the purpose set forth.

No. 30,006.—THOMAS STEWART, of Pittsburgh, Pa.—*Improvement in Safety Guards for Harvesters.*—Patent dated September 11, 1860.—This invention has for its object the preventing of the throwing of the cars from the track by obstructions or other causes, as well as the sustaining of the cars in case of the breaking of a wheel or axle; also, in a novel and improved brake for breaking up the cars by a moderate of power.

Claim.—The arrangement of the central roller G, rail B, pendants *h*, and hooks *i*, with the wheels E, rails A, pendants H H, springs *l l*, rods I, bars F F, rollers *o o f**, lever J, and rod K, all as shown and described.

No. 30,007.—J. C. STODDARD, of Worcester, Mass.—*Improvement in Horse Rakes.*—Patent dated September 11, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Operating the rake so as to raise or hold it in a depressed state, by means of the friction wheel, hung in movable bearings, and between the rim or flange of the driving wheel and a friction roller, essentially as set forth.

No. 30,008.—LEVI F. STRAIGHT, of Fairbury, Ill.—*Improvement in Corn Planters.*—Patent dated September 11, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination and arrangement of the levers I I¹ and K¹ K², constructed and operating in the manner and for the purposes set forth.

Second. The combination of the removable valve E, forked lever F, and slides H H¹, arranged and operating substantially as and for the purposes set forth.

Third. The combination of the internal adjustable slide *h*, with the vertical hollow barbed seeding slide H or H¹, constructed, arranged, and operating, in connection with the conducting tube D, in the manner and for the purposes set forth.

No. 30,009.—JOSEPH W. STRANGE, of Bangor, Me.—*Improvement in Spring Dividers.*—Patent dated September 11, 1860.—This invention consists in a peculiar arrangement and combination of the inclined plane and screw, relatively to the other parts of the dividers and calipers, and each to the other, by which the legs of the dividers and calipers are relatively contracted or allowed to diverge.

Claim.—The combination and arrangement of the sliding yoke Y, and the screw S, when applied to calipers and dividers substantially as and for the purposes set forth.

No. 30,010.—DANIEL STROCK, of Chambersburg, Pa.—*Improvement in Horse Rakes.*—Patent dated September 11, 1860.—This improvement consists in arranging the rake head and straining frame in such relation to each other that the rake head shall occupy a position near the centre of the straining frame, the two being united together and rotating upon the same axis.

Claim.—The combination of the rake head and straining frame, when arranged and operating substantially as described, for the purpose set forth.

No. 30,011.—ALPHEUS C. TIBBETTS, of Rockland, Me.—*Improvement in Fore and Aft Sails of Vessels.*—Patent dated September 11, 1860.—A denotes the bowsprit, B a boom, whose forward end should be so applied to the fore end of the bowsprit as to enable the boom to swing to the leeward. For this purpose a pin *a*, hung to a staple *b*, (fixed to the end of the boom,) passes downward into a hole made in the bowsprit, the said pin serving to maintain the nose of the boom in its proper position, with respect to that of the bowsprit, while the boom is swung laterally. On the opposite sides of the boom are two projecting rails *c c*, which extend longitudinally along it, and support a sail carriage or slider C, the latter being constructed partly of three bars *d d¹ d*, connected together by arched bars *e*.

Claim.—The described application or arrangement of the carriage C, and swinging boom B, together with the bowsprit A; the whole being to operate in the manner and for the purpose substantially as specified.

No. 30,012.—DWIGHT TRACY, of Worcester, Mass.—*Improvement in Sewing Machines.*—Patent dated September 11, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination, with the perforating eye pointed needle of a sewing machine, of the thread clamping device, constructed and operating substantially as described, and the independent thread drawing device, constructed and operating substantially as shown and described.

Second. The employment, within the shuttle of a sewing machine, of a take-off apparatus, operating to take off from the bobbin a quantity of thread, to be held in reserve between the bobbin and the point where the thread leaves the shuttle until it is required to be delivered from the shuttle, and then to let out the quantity necessary to form a stitch without drawing from the bobbin, substantially in the manner described.

Third. The combination, in the shuttle of a sewing machine, of the take-off apparatus described, with the clamping piece, constructed as described, and operating to hold the thread at the time of the tightening of the stitch as specified.

Fourth. The employment, in combination with a needle and shuttle, of an elastic pointed fork, constructed and applied and operating to extend and spread the loops of the shuttle thread, which are drawn through the cloth, substantially as set forth.

No. 30,013.—JOHN G. TREADWELL, of Albany, N. Y.—*Improvement in Ranges and Stoves.*—Patent dated September 11, 1860.—A represents the body of a stove or range, in which are arranged two ovens D and E. The ovens are distinct from each other, being divided by means of a fire box and flues. B shows the ash pit, and *a* represents draft flues leading to the fire box H. The flues enter into the ash pit through the inverted hoppers F F.

Claim.—The arrangement of the fire box, the draft flue *a*, and the hoppers F F, with the ovens D and E, and with the hot air flues around and between the hoppers, substantially as and for the purpose specified.

No. 30,014.—LEVI B. TYNG, of Lowell, Mass.—*Improvement in Railroad Joints.*—Patent dated September 11, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The method described of constructing rail joints for railroads, that is to say, I claim the bar I, connected to side splices A, in combination with rails F and plates *a b c*, substantially as described and for the purposes fully set forth.

No. 30,015.—A. L. O. WALL, GEORGE ROBERTS, and M. S. CARTTER, of Decatur, Ill.—*Improvement in Portable Capstans for Mole Ploughs.*—Patent dated September 11, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the combination of the spools G H, and shaft F, with the system of cords *d¹ d² d⁵*, levers D, and pulleys *d³*, when the whole are arranged together for joint operation, substantially in the manner described, for the purpose set forth.

Second. The construction of the front axle C, with a swivelling bearing *c*, in combination with the semi-circle *c²*, and turning latch *c¹*, when arranged together for joint operation, substantially as and for the purposes set forth.

Third. Supporting the wheels in adjustable arms *b*, when said arms are arranged and operate, in relation to the bent axles, substantially as and for the purpose described.

No. 30,016.—JONATHAN WALTON, of Brooklyn, N. Y.—*Improved Door Latch*.—Patent dated September 11, 1860.—This invention consists in providing the nosing or face plate of a door latch with a slot, said slot serving as a passage for the latch of the door. At the base of said slot is constructed an inclined plane B; upon this inclined plane the ball C traverses when acted upon by the latch of the door.

Claim.—The combination and arrangement of the slot A, the inclined plane B, and ball C, substantially as and for the purpose described.

No. 30,017.—S. M. WIRTS, of Hudson, Mich.—*Improvement in Grain Separators*.—Patent dated September 11, 1860.—The shoe B is slightly inclined, and is provided with the usual number of screens; C is a hopper placed on the upper part of the case, and provided with sides *c c*; on the shoe, near its upper end, a transverse bar *d* is placed, and to this bar a semi-elliptic, or other proper spring D is attached, on which the bottom E of the hopper is placed.

Claim.—The arrangement of the spring D, and bottom E, with the hopper C, and shoe B, as and for the purpose shown and described.

No. 30,018.—W. A. WOOD, of Hoosick Falls, N. Y.—*Improvement in Raking Apparatus for Harvesters*.—Patent dated September 11, 1860.—The claim and engravings explain the nature of this invention.

Claim.—In combination with an automatic rake, a travelling belt for carrying the front, and a turning guide for directing the shank of the rake, when the belt moves with the rake horizontally over the platform, substantially as described.

No. 30,019.—G. W. N. YOST, of Yellow Springs, Ohio.—*Improved Link for Chains*.—Patent dated September 11, 1860.—A is a chain link with a portion of the side cut out, and having a thread *a* cut on one end, and a head or shoulder *b* upset on the other; B is a swivel forming the connection between the ends of the links; *c* is a conical hole in the swivel; *d* is a female screw in the swivel, and in line with the openings *c*; this screw is intended to act as the nut for the screw *a*, on the end of the link A.

Claim.—The combination and arrangement of the open link A, and swivel B, constructed and operating substantially as described and for the purposes set forth.

No. 30,020.—AMOS CHASE, of North Weare, N. H., assignor to NATHAN C. PAGE, of said North Weare.—*Improved School Desk*.—Patent dated September 11, 1860.—This invention consists in a peculiar arrangement of the slide for the desk and seat, whereby the desk seat may be adjusted to the desired height and retained firmly in proper position, and a back permitted to be used with the seat.

Claim.—The arrangement of the desk A, and sliding bar C, with the bar E, bolt F, and sockets B D, as and for the purpose shown and described.

No. 30,021.—HENRY BURROWS, of Georgetown, D. C., assignor to himself, and E. W. WOODRUFF, of Washington, D. C.—*Improvement in Fences*.—Patent dated September 11, 1860.—The claim and engravings explain the nature of the invention.

Claim.—Adjusting the wires around the posts of a portable folding fence, in the manner described, so that the requisite degree of tension is produced by prolonging the sections, and the wires are held firmly in their places, as shown and set forth, for the purposes specified.

No. 30,022.—L. B. BATCHELLER, of Rochester, N. Y., assignor to himself and R. B. HURD, of said Rochester.—*Improved Chair Seat*.—Patent dated September 11, 1860.—This invention consists in the employment of wire fabrics woven in the piece, from which they are cut of the desired form and size.

Claim.—Constructing chair seats from wire cloth, arranged substantially in the manner and for the purposes set forth.

No. 30,023.—LUCIUS M. GILMORE, of Janesville, Wis., assignor to himself and J. M. MAY, of said Janesville.—*Improvement in Rock Drilling Machines*.—Patent dated September 11, 1860.—This invention relates to certain improvements in drills for drilling or dressing stone, and adapting the same in boring great depths in rock for water, or for analogous uses.

The inventor says: I *claim*, first, constructing and combining members G H and I, of a drill, and rings *d d*, or their equivalent, when arranged substantially as described and for the purposes set forth.

Second. The devices, consisting of plates *e e*, or their equivalent, in combination with members G H and I, and rings *d d*, when used for adjusting the diameter of a drill, substantially as described.

Third. The use of the elastic strap E, and cams B B, when arranged for operating a drill, and for analogous purposes, substantially as described.

No. 30,024.—CHARLES B. HUTCHINSON, of Auburn, N. Y., assignor to R. A. HUTCHINSON, of said Auburn.—*Improved Barrel Head Machine*.—Patent dated September 11, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the cast iron frame A, supporting all the working parts, and constructed substantially as and for the purposes specified.

Second. I claim the swing crane or pier C, the lever *w*, the locking bar F, the centre points N N, the form of the cutters O O, and their mode of attachment in the cutter head *h*, in combination with the projections M M, and their indentations K, substantially as described, and for the uses and purposes set forth.

No. 30,025.—Z. McDANIEL, of Bowling Green, Ky., assignor to himself and J. W. JEWELL, of said Bowling Green.—*Improvement in Hanging Mill Stones*.—Patent dated September 11, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Providing the balance iron A with a recess *a* larger in diameter than the upper part of the spindle, and having a plate *b*, which rests on the spindle, fitted in the recess, as and for the purpose set forth.

No. 30,026.—JAMES MOLYNEUX, of Bordentown, N. J., assignor to the BORDENTOWN MACHINE Co.—*Improvement in Blocks for Forming Tiles*.—Patent dated September 11, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Constructing the block for forming tiles and other clay forms in two halves A and B, and combining therewith the bar C, or any other equivalent device, by which the block may be expanded or contracted, for the purpose specified.

No. 30,027.—H. B. NASH, of Sandy Hill, N. Y., assignor to A. B. KING, of Troy, N. Y.—*Improved Mitre Box*.—Patent dated September 11, 1860.—The upright portion of each of the arms D D¹ is made of two parts *f* and *g*, which are screwed together by screw pivots *h*, thus allowing the upper parts *g* to turn freely, and to be set to any desired angle.

Claim.—The arrangement of the sliding, oscillating, adjustable arms *g g*, and parts *ff*, with the sliding pivoted arms D D¹, and adjustable guide gates K K, as and for the purpose shown and described.

No. 30,028.—GEORGE W. PITTOCK, of Union Mills, N. Y., assignor to ISAAC BROWN, of said Union Mills, and JOSEPH BOWMAN, of Troy, N. Y.—*Improvement in Griddles*.—Patent dated September 11, 1860.—This invention consists in so constructing and arranging arms or cross pieces, in connection with a tube or circular ring, as to form a centre or axis, all of which shall contract and expand in equal proportion to the expansion and contraction of the tube or circular ring, and allow any rotating top to easily revolve thereon, as well as to prevent the breaking of either of the said arms or cross pieces, or any part of the ring, as otherwise would be the case, by reason of an unequal contraction and expansion; also, to prevent friction.

Claim.—The combination of the arms or cross pieces A with the inner ring R R, and the tube or ring B, as and for the purposes shown and described.

No. 30,029.—A. T. UNDERHILL, of New York, N. Y., assignor to C. R. UNDERHILL, of Newcastle, N. Y.—*Improvement in Evening the Edges of Shirting*.—Patent dated September 11, 1860.—In this invention the inventor employs suitable strips of wood, with projecting pins, placed at desirable intervals apart, extending the entire length of the strips; upon these pins the fabric is to be hung, which support it until the required number of folds are made. When this is done, the several thicknesses are clamped together with suitable clamps, and the shirting in this state is ready for the cutter's table.

Claim.—The method of evening shirting herein shown and described.

No. 30,030.—WALLACE WELLS, of New York, N. Y., assignor to himself and SAMUEL B. WELLS, of said New York.—*Improvement in Steam Engines*.—Patent dated September 11, 1860.—The claim and engravings explain the nature of this improvement.

Claim.—The combination of the pistons with the connecting rods and crank arms, or their equivalents, arranged substantially as described.

No. 30,031.—THEODORE S. WASHBURN, of Rochester, N. Y., assignor to EZRA B. BOOTH, of said Rochester.—*Improvement in Sewing Machines*.—Patent dated September 11, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the spur *m*, on the cam *F*, with the abrupt notch or recess *r*, in the looper *H*, when so arranged as both to allow the looper to more speedily enter the loop of the needle thread, and to prevent any reverse motion of the parts at the most critical moment in forming the stitch, substantially as specified.

No. 30,032.—HENRY A. ALDEN, of Matteawan, N. Y., assignor to the NEW YORK RUBBER Co.—*Improvement in Water Proof Hose.*—Patent dated September 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Making flexible tubing or hose by first lapping around a mandrel, or its equivalent, a strip or strips of flexible material lined or coated on one or both sides with an India rubber or other cementing substance, and then drawing on or over the same a similarly coated close or woven tube, substantially as described.

No. 30,033.—ETHAN ALLEN, of Worcester, Mass.—*Improvement in Breech Loading Fire Arms.*—Patent dated September 18, 1860.—This invention refers to that class of breech loading fire arms in which a metal cartridge is inserted into the rear end of the barrel, and is covered by a sliding breech piece, and consists of a device for ejecting the empty metal cartridge case from the barrel, after firing, by the operation of the parts which move the sliding breech pin.

Claim.—In combination with the lever *E* that moves the sliding breech, the discharger *F*, constructed and operating in the manner substantially as set forth.

No. 30,034.—JAMES M. ALLEN, of Fredericktown, Ohio.—*Improvement in Boots and Shoes.* Patent dated September 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—As a new article of manufacture, a boot or shoe having an India rubber or gutta percha tip, and an India rubber or gutta percha outsole, made in one piece, and united thereto as described, expressly disclaiming the two things, when separately used or not upon the same shoe, or when made in separate pieces.

No. 30,035.—E. G. F. ARNDT, of Rondout, N. Y.—*Improved Portable Door Lock.*—Patent dated September 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the lock proper, the bolt and the parts connected immediately therewith, with the hasps, whereby the portable door lock may be used either as an inside or outside lock.

Second. In combination with the lock, constructed substantially as described, I claim the key made up of the parts, and susceptible of being operated, as set forth.

No. 30,036.—W. B. ATKINSON, of Plymouth, Ill.—*Improvement in Mole Ploughs.*—Patent dated September 18, 1860.—This invention consists in arranging the sharp pointed shoe or mole with a rounded and narrow bottom, and with an inclined top running up to the flanged back, and in such a manner that the drain formed by the shoe is provided with two shoulders ready to receive the drain boards, and that the sides of the drain are left comparatively impressed; and also, in the arrangement on the back end of the shoe, of a clamp to be operated by a screw rod from the top of the standard in such a manner that the drain boards can be secured in the shoe, and down into the drain, as the plough passes along through the ground.

The inventor says: I *claim*, first, the combination of the V-shaped sharp pointed mole *E*, with the side flange *F*, constructed and operating in the manner and for the purpose set forth.

Second. The arrangement of the clamp *K*, in combination with the shoe *E*, constructed and operating substantially as and for the purpose specified.

No. 30,037.—AUSTIN AVERY, of South Windham, Conn.—*Improved Mode of Attaching Horses to Vehicles.*—Patent dated September 18, 1860.—This invention consists in applying, to the ends of short shafts of any one horse vehicle, metal ferules, with T-heads on their ends that are round on the bottom and flat on the top, and attaching these shafts to the ends of metal tubes by a slotted eye and spring bolt or latch joint, which tubes are attached by a swivel and spring bar to the frame straps, and to the belly band and breeching straps in such a manner that by detaching the shafts the horse will be free to walk from the vehicle.

Claim.—The metal tubular portion *A*, constructed substantially as described, and furnished with a spring latch *b*, and slotted hooks *a a*, for receiving the T-heads of the shafts and loops *E*, for receiving the tug and belly band straps, as described.

No. 30,038.—JABEZ K. BABCOCK, of Canandaigua, N. Y.—*Improvement in Wind Mills.*—Patent dated September 18, 1860.—This invention consists in combining with a wind wheel

a rotary hollow air tight tower, that serves as the receiver of air which may be compressed by a suitable pump connected to the wind wheel, said tower being provided with a hollow tubular centre to draw off the air which may have been compressed in the same.

Claim.—The arrangement of the hollow rotary tower C, with a hollow centre *c*, in combination with the wind wheel A, constructed and operating substantially as and for the purpose described.

No. 30,039.—ABEL H. BARTLETT, of Spuyten Duyvil, N. Y.—*Improvement in Hot Air Furnaces.*—Patent dated September 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim the employment of radiators *e*, that are each made with two separate straight legs, having curved extremities, and an arched shoulder with a horizontal neck *e*¹ projecting therefrom, as shown, so that the said radiators may be cast in one piece of metal, and so that when the curved extremities are laid one upon the other a continuous fire or radiator of vertical serpentine form is made, the necks *e*¹ serving to facilitate the cleaning of the radiators, besides supporting and strengthening the pile by being laid in the brick work, all as set forth.

I also claim the special arrangement, as shown and described, of the plates *m m*, dome plate *d*, fire pot *b*, radiators *e*, and flues *f g h*, for the purpose specified.

No. 30,040.—MELLEN BATTEL, of Albany, N. Y.—*Improvement in Furnaces.*—Patent dated September 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A coking or drying cylinder, or box, hung on a hollow shaft in the fire box of a boiler, or other furnace, over or above the grate, the shaft being perforated with holes, to allow the atmosphere to pass in by a cock or valve, to commingle with the coal and gases as the cylinder revolves, and necessary to pass from the hollow shaft through the arms to the rim of the cylinder, and then pass out in jets, these cylinders to be revolved at pleasure, substantially as set forth for the purposes described and made to operate.

No. 30,041.—H. BAGLEY, of Tipton, Iowa.—*Improvement in Mole Ploughs.*—Patent dated September 18, 1860.—The object of this invention is to obtain a simple and inexpensive means for adjusting the mole tooth while in or out of the ground, so that the underground channel may be made deeper or shallower, as occasion requires, or so that the tooth may be made to enter into or run out of the ground whenever necessary.

Claim.—The arrangement of the swivel or oscillating bar H, upright G, adjusting screw rod J, and nut K, with the adjustable stock D, beam A, screw L, and mole tooth E, as and for the purpose shown and described.

No. 30,042.—WILLIAM BEACH, of Philadelphia, Pa.—*Improvement in Rammers for Street Paving.*—Patent dated September 18, 1860.—This invention consists in the construction and application of a balanced revolving beater to a locomotive truck, whereby cobble or other stones, after being set in the usual manner for paving streets, can be rammed down to the compactness, solidity, and evenness which are required to produce a well paved road way.

The inventor says: I claim, first, the revolving beater A, the same being constructed and applied to operate substantially in the manner and for the purpose set forth and described.

Second. I also claim, in combination with the driving wheels *l l* of the truck B, the combined arrangement of the differential mechanism *t t*¹, the worm wheel *u*, and shaft *u*¹, the same being made to operate together, substantially in the manner and for the purpose set forth and described.

No. 30,043.—GEORGE BENJAMIN, of Avoca, N. Y.—*Improved Lifting Jack.*—Patent dated September 18, 1860.—E F are clasps that extend around the lever. They are provided each with a bearing at the under side that extends outward into the fulcrum of the plates C C¹. These clasps must be so made as to pass between the plates C C¹, and each clasp is provided with a handle.

Claim.—The combination and arrangement of a lifting apparatus, consisting of uprights B and B, fulcrum plates C and C, and clasps E and F, provided with latches G and H, substantially as and for the purpose described.

No. 30,044.—ALFRED BRADY, of New York, N. Y.—*Improvement in Casting Pipe.*—Patent dated September 18, 1860.—This invention consists in applying to the ends of the hollow core bar, either inside or outside of the flask, suitable levers and one or more bars extending from the end of one lever to that of the other, by which means the levers may be made to act upon the core bar so as to prevent it from springing while the pipe is cast; said arms or levers and brace rod are to be arranged and applied to the ends of the core bar.

Claim.—The application of a counteracting force to the ends of the core bar B, in the casting of pipes or tubular work, by means substantially as described and for the purposes set forth.

No. 30,045.—CHARLES F. BROWN, of Warren, R. I.—*Improvement in Fire Arms.*—Patent dated September 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The wheel J, applied in combination with the cam K, or its equivalent, for the purpose of producing the necessary operation of the said cam, or equivalent, to effect the rapidly repeated firing of a piece of ordnance, by the act of its movement, from place to place, substantially as specified.

No. 30,046.—H. BUCKINS, of Canton, Ohio, assignor to himself and SAMUEL PETREE, of said Canton.—*Improved Milk Straining Pails.*—Patent dated September 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination, with the pail A, and spout or channel E, of the removable and sliding strainer G, arranged to work up and down on the under side of the guard or top piece D, as shown and described and for the purposes stated.

No. 30,047.—MOSES BUGHER, of New Philadelphia, Ohio.—*Improvement in Grain Separators.*—Patent dated September 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the double series of tossing rakes I I¹, in combination with the hinged hopper bottom, or delivering board E, curved rods j, and shoe J, constructed and operating substantially as and for the purpose set forth.

Second. The arrangement of the rear extending teeth g, and arms n, extending from the oscillating rake head F, substantially as described, for the purpose of imparting the desired motion to the delivering board and to the shoe.

Third. The arrangement of the tossing rakes I I¹, shoe J, double conical revolving sieve L, and an elevator O, substantially in the manner and for the purpose specified.

No. 30,048.—CHARLES H. COOPER, New York, N. Y.—*Improved Mode of Hanging Torch Lamps.*—Patent dated September 18, 1860.—This invention consists in using infusible metal and riveted pivots to attach the ring to the socket arms.

Claim.—The infusible metal, pivotted joint riveted inside and outside, in the manner and for the purposes set forth.

No. 30,049.—H. R. CRAMPTON, of Lockport, N. Y.—*Improved Bed Bottom Springs.*—Patent dated September 18, 1860.—This invention consists in constructing and arranging the several parts of the bed.

Claim.—The spring slats a a, the binders c c and s s, the end straps d d, the springs m m, and the bottom slats n n, the binders c c being hinged as represented, and the several parts constructed and arranged substantially in the manner and for the purpose specified.

No. 30,050.—AUGUSTIN J. DESPINOY, of Lille, France.—*Improvement in the Preparation of Medicinal Extracts.*—Patent dated September 18, 1860.—This invention is the production of a concentrated extract from the liver of fishes living in salt water.

Claim.—The new substance produced substantially in the manner described, the same being extracted from the mother liquid of the liver of the sea fish.

No. 30,051.—JACOB DRAKE, of New York, N. Y.—*Improvement in Tapping Water Pipes.*—Patent dated September 18, 1860.—This invention relates to that class of machines for tapping pipes, or other vessels containing fluids under pressure, wherein the drill acts on the pipe from within a chamber clamped to the pipe or other vessel for the purpose of preventing undue waste of the fluid when drilling, or when introducing the service cock.

The inventor says: I *claim*, first, the divisible chamber stuffing box and gland, in combination with the machine, substantially as described.

Second. The equilibrium passage and valves, in combination with the chamber and check valve, substantially as described.

No. 30,052.—MARTIN DREW, of Saint Paul, Minn.—*Improvement in Hames for Horse Collars.*—Patent dated September 18, 1860.—The claim and engravings explain the nature of this improvement.

Claim.—The combination of the extension hames produced by the slides B with the variable tug attachment, formed by the notched or bent staples e, as and for the purpose set forth.

No. 30,053.—H. F. DROTT, of Cumberland, Md.—*Improved Egg Beater*.—Patent dated September 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment of the gauze wire partition D, in connection with the cup A, and close fitting cover C, the eggs being forced or driven through the partition, substantially as and for the purpose specified.

No. 30,054.—LEWIS EVANS, of Morgantown, Va.—*Improvement in Moulds for Rifle Balls*.—Patent dated September 18, 1860.—This invention consists of two flasks of a bullet mould, and a die carrier, furnished with dies hinged together.

The inventor says: I *claim*, first, two flasks A B, of a bullet mould, and a die carrier J H, furnished with dies L, hinged together at C, substantially as and for the purposes set forth.

Second. The combination of a sliding cutter F, with the flasks A B, and die carrier J H, and dies L, substantially as and for the purposes set forth.

No. 30,055.—JAMES FARNAN, of Cleveland, Ohio.—*Improved Faucet*.—Patent dated September 18, 1860.—B is the cap or stuffing box which screws into the neck A, as seen at B¹. C is the stem which passes through the stuffing box, or cap B. At C upon this stem is a circular valve, which fits the valve seat C², situated above the valve C¹ in the cap B.

Claim.—The cap B, with its extension B², valve C¹, cup valve E, and the valve G, when these several parts are constructed, arranged, and operated substantially as and for the purpose set forth.

No. 30,056.—JACOB D. FELTHOUSEN, of Michigan City, Ind.—*Improvement in Hay and Straw Cutters*.—Patent dated September 18, 1860.—This invention consists in making the machine so as to feed itself at all times while in operation, without regard to the quantity of material to be cut, and regulating the length of the feed or cut, to any desired length, and also cutting the same of a uniform length during the will of the operator, which is done by means of the inside box A, with its movable lid B, having a lever C on the top, and operated by the rock shaft D, and regulated by the set screw F.

The inventor says: I *claim* the rock shaft D, in combination with the stirrup G, and set screw F, at the top of the gate, for the purposes substantially as set forth.

I also claim the spring pressure pad or holder H, with teeth on its lower side, inclining each way from the centre to the side of the box, in combination with the knives I I, substantially as described, and for the purposes indicated.

No. 30,057.—L. B. FLANDERS, of Cleveland, Ohio.—*Improvement in Marine Propulsion*.—Patent dated September 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: First, when two or more propellers are upon the same shaft, and rotated in the same direction, I *claim* arranging the blades of said propellers upon their respective shafts, so that the blades of the propeller nearest the bow shall be at a greater angle from the line of the shaft, and the blades of each propeller in the rear of it at a less angle from the line of the shaft, as set forth.

Second. I claim constructing the bearings of the propeller shaft, of tables or plates, attached to, and projecting from, the sides of the vessel, as described, so that said bearings constitute cut-water surfaces as well as supporting surfaces, as set forth.

Third. I claim operating the propeller shaft by toothed or bevelled wheels projecting through the sides of the vessels, and gearing into toothed or bevelled surfaces, encircling or upon a band around the propeller, as described.

No. 30,058.—WILLIAM FUZZARD, of Charlestown, Mass.—*Improvement in Manufacturing Sheets of Fibrous Material*.—Patent dated September 18, 1860.—The inventor says, for the purpose of manufacturing bats, "I employ what may be termed a press box, a heating chamber, or chambers, and feed rollers, arranged so that the substance, of which the bats are composed, is forced through the press box aforesaid, and formed by compression under heat and with any suitable cement, or glutinous substance, in paper bats or sheets."

Claim.—The taper press box B, provided with the heating chambers E E, one or more, in connection with the feed rollers C C, or their equivalents, for the purpose specified.

No. 30,059.—RICHARD J. GATLING, of Indianapolis, Ind.—*Improvement in Machine Gearing*.—Patent dated September 18, 1860.—The claim and engravings explain the nature of this improvement.

The inventor says: I *claim*, first, the arrangement of the fixed collar *a*, loose washer *c*, India rubber spring *d*, loose washer *e*, with the female screw *f*, and the male screw *f*¹, when used in combination with the cog wheel or pulley, as described, and operated, for the purpose set forth.

Second. I claim the enlarged hub or appendage E, of, and to, the wheel or pulley, with recess or cavity formed by the flanges g, in the same, for receiving the caps D, when constructed and arranged as described, and operated, for the purpose set forth.

No. 30,060.—L. S. GRAVES, of Rochester, N. Y.—*Improvement in Machines for Cutting Boot and Shoe Soles*.—Patent dated September 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, the combination, with toggle levers *b b*, operated as set forth, of the bent lever H, cutter spindle *g*, and reciprocating block K¹, carrying the cutter, the lever J, and rack arm *j*¹, with wheel *i*, and its engaging pawl *k*; all arranged in a suitable relation to each other, and operating as set forth.

Second. The slotted cam drum D, slotted lever 3, and adjustable fulcrum screw 9, with the carriage 2, and block 7, movable in the carriage; all combined and arranged in the manner and for the purposes set forth.

Third. The manner of securing the cutter L to its holder N N, by screw rods or rod P, running lengthwise of the cutter, and blocks *p p*, with their pins *p*¹ *p*¹, arranged and combined with the slotted and grooved arms of the holder, substantially as set forth.

No. 30,061.—EMANUEL FERDINAND HAMANN, of Collikoon, N. H.—*Improved Barometer*.—Patent dated September 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A tube containing a column of mercury, so balanced or equilibrated that the atmospheric changes produce a greater extent of movement in said tube than the actual change in the altitude of the column of mercury, as set forth.

No. 30,062.—WILLIAM H. HEALD, of Baltimore, Md.—*Improvement in Apparatus for Tanning*.—Patent dated September 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—In combination with a tanning vat, a frame which can move vertically and also turn upon its journals or bearings, and to which the hides are suspended in a perpendicular position while in the tanning liquor, but which, when raised, will, together with the hides, tilt to an inclined or horizontal position, bringing the hides in a pile, substantially as described, and from whence they are readily removed and others attached thereto, as set forth.

No. 30,063.—R. HEMINGRAY, of Covington, Ky.—*Improvement in Moulds for Glass Jars*.—Patent dated September 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The mould, herein described, for moulding such jars as have an annular groove *h* surrounding the mouth of the jar, consisting of the parts D D having an angular projection *i*, for the purpose of forming the grooves *h* so hinged or connected with the parts A A of the mould as to open upward, while the parts A A subsequently open laterally, thus releasing the jar from the mould and permitting the same to be removed without injury, substantially as set forth.

No. 30,064.—M. HEMINWAY, of Watertown, Conn.—*Improvement in Swifts*.—Patent dated September 18, 1860.—The end of each spoke A is jointed to a hub or wheel G that is keyed to the shaft E, and between this hub G and the wheel D is interposed a coiled spring J attached to both wheel and hub in such a manner that it will force the arms out in a position nearly radial with the axis of the shaft E.

Claim.—The arrangement of the slotted arms A and wheel D with the hub G and spring J, as and for the purposes set forth and described.

No. 30,065.—JACOB F. HUNTER and F. W. GEISSENHAINER, of New York, N. Y.—*Improved Apparatus for Heating Apartments by Hot Water*.—Patent dated September 18, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We claim the combination and arrangement of the coils of pipe G and H, or their equivalent water heating surface, the casing A, and one or more annular heat radiating vessels, or one or more series of air heating pipes P, surrounding the same, forming a portable hot water stove, substantially of the character above set forth.

We also claim the employment of the cone K in the above described hot water stove, arranged relatively to the other parts of the same in the manner and for the purpose set forth.

No. 30,066.—JOSHUA JENKINS, of Boston, Mass.—*Improvement in Moulds for Glass Lamps*.—Patent dated September 18, 1860.—This invention consists of a mould, provided with a chamber so arranged alongside of the mouth of such mould as to enable a glass blower, while blowing a lamp fountain in the mould, to raise a concavo-convex projection alongside the

neck of the article so blown, such projection to be afterward opened or cut away, so as to form an auxiliary neck through which the lamp at any time may be supplied with fluid without the necessity of removing the wick tube cap from its neck.

Claim.—The improved lamp mould, as constructed, with the auxiliary neck chamber *b*, combined with the main matrix and arranged with respect to the mouth or sprue hole *a*, substantially as described

No. 30,067.—WILLIAM B. KERN, of Middlebourne, Va.—*Improvement in Straw Cutters.*—Patent dated September 18, 1860.—The material to be cut may be kept in place by the pressure of the spiral spring *x* on the block *y*, placed and secured so as to move up or down within the box *A*, by means of the guides fastened to the block *y*, which work in the grooves *z z*.

Claim.—The arrangement of the pressure block *v*, spreading spiral spring *x*, screw *L*, and frame *m*, combined with box *A*, feed shaft *D*, and cutting blades *S*, as and for the purpose set forth.

No. 30,068.—JEROME KIDDER, of New York, N. Y.—*Improved Electro-Magnetic Apparatus.* Patent dated September 18, 1860.—This invention consists in combining the ends of the two coils of fine wire contained within the helix of an electro-magnetic machine with a series of posts or studs, and with the helix of the electro-magnet, in such a manner that the currents produced by the electro-magnetic machine can be used either singly or in combinations, and also directly or alternately.

The inventor says: I *claim*, first, the arrangement of the wires 12 13 14 14 15 16 17 18 and 19 in combination with the electro-magnet *D* and with the cylinder *A*, constructed and operating substantially in the manner and for the purposes set forth.

Second. The arrangement of the wire 17 in combination with the wire 13, substantially in the manner and for the purpose set forth.

No. 30,069.—SALEM T. LAMB, of New Washington, Ind.—*Improved Clothes Frame.*—Patent dated September 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, in combination with the series of hinged and folding arms *D E*, the lever *H* extending out beyond the frame, for the purpose of raising or lowering said frame, substantially as described.

I also claim, in combination with the series of hinged and folding arms *D E*, the straining lever *I*, with its cord *m*, for straining up and holding in a strained up position the clothes lines, substantially as described.

I also claim, in combination with the groove *e*, on the spindle, the cut-away key *f*, in the pedestal, for the purpose of removing the spindle from the pedestal, when necessary, or for locking thereto, but always so that it may turn around, substantially as and for the purpose described.

I also claim so shaping and arranging the legs *B*, on the pedestal, that their upper ends shall lock or lap over each other and bear equally on each side of the pivot pin, to prevent their splitting, substantially as described.

No. 30,070.—JOEL LEE, of Galesburg, Ill.—*Improved Method of Raising Water from Wells, &c.*—Patent dated September 18, 1860.—This invention consists in constructing and arranging the several parts of the machine.

Claim.—The arrangement of the drum *H*, the cords or ropes *B B*, the equalizer *C*, the valve rod *D*, the valve *M*, the bumper *E*, and the weight *I*, with the curb *L* and the bucket *K*, provided with spout *A*, substantially as and for the purpose specified.

No. 30,071.—SAMUEL LEONARD, of Bridgewater, Mass.—*Improved Spoke Shave.*—Patent dated September 18, 1860.—This invention consists in an improved arrangement of the adjustable mouthpiece and its operative mechanism, with respect to the stock and cutter arranged in the stock.

Claim.—An improved arrangement of the adjustable mouthpiece and its operative mechanism, with respect to the stock and the cutter arranged in the stock, as specified.

No. 30,072.—DAVID S. MACKEY, of Batavia, N. Y.—*Improvement in Machines for Separating and Scouring Grain, &c.*—Patent dated September 18, 1860.—The curb *J* is fitted between two wings or annular plates *m*, which are grooved to receive the edges of the curb; on the upper ring *m* a stone *L* is placed; this stone *L* has bars *M* resting or bearing upon its upper surface, said bars extending entirely across the stone *L* and having screw bolts *n* passing through their ends, said bolts also passing through ears or bolts *o* attached to the wings *m m*.

The inventor says: I *claim* the arrangement of the suction blast spout *G*, with the air chamber *F*, spout *N*, fan box *B*, inclined spout *K* and box *H*, as and for the purposes shown and described

I also claim the arrangement of the stone L with the wings or annular plates *m m*, bolts *n*, curb J, and bars M, as and for the purposes shown and described.

No. 30,073.—WILLIAM H. LIVINGSTON, of New York, N. Y.—*Improvement in Wood Saw Frames*.—Patent dated September 18, 1860.—The object of this invention is to strengthen the cross piece of the saw frame, prevent said cross piece from bending laterally, or in a direction at right angles thereto, and also prevent the winding and racking of the saw frame.

Claim.—The combination of the screw rods E E, loops F F, or their equivalents, bar D, and frame C, applied to the saw frame A, as and for the purpose set forth.

No. 30,074.—W. W. MARSH, of Alton, Ill.—*Improvement in Grate Bars*.—Patent dated September 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The construction of revolving grate bars with alternate longitudinal grooves and pins, and a spiral transverse groove around each bar, by which the edges of the fins are divided into notches and projections spirally arranged, all as herein shown and described, for the purpose set forth.

No. 30,075.—WILLIAM G. MAUPIN and JOHN B. ROOKE, of Portsmouth, Va.—*Improved Ships' Air Ports*.—Patent dated September 18, 1860.—D is a circular frame or ring for closing the one half of the port. This frame, with its semi-circular glass plate, is placed behind the ring B and kept in close contact with it. Each circular frame B D has a central enlargement or eye E E¹, through which passes a stem G; one part of said stem is round and turns easily in the stationary eye E and the stationary eye E¹, and the other part is square and fits into a square hole in the eye E, so that by turning the stem this ring, with its glass, will turn with it.

Claim.—The arrangement of the ring B and glass C, with the rings D, eyes E E¹, stem G, and pipe A, all as and for the purposes set forth and described.

No. 30,076.—WILLIAM H. LIVINGSTON, of New York, N. Y.—*Improvement in Wood Saw Frames*.—Patent dated September 18, 1860.—This invention consists in attaching a metal plate to the cross bar of the saw frame, and connecting an adjustable brace to said metal plate and one of the end pieces of the frame.

Claim.—The combination of the brace rod E and metal plate D, arranged or applied to the saw frame, substantially as and for the purpose set forth.

No. 30,077.—WILLIAM E. MCINTIRE, of Salem, Mass.—*Improvement in Safety Stables for Horses, &c.*—Patent dated September 18, 1860.—This invention has for its object the preservation of horses or cattle, in case a fire should occur in the house where they are stabled, and even should the fire be so great as to prevent persons entering the stable, the animals may be readily and safely taken therefrom without danger to man or beast.

Claim.—The doors E, springs G, bar H, lever bolts J, and hand lever K, when the same are combined for joint action and arranged substantially in the manner and for the purposes set forth.

No. 30,078.—PATRICK MIHAN, of Boston, and MAJOR A. LANE, of Charlestown, Mass.—*Improvement in Apparatus for Condensation*.—Patent dated September 18, 1860.—The vessel A is furnished at its bottom with a rim *a*, which fits into the top of a kettle or boiler containing hot water. The bottom of the vessel A forms a truncated cone *b*, which is surmounted by the trumpet shaped false bottom *c*; the lower edge of this bottom projects beyond the upper edge of the truncated cone, and above the point of said bottom a tube B rises, which is supported by its trumpet shaped end *d*, that rests on the bottom *c*.

Claim.—The arrangement of the water spaces C and E with the tubes B and *k* and with the trumpet shaped bottom *c*, in combination with the steam space D and tubes *h*, constructed and operating substantially in the manner and for the purpose set forth.

No. 30,079.—DANIEL MOORE, of Brooklyn, N. Y.—*Improvement in Revolving Fire Arms*.—Patent dated September 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim the centre pin 3 and its collar at the back end, retained within the recess *g*, combined with the cylinder *c* and barrel *b*, swinging on the gudgeon *l*, in the manner and for the purposes set forth.

And, in combination with said centre pin 3, moving as aforesaid, I claim the latch *i*, to retain the parts in place while the arm is being discharged, as specified.

No. 30,080.—ALEXANDER MORTON, of New York, N. Y.—*Improved Trip Hammer*.—Patent dated September 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the automatic stop mechanism for giving the positive number of strokes required to the hammer, formed by the gearing D P R S T U, with the perforated disk V, the tilting shaft Q, lever Y, provided with the pin q, and spring Z, and bar B¹, the latter being arranged relatively with the hammer arm H, essentially as set forth, the rotary motion of the regulating disk V being controlled by the hammer shaft, so that the disk is moved simultaneously with the hammer, and the number of blows of the latter regulated by the movement of the former.

Second. The employment or use of the elastic band O, applied to the hammer arm H, essentially as and for the purpose set forth.

Third. Forming the hammer arm H, socket G, and head J separately, and connecting them together by means of the plate K and screw rods h h, the latter being screwed into head J.

Fourth. The employment or use of the bed M, provided with a convex face and fitted in the anvil L, for the purpose set forth.

No. 30,081.—S. W. MUDGE, of Rome, N. Y.—*Improved Washing Machine*.—Patent dated September 18, 1860.—The shaft B has a beater C attached to it. This beater is comprised of a disk or wheel b, which is attached to the shaft B, as shown at c, and has a series of slats d attached to its rim at a suitable distance apart. These slats are rounded at their inner sides.

Claim.—The arrangement of the open rotary slatted beater C, shaft B, and pinion j, with the central hollow rotating beater D, rotating disk g, pinion i, and driver E, as and for the purpose shown and described.

No. 30,082.—GEORGE NEILSON, of Boston, Mass.—*Improvement in Lamps*.—Patent dated September 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the arrangement and application of the contractile ring with reference to the spring jaws a a a and the shaft of the wick elevator, and to operate in manner substantially as described.

I also claim the improved mode of constructing the base part of the conical deflector, viz: with an annular shelf e and trough f, and a series of air inlets g g, arranged together and with the conical body of the deflector, substantially as specified.

No. 30,083.—WILLIAM NEWELL, of Philadelphia, Pa.—*Improvement in Apparatus for Cleaning, Drying, and Polishing Coffee, &c.*—Patent dated September 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—In combination with a revolving double-jacked cylinder, with steam space between them and doors communicating with the interior thereof, the arrangement of the wire rubbing surfaces F, the flanges d, radial heating tubes E, and the flanged longitudinal heating tubes M, for the purpose and in the manner set forth.

No. 30,084.—JOHN NORTH, of Middletown, Conn.—*Improved Snap Hook for Harness*.—Patent dated September 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A snap hook in which the eye is made in one piece with the tongue, and has a position relative to the bearing point of the hook or that point in which a ring rests, substantially such as is before described.

No. 30,085.—GEORGE M. NORTON, of San Francisco, Cal.—*Improved Amalgamator*.—Patent dated September 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the circular annular revolving funnel G G, with attached pipes H H H H, with the annular revolving pan I I and annular plates J J and K¹, to compel the material to traverse from the centres to the circumference, and insure the certainty of its being operated on before it can possibly be discharged at the openings N M O.

Second. The annular revolving pan I I and the annular plates J J and K, constructed and operated as set forth.

Third. The manner in which the grooves or openings and projection in the different plates are arranged, according to curved lines, as shown in the different drawings, and the manner in which the projecting points O O of the plates J J and K¹ take the feed and force it from the centre as it passes through the pipes H H into the mill, causing an eccentric motion in the material under operation, thereby causing it to come repeatedly under the operation of the mill or machine.

Fourth. The manner of adjusting the inside centre I I with the arms V V, so as to leave any desired space between the revolving centre and bottom of the pan L L, as well as giving it great facility for being removed and held out of the way whilst cleaning out the mill or machine.

No. 30,086.—BEARNARD O'BRYAN, of Lancaster, Pa.—*Improved Ore Washer*.—Patent dated September 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The construction and arrangement of the double cone-shaped cylinder, formed of cast iron plates, united as described, and furnished with solid pins and angular shovels on the inside, for agitating and advancing the ore to the discharging point, as represented.

No. 30,087.—DANIEL K. PEOPLES, of Philadelphia, Pa.—*Improved Stern Paddle Wheel*.—Patent dated September 18, 1860.—This invention consists in combining the shaft of a paddle wheel and the horizontal or diagonal engine or engines, which operate the same with sliding bearing blocks, certain screws, and the system of gearing, in this invention or its equivalent; the whole arranged and operating so that the paddle shaft may be raised and lowered at pleasure without materially affecting the proper relative position of the different parts of the engine.

Claim.—Combining the shaft A of a paddle wheel and the horizontal or diagonal engine, which operates the same, with the sliding bearing blocks D and D¹, the screws F F, and the system of gearing described, or its equivalent; the whole being arranged and operating substantially as and for the purpose set forth.

No. 30,088.—JOHN G. PERRY, of South Kingston, R. I.—*Improved Meat Cutter*.—Patent dated September 18, 1860.—The claim and engravings show the nature of this improvement.

Claim.—The combination of a tapering or slanting row of studs with the knives, substantially as and for the purposes set forth.

No. 30,089.—LEONARD T. PITKIN, of Hartford, Ct.—*Improved Frame for Swinging Lamps or Torches*.—Patent dated September 18, 1860.—This invention consists in the arrangement and application of a malleable iron ring, forming a part of the revolving and oscillating frame to contain a lamp or torch.

Claim.—The solid metal ring A, and cast with the pivots B B C C, in the manner and for the purpose substantially as set forth and described.

No. 30,090.—GEORGE P. PLANT and J. RAITH, of St. Louis, Mo.—*Improvement in Machines for Scouring, Cleaning, and Polishing Grain*.—Patent dated September 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the screen C and beaters k, brushes j and feeders i, when the beaters, brushes, and feeders, are placed within the screen C, and the latter made to rotate in a reverse direction to the former, and the screen formed with the three different kinds of perforations c d e, substantially as and for the purpose set forth.

No. 30,091.—AUGUSTUS REEVE, of Allowaystown, N. J.—*Improved Shutter Bolt*.—Patent dated September 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The supplemental socket I, having a position relatively with the socket H, as shown, in connection with the bolt C, provided with a lip f, and having a rising and falling, or equivalent movement for the purpose specified.

No. 30,092.—GEORGE ROSNER, of Rochester, N. Y.—*Improvement in Locks*.—Patent dated September 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the attachment to a lock of one or more "secondary locks," for the objects substantially as set forth.

Second. The construction of the "secondary lock" and its attachment to the movable portion of the primary lock, substantially as described.

Third. The independent bearings K L and M to the wheels H I and J, constructed substantially as described.

Fourth. In case of locks requiring an opening in the back, the attachment of a cover to some movable portion of the lock, which cover shall close the opening except when the bolt of the lock is out, for the object substantially as set forth.

Fifth. The construction of the "tumbler," with two independent bearings, one on a disk (as E) revolving with the handle of the lock, the other on the movable wheels H I, &c., substantially as described.

Sixth. The construction of the tumbler in two parts—the first part capable of motion in a single direction, the second part capable of motion in the same direction as the first part, and

also in a direction at an angle (as a right angle) to the motion of the first part, for the object and in the manner substantially as described.

Seventh. The combination of the spring P, tumbler O, and projecting cam p, of the eccentric F, for the purpose of supporting the tumbler during the greater part of the revolution of the handle of the lock, substantially as described.

Eighth. The construction of the spindle of the lock with a shoulder, for the object substantially as set forth.

No. 30,093.—GEORGE W. SCOLLAY, of St. Louis, Mo.—*Improvement in Glass Moulds*.—Patent dated September 18, 1860.—This invention consists of a hollow mould in combination with a covering and plunger of peculiar construction.

Claim.—The use of moulds for pressing glass coffins, constructed as shown in Figs. 1, 2, 3, 4, and 5, and substantially as described, the coffin to be made substantially as shown in Fig. 8.

No. 30,094.—D. E. SOMES, of Biddeford, Me.—*Improved Heel for Boots and Shoes*.—Patent dated September 18, 1860.—This invention consists in the employment of a hollow metallic heel, which is provided around its top with a flange pierced with small holes, through, or by means of which, the heel is secured to a boot or shoe.

Claim.—The described heel made entire in one piece, and provided with a flange B around its top pierced with small holes, substantially in the manner and for the purpose specified.

No. 30,095.—L. W. THICKSTUN, of Chatfield, Minn.—*Improvement in Hanging Window Sashes*.—Patent dated September 18, 1860.—The object of this invention is to combine a sash stop and weather strip in such a way that the device will operate perfectly in either capacity, and also to use with the sash and weather strip spring bolts so arranged as to serve as pivots and allow the sashes to be turned in the frame horizontally for the purpose of washing, ventilation, &c.

Claim.—The bolts *l* fitted in the sashes B B*, in connection with the strips B¹ in the sashes, and the holes *n* in the stiles *l* of the frame A, all being arranged for joint operation, as and for the purpose specified.

No. 30,096.—JOEL TIFFANY, of Syracuse, N. Y.—*Improvement in Machines for Hulling Cotton Seed*.—Patent dated September 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the employment of the main rotating roller, formed substantially as described, with pyramidal teeth, by longitudinal and circumferential grooves, when operating in combination with one or more working rollers, having similarly formed teeth, and so arranged and geared that the periphery of the working roller shall travel with greater velocity than the periphery of the main roller, the zones of teeth on the working roller operating opposite the spaces between the zones of teeth on the main roller, substantially as and for the purposes specified.

I also claim, in combination with the main and working rollers, having a construction and mode of operation substantially such as described, the employment of a range of teeth on one of the bottom edges of the hopper, substantially as and for the purpose specified.

And I also claim, in combination with the main and working rollers, substantially such as above described, the employment of a screen or sieve below them, and a rotating whipping cylinder of teeth below the screen, substantially as described, that the screen may separate the loose hulls from the kernels, and that the whipping cylinder of teeth may finally loosen the remaining hulls and fibres substantially as set forth.

And, finally, I claim, in combination, the main and working rollers for hulling, the screen for effecting the first separation, the whipping cylinder of teeth that play between fixed teeth to effect the final loosening of the hulls and fibres from the kernel, and the final screen for effecting the final separation of the kernels from the last fragments of hull and from fibres, substantially as set forth.

No. 30,097.—WILLIAM B. TREADWELL, of Albany, N. Y.—*Improvement in Stoves*.—Patent dated September 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment of the gas cups C C, with projecting lips above, when the said cups are perforated with small holes, and are provided with an opening through which the products of combustion pass, substantially as specified.

Second. The combination of the cups C C, with the horizontal flues E, and the vertical flues F, the same being used substantially as and for the purpose specified.

Third. The use of the hot air chamber H, in connection with the cylinder G, the gas cups C C, and the flues E and F, the several parts being employed substantially in the manner and for the purpose set forth.

No. 30,098.—MARK B. TRUE, of Newburyport, Mass.—*Improvement in Excavating Machines*. Patent dated September 18, 1860.—The object of this invention is to furnish a better means of operating the shovel and hollow cutter of J. W. MORRELL's ditching machine, patented May 10, 1853.

The inventor says: I *claim* the arrangement of the slotted pivotted lever G and adjustable roller *a*, with driving shaft I¹, wheel I, head block E, cutter box C, and shovel D, in the manner and for the purposes set forth and described.

I also claim the arrangement of the ratchets N N, shaft A, pawls M M, with the shaft J¹ and cams *d d*, in the manner and for the purposes set forth and described.

No. 30,099.—JOHN P. TUNNISON, of Ovid, N. Y.—*Improvement in Grain Cleaning Machines*. Patent dated September 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, carrying the upper half of the endless slatted belt E of my additional separator, over intermediate guide rollers H I, so that said upper half of the belt be divided into two portions of different inclinations, and another vertical, or nearly vertical, portion between the two, in combination with a fan blower M, hopper L, and skeleton bottom S, substantially as and for the purposes set forth.

Second. Arranging the fan within the endless slatted belt substantially in the manner and for the purpose described

No. 30,100.—WILLIAM WHARTON, JR., of Philadelphia, Pa.—*Improvement in Transferring Cars from One Track to Another*.—Patent dated September 18, 1860.—This improvement consists in an arrangement of rails, forming a main track and a siding or turn out, with a guide rail, in combination with car wheels, having simple annular projections so arranged as to bear against the side only of said guide rail, by means of which the wheels are directed on to the siding or turn out by a lateral thrust.

Claim.—The described arrangement of the rails A A¹ and A² and B B¹, and the curved rail D, in combination with wheels having simple annular projections, so arranged as to bear against the side only of the said curved rail, as and for the purpose set forth.

No. 30,101.—ETHAN WHITNEY, of Lynn, Mass.—*Improved Folding Case Bedstead*.—Patent dated September 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the described improved manner of constructing the case A, and applying it to the parts C C, such being not only particularly useful in supporting the rear part D, but beneficial as respects not only the turning of the parts C D, either upward or downward, but in respect to their elevation high enough for the case A to receive a washstand underneath the said parts C D, in manner as described.

I also claim the arrangement of the folding legs *l o p*, with respect to the part C and a leaf G, applied thereto and operating therewith substantially as specified.

No. 30,102.—SETH L. WILKINSON, of Cross Plains, Texas.—*Improved System of School Desks*.—Patent dated September 18, 1860.—This invention consists in so constructing and arranging the desks of a school room that the desk of each scholar shall be at right angles to his seat, and the bottom of the desk be on nearly the same horizontal plane, the former being attached to the back of a contiguous seat.

Claim.—Connecting a series of seats A A¹, in a school room, by means of boards *a b*, running at right angles to the seats, in the manner and for the purposes described

No. 30,103.—McCLINTOCK YOUNG, JR., of Frederick, Md.—*Improvement in Combined Rake and Reel for Harvesters*.—Patent dated September 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, in combination with a continuously revolving inclined reel shaft and a stationary cam, a rake and reel having the corresponding and differential motion set forth while turning with said shaft, substantially as described.

Second. I also claim, in combination with a rake turning on the same shaft with the reel, but in a variable path therewith, a counterpoise to prevent said rake from suddenly rising or falling, substantially as and for the purpose described.

No. 30,104.—HAZEN J. BACHELDER, of Marlboro, Mass., assignor to himself and WILLIAM F. EAGER, of the same place.—*Improvement in Lamps*.—Patent dated September 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The application of a reflector to a lamp cap, substantially as described, by means of the projection *g*, extended from the reflector and between the shoulders of such cap, and held in place by the action of the screws thereof, as explained.

No. 30,105.—DANIEL C. COLBY, of Newport, N. H., assignor to himself and EDMUND BURKE, of the same place.—*Improved Fruit Drying Attachment to Cooking Stoves*.—Patent dated September 18, 1860.—The object of this invention is to intercept the heat which radiates from the stove, and which passes off into the room, and to apply the same to the purposes of warming and drying.

Claim.—The receiving chamber B, the perforated partition C, the central partition, composed of the plates D D¹ and E, and the escape flue H, in combination with the box composed of the wall plates A A, the top plate A¹, and the doors F F¹, constructed and arranged as set forth.

No. 30,106.—JOHN FORCER, of Glassborough, N. J., assignor to WHITNEY BROTHERS, of the same place.—*Improvement in Tools for Forming Screws in the Necks of Bottles*.—Patent dated September 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Forming a screw within the neck of a bottle, and shaping the exterior of the neck by means of the rod E, its screwed portion *e*, and the jaws B B, the latter being arranged to open and close substantially as set forth, and the whole being combined with the devices described, or their equivalents, so that the rod may be readily released or retained for the purpose specified.

No. 30,107.—JOHN M. JONES, of New Orleans, and JOSEPH M. CHARPANTIER, of St. Mary's Parish, Louisiana, assignors to themselves and A. B. CHARPANTIER, of said New Orleans.—*Improvement in Bagasse Furnaces*.—Patent dated September 18, 1860.—This invention consists in the employment of a movable grate, arranged and operating in combination with a fixed grate or bed.

The inventors say: We *claim* the employment of a movable grate E E¹, applied to a furnace and operating in combination with the fixed grate or bed B thereof, substantially as and for the purposes described.

And we also claim the division of the movable grate E E¹, into two sections, to run in and out of the furnace on opposite sides thereof, and meet in the middle of the interior thereof, substantially as described.

No. 30,108.—HERMAN G. G. PAULSEN, of New York, N. Y., assignor to HORATIO N. FRYATT, of the same place.—*Improvement in Refining Sugar*.—Patent dated September 18, 1860.—The claim explains the nature of this invention.

Claim.—The application of alcohol of a certain strength, in combination with sulphuric ether, in the proportions as stated, and at a degree of heat of the boiling point of said combined liquors, and then of 10° or 15° Fahrenheit above it, to raw sugars and molasses, for the purpose of refining and purifying said raw sugars and molasses, as stated.

No. 30,109.—ETHAN ALLEN, of Worcester, Mass.—*Improvement in Metallic Cartridges*.—Patent dated September 25, 1860.—This invention consists in constructing a projection or lip on a metallic cartridge for the reception of the fulminate.

Claim.—Constructing a metallic cartridge, with a projection or lip, for the reception of the fulminate, substantially in the manner and for the purpose set forth and described.

No. 30,110.—LEVI L. ALRICH, of Carthage, Mo.—*Improvement in Faucets*.—Patent dated September 25, 1860.—This invention consists in operating a plug or valve that is fitted into a cylindrical chamber projecting up from the top of the faucet, so that it may be moved up or down, but which will not turn in the cylinder; said plug being seated in such a manner in the faucet tube and acted upon by a spring that the flow of liquid can only be obtained by using a key adapted to the faucet.

Claim.—The valve plug C, with its key hole recess *g*, and spring G, in combination with the cylinder E, and the faucet portions A *a* and B, the whole being arranged and operated by a key, in the manner and for the purposes set forth.

No. 30,111.—GEORGE B. ARNOLD, of New York, N. Y.—*Improvement in the Manufacture of Ruffles*.—Patent dated September 25, 1860.—The claim and engravings explain the nature of this invention.

Claim.—As a new article of manufacture, the ruffle or plaited fabric made as described; that is to say, the fabric to be plaited or ruffled being operated upon so as to be ruffled by the feeding device, and fastened by the stitching apparatus of a sewing machine at one and the same operation, when no binding or foundation fabric is employed.

No. 30,112.—GEORGE B. ARNOLD and ALFRED ARNOLD, of New York, N. Y.—*Improvement in Sewing Machines*.—Patent dated September 25, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, in a sewing machine, the employment of the separator C, or its equivalent, for the purpose of separating two pieces of cloth E and F, and thereby protecting F from the action of the gathering mechanism, substantially as set forth.

Second. Gathering cloth and stitching or fastening the gathers on a sewing machine, by the combined action of the single feeding device A, presser foot B, and separator C, or their equivalents, substantially in the manner described.

Third. Regulating the length of the stitches in the production of a gathered fabric, by changing the position of the separator C, or of C, and the presser foot B, relatively to the forward extremity of the path traversed by the feeder A, substantially as set forth.

No. 30,113.—JAMES C. BALDWIN, of Waterville, N. Y., and M. D. BALDWIN, of Buffalo, N. Y.—*Improvement in Preserving Hops*.—Patent dated September 25, 1860.—This discovery relates to an improved mode of preserving the cones, or catkins, of the hops for storage and transportation, by which the natural and characteristic properties of the plant are retained for any length of time, unimpaired in any degree of latitude, or under atmospheric changes, or vicissitudes of weather to which they may be exposed, which is not the case in the ordinary mode of preserving hops.

Claim.—The described process of preparing and preserving hops, substantially as set forth.

No. 30,114.—G. S. BALL and WILLIAM H. NAUMAN, of Dayton, Ohio.—*Improvement in Seed Drills*.—Patent dated September 25, 1860.—In the engraving the inside is shown with the feeder *a*, working on a roller R. The slides slightly opened are seen at *c*.

Claim.—The arrangement and combination of the feeder *a*, the indicator D, graduated arc E, slides B B, and cut-off F, the whole constructed and operating as set forth.

No. 30,115.—BENJAMIN BARNARD, of Farmington, Ohio.—*Improvement in Seeding Machines*. Patent dated September 25, 1860.—Within the box D there is placed a longitudinal bar L, which is connected by a rod M with the bar K. To the bar L there is attached a series of metal loop-shaped scrapers *a*¹; these scrapers are attached to the bar L at equal distances apart, and directly over the holes *u* in the slide *v*.

Claim.—The arrangement of the plates *n h g j*, slide *v*, scrapers *a*¹, and bars K L, and rod M, as and for the purpose shown and described.

No. 30,116.—GEORGE E. BEACH, of Jersey City, N. J.—*Improved Railroad Switch*.—Patent dated September 25, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, so hinging and connecting two rails B C, or J K, in a continuous series that their positions may be shifted, for the purpose of guiding a train upon another track without breaking their continuity, substantially as set forth.

Second. I claim the fixed bearings *m m*, in combination with the forked bar or rod P, and the hinged continuous rails B C and J K, substantially as and for the purpose described.

Third. I claim, in combination with the hinged continuous rail, or rails B C J K, the employment of the tongue or tongues E G, operating together, substantially as and for the purposes described.

Fourth. I claim, in combination with the hinged continuous rails B C J K, and tongues E G, the spring or springs R T, or their equivalents, arranged substantially as and for the purpose set forth.

No. 30,117.—SAMUEL A. BLACK and FREDERICK C. FORD, of Erie, Pa.—*Substitute for Railroad Frog*.—Patent dated September 25, 1860.—This invention is designed to perform all the functions of a frog ordinarily used on railroads for guiding the train in its passage on the track in crossing another track, and to be operated by the wheels of the locomotive.

Claim.—The arrangement of the levers and bars set forth, in combination with the piece *c* of the rail, supported upon the chair and operated as described.

No. 30,118.—J. H. BOYD, of Baltimore, Md.—*Improvement in Saddles*.—Patent dated September 25, 1860.—This invention consists in providing the cantle of a saddle with an India rubber roll.

Claim.—The application to the cantle of saddles of an India rubber roll, as described.

No. 30,119.—T. E. C. BRINLY, of Louisville, Ky.—*Improvement in Cultivators*.—Patent dated September 25, 1860.—The nature of this improvement is shown by the claim and engravings.

Claim.—The combination and arrangement of the plough beam A, provided with removable feet or standards D C F, and the two pairs of adjustable rings or arms H H N N, provided respectively with the shares J, and teeth L, as and for the purposes set forth.

No. 30,120.—J. CARD, of Cleveland, Ohio.—*Improved Carriage Jack*.—Patent dated September 25, 1860.—This invention relates to a carriage jack having a rolling and moving fulcrum, which, with a foot piece, forms the supports to the carriage axle tree, when the same is raised in order to remove the wheel.

Claim.—The special arrangement of the wheel A, lever E, and foot piece D, operating as and for the purpose set forth.

No. 30,121.—ALFRED CARSON, of New York, N. Y.—*Improved Stench Trap for Sinks*.—Patent dated September 25, 1860.—A represents a sink, or basin, which may be of any proper form and dimension. At the bottom of the sink or basin, at about its centre, there is a small box or chamber B, which communicates with the sink, and has the eduction pipe C passing up a proper distance within it.

Claim.—The arrangement of the chamber B, plate *a*, partition *a*¹, screen *d*, and pipe C, with the basin A, in the manner and for the purposes shown and described.

No. 30,122.—WILLIAM CLEVELAND, of Orange, N. J.—*Improvement in Faucets*.—Patent dated September 25, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, in combination with the body and top of a faucet, one of which is packed with suitable flexible material, the elastic washer *e*, for the purpose and substantially in the manner described.

I also claim the recesses *m m*, in the inside of the body of the faucet, to allow the packing to swell or distend into, and thus prevent it from being injured or misplaced by the turning of, the tap, substantially as described.

I also claim, in combination with the packing, the ribs or projections *o*, that imbed themselves therein, to prevent said packing from slipping, substantially as described.

No. 30,123.—JOHN W. COCHRAN, of New York, N. Y.—*Improvement in Projectiles*.—Patent dated September 25, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the construction of projectiles with corrugations, or hollow beads *a a b b*, made and applied substantially as set forth and described, so that the force of the explosion of the charge will cause said corrugations to be expanded laterally, as and for the purpose set forth and described.

Second. The mode of providing for the lubrication of the gun by the perforations *n n*, in the beads, fillets, or corrugations of the cap or other portion of the projectile.

Third. Placing the missiles or substance to be scattered by the explosion of a hollow projectile within a cylindrical casing D, fitted to the interior of the projectile, substantially as and for the purpose described.

Fourth. The employment of the cap C, or its equivalent, with the cylinder A, as and for the purposes set forth and described.

Fifth. The arrangement of the tube F, nipple *g*, plunger G, and spring H, in combination with the powder cylinder E, substantially as described.

No. 30,124.—PATRICK CADY, of Hamilton, N. Y.—*Improved Clothes Frame*.—Patent dated September 25, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The connecting of the inner ends of the arm E of a folding clothes frame, by bevel or mitre gears C, substantially as set forth.

No. 30,125.—G. W. CUNNINGHAM, of Paris, Mo.—*Improvement in Ploughs*.—Patent dated September 25, 1860.—This invention consists of the mould board I G J, extending laterally from the standard B; it is open at *a a a*, and the horizontal edges L and M are made sharp. The standard B is provided with a coulter edge from the point up to the plough beam A, to which the standard is secured in the usual manner. The landside handle C is attached to the rear end of the plough beam, and to the rear end of landside E, the latter extending from the point of the standard back.

Claim.—The arrangement in a plough of a mould board I G J, open at *a a a*, coulter H, sharp edges M L, furrow side E, handles D C, and bearer A, as and for the purposes described.

No. 30,126.—P. DAVEY, of Portsmouth, Ohio.—*Improvement in Iron Ties for Cotton Bales.*—Patent dated September 25, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The manner described of fastening the ends of an iron tie, by means of the elevations a^1 , fitting into the corresponding depressions a , when used in connection with a keeper B, or its equivalent, all substantially as and for the purpose specified.

No. 30,127.—A. G. DAVIS and H. S. FROST, of Watertown, Conn.—*Improvement in Parasols.*—Patent dated September 25, 1860.—A and B exhibit the two main parts of the stick which are so connected by a folding joint C as to enable one of such parts to be folded down upon the other, the said folding joint being composed of two socketted portions, or slides $a b$, and a flat connection bar c , the bar c being jointed to each of the said portions $a b$.

Claim.—The combination and arrangement of the duplex spring catch E, and the two slots $d e$, with the tubular slide b , and the reception tube D, of the folding joint C, of a parasol stick, the whole being to operate in manner, as specified.

No. 30,128.—P. S. DEVLAN, of Elizabethport, N. J.—*Improvement in Journal Boxes.*—Patent dated September 25, 1860.—The claim explains the nature of this invention.

Claim.—The employment of paper pulp to form boxes for bearings of journals of shafts and axles, substantially as before described.

No. 30,129.—DAVID ELDRED, of Monmouth, Ill.—*Improvement in Seeding Machines.*—Patent dated September 25, 1860.—Each bottom a of the seed boxes has a seed conveying spout d attached, and in the frame A directly behind each seed box E, there is placed a vertical adjustable bar J, which is secured at any suitable height, by pins e , passing into any of a series of holes f in the sides of the bars J.

Claim.—The arrangement of the cutters M, guards K, and adjustable bars J, with the variable cells $c c$, covers I, seed boxes E E, elastic plate l , pole N, and frame A, as and for the purposes shown and described.

No. 30,130.—WILLIAM DOUGHERTY, of Philadelphia, Pa.—*Improved Saw Grinding Machine.*—Patent dated September 25, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the reciprocating frame Q, and the frames R and S, connected together and arranged substantially as set forth, in combination with the revolving grindstone.

Second. The frame R, hung to the reciprocating frame Q, substantially in the manner described, in combination with the arm q , and the adjustable slotted bar U, the whole being arranged and operating substantially as and for the purpose set forth.

Third. The frame S, with its rib w , and the stationary arm V, or its equivalent, in combination with the reciprocating frame, for the purpose specified.

Fourth. The yielding plates T T, with their rollers $p p$, when arranged in respect to the frame, substantially as and for the purpose set forth.

No. 30,131.—SILAS DODSON, of San Francisco, Cal.—*Improvement in Machines for Cleaning Rice.*—Patent dated September 25, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the blocks G G, composed entirely of stone, forming a vertical hollow cylinder, with uninterrupted inner surface, when the said blocks are arranged and combined with the drum J, and its sheep skin strips, as and for the purpose set forth.

Second. The drags or scrapers $n n$, hung loosely to the drum within the folds of the sheep skin strips, and arranged in respect to the stone cylinder, as specified, in combination with the sheep skin strips, arranged as described.

No. 30,132.—CYRUS J. FAY, of Hamonton, N. J.—*Improvement in Hay Rakes.*—Patent dated September 25, 1860.—In this invention there is employed a rotating cylinder provided with movable, or adjustable teeth, and in connection with the same elastic guides, and an intermittingly rotating crib reel.

The inventor says: I *claim*, first, the revolving cylinder E, provided with the self-adjusting teeth i , arranged substantially as and for the purpose set forth.

Second. The combination of the revolving toothed cylinder E, guides G, and intermittingly rotating crib reel formed of the shaft n and rods o , as and for the purposes specified.

No. 30,133.—ROBERT W. FENWICK, of Washington, D. C.—*Improved Metallic Bands for Cotton Bales.*—Patent dated September 25, 1860.—This invention consists in a turning fastening for metallic bands for cotton bales, made or cast in the form of a right angle, or a com-

pound of two right angles, and with a slot at each side of, and a little below the corner of, the two meeting lines forming the angle or angles, so that the inner, or under portion of the fastening, when applied, will stand at right angles to the inner surface of the metallic band.

Claim.—The fastening, substantially as described, for metallic bands for cotton bales.

No. 30,134.—ELMER C. FORD, of New York, N. Y.—*Improved Apparatus for Opening and Closing Hatchways.*—Patent dated September 25, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Opening and closing hatchways automatically by means of a revolving screw and cams, or their equivalents, such cams and screw having a relative motion to the hoisting gear and to the ascent and descent of the load, and which are so arranged and connected with the hatches that each of them, respectively, shall thereby open at the passing of the load and close again after its passage, substantially as set forth.

No. 30,135.—HENRY H. FOYE, of Ottawa, Ill.—*Improvement in Harvesters.*—Patent dated September 25, 1860.—This invention relates to an improved position for the reel posts of an overhanging reel, with respect to the main frame, draught bar, and cutting apparatus, whereby greater steadiness and regularity in its revolution are secured, and the efficiency of the whole machine is improved when in use.

Claim.—The arrangement of the reel post P and Q, with respect to the main frame, draught bar J, and the cutting apparatus, substantially in the manner described, and for the purpose specified.

No. 30,136.—EDWIN J. FRAZER, of Kansas City, Mo.—*Improvement in Ploughs.*—Patent dated September 26, 1860.—This invention relates to certain improvements in that class of ploughs which are connected with wheels and are termed "sulky ploughs."

Claim.—Connecting the plough beam K, to the bar G, through the medium of the pendent bar I, provided with the slide *i*, and bolt *k*, in connection with the clip J, attached to the plough beam K, and provided with the slot *l*, substantially as described.

No. 30,137.—HENRY FRANZ, of Philadelphia, Pa.—*Improvement in Floors for Malt Kilns.*—Patent dated September 25, 1860.—This invention consists in making the plate for malt kiln floors of wire, or otherwise into rails whose transverse sections are cuneate, or thicker along their upper than they are along their under edges, and united together with their sides parallel to each other, leaving spaces between so as to produce a grated plate of the said material.

Claim.—The wire rail plate described, the same being constructed substantially as described and for the purpose specified.

No. 30,138.—GEORGE FROST, of Brooklyn, N. Y.—*Improvement in Cut-off Valves for Steam Engines.*—Patent dated September 25, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the opening of the balance poppet valve D by its valve rod E coming in contact with the adjustable stop F, through the movement of the box slide valve A.

Second. The retaining of the balance poppet valve D, after it is opened by the catch K, or its equivalent, until the proper period for tripping it again occurs.

Third. Tripping the catch K by the pins L on the sliding bars M, they being in connection with the governor.

Fourth. The opening of the balance poppet valve D the reverse way, by means of a lever W, in the manner as described and set forth, through the movement of the box slide valve A.

Fifth. The closing of the balance poppet valve D by a small cylinder and piston Y, having steam continually impinging on its piston, when the catch K is disengaged, which cylinder and piston Y can be arranged in any required position, the whole being combined, arranged, and operating substantially as described, and set forth.

No. 30,139.—J. L. GARLINGTON, of Snapping Shoals, Ga.—*Improvement in Sowing Machines.*—Patent dated September 25, 1860.—The object of this invention is to obtain a simple and efficient machine for planting all kinds of seed, and also for sowing pulverulent manures.

Claim.—The vibrating hopper D, in connection with the fixed bag and stationary standard H, provided either with the rod *l*, with arms *m* attached, or provided with the supplemental bag *n*, as and for the purpose set forth.

No. 30,140.—JOSEPH L. HALL, of Cincinnati, Ohio.—*Improvement in Locks*.—Patent dated September 25, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the peculiar construction of the bolt D, and its arrangement, with reference to the other parts of the lock, whereby the whole mechanism is enclosed within and protected by the bolt.

Second. I claim the combination, with the tumblers 1, 2, &c., of the central plate or disk F, as constructed, the same being made to operate in connection with the central stem H, in the manner as and for the purpose specified.

Third. I claim making the tumbler 2, with an internal sectoral enlargement z , for the purpose of affording space u for the guard plate J, without destroying the continuity of metal composing the tumbler.

Fourth. I claim the conical key blocks I I¹, constructed substantially as described, and inserted into the door plate, with reference to the stems G and H, for the purpose of operating a combination lock from without by means of a key, in the manner specified.

Fifth. I claim the peculiar construction and adaptation of the stems G H, so that the relative position of the same, with reference to their corresponding key blocks I I¹, may be varied in the manner and for the purpose specified.

Sixth. I claim the combined arrangement of the internal enlargement y upon the tumbler 4, the pin w , upon the outer surface of the same, and the corresponding pin upon the under surface of disk F and the lug K, upon the stem H, for the purpose of rendering the combinations of the lock, and particularly the changes thereof, more obscure and intricate, as described.

Seventh. I claim the manner of changing the combinations without the necessity of removing the lock for that purpose, by allowing the stem H to be withdrawn from the inside of the lock and replaced in the contemplated new position, in the manner substantially as described.

Eighth. I claim the key 12 and the portable index plate 13, in combination, the former constructed with a part x fitted to, and entering an aperture in, the index plate in various positions, and forming therewith an element in the combination of the lock.

No. 30,141.—JACOB HALLER, of Ann Arbor, Mich.—*Improved Electro-magnetic Burglar Alarm*.—Patent dated September 25, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of a series of ropes or chains B, extending over pulleys $a b$, in combination with the double armed levers $c d$, rockshaft E, and alarm F, or its equivalent, constructed and operating substantially in the manner and for the purpose specified.

Second. The arrangement of the pin p^2 on the hammer t of the alarm, in combination with a self-lighter H, substantially as described, so that, by the action of the hammer itself, the light is struck.

Third. The arrangement of the circuit breakers r and w and their connecting wires, in combination with the armature n of the electro-magnet, and with the hammer t and bell u , constructed and operated substantially in the manner and for the purpose set forth.

Fourth. The arrangement of the spring frame G in combination with the electro-magnetic alarm F, constructed and operating substantially as and for the purpose specified.

No. 30,142.—ZEBULON HUNT, of Hudson, N. Y.—*Improvement in Cooking Stoves*.—Patent dated September 25, 1860.—This invention consists in placing within the ventilated or air chamber brace, commonly attached to the lower side of the middle pieces between boilers in stoves and ranges, a detached arched brace or bridge, resting on its extremities on the bottom of the air chamber, and supporting at its crown the top plate of the middle piece, thereby preventing the latter from sinking or dropping at the middle.

Claim.—Placing the bridge or brace B, or any similar device, within the ventilated chamber A, substantially in the manner and for the purpose set forth.

No. 30,143.—JOHN JACOBS, of Columbus, Ohio.—*Improvement in Bee Hives*.—Patent dated September 25, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the posts A, joists B, top and bottom longitudinal strips $b b^1$, adjustable notched cross pieces $e^1 e^1$, detachable shouldered cross pieces $e e$, detachable longitudinal central strips d and sectional bottomless hives $g g^1 g^2$, when the whole is constructed and operated in the manner and for the purpose described.

Second. In combination with the above, the wire gauze ventilating valve s , when said valve is constructed and arranged in the manner and for the purpose described.

No. 30,144.—GEORGE W. KERSEY and JOHN J. KERSEY, of Beartown, Pa.—*Improvement in Potatoe Planters*.—Patent dated September 25, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The rotating disk F, armed with hooks *a*, in connection with the hopper G and rotating brush wheel H, the above parts being placed on a mounted frame A, and arranged relatively with each other, to operate as and for the purpose set forth.

No. 30,145.—CHARLES KINZLER, of New York, N. Y.—*Improved Sugar Cutting Machine.*—Patent dated September 25, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the plates A and B, made to move towards and from each other, and provided with knives running parallel to each other, and attached perpendicular on the faces of said plates, directly opposite each other, in combination with two rollers H and H¹, provided with knives *m m*¹, running horizontally across the surfaces of said rollers, and so combining said rollers that, in operation, these horizontal knives will act simultaneously on each side of the slabs or pieces of sugar, the whole being arranged and combined in the manner substantially as described.

No. 30,146.—W. H. LIVINGSTON, of New York, N. Y.—*Improvement in Fastening Axes to Handles.*—Patent dated September 25, 1860.—The object of this invention is to attach the implement to the handle in such a way that it may be readily detached when necessary, and also readily secured thereto, and a connection obtained, the invention admitting of the implement being adjusted on its handle by any person of ordinary ability, and with the aid only of a simple wrench.

Claim.—The arrangement of the wedges D D¹, cap E, and screw F, with the strap C, helve B, and axe A, as and for the purposes shown and described.

No. 30,147.—FERDINAND LUEDKE, of New York, N. Y.—*Improvement in Factitious Beer.*—Patent dated September 25, 1860.—The claim explains the nature of this invention.

Claim.—The combination of sugar, red wine, gum arabic, bicarbonate of soda, and tartaric acid, in the manner and for the purpose set forth.

No. 30,148.—FRANKLIN MAYNARD, of Cambridge, Mass.—*Improvement in Shoe Lasts.*—Patent dated September 25, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Providing that part of the last, on which the pegging is performed, with any substance or material of a plastic nature, or which can be resolidified and resurfaced for continued use without removal from the body of the last, and be pegged into without abrasion or destruction, in the same or any equivalent manner set forth and described.

No. 30,149.—CHARLES MESSENGER, of Warren, Ohio.—*Improved Chair for Invalids.*—Patent dated September 25, 1860.—This invention consists of a chair constructed with an adjustable block that can be raised or lowered; also, an adjustable table in front, on which to place food, or to write, that can be moved out of the way when not in use. There are two lids turned down in front, one or both of which can be raised.

The inventor says: I *claim* the seat A, movable piece A¹, support W, and button G, when these parts are constructed, arranged, combined, and operated as set forth.

I also claim the lids M N, slides R, cord S¹, pulley L¹, and ring O¹, when these parts are constructed, arranged, and operated as specified.

No. 30,150.—JAMES MILLHOLLAND, of Reading, Pa.—*Improvement in Slide Valves.*—Patent dated September 25, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the cap C, with its annular flanges *f* and *e*, and the spiral spring D, or its equivalent, when the flange *e* is so adapted to the hub *c* of the valve, that the said hub shall resist all lateral strains imparted to the cap, and when the whole is applied and arranged in respect to the valve, substantially as specified.

Second. I claim the described application of one or more severed metallic rings *i i*, fitted into grooves in the annular flange *d* of the valve, and bearing against the annular flange *f* of the cap, as and for the purpose set forth.

Third. I claim bevelling the upper sides of the annular recesses *h h*, so as to present a sharp edge, for the purpose specified.

No. 30,151.—JOHN B. MURRAY, of New York, N. Y.—*Improvement in Prepaid Envelopes.*—Patent dated September 25, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a prepared postage stamp, of suitable size and form, for a postal wrapper for newspapers, periodicals, &c., substantially as described, and in contradistinction to the letter envelope stamp and the small stamp in common use.

Second. I claim, in connection with the wrapper stamp, parallel superscription lines, substantially as described.

Third. I claim, in combination with the wrapper stamp, a marginal coating of gum arabic, or other adhesive material, substantially as described.

Fourth. I claim a prepaid postage stamp, which is also a ruled and self-sealing newspaper wrapper, substantially as described.

No. 30,152.—WILLIAM T. NICHOLSON, of Providence, and T. EARLE, of Smithfield, R. I.—*Improved Egg Beater*.—Patent dated September 25, 1860.—The wheel E is attached to the hollow spindle or sheath H, through which the spindle F passes, and to the lower end of the spindle are secured the propeller blades G G. As the bevelled wheels D and E are rotated in opposite directions, the wire frame I I and the propeller blades G G will also be made to rotate in opposite directions.

Claim.—The arrangement of the propeller blades G G, in combination with the wire frame I I, substantially as described, for the purposes specified.

No. 30,153.—ISAAC PELHAM, of Ithaca, N. Y.—*Improved Method of Attaching Handles to Cross Cut Saws*.—Patent dated September 25, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The rods C E, fitted in the handle A, and provided with the screw nuts D F, and slotted parts *d*, the latter being fitted on the saw, and having their ends in notches *e e* therein, the ends of the saw being fitted in the bent notched ends *h h* of the plate *g*, essentially as and for the purpose set forth.

No. 30,154.—IRA PERREGO, JR., of New York, N. Y.—*Improvement in Shirt Bosoms*.—Patent dated September 25, 1860.—This invention consists in the insertion of one or more strips of linen, cotton, or other suitable material, in the plaits of the bosom, more or less, and stitched to the plaits.

Claim.—A shirt bosom, made with stiffening strips of the same or other material as the bosom, applied substantially as and for the purposes set forth.

No. 30,155.—JAMES M. RABB, of Charleston, S. C.—*Improved Railroad Frog*.—Patent dated September 25, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the rods C C¹ B B¹, and the curved chilled ridge D¹ D² D², when the chilled curved ridge has projections *b¹ b¹*, formed on it, and the bottom flanges of the rails have recesses *a¹ a¹* cut in them, substantially as and for the purposes described.

No. 30,156.—WILLIAM RALPH, of Holland Patent, N. Y.—*Improvement in Cheese Vats*.—Patent dated September 25, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment or use of a stove or heater B, fitted within a jacket *b*, and applied to the water chamber A of a cheese vat, substantially as and for the purpose set forth.

Second. In combination with a stove or heater B, thus applied to the water chamber A, the oblique strips *d*, attached to the bottom of said water chamber, for the purpose specified.

Third. The warm water reserve chamber and refrigerator E, applied to the vat, and arranged substantially as shown, to be used jointly either within the stove or heater B, and water chamber A, as occasion may require, for the purpose specified.

No. 30,157.—P. H. ROOTS, of Connerville, Ind.—*Improvement in Blowers*.—Patent dated September 25, 1860.—This invention consists in the combination with two pistons which form arcs of circles, each enclosing one quarter the circumference of a given circle, of two recesses which form quadrants of circles, when each of such recesses occupies just one quarter of the circumference of said circle.

Claim.—The combination of the pistons D D, and recesses E E, when so constructed as to present but four essential points of positive contact, as described and for the purposes set forth.

No. 30,158.—W. G. SAVAGE, of Clinton, Ill.—*Improvement in Corn Planters*.—Patent dated September 25, 1860.—The frame A, by the actuating lever K, may be tilted, or its front end raised, and the furrow openers or shares F readily elevated, when desired, above the surface of the ground. The depth of the furrow may be regulated by adjusting the chain *j*, which connects the front part of the frame A with the draft pole J.

Claim.—The arrangement of the slides *e e*, boxes B, levers *d d*, slide E, adjustable seat G, seat C, axle H, pole J, and lever K, all as shown and described for the purposes set forth.

No. 30,159.—CHRISTIAN S. SCHMIDT, of New York, N. Y.—*Improved Mop Wringer*.—Patent dated September 25, 1860.—This invention consists of a semi-circular board with a slot cut in it sufficiently large to receive the mop; this board is furnished with cleats that will prevent it from slipping off the tub or pail on which it is placed for use, in combination with a fixed and movable clamping arm, between which arms the end of the mop is held, while the water is wrung out of it.

Claim.—Combining, with the board A, having a slot C cut in it, as described, the pivotted arm E, and arm F; the same being arranged and operating as and for the purposes set forth.

No. 30,160.—WILLIAM J. SCOTT, of Albany, N. Y.—*Improved Lock for Burglar Proof Sockets, &c.*—Patent dated September 25, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The method of constructing a lock of two plates of metal, held together, when locked, by spring head bolts attached to one of the plates passing through suitable apertures made in the other plate, together with the key for separating the plates, substantially for the purpose and in the manner set forth in the within specification.

No. 30,161.—IVES SCOVILLE, of Chicago, Ill.—*Improvement in Hemp Brakes*.—Patent dated September 25, 1860.—This invention consists in the arrangement of successive sets of breaking, beating, and cleaning rollers, running at different speeds, and the lower rollers having their bearings in a frame vibrating upon the driving shaft in combination with a treadle.

Claim.—The arrangement of successive sets of breaking, beating, and cleaning rollers, running at different speed, and the lower rollers M¹ N¹ O¹, having their bearings in a frame B, vibrating upon the driving shaft D, in combination with a treadle I, substantially as and for the purposes set forth.

No. 30,162.—WILLIAM H. SCOVILLE and IVES SCOVILLE, of Chicago, Ill.—*Improvement in Quartz Pulverizers and Amalgamators*.—Patent dated September 25, 1860.—This invention consists in the arrangement of a double trough and gutter in combination with four crushing and driving wheels, two grinding rollers, and two breaking rollers, the various parts of the machine being connected and placed in relation to each other for the purpose of constituting a quartz mill and amalgamator.

Claim.—The arrangement of a double trough R U, and gutter Q, in combination with four crushing and driving wheels B B B B, two grinding rollers H H, and two breaking rollers J J; the various parts of the machine being connected and placed in relation to each other substantially as and for the purposes set forth.

No. 30,163.—J. C. SELLERS, of Woodville, Miss.—*Improvement in Cotton Cultivators*.—Patent dated September 25, 1860.—This invention consists in the arrangement of a reciprocating hoe frame and cam grooves, in combination with an independent revolving shaft, plough shares, and coverers of a cotton thinning plough.

Claim.—The arrangement of a reciprocating spring hoe frame N N G, and cam grooves L H, in combination with an independent revolving shaft E, and with the plough shares V V, and coverers U U, of the cotton thinning plough, substantially as and for the purpose set forth.

No. 30,164.—KIRBY SPENCER, of Minneapolis, Minnesota.—*Improved Refrigerator*.—Patent dated September 25, 1860.—This invention consists in placing a preservatory, having one or more tight, dark, dry ventilating apartments within a refrigerating chamber, and the edibles and fluids to be preserved to be placed in the apartments of the said preservatory.

Claim.—The apartments *f*, in combination with the ventilating apertures *g*, the aperture *x*, the sliding covers *j*, the ventilating flue K, the pipe L, the refrigerating chamber *x*¹, the apertures *h*, and the aperture I, constructed substantially in the manner specified, and operating together for the purposes above described.

No. 30,165.—THOMAS SPENCER, of Syracuse, N. Y.—*Improvement in the Manufacture of Common Salt*.—Patent dated September 25, 1860.—The claim explains the nature of this invention.

Claim.—The admixture with common salt, after crystallization, of sulphate of soda, or its equivalent, as and for the purposes set forth.

No. 30,166.—THOMAS T. STRODE, of Mortonville, Penn.—*Improved Calendar Clock*.—Patent dated September 25, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement and combination of the year wheel C, with the grooves *n n*¹ *n*^{*} and *o o*¹ *o*^{*}, or their equivalents, the month wheel D, the levers *h i*

and *b c*, the pins *m* and *c*, and the pawls *l* and *f*, constructed and operating substantially in the manner and for the purpose described.

Second. The arrangement of the grooves *n n¹ n²*, pin *e*, and pawl *f*, substantially as set forth, for the purpose of controlling the motion of the month wheel according to the variations in the lengths of the months.

Third. The arrangement of the grooves *o¹ o o²*, pin *m*, and pawl *l*, substantially as specified, for the purpose of controlling the motion of the year wheel.

Fourth. The manner in which the names of the months are arranged on the face of the year wheel, viz: marking the name of each long month once, and the name of each short month twice, in two consecutive spaces, as and for the purpose set forth.

Fifth. The employment of the year wheel C, constructed substantially as specified, for the purpose of controlling its own motion and that of the month wheel D.

No. 30,167.—W. S. STETSON, of Baltimore, Md.—*Improvement in Reaping Machines*.—Patent dated September 25, 1860.—This invention consists of a new implement, combining a rake and fork for use in connection with reaping machines. One end of the rake *a* is provided with a fork *b*.

Claim.—The improved implement for harvesters, the same consisting of the combination of a rake and fork, substantially in the manner and for the purposes set forth.

No. 30,168.—SAMUEL E. TOMPKINS, of Baltimore, Md.—*Improvement in Saddle Trees*.—Patent dated September 25, 1860.—This tree consists of two principal parts, to wit: the frame A, and the seat B, secured together by means of a screw *a*, in connection with a bolt *b*, which secures the check rein hook C to the tree.

The inventor says: I *claim*, first, a metal frame A for saddle trees, when said frame is cast with depressions *s s*, flanches *e e*, and holes *f f*, in the manner and for the purposes described.

Second. The use of a piece of leather D, of a form and size corresponding to the underside of the seat B, in combination with a frame A, which is constructed with depressions *s s*, flanches *e e*, and holes *f f*, in the manner described.

Third. The combination of the rear shoulder *m¹* of the hook H, with the jog *n* of the tree, in the manner and for the purpose described.

Fourth. The combination of the projections *h h* of the tree, with the shoulders or sockets *j j* in the underside of the seat, in the manner and for the purpose described.

No. 30,169.—JOHN UNDERWOOD, of Cameron, Ill.—*Improvement in Corn Planters*.—Patent dated September 25, 1860.—The shaft *a¹* is connected at each end by a crank and pitman, with a wrist or pin on the wheels B, whereby motion is communicated to the dropping wheels *a* from the wheels B by means of the pitman C. The cranks on shaft *a¹* are set at right angles toward each other, while the wrists or pins on the wheels B occupy a similar position in respect to each other.

Claim.—The relative arrangement and combination of the adjusting wheels H H, with their frames, supporting and marking wheels B B, pitman C C, dropping wheels *a a*, and opening wheels E E, operating as and for the purposes set forth.

No. 30,170.—WALTER WARREN, of Penn Yan, N. Y.—*Improvement in Ploughs*.—Patent dated September 25, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the beam A, when made from its forward part to near its union with the mould board, as described, with the standard E of the fore plough D, and mould board B, as specified, for the purposes set forth.

No. 30,171.—JAMES WHITE, of Cleveland, Ohio.—*Improvement in Smut and Scouring Machines*.—Patent dated September 25, 1860.—This invention embraces two points of novelty, first, the adjustable metallic perforated screen, in combination with the wire cloth, cockle, and chess screen, embracing also the motion of the screen frame and mode of suspending the same. Second. In relation to the adjustable beaters, which can be readily expanded or contracted and adjusted vertically or inclined at any desirable angle.

The inventor says: I *claim*, first, the frame F, springs L, perforated adjustable plate E, wire screen I, and plate K, the several parts being arranged and operated as described.

Second. I claim the adjustable beaters T, constructed, arranged, and operated substantially as and for the purposes specified.

No. 30,172.—J. G. WHITWELL, of New York, N. Y.—*Improved Curtain Fixtures*.—Patent dated September 25, 1860.—This invention consists of a new and improved form of curtain or shade fixtures, by which the curtain can be raised or lowered without the aid of any rack, pulley, or other device for holding the cord, and which will keep its place in any position it may be desirable to place it by simply pulling the cord.

Claim.—The arrangement of the spiral springs *d d*, between the divided half circles *a a* of the roller end, which, by expanding, holds a cord or band against a circular surface *f*, as described, substantially as and for the purpose specified.

No. 30,173.—JOHN F. WOOD, of Houma, La.—*Improvement in Cultivators*.—Patent dated September 25, 1860.—The ground is turned up by the shovels *D*, which are attached to the under side of the frame *A*, and the quantity of earth to be put on the plants is regulated by two adjustable hinged wings *E*. These wings swing on the upright rods *i*, and their position is determined by the hooks *j* catching the loops *k*, or in any other convenient manner.

Claim.—The arrangement of the hinged adjustable wings *E*, when used in combination with the adjustable frame *A*, shovels *D*, and rakes *C*, substantially in the manner and for the purpose set forth.

No. 30,174.—JOSEPH WORCESTER, of Newport, Ky.—*Improved Annealing Apparatus*.—Patent dated September 25, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The dwarf sleeper walls *e e* in the annealing furnace *A*, affording a bed for the annealing box *B*, when used in combination with the carriage *C*, or any similar carriage for raising or lowering its load; all substantially arranged as described, and for the purpose set forth.

No. 30,175.—ALLEN S. BALLARD, of Mount Pleasant, Iowa, assignor to himself and R. I. ROBESON, of the same place.—*Improvement in Earth Borers for Post Holes, &c.*—Patent dated September 25, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The manufacture of earth borers in separate parts, all arranged and operating substantially as and for the purposes set forth.

No. 30,176.—GEORGE BURNHAM, of Pittsburgh, Pa., assignor to himself, W. D. RINEHART, and C. A. NAUMAN, of the same place.—*Improvement in Oscillating Valves for Steam Engines*.—Patent dated September 25, 1860.—The claim and engravings explain the nature of this invention.

Claim.—So constructing the plug and seat of cylindrical or conical valves, substantially as described, as that the live steam from the boiler will press on both sides of the valve plug, while the exhaust steam will pass through a central cavity in the plug, for the purpose of equalizing the pressure of the steam on the plug, so as to prevent the valve wearing unevenly and to reduce the friction of the plug inside the valve seat.

No. 30,177.—HUGH W. COLLENDER, of New York, N. Y., assignor to himself and MICHAEL PHELAN, of the same place.—*Improvement in Cushions for Billiard Tables*.—Patent dated September 25, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Making cushions for billiard tables of two thicknesses of what is known as the soft compound of vulcanized India rubber, or allied gum, with an interposed thickness of what is known as the hard compound of vulcanized India rubber, or allied gum, or, as the equivalent thereof, with an interposed thickness of the soft compound of vulcanized India rubber, or allied gum, rendered hard by the admixture of fibrous or equivalent substance, substantially as and for the purpose specified.

No. 30,178.—SAMUEL F. GELSTON and JOHN T. JOHNSON, of Buffalo, and CHARLES R. TOMPKINS, of Rochester, N. Y., assignors to SAMUEL F. GELSTON and JOHN T. JOHNSON, aforesaid.—*Improvement in Stave Machines*.—Patent dated September 25, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The method of adjusting the machine to operate on staves of different lengths, by means of the index driving wheel *N*, in combination with the rib *b*, substantially as described.

No. 30,179.—JOHN LYKER, of Argosville, N. Y., assignor to himself and J. I. BROWN, of the same place.—*Improvement in Combined Roller and Manure Spreader*.—Patent dated September 25, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the rollers *B B* with the frame *A*, gear wheels *f g*, connecting rod *E*, hopper *D*, pendant *c*, and slide *b*, all as shown and described, for the purposes set forth.

No. 30,180.—ANTONIO MEUCCI, of Clifton, N. Y., assignor to the NEW YORK PARAFFINE CANDLE COMPANY, of Richmond County, N. Y.—*Improvement in Apparatus for Moulding*

Candles.—Patent dated September 25, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of die and candle guide, substantially as described, for the purpose of finishing candles.

I also claim the combination of an elastic strap with the receiving bed, for the purpose of holding the candle in contact therewith.

I also claim the combination of die, candle guide K, and candle receiving bed, substantially in the manner and for the purpose described.

No. 30,181.—DUBOIS D. PARMELEE, of Salem, Mass., assignor to the BEVERLY RUBBER COMPANY, and said Company assignors to JOHN H. CHEEVER, of New York City.—*Improvement in Restoring Waste Vulcanized Rubber.*—Patent dated September 25, 1860.—The claim explains the nature of this invention.

Claim.—The process described of rendering waste vulcanized, hermized, or changed India rubber useful and capable of being reworked, for the manufacture of articles of trade and commerce, by reducing said rubber to a fine or powdered state, and then combining, with the same, India rubber, which has been modified by heat, so as to obtain it either in a semi-liquid or melted condition, or in a liquid or vaporous condition, *i. e.*, in the form of its products of distillation, substantially in the manner and modes herein set forth.

No. 30,182.—JAMES W. PARNELL, of Troy, N. Y., assignor to JAMES MORRISON, JR., of the same place.—*Improved Stove Grate.*—Patent dated September 25, 1860.—This invention consists in so constructing and combining parallel bars lengthwise of and to the frame of the fire grate, and with the said frame, as to form a shaking fire grate, one half of the bars of which move by using the shaking handle.

Claim.—An improved fire grate for stoves, consisting of the frame A, the separate and parallel grate bars B, and the rocker E, constructed and arranged as herein described and set forth.

No. 30,183.—HUBBARD W. PUTNEY, of Lyons, N. Y., assignor to himself and CYRUS C. CRANE, of Penn Yan, N. Y.—*Improvement in Sieves for Separating Grain, &c.*—Patent dated September 25, 1860.—A is a rectangular frame; on the upper side the wire gauze B is fastened; above the gauze is the separating board C, and at the under side of the frame is the conducting board D; at the highest end the frame E is attached by means of screws.

Claim.—The arrangement of the distributing board C, the conducting board D, and auxiliary sieve F, when applied to the frame A and gauge B, in the manner and for the purpose specified.

No. 30,184.—JOHN RANDALL, of Elmira, N. Y., assignor to himself and R. R. SMALLEY, of Troy, N. Y.—*Improvement in Slide Valves.*—Patent dated September 25, 1860.—This invention consists in certain means whereby the valve is relieved of all pressure towards its seat, and is made to work with an inconsiderable amount of friction.

Claim.—The employment, in combination with the valve, constructed with a single opening *b* right through it, of the induction cavity *b* in the seat, the plate E, and set screws F F, applied to the back of the valve, and a valve chest, in constant communication with the education pipe, the whole arranged and operating substantially as herein set forth.

No. 30,185.—J. C. RICHARDS, of Lafayette, Ind., assignor to himself, J. HUBBLER, and R. M. McGRATH, of the same place.—*Improvement in Corn Shellers and Cleaners.*—Patent dated September 25, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the cylinder *k*, made up of rods and arranged in relation to the revolving screen, and operated as herein set forth.

Second. The arrangement of the toothed cylinder *i* within the rod cylinder *k* and revolving screen cylinder *n*, with the hopper at the one end and the cob chute at the other end, the corn being delivered through the rod cylinder to the screen, the cobs being conveyed to the chute by the helical arrangement of the teeth, as described.

Third. The revolving screen or cleaner *n*, in combination with a sheller composed of the toothed cylinder and rod cylinder, or its equivalent, said cleaner rotating around the whole length of the sheller, and the entire surface of both sheller and cleaner being operative surfaces, as set forth.

No. 30,186.—JOHN J. WALSH, of New York, N. Y., assignor to himself, THOMAS L. BRAYNARD, and H. C. ADAMS, of the same place.—*Improvement in Gun Carriages.*—Patent dated September 25, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the use and arrangement of the hand wheel D and gear wheel

B, in combination with the supporting and pivot wheel A, substantially as described, for the purpose of running out and in and training cannon, as described.

I also claim the arrangement of the said wheels D and B, in combination with the geared sector J, for the purpose of elevating or depressing the gun, as described.

I also claim the arrangement of the rods L, links *h h*, and levers *k k*, in combination with the two carriages, substantially as described, for the purpose of lessening the extent and force of the recoil of the gun.

I also claim the arrangement and combination of the screw 1 2, and the pivot wheel A, substantially as described, for the purpose of elevating and lowering the gun carriage, for the purposes set forth.

No. 30,187.—FRANK H. WEST, of San Francisco, Cal., assignor to THOMAS S. SEABURY, of Stony Brook, N. Y.—*Improved Compass Protractor*.—Patent dated September 25, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination, with ordinary parallel rulers A, of a movable circle B, graduated as a compass, and provided with a semi-circular central opening *b*, with the exact centre of the circle marked therein, substantially in the manner and for the purposes herein set forth.

No. 30,188.—WILLIAM T. ZOLLIKOFFER, of Shelbyville, Tenn., assignor to himself and WILLIAM BROWN, of the same place.—*Improvement in Ploughs*.—Patent dated September 25, 1860.—To the side of the beam A there is attached a foot D, which is made of wrought iron. The upper part of the foot D is attached to the beam by a bolt *b*, and said upper end is directly under the back end of the upper part of the bar C. The lower part of the bar C has a side piece *d* attached so as to form a forked end.

Claim.—The arrangement of the curved bar C, foot D, and beam A, with the serrated bar E, slotted clevis F, pawls *e e*, and hooks *d¹ d¹*, all in the manner and for the purposes described.

No. 30,189.—J. D. ALVORD, of Bridgeport, Conn.—*Improvement in Making Emery Wheels*.—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The method described of making emery wheels, and which consists in pressing or casting the wheel upon a flanged tube, so that, when the wheel contracts in drying, the central part thereof will have lateral support, and thus be prevented from cracking, and so that the wheel will become firmly attached to the tube and flanges, all as represented and described.

No. 30,190.—JOHN ANDREWS, of Elmira, N. Y.—*Improvement in Grinding Circular Saws*.—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the anti-friction rollers E, when arranged in the manner set forth, for the purpose specified.

Second. The manner of presenting the saw to the stone, by means of a separate frame resting on a slide and moved by the set screw C.

No. 30,191.—HORATIO G. ARMSTRONG, of Philadelphia, Pa.—*Improvement in Paper Bag Machines*.—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment, for severing the folded paper, of the upper and lower knives, with their edges X and Y, arranged in respect to each other, substantially as set forth, in combination with the revolving striker *k*, or its equivalent.

Second. In combination with the said knives and striker, I claim the rollers U and V, for retaining the end of the folded paper during the operation of the striker.

Third. The roller Q Q¹, in combination with the blade N, the upper roller having one or more collars *n n*, so arranged in respect to openings in the blade that the action of the rollers on the folded paper cannot interfere with the said blade, as set forth.

Fourth. The horizontal rollers K K¹ and the guide blocks J J¹, arranged in respect to each other and to the blade N, substantially as and for the purpose set forth.

Fifth. The plate L, with its projections *l* and *l¹*, or their equivalents, arranged and operating as set forth, for the purpose specified.

Sixth. Causing one edge of the paper to traverse in contact with a ratchet or notched wheel *b*, arranged to revolve in a trough containing the paste, as set forth, for the purpose specified.

No. 30,192.—SAMUEL W. BARR, of Mansfield, Ohio.—*Improvement in Velocipede Vehicles*.—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, in three wheel wagons, the peculiar arrangement of the spring clutch *o*, hand levers *c c*, and break arms *e*, in combination with the devices for applying the motive power and guiding the wagon, as described, and for the purpose set forth.

No. 30,193.—HENRY BEHN, of New York, N. Y.—*Improved Alarm for Doors*.—Patent dated October 2, 1860.—This invention consists in the arrangement of a movable plate placed in the opening of a door and covered with a carpet, rug, or any similar substance, and so combining said plate with a lever or rod connected with a bell or alarm that any person passing through the door shall by his weight operate said plate so as to give an alarm and thereby announce his entrance or exit.

Claim.—The arrangement of a hinged plate *B*, acting on arms or levers fast on a shaft and placed in the opening of a door, when combined with a bell or alarm and operated in the manner and for the purpose substantially as specified.

No. 30,194.—WILLIAM B. BILLINGS, of New York, N. Y.—*Improvement in Vapor Lamps*.—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the use of the hollow heater *B*, when constructed substantially as described and provided with the broad flange *D*, for the purposes set forth.

Second. I claim the use of the removable flange *F*, in combination with the heater *B* and broad flange *D*, when constructed substantially as described, for the purpose of regulating the heat and the illuminating power of the lamp, thus adapting the same to burning different materials.

No. 30,195.—I. F. BLONDIN, of Niagara Falls, N. Y., assignor to himself, FRANK DOUGLAS of Norwich, Conn., N. H. SPOFFORD, of Boston, Mass., and J. B. HERNSHOOF, of Seekonk, Mass.—*Improvement in Skates*.—Patent dated October 2, 1860.—This invention relates to the construction and arrangement of side supports for the ankle and leg, in combination with a skate.

The inventor says: I *claim* the supports *E E* hinged or jointed to the heel, in combination with a skate, for the purposes substantially as described.

I also claim the arrangement of the adjustable bars *I*, screws *K*, swivel block *n*, plate *s*, and strap *L*, for the purposes described.

No. 30,196.—E. I. BODRIO, of St. Louis, Mo.—*Improvement in Machines for Drying Grain*.—Patent dated October 2, 1860.—The cylinders are heated with steam, and the steam is kept from condensing by the fire in the furnace *K*, on the outside of the cylinder, and by the introduction of super-heated steam or heated air in the inside of the cylinder, which also blows the musty smell out of the cylinder as it rises or dries out of the grain.

Claim.—The combination of the cylinders *B*, the pipes *r* and *v* and *y*, the diaphragm plate *o*, and the furnace *K*, the whole being arranged and operated substantially as described.

No. 30,197.—CHARLES K. BRADFORD, of Lynn, Mass.—*Improvement in Gaiter Boots*.—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

Claim.—In a gaiter boot, having a front and flap divided by a side opening, as shown, the holding up and fastening of said front and flap to each other and to the ankle of the wearer by means of the strap *B* fastened to said fore part and passing through a slot *f*, thence around the ankle and buckled to the flap *C*, as described and represented.

No. 30,198.—JEHU BRAINERD, of Cleveland, Ohio.—*Improvement in Rotary Harrows*.—Patent dated October 2, 1860.—This invention relates to feathering the harrow teeth by means of the peculiar form thereof and the manner in which they are secured to the frame of the harrow; the teeth have a partial rotation upon their own axis while revolving around the common centre of the harrow frame, the teeth having such a form that the portion which enters the soil as the harrow is drawn forward; upon one side of the frame the teeth adjust themselves at a greater distance from the common centre of the frame than do the teeth on the opposite side; this feathering or self-adjusting of the teeth upon greater and lesser circles causes the whole harrow to rotate.

Claim.—Feathering the teeth of a harrow, substantially as described.

No. 30,199.—W. E. BRIDGES and D. P. DIETERICH, of Cleveland, Ohio.—*Improved Hose Protector*.—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The described hose protector, composed of two sheets of gum elastic, or other suitable flexible material, connected together at one end, the lower sheet being furnished with

transverse ribs *a a*, and the whole being constructed and applied substantially in the manner set forth, for the purpose specified.

No. 30,200.—RHODOM M. BROOKS, of Greenville, Ga.—*Improved Cotton Press*.—Patent dated October 2, 1860.—This invention consists in constructing and arranging the several parts of the machine.

Claim.—The arrangement of the box B, the trunnions *x*, projecting pieces *a a*, working in grooves or openings in the frame pieces A A, the head D, arms *d d*, block *c*, and screw E, with the frame pieces A¹ and A², and gear wheels F G, when the same are constructed and used as and for the purpose specified.

No. 30,201.—FERDINAND PHILIP EDWARD CARRÉ, of Paris, France.—*Improvement in Apparatus for Freezing Liquids*.—Patent dated October 2, 1860.—A description of this invention is too long for a place in this volume. The reader is referred to the specification and engravings.

Claim.—The general arrangement of apparatus described, for producing cold in manufacturing ice by chemical agents.

No. 30,202.—SAMUEL R. BRYANT, of Waterford, Pa.—*Improvement in Bee Hives*.—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the rotating cap *b*, perforated at one side and fitted within a circular recess *d* at the centre of the bottom A of the hive, the bottom within the recesses having openings *e* made through it to form a ventilator, as set forth.

Second. Constructing the bottom A of the hive, elevated within the body, so as to form a ledge *j* for the parts C to close against, and having the outer part of the bottom inclined or bevelled and made horizontal beneath the parts C, for the purpose specified.

Third. Constructing the comb frames D with diagonal braces *m n*, and having the upper cross rails *a* grooved to form ledges or guides O for the combs, as set forth.

No. 30,203.—JAMES BROWN and LYMAN BRIDGES, of Chicago, Ill.—*Improved Furnace and Cooking Range*.—Patent dated October 2, 1860.—This invention consists in the arrangement of coils of hot water pipes at both sides of the removable ovens, in combination with a combustion chamber, hot air chamber, and coils of hot water pipes, all the parts constructed and connected together so as to accomplish the desired end.

Claim.—The arrangement of coils of hot water pipes N¹ N² at both sides of the reversible ovens B B, in combination with a combustion chamber G, hot air chamber D, and coils of hot water pipes P and P¹, all the parts constructed and connected, substantially as and for the purposes set forth.

No. 30,204.—CYRUS CHAMBERS, JR., of Philadelphia, Pa.—*Improved Copying Press*.—Patent dated October 2, 1860.—This invention consists in constructing a copying press, with the travelling platen working upwards, and operated by a toggle connected with a treadle controlled by the foot, so that the upper part of the press is left free to receive a top which can be used as an office table or stand, the whole forming an ornamental and convenient press.

The inventor says: I *claim*, first, the combined stand and press, constructed substantially as described.

Second. The combination of the bed toggle, platen, and treadle, for the purpose and substantially in the manner specified.

Third. The stops *m n o p* on the arms of the toggle, arranged and operating as specified.

Fourth. The lugs or stops *i* on the platen F to determine the position of the book in the press.

Fifth. The combination of the mortise and screw, for the purpose set forth.

Sixth. Casting the column, frame, and bed, in one piece, in the manner described and shown.

No. 30,205.—FRANCIS J. COLLIER, of Philadelphia, Pa.—*Improved Label Holder*.—Patent dated October 2, 1860.—This invention consists of a metal casing for holding a label of paste-board or other suitable material, the said casing having retaining flanges, recesses, and openings, so that the label may be effectually retained within the holder, readily removed therefrom, reversed and reinserted therein.

Claim.—The described label holder having the end retaining flanges *e* and *e*¹, the curved slide flanges *f* and *f*¹, the recesses *y y*, and openings *m* and *n*, arranged substantially as and for the purpose set forth.

No. 30,206.—JAMES P. COLLINS, of Troy, N. Y.—*Improved Hanger for Shafting*.—Patent dated October 2, 1860.—The object of this invention is to obtain a bearing of simple construction which will have a universal adjusting movement, and at the same time be properly supported at all points, so as to admit of belts being applied to the shafting in any direction.

The inventor says: I *claim* the combination, with the shaft box F, trunnions g, and adjusting screws h, of the shell D, arm E, rod C, curved plate B, arbor b, screw c, and frame A, in the manner and for the purpose shown and described.

I also claim the peculiar arrangement of the cap G, with the trunnions and the rod C, as and for the purpose shown and described.

No. 30,207.—JOHN COMMINS, of Charleston, S. C.—*Improvement in Saddles*.—Patent dated October 2, 1860.—This invention consists in attaching to the front part of a saddle a bar which extends outward from the saddle at either side in such a manner that a fowling piece or rifle may be suspended thereto, the bar admitting of being turned so that it as well as the rifle or other fire-arm cannot serve as an obstruction in passing through underbrush; the bar also may be used as a means for supporting an umbrella, when necessary.

Claim.—The bar B, attached to a saddle, essentially as and for the purposes set forth.

No. 30,208.—JAMES COOPER COOKE, of Middletown, Conn.—*Improved Machine for Sharpening Tools*.—Patent dated October 2, 1860.—This invention consists of a machine whose principal elements are a hone carriage and a tool holder, said carriage having a reciprocating rectilinear motion in a direction parallel, or nearly so, to the edge of a tool, and a gradual or step by step movement in a transverse direction, and the tool holder being applied in a peculiar manner relatively to the said bed, so that the tool may rest upon the hone at any required inclination to the face thereof, according to the degree of bevel desired.

Claim.—The combination of the reciprocating carriage B and the transversely moving hone bed C with the tool stock L, by means of a bar M applied, and having the tool stock fitted to it, substantially as and for the purpose described.

No. 30,209.—J. D. CUSTER, of Norristown, Pa.—*Improved Saw Grinding Machine*.—Patent dated October 2, 1860.—This invention consists in constructing a wheel of proper diameter and face to admit of bending and laying the saws on the face of the wheel and fastening them with bevel headed hooks, so as to hold them tight on the face of the wheel, while it revolves, in contact with a revolving traversing grindstone, or polishing wheel, or polishing belt.

Claim.—The slotted wheel K, constructed as described, and operated in connection with the hook P and pin N, in front of a traversing grindstone, for grinding and polishing saws, as set forth.

No. 30,210.—JEAN DE LIHATCHEFF, of Yaroslavl, Russia.—*Improved Machine for Planing Staves*.—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Supporting the frame or table carrying and presenting the staves to the planing tools, and at various parts of its length, upon a series of eccentrics mounted upon shafts having pinions at their extremities, each and all of which are operated by means of one common transverse shaft provided with a worm or endless screw, as set forth and for the purpose and purposes specified.

No. 30,211.—D. B. DORSEY and E. MATHERS, of Fairmount, Va.—*Improvement in Setting Type*.—Patent dated October 2, 1860.—The object of this invention is to facilitate the handling of composed matter without danger of knocking it into pi. To do this the inventor proposes to set up the type in a permanent galley, where it shall remain until distributed. To this galley are added movable and justifying rules.

Claim.—The employment of a permanent column galley A, arranged with end rules a b, and with a justifying rule B, substantially as and for the purpose set forth.

No. 30,212.—J. B. DUANE, of Schenectady, N. Y.—*Improvement in Seeding Machines*.—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the toothed bars b b, and perforated plates h i, outside or in front of the hopper G, substantially as and for the purpose specified.

Second. The adjustable board N, placed relatively with the shake board M, harrow O, and drags Q, to operate as and for the purpose set forth.

Third. The arrangement of the lever frame D, roller E, bars b b, shaft B, and castor wheels C C, substantially as shown and described, for the purpose set forth.

Fourth. The combination of the vibrating board M, hopper G, with the reciprocating

agitators *l l*, the seed box *S*, harrow *O*, drags *Q*, frame *D*, with roller *E*, attached and connected to the shaft *B* by the rods *b*, all arranged for joint operation, as set forth.

No. 30,213.—JOSEPH T. EICHBERG, of New York, N. Y.—*Improved Parasol and Fan*.—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, arranging the handle of a parasol, substantially as described, so that a portion of the same can be taken off at pleasure and used as a fan.

Second. Arranging the fan *D*, which forms the end of the handle *B* of a parasol, with folding sides of a tapering form, substantially as set forth, so that the same, when closed, forms a case which protects the fabric of the fan, and which produces a good and convenient hold for the hand.

No. 30,214.—ISRAEL FORMAN, of Grafton, Va.—*Improved Culinary Apparatus*.—Patent dated October 2, 1860.—This invention consists in constructing a chest or chamber in such a manner that it will hold water in its bottom for the generation of steam, and also articles to be cooked on racks in it; and also in having a movable sliding door.

Claim.—The chest or box *A*, with an inclined top water receptacle in its bottom, and provided with a movable sliding door *B*, flanges *a*, shelves *C C*¹, and otherwise constructed and arranged as and for the purposes set forth.

No. 30,215.—THOMAS N. FOSTER, of Watertown, N. Y.—*Improvement in Harvesters*.—Patent dated October 2, 1860.—This invention consists in the arrangement of a frame mounted on wheels, and carrying a lower frame, which is hinged to it behind the carrying axle, applying a tongue or pole to the upper frame and the draught rod to the lower frame, so as to allow both frames to vibrate freely, and hanging or hinging the cutter bar and platform to the lower frame.

Claim.—The arrangement of the three hinged frames *N N*¹ *A* and *B*, with their hinges, in relation to each other, the axle *A*², and inner driving wheel *A*³, in combination with the rigid and flexible draught connection *D D*¹, operating jointly in the manner and for the purpose described.

No. 30,216.—ADONIRAM J. FULLAM, of Springfield, Vt.—*Improved Stencil Printing Machine*.—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A stencil printing or marking machine, as composed of a rotary brush *C*, or its equivalent, a stencil plate *D*, and a sheet supporter or carriage *B*, combined together, and with mechanism for rotating the brush, or for revolving it and moving the sheet supporter or carriage, substantially as and for the purpose specified.

No. 30,217.—JAMES P. GAY, of Cincinnati, Ohio, assignor to himself and DAVID C. KING, of said Cincinnati.—*Improvement in Composition for Roofing Purposes*.—Patent dated October 2, 1860.—The following are the various ingredients and proportions that compose this composition: Eighty parts, by weight, of Carolina pitch, eighty parts of candle pitch, three parts of flour of sulphur, eight of linseed oil, three of litharge, eighty of naphtha, three of gutta percha, and three of caoutchouc.

Claim.—The composition described, consisting of the various ingredients in the proportions named, or similar proportions, substantially as and for the purpose described.

No. 30,218.—PORTER A. GLADWIN, of North Providence, R. I.—*Improved Sash Fastener*.—Patent dated October 2, 1860.—This improvement consists in constructing the stop as a part of a lever, the whole constituting one piece, and in the combination of the lever, locker, and spring.

The inventor says: I *claim* a lever with a curved end *k*, or its equivalent, moving eccentrically on a pivot, constructed and operating substantially as described, for the purposes specified.

I also claim the combination of such a lever with a locker and spiral spring, or their equivalents, constructed, arranged, and operating substantially as described, for the purposes specified.

No. 30,219.—ISRAEL GRAFUIS, of Alexandria, Pa.—*Improved Portable Fire Escape*.—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A portable fire escape, constructed of a folding frame *A*, covered by an elastic sheet *B*, and cushion *C*, and having its edges protected by a stout elastic tube *D*, and operating in the manner and for the purpose set forth.

No. 30,220.—ROBERT HARPER, of Trumbull, Ohio.—*Improvement in Tanning*.—Patent dated October 2, 1860.—The following named ingredients compose the article used in this invention: Worm seed, thoroughwort or boneset and golden root, to be used in connection with japonica, alum, and saltpetre; a liquor to be made by steaming the weeds together in equal proportions, then adding the japonica, alum, and saltpetre, in the proportions of fifty pounds of japonica, ten pounds of alum, and one pound of saltpetre, to two hundred pounds of the above named weeds or plants when dry.

Claim.—The use of the above mentioned weeds, in combination with the aforesaid drugs, in the proportions named, thereby facilitating the process of tanning, as well as being much cheaper than the usual process of tanning with bark.

No. 30,221.—JOHN HOLMES, of St. Clair, Pa.—*Improvement in Pumps*.—Patent dated October 2, 1860.—The following is the operation of this invention: The rod D^1 draws or pulls the frame C in the direction indicated by the arrow, and raises the truck D, and consequently draws up the plunger rod F^1 , the pipe H and pump cylinder filling with water as the frame C moves in the reverse direction, and then the truck D descends by its own gravity forcing the water drawn up by the previous upward movement of the plunger rod up through the pipe I; the frame C may have a weight attached to it to counterpoise the truck D.

Claim.—The arrangement of the loaded truck D, rod F, plunger rod F^1 , with the pump G, chain E, frame C, and rod D^1 , as and for the purposes set forth and described.

No. 30,222.—S. J. HOMAN, of Walden, N. Y.—*Improvement in Hay Rakes*.—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Attaching the rake tooth to the axle C, and mounting the thills on the hubs of wheels A A, and the driver's seat on the thills, substantially as and for the purposes set forth.

No. 30,223.—C. B. HURXTHAL and JOHN LEE, of Bolivar, Ohio.—*Improvement in Gates*.—Patent dated October 2, 1860.—In operating this gate, as the driver approaches it, he extends his hand, and grasping the handle f throws it up, as it goes up the arms e , at the end of the operating lever E, operate the rods c , thereby unlatching the gate by sliding back the latch slat C, at the same time the operating lever E, by its attachment to the main pivot F, throws up the balance gate, the slats of which fold up and assume a vertical position.

Claim.—The arrangement of the inclined standard B, slots C and C^1 , spring a , levers E, and fixed bearing F, and weight b , the whole operating as set forth.

No. 30,224.—WILLIAM HUMPHREYS, of Cold Spring, N. Y.—*Improvement in Rotating Engines*.—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the annular arrangement of the recesses e , in the cylinder B, in combination with the flanges c c^1 , on the piston C, and with the cylinder heads or covers i , constructed and operating substantially as and for the purpose described.

Second. The arrangement of the adjustable packing plates k , in the ends of the sliding abutment D, constructed and operating substantially as and for the purpose set forth.

Third. The arrangement of the abutment D, in the interior of a closed box E, in combination with the pipe e^2 , constructed and operating substantially in the manner and for the purpose specified.

Fourth. The arrangement of the hand rock shaft r^2 , with eccentric rollers v v^1 , and a pinion i , in combination with the valve t t^1 , and eccentrics I I^1 ; the whole constructed, combined, and operating as and for the purpose described.

No. 30,225.—JOSEPH HARVEY and EDWIN FORD, of Philadelphia, Pa.—*Improvement in Handles for Canes, &c.*—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The art, process, or mode of making handles, shown and described, consisting substantially in the employment of forms or models composed of tapering angles and the providing of the sections of which the handle is to be composed, with tapered apertures, and the fitting of said sections upon said tapered angles; all as set forth and represented.

No. 30,226.—W. F. JOHNSON, of Philadelphia, Pa., and J. DOYLE, of Wetumpka, Ala.—*Improvement in Sugar Cane Harvesters*.—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the double axle C, or an axle formed of two parts a a , connected by a clasp E, or its equivalent, in connection with the right and left screw shaft F F, fitted in the parallel beams A A, to which the parts a a of the axle are attached, for the purpose of admitting of the lateral adjustment of the cutters O, to suit the width of the space between the rows of canes, as set forth.

Second. The employment or use of the cutters O, and knives T, when placed on shafts T R, and used in connection with leger blades *m*, beaters S, and guide rods W, for the purpose of cutting simultaneously, the cane at top and bottom, as described.

Third. The arrangement of guide rods X, and pendant curved rods Z, in connection with the discharging levers B¹, substantially as shown, for the purpose of allowing the cut cane to be discharged from the machine in gavels, as set forth.

Fourth. The arrangement of the sliding shafts L, with slides or bearings *f*¹, levers *h*, and shafts M, substantially as shown, to admit, when necessary, of the cutters O, as well as the knives T, being readily thrown out of gear, and the cutters O, at the same time, elevated.

No. 30,227.—WILLIAM H. JOHNSON, of Richmond, Ark.—*Improvement in Cotton Cleaners*.—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination, with a cotton gin, of an inclined flue, having a continuous slotted bottom with curved tapering passages through it, and the fan beaters; said parts being arranged and operating, relatively to one another, substantially as and for the purposes set forth.

No. 30,228.—FREDERICK JONAS, of McConnel's Grove, Ill.—*Improvement in Breech Loading Fire Arms*.—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the connection of the barrel C, with the frame A, by means of a spring D, applied as described, to serve both as a flexible joint and as a means of returning the barrel to its position for firing, substantially as described.

Second. The arrangement of the cocking lever K, in combination with the trigger guard lever E, substantially as described, to provide for the operation of the said lever K, either by or independently of the trigger guard lever.

No. 30,229.—JOEL F. KEELER, of Cleveland, Ohio.—*Improvement in Freight Car Locks*.—Patent dated October 2, 1860.—This invention relates to the form and structure of the lock, by means of which the key hole can be sealed up, either before or after locking, being self-acting, that is, it can be locked without the use of the key and without breaking the seal.

Claim.—The spring lock and hasp, in combination with the provisions for sealing the escutcheon, as described.

No. 30,230.—JOHN KOPPE, of New York, N. Y.—*Improvement in the Glass or Metal Harmonicon*.—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Producing a scale of tunes, hanging the plate A, of a pianoforte upon two threads *n u*, passing over two rows of pins *e*, in such manner that each end of each plate A shall be supported between two inclined portions *n*¹ *n*¹, of thread *n*, for the purposes described.

No. 30,231.—SALEM T. LAMB, of New Washington, Ia.—*Improvement in the Cutting Apparatus of Harvesting Machines*.—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A cutting apparatus composed of the following elements, viz: a guard hollow above and below the cutter blades, opening above, below, and in rear of the cutter bar, and flanges on top, extending in a curve forward to the cutters and laterally to each other, to form a line in close proximity with the cutter blades and a cutter bar, supported on all four sides on independent bearers; all substantially as and for the purpose described.

No. 30,232.—HENRY S. LESHER, of Brooklyn, N. Y.—*Improvement in Diaper Pins*.—Patent dated October 2, 1860.—This invention consists in combining, with a circling pin jointed to the end of a tube made in the form of a segment of a circle corresponding with the circle of the pin, in the opposite end of which the sharpened end of said pin enters, a spring hook bar, which extends to and hooks on the portion of the pin directly opposite, in such a manner as to enable the pin to be secured in place when passed through the portions of the diaper required to secure the same, with its sharpened end or point sheathed in the tube.

Claim.—Combining with the pin A, and tube B, jointed together as described, the cross hook bar C, or its equivalent, for holding the point of the pin A, in place within said tube, substantially as set forth.

No. 30,233.—DE WITT C. LOCKWOOD, of Derby, Conn.—*Improvement in Martingale Rings*.—Patent dated October 2, 1860.—This invention consists in interlocking with one or both sides of the ring its metallic lining.

Claim.—As a new article of manufacture, a martingale ring having its metallic lining interlocked with its sides, substantially as and for the purpose described.

No. 30,234.—CHARLES B. LONG, of Worcester, Mass.—*Improvement in Planing Valve Seats of Steam Engines.*—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the arrangement and combination of the carriage B, and its feeding mechanism with the supporting frame A, the cutter carriage F, and its mechanism for imparting to it reciprocating longitudinal movements, as described; the whole being substantially as and for the purpose specified.

I also claim the combination and arrangement of the parts for operating the screw H, for effecting the reciprocating movements of the cutter carriage F, such parts being the two tubular shafts K L, the clutch P, the pitman or slide rod R, the bifurcated lever S, the weighted lever T, and its shouldered rod V, and the bent arm U; the whole being applied to the set screw and to the two carriages B and F, and the tubular shafts K L being geared to the driving shaft, substantially as described.

No. 30,235.—FREDERICK H. MANNY, of Rockford, Ill.—*Improvement in Harvesters.*—Patent dated October 2, 1860.—This invention consists in so arranging the frame timbers upon which the platform rests, with respect to the finger beam and main frame, as to diminish the distance between the front and rear of the frame.

Claim.—The arrangement of the beams *a b c d*, relatively to the finger beam and main frame, and to each other, substantially as described, for the purpose set forth.

No. 30,236.—NATHANIEL HENRY McLEAN, of the U. S. Army.—*Improved Window Curtain Fixture.*—Patent dated October 2, 1860.—This invention consists of a case A B C D, in which work a large wheel or roller 1, two small wheels or rollers 2 and 3, a sliding carriage E F G H, a spring S, and a rod R.

Claim.—The large wheel or roller 1, and the two wheels or rollers above it, 2 and 3, the sliding carriage E F G H, the spring S, and rod R, when arranged and combined, substantially as and for the purpose specified.

No. 30,237.—LEVI J. MASTERSON, of Newton, Mass.—*Self-adjusting Skate.*—Patent dated October 2, 1860.—This invention consists of a skate, the spring of which is locked in position on the runner by the downward pressure of the foot, when the skate is applied to the foot and in combination therewith, of adjustable toe clamps for holding the front part of the boot to the skate, which clamps are drawn backward and tightened to the foot by the descent of the heel part of the foot piece.

The inventor says: I *claim*, first, the spring foot piece C J B, locked to the runner A, by the pressure of the foot, substantially as set forth.

Second. I claim the clamps E, operated by the descent of the heel piece C, substantially in the manner described.

No. 30,238.—A. C. McNULTY and D. LYMAN, JR., of New York, N. Y.—*Improved Kaleidoscope.*—Patent dated October 2, 1860.—The nature of this improvement is shown by the claim and engravings.

Claim.—The arrangement of two or more pairs of kaleidoscopic mirrors A, in one case B, substantially as and for the purpose set forth.

No. 30,239.—DAVID M. MEFFORD, of Jeffersonville, Ind.—*Improvement in Machines for Stemming Corn Husks.*—Patent dated October 2, 1860.—This invention has for its object the effective and economical separation from corn shucks of the hard portion at the base of the blades, commonly called "the stub" or but, and consists of a series of toothed and corrugated cylinders, guard and stripper.

Claim.—The combination of the toothed picker B, gripping cylinder G, and guard J, operating in the manner and for the purposes set forth.

No. 30,240.—CHARLES R. OTIS, of Yonkers, N. Y.—*Improvement in Oscillating Engines.*—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment, in combination with a steam chest, arranged at one side of the cylinder of an oscillating engine, and having the bearing of one trunnion resting upon it, of two arms G G, secured to the said chest, for the purpose of supporting the opposite trunnion, also, from the steam chest, substantially as described, for the purpose set forth.

No. 30,241.—E. G. OTIS, of Yonkers, N. Y.—*Improvement in Oscillating Engines*.—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the steam chest B, containing the two sets of passages $d^* d^1 d^1 d^2 d^2 e^* e^1 e^1 e^2 e^2$, in such a manner as to constitute the main framing of the engine, that is to say, as to support the bearings of the main shaft, and of one trunnion of each cylinder, substantially as described.

Second. The arrangement of the steam chamber n in the bed plate, in communication with cavities in the standards F F, for supporting the outer trunnions, whereby the outer trunnion bearings are caused to rise and descend with the inner ones, as the latter rise and descend with the expansion of the steam chest B.

Third. The springs L L, applied to the outer trunnions, substantially as and for the purpose specified.

No. 30,242.—AUGUSTE PELLET, of Paris, France.—*Process of Ornamenting Leather Cloth*. Patent dated October 2, 1860.—The claim explains the nature of this invention.

The inventor says: I *claim* the peculiar succession of operations to secure the firmness and durability of the ornaments, consisting of, first, ornamenting the unvarnished tissue with colors that sink to the surface thereof, and then varnishing and rolling the same to complete the operation; and this I claim as my invention, for the purposes set forth.

No. 30,243.—MALTBY K. PELLETREAU, of New York, N. Y.—*Improvement in Bookbinders' Standing Presses*.—Patent dated October 2, 1860.—This invention consists in mechanism for locking and unlocking the cylinder, and also in furnishing the front part of the frame with a projection extending in a rearward direction, and surrounding the cylinder axis pin in front of the cylinder, and having the part above the said pin made V-shaped and sharp edged, for the purpose of scraping from the front of the cylinder any dirt that may result from the firing of the charges, and preventing such dirt finding its way between the cylinder and pin, and clogging the operation of the cylinder.

The inventor says: I *claim* the arrangement of the guide rack bars G, pinions E E, shaft D, worm wheel L, screw C, and shaft M, with the followers A³ I, and top and bottom plates A A, as shown and described, whereby the press is strengthened, the followers guided, and the lower follower quickly adjusted, all as set forth.

No. 30,244.—WILLIAM PHELPS and CLARK WRIGHT, of Sycamore, Ill.—*Improved Washing Machine*.—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The described arrangement of a smooth board G, and a corrugated rubber H, fixed obliquely in opposite outside corners of each of a series of chambers mounted on the extremities of revolving arms; the said parts being constructed and combined in the manner and for the purposes set forth.

No. 30,245.—E. A. PRESCOTT, of Worcester, Mass.—*Improvement in Revolving Fire Arms*. Patent dated October 2, 1860.—This invention consists in the peculiar arrangement of a smooth board and corrugated rubber, fixed obliquely in opposite corners of each of a series of chambers, mounted on the extremities of revolving arms to increase the efficiency of the machine.

The inventor says: I *claim* the combination of the lever-like locking dog G, elbow-shaped unlocking lever H, and the stud l ; the whole applied and operating, in connection with and relatively to the hammer, substantially as specified.

And I further claim the rearward projection on the front part of the frame, having its upper part made V-shaped and sharp edged, as illustrated in Figs. 5 and 2, for the purpose specified.

No. 30,246.—ISAAC M. POTTER, of Providence, R. I.—*Improvement in the Manufacture of Sheet Metal Finger Rings, &c.*—Patent dated October 2, 1860.—This improvement consists in bending the blank, after it has been struck in a die, without first filling it with solder. For this purpose a metallic former 5 is used, the diameter of which is smaller than that of the ring to be made. The former has upon its surface the same figure or device that is upon the blank after it comes from the die, so that the elevations and depressions on the under surface of the blank will fit the corresponding elevations and depressions on the former.

Claim.—The use of a former Fig. 5 when used in the manner described, for the purposes specified.

No. 30,247.—GEORGE P. REED, of Roxbury, Mass.—*Improvement in Watches*.—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The construction of a flat or cylindrical balance spring for a watch or other time

keeper, with an adjusting coil *a a* or *e e*, substantially as described, making at least one full turn around the the axis of the balance, but not forming a regular continuation of the coil of the spring.

No. 30, 248.—THEODORE M. RICHARDSON, of Stockton, Me.—*Improved Device for Securing Plane Bits*.—Patent dated October 2, 1860.—The throat *b* of the plane stock A, is furnished with a stationary cap iron or cutter bearing C, against the under side of which the cutter or plane iron D is arranged. The said plane iron is forced or clamped against the cap iron by means of a wedge E, a pitman F, an inclined plane G, and a screw H, arranged relatively to each other.

Claim.—The arrangement of the clamp wedge E, the pitman F, the inclined plane G, and the screw H, with the plane iron D, its cap bearing C, and the stock A, substantially as described.

No. 30,249.—CHARLES ROBINSON, of Cambridgeport, Mass.—*Improved Clothes Dryer*.—Patent dated October 2, 1860.—From the loose collar C, turning freely on the upper end of the rod B, is suspended, by a suitable number of elastic cords *ff*, a hub or ball D, which has an aperture through its centre sufficiently large to allow it to freely turn and slide on the rod. A convenient number of radial arms *d d* project horizontally outward any desirable distance. The collar C is supported by the pin *c*, and a knob *a*, or its equivalent, is attached to the lower end of the rod B to prevent the hub D from sliding off from the rod, and to support the same when its arms are loaded.

Claim.—The combination and arrangement of the rod B, with its catch *b*, hub D, with its radial arms *d d*, and the elastic cords *ff*, the whole forming an improved article of manufacture substantially as and for the purposes specified.

No. 30,250.—GEORGE SANFORD, of Providence, R. I.—*Improvement in the Manufacture of Bracelets*.—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The improvement described in the method of making the half band for ladies' bracelets, and similar articles—that is to say, in forming both the outer and inner surfaces from a single piece of sheet metal, substantially as specified.

No. 30,251.—WILLIAM SCARLETT, of Aurora, Ill.—*Improvement in Biers*.—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: First. I *claim*, in biers, constructed with windlasses for lowering the coffin, the arrangement of the longitudinal cords C C and cross supports D D, adapted to slide thereon, substantially in the manner and for the purposes set forth.

Second. I claim so arranging the cords C C and straps E E, or their equivalents, upon the windlasses B B¹, that a continued rotation of the latter lowers the coffin and then disengages the sliding supports D D, or their equivalents, therefrom, substantially in the manner above specified.

No. 30,252.—GEORGE W. SCOLLAY, of St. Louis, Mo.—*Improvement in Glass Coffins*.—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, making a glass coffin, with the rib I near the upper edge thereof, and in combination with the flange *v*, to strengthen and stiffen the said flange and upper edge of the coffin, to serve as a basis for the lid to rest upon and as a handle to lift the coffin by.

Second. I claim making the upper edge of the body of the coffin and the lower edge of the lid thereof, with the flange and lateral grooves, in the manner described, for the purpose specified.

Third. I claim the use of a valve or cock, in combination with a coffin, arranged in the manner described, so that a pipe can be attached to exhaust the air out of the coffin, when said cock and coffin are of glass.

Fourth. I claim the use of the glass plugs *b*, (the head of which is shown in Fig. 2, by *b*,) for the purpose of uniting the lid to the body of a glass coffin more firmly than the cement would unite it unaided by the said plug.

No. 30,253.—JOHN P. SCUDDER, of Hightstown, N. J.—*Improvement in Potato Diggers*.—Patent dated October 2, 1860.—The claim and engravings explain the nature of this improvement.

Claim.—Constructing the elevator with a series of open or grated bottom radial chambers and corresponding series of open curved fingers *j*, which are caused to pass through a series of open fingers *k*, upon the digger, as set forth.

No. 30,254.—S. B. SEXTON, of Baltimore, Md.—*Improvement in Cooking Stoves and Ranges*.—Patent dated October 2, 1860; antedated September 17, 1860.—This invention consists in a certain arrangement in the construction of cooking ranges.

Claim.—The arrangement of chambers A B and C, and flues *a b c d e* and F, with the grate G, constructed as described.

No. 30,255.—HIRAM M. SHAFFER, of Bucyrus, Ohio.—*Improvement in Bee Hives*.—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The within described miller and robber trap, constructed substantially in the manner specified, to wit: a box A, provided with a wire gauze cover and having two of its sides pierced with inclined holes D D, one of its sides provided with a sliding door and the other side provided with a flange or shelf, beneath and above which long openings are cut, the whole being arranged and used as and for the purpose set forth.

No. 30,256.—JAMES S. SILVA, of Savannah, Ga.—*Improvement in Ice Cream Freezers*.—Patent dated October 2, 1860.—This invention consists in the arrangement of a triangular hollow dasher, in combination with a scraper of corresponding form in the interior of the barrel, in such a manner that by turning the dasher its three corners scrape off the ice which may adhere to the inside of the barrel, and on moving the dasher up and down its sides are scraped off clean by the action of the scraper; by this arrangement the formation of the ice is considerably accelerated.

The inventor says: I *claim*, first, the arrangement of a triangular dasher C, in combination with the cylindrical barrel A, as described, so that in turning the dasher its corners serve to keep the inside of the barrel clear of ice.

Second. The arrangement of the scraper E, in combination with the hollow dasher C, constructed and operating substantially as and for the purpose set forth.

No. 30,257.—SAMUEL SLOCOMB, of Cambridge, Mass.—*Improved Inkstand*.—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

Claim.—In combination with a well and a hollow plunger, the projection *f*, formed of the same material and at the same time that the bowl of the inkstand is formed, and fitting into the opening *e* in the plunger, as set forth and represented, and for the purpose specified.

No. 30,258.—ERASTUS W. SMITH and JOHN H. MARS, of New York, N. Y.—*Improved Steam Boiler*.—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the combustion chamber D, relatively to the two tiers of furnaces and to the flues, or their equivalents, whereby the gases from the upper tier of furnaces are drawn downward and mingled with those from the lower tier, in the middle and lower portion of the combustion chamber, and the agitation and combustion is allowed to proceed in the large flues along the bottom of the boiler, and the heat is extracted in a series of smaller flues or tubes, which makes a partial return of the draught and terminates in an uptake or equivalent connection H immediately behind the upper furnaces, substantially as set forth.

No. 30,259.—SAMUEL SOULE, of Cincinnati, Ohio.—*Improved Apparatus for Printing Addresses on Newspapers, &c.*—Patent dated October 2, 1860.—A represents a plate made of metal or other material, to which is secured a platen C; this platen is secured to the plate by means of a shaft D which passes through its rear end and which rests in suitable bearings upon the plate.

Claim.—The moving plate A, with platen attached, when used in connection with and made to traverse the forms in the chase, in this or any equivalent manner, for the purpose specified.

No. 30,260.—AUGUST SPELLIER, of Philadelphia, Pa.—*Improvement in Revolving Fire Arms*.—Patent dated October 2, 1860.—This invention consists of a spring, or its equivalent, connected to and arranged on the frame which carries the revolving breech, so that the fire-arm may be used for metallic cartridges, or ordinary charges.

Claim.—The spring I, or its equivalent, connected to and arranged on the frame B, in respect to the revolving breech and hammer D, substantially as specified.

No. 30,261.—CHARLES F. SPENCER, of Rochester, N. Y.—*Improved Hose Coupling*.—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* my improved packing for hose couplings, consisting of the loose ring *f*, of India rubber, or its equivalent, in combination with the annular chamber *d*, for retaining the same in a position to readily impact with the end of the inserted section B by the force of the water passing through the hose, substantially as set forth.

I also claim, in combination with said packing ring, the groove i^1 , on the neck of tube B, and latch g, or its equivalent, substantially as and for the purposes specified.

No. 30,262.—GEORGE A. STEPHENSON, of Paw Paw, Mich.—*Improvement in Reapers and Mowers*.—Patent dated October 2, 1860.—This invention relates to an improvement in the metal harvester frame; its object is to secure lightness and economy in construction and a simple means of adjustment of the sickle-operating mechanism.

Claim.—The combination of curved loops D D, forming the main frame, with the finger bar B, cam wheel E, with its adjustable journal boxes and pins i i , when the parts are constructed, arranged, and operated as described.

No. 30,263.—JOHN A. STEWART, of Philadelphia, Miss.—*Improvement in Ploughs*.—Patent dated October 2, 1860.—This invention consists in the arrangement of an adjustable triangular point, perforated cutter, and landside, also perforated and adjustable, and the mould board of a plough.

Claim.—The arrangement of an adjustable, triangular point C, perforated at J^1 J J^1 , cutter and landside D, also perforated and adjustable, and mould board A of a plough, the whole constructed substantially as and for the purposes set forth.

No. 30,264.—THOMAS T. STRODE, of Mortonville, Pa.—*Improvement in Adding Machines*.—Patent dated October 2, 1860.—This invention consists, first, in the combination with the registering apparatus, of a platform, provided on one end with a stationary guide strip, and on the other with an adjustable slide, so that it can be conveniently adjusted to the size of the account book with which it is to be used; second, in the arrangement of a notched slide in combination with a platform and the registering apparatus, so that by adjusting said slide the row of figures to be added is kept before the eyes of the accountant.

The inventor says: I *claim*, first, the combination of a registering apparatus A with the platform C and V-shaped guide strips E E^1 , constructed and operating substantially as and for the purpose described.

Second. The arrangement of the notched slide D, in combination with the registering apparatus A, constructed and operating substantially in the manner and for the purpose set forth.

No. 30,265.—DARWIN TALBOT, of Ironton, Mo.—*Improvement in Saws*.—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Combining alternate short and long teeth, when the former are narrower at their cutting points than the latter, both being made as hereinbefore described.

No. 30,266.—WILLIAM H. TOWERS, of New York, N. Y.—*Improved Inkstand*.—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Combining, with the body or reservoir A of the inkstand, having a circular opening C in its top and a groove F around its periphery, a correspondingly perforated turning cover B, having lugs E on its rim, which move in said groove substantially in the manner and for the purpose set forth.

No. 30,267.—PHILIP ULMER, of Charlestown, Mass.—*Improved Bed Bottom*.—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination and arrangement of the rubber webbing, the steel spring, the wood slat, and the leather strap, by which one length slat may be made adjustable to bedsteads of various lengths, substantially as and for the purpose specified.

No. 30,268.—PIERRE D. VAN HOESSEN, of New York, N. Y.—*Improvement in Wagon Wrenches*.—Patent dated October 2, 1860.—This invention consists in the arrangement of a revolving head, with holes of different sizes in its sides, in combination with a rotary handle, in such a manner that the different sides of the head can be brought to face the nut or screw to be operated upon, and that by the different sizes of the holes provision is made for the different sized screw heads or nuts on a wagon.

The inventor says: I *claim*, first, the arrangement of the revolving head A, provided with holes b of different sizes, in combination with the rotary handles D, constructed and operating substantially as and for the purpose specified.

Second. The combination, with the revolving head A and handle D; of an additional stationary handle or supporter E, constructed and operating substantially as and for the purpose set forth.

No. 30,269.—HENRY G. WILDEY, of Philadelphia, Pa.—*Improvement in Animal Traps*.—Patent dated October 2, 1860.—The operation of this trap is as follows: The animal enters

the box A through the hole B, and its weight carries down the shelf B and raises the weight J, opening the hole B¹ and closing the hole B by piece D¹; the light then attracts the animal into the cage C, when the weight J will raise the shelf and close the hole B¹; the parts will then be set again for another.

Claim.—The arrangement of the movable shelf D, box K, cover L, and sliding doors J D¹, with the rods E g and weighted lever E, as and for the purposes set forth and described.

No. 30,270.—JONATHAN WARREN, of Brooklyn, N. Y.—*Improved Pen Cleaner.*—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A pen cleaner constructed of a bottle A, with an inclined spout and with a curved back, and being provided with a brush B, which is retained by a notch c under the neck of the bottle, as described.

No. 30,271.—MAURICE VERGNES, of New York, N. Y.—*Improved Electro-Magnetic Helix.* Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* constructing a helix of a number of separate wires, when each of such wires is so arranged or coiled as to form a double lay, substantially as described, each lay lying against or in contact with the other, but not crossing it, and when such wires are so connected with each other, as described, that the section of the helix, at right angles with the axis of its core, shall be increased as the distance from the battery is increased, such section being the greatest in the middle of the helix.

I also claim, in combination with a helix, the use and application of the armature or iron plates k k¹, substantially as described, for the purpose of increasing the power of the helix.

No. 30,272.—MAURICE VERGNES, of New York, N. Y.—*Improvement in Electro-Magnetic Engines.*—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of a series of electro-magnets disposed as the radii of a wheel, on a common centre or axle, and revolving within stationary helices, and the polarization of which revolving magnets is constantly changed, as described, so that all such magnets shall have a like polarization when passing through one end of the helices, the polarization of which helices remains continually the same.

I also claim the general arrangement of the whole apparatus, substantially as and for the purposes set forth and described.

No. 30,273.—JOHN A. VEATCH, of San Francisco, Cal.—*Improved Gold Separator.*—Patent dated October 2, 1860.—This invention consists in the use of a rotating disk, annular trough, and a cup, by which the desired end is obtained.

Claim.—The rotary disk D, with or without the trough C, in connection with a cup E, communicating with the disk by a perforated space e, substantially as and for the purpose specified.

No. 30,274.—JOHN J. WATSON, of Buffalo, N. Y.—*Improved Water Wheel.*—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

The inventor says; I *claim*, first, the wheel C, consisting of a series of buckets made and placed substantially in the form and position herein represented, together with the cylinder G, and its arms H H and collar I, as set forth.

Second. The lower wheel, as constructed, revolving independently in the cylinder G, and used separately or in connection with the wheel C, when the whole are constructed and arranged to operate substantially as specified.

No. 30,275.—HENRY WILKINS, of Brownsville, Pa.—*Improvement in Furnaces for Steam Boilers.*—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of two furnaces or fires, separated by a division wall, with a return flue arranged as described, so that the smoke and products of combustion from one fire, after traversing its furnace, are caused to pass over the other fire, previous to their escape into the chimney, for the purpose set forth.

No. 30,276.—McCLINTOCK YOUNG, JR., of Frederick, Md.—*Improvement in Reaping and Mowing Machines.*—Patent dated October 2, 1860.—This invention relates to the combination of certain devices for the purpose of connecting or disconnecting the cutting apparatus to or from the gearing of a harvesting machine.

Claim.—The combination of the self-acting spring clutch lever G with the loose driving wheel D, and fast gear wheel E, for making a self-acting clutch, substantially in the manner and for the purpose described.

No. 30,277.—WILLIAM T. ANDERSON, of Brooklyn, N. Y., assignor to himself and H. S. ARCHER, of said Brooklyn.—*Improvement in Binding Engravings, &c.*—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The construction and arrangement of the sheets with joints or hinges at graduated distances from the back of the cover, increasing from the sides towards the middle of the book, so that the inner leaves will fold over those outside of them without breaking or coming loose from the cover, as described.

No. 30,278.—EDWARD H. GRAHAM, of Manchester, N. H., assignor to BENJAMIN H. WHITCOMB, of Henniker, N. H.—*Improvement in Skates.*—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* hinging the fore end of the toe pad to the runner, so that it may be vibrated and adjusted to the height of the heel of the boot or shoe, as required.

And, in combination with a toe pad hinged to the runner, as above claimed, I claim the screw D, or its equivalent, for adjusting and supporting the rear end, substantially as described.

I claim fastening the heel pad to the runner by means of the dovetailing score E, groove H, and screw F, substantially as described.

No. 30,279.—FREDERICK MATHUSHEK, of New York, N. Y., assignor to himself and WASHINGTON WELLS, of said New York.—*Improvement in Piano Fortes.*—Patent dated October 2, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination and arrangement of the cross bars 13, the wrest plank bar 5, the wrest plank 4, the string plate 9, and the interior braces and bolts forming the frame work of the piano forte, substantially as set forth.

Second. The mode of arranging the strings of a piano forte, in combination with the arched or concave sounding board, so as to make a tension or pressure of the strings against the arch of the board, and in the same direction with the stroke of the hammers, substantially as described.

Third. The wrest plank bar 5, with the arrangement of the inverted bridge 8, or its equivalent, and of the strings thereon, in combination with said bar and the wrest plank and cross bar, substantially as described.

No. 30,280.—C. WATSON, of Cascade, Va., assignor to himself and A. H. TINSLEY, of said Cascade.—*Improvement in Harrows.*—Patent dated October 2, 1860.—The inventor says: From a description of this machine, it will be seen that the harrow is composed of but few parts, but one toothed wheel being used, and a single adjustable weight, which does not require to be very heavy in order to be efficacious, on account of the leverage obtained in connecting it with the upper part of the axle E.

Claim.—The arrangement of the box I, arm z^1 , rotary collar H, upright axle E, brace G, beam F, hub A, and arms B, all as shown and described, for the purposes set forth.

No. 30,281.—E. R. SHEPARD, of Scranton, Pa., assignor to ABEL BAKER, of Carbondale, Pa.—*Improvement in Blind Hinges.*—Patent dated October 2, 1860.—This invention consists in a particular manner of attaching the endless screw and the head, which serve for operating the hinge, to their respective guide plates by means of double nosed flanges, whereby is used a connection rod, which is placed quite loosely into the sockets in the screw and in the head, the length of which can be adjusted according to the thickness of the casing through which it passes.

The inventor says: I *claim*, first, arranging the flanges $g g^1$ in the head D, or on the screw d with two noses m , in the manner and for the purpose set forth.

Second. Arranging the head and the screw d in such a manner that the connection rod F can be placed quite loosely into the sockets $j j^1$, as and for the purpose specified.

No. 30,282.—FRANCIS B. ABBOTT, of St. Louis, Mo.—*Improved Quartz Crusher and Amalgamator.*—Patent dated October 9, 1860.—The frame of this machine consists of a bed plate A and four upright columns B; the said columns are made hollow, and bolted to the bed plate by means of link bolts passed through the column; between each pair of columns the braces Y Y and W W are fixed to secure the said columns to each other, and to serve as guides for the stamping rods. R^1 is a steam boiler with the ordinary mountings attached; and G is a steam pipe leading from the boiler to the engine to supply it with steam. H is the exhaust pipe leading from the engine to the heater R, fixed upon the upper end of the two inside columns.

The inventor says: I *claim*, first, the use of the heater R, in combination with the boiler and crusher, when arranged in the manner described for the purpose specified.

Second. I claim constructing, arranging, and operating the amalgamator, substantially in the manner described for the purpose specified.

Third. I claim arranging the engine and boiler with the crusher and amalgamator, substantially in the manner described, for the purpose of economizing in the room, weight, and cost of quart crushing apparatus.

No. 30,283.—A. LEMUEL ADAMS, of Philadelphia, Pa.—*Improved Apparatus for Copying Letters*.—Patent dated October 9, 1860.—This improvement consists in the use of movable retaining hooks, or their equivalent, for retaining the roller after the papers have by its aid been rolled up in the folds of the apron, thereby relieving the operator from the necessity of holding the rollers in the desired position while the copy is produced.

Claim.—The employment of the retaining hooks *d d*, or their equivalents, in combination with the roller B and its apron C, whether the said roller and apron are used in connection with the board A, or are applied directly to a copying book, as set forth.

No. 30,284.—JOSIAH ASHENFELDER, of Philadelphia, Pa.—*Improvement in Transferring Railroad Cars from one Track to Another*.—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment, in connection with the sidings or turnouts of railroads, of a supplementary inclined rail, in combination with car wheels, so constructed in respect to said supplementary rail, which is so arranged in respect to the rails of the straight and of the deviating line of road, that the wheels are moved from the influence of the rails of the one line of road to that of the other, as described.

No. 30,285.—HENRY BEAMER, of Smithburg, Pa.—*Improvement in Fruit Dryers*.—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, in combination with the drawers or trays E, the double inclined hinged covers B B, and hinged gables C C, arranged as represented, so as to protect or expose said trays, in the manner and for the purpose set forth.

I also claim, in combination with the drying chamber, the hinged frames E, that may be swung into or out of said chamber, for the purpose of protecting or drying by artificial heat inside, or exposing the fruit to the air or sun, as circumstances may require, and as set forth.

No. 30,286.—AARON BECHTOL, of Berkley Spring, Va.—*Improved Bedstead Fastening*.—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The bed posts mortised as described, in combination with a bed frame mortised in a corresponding manner, so that the two ends of the frame may be supported across their entire width by means of transverse rails, and the posts and frame held together by means of adjustable dogs or buttons, substantially as and for the purposes set forth.

No. 30,287.—JAMES ARLINGTON BENNET, of Kings County, N. Y.—*Improvement in Propelling Cars on Railroads*.—Patent dated October 9, 1860.—In this machine there are 16 cog wheels, 8 inside and 8 outside of the sides of the car, and two small wheels fixed on the axle as at S. A lever on each side will wind up the whole, equal to fifty horses.

Claim.—The combination and arrangement of the entire machine for propelling machinery, cars on railroads, and other vehicles, as described in this specification, consisting of springs, cog wheels, ratchets, and levers.

No. 30,288.—JOHN A. BERRILL, of Waterville, N. Y.—*Improved Paint Mill*.—Patent dated October 9, 1860.—The object of this invention is to prevent the paint, as it is ground, from flying off from the runner or revolving grinding plate, as it is discharged from between said plate and the upper stationary one.

Claim.—Forming the periphery of the rotating grinding plate A, with a recess *a*, to provide a ledge *b*, as and for the purpose set forth.

No. 30,289.—PETER I. BIDERMAN, of Philadelphia, Pa.—*Improvement in Conveying City Railroad Cars over Obstructions*.—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Raising and lowering the forward and rear trucks of the car, substantially in the manner specified, whereby the car wheels are elevated so as to pass over obstructions upon the track, as and for the purpose set forth.

No. 30,290.—WILLIAM OLAND BOURNE, of New York, N. Y.—*Improvement in Ore Separators*.—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a bed for separating ores or similar substances, composed of layers of fibrous or woven materials, secured by stitches or equivalent means for main-

taining a fixed and firm support to said bed, and preventing unevenness and bagging, as set forth.

Second. In combination with a bed, constructed as set forth, I claim the adjustable plate or rim *f*, for regulating the depth of the ore on the bed, as described.

No. 30,291.—WILLIAM BRETENSTEIN, of New York, N. Y.—*Improved Fire Escape*.—Patent dated October 9, 1860.—This invention consists in constructing a fire escape, in which the ladder of the required length is wound around a reel in such a manner that it may be elevated and made rigid, similar to the ladders usually employed for that purpose; and it also consists in constructing an escape box, and in so connecting the same with the ladder that it may slide up or down on one side of the ladder, having the other side of the ladder free for ascension or descension.

The inventor says: I *claim*, first, the construction of the ladder, consisting of several sections joined and hinged, substantially as described.

Second. The secure folding and unfolding of the ladder, by means of the windlass H, the reel or drum D, and the ropes H, substantially as specified.

Third. The manner of attaching the escape box N to the ladder, and of sliding it on the same, substantially as set forth.

Fourth. The manner of adjusting the carriage and frame A to any position required, by means of the division of the frame, and the insertion of lever screw and handle P P, substantially as specified.

Fifth. The general construction of the machine, in the manner and for the purpose substantially as described.

No. 30,292.—FREDERICK BRUBACH, of Lancaster, Pa.—*Improvement in Wooden Coffins*.—Patent dated October 9, 1860.—This invention consists in forming the top or lid of two united halves B, on the head and foot pieces D, framed together at the wide or shoulder points by a cross piece C; the raised edges A, meeting centrally, fastened down by the screws *b*, thus forming four open pannels, against the under side of which, plates of glass E are secured air tight.

Claim.—The combined framework of the coffin lid A B C D, and pins *d*, with the glass plates E inserted, the loose pannels G H, with their pins K, and lock button I, when made substantially as specified, for the purpose set forth.

No. 30,293.—ISAAC C. BRYANT, of Philadelphia, Pa.—*Improvement in Casting Embossed Type*.—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the bottom and top letter, or letters, in a frame made of iron, brass, copper, or any other metal, suitable for the purpose.

Second. I claim the arrangement of the openings in the top letters, for putting in the steel, iron, or brass wire, forming the points or projections on the face of the type.

Third. I claim the combination of one or more guide letters at the top, with one or more letters at the bottom, formed so as to give the desired shape in points or projections to the letters or designs to be cast.

Fourth. I claim the combination of separate pieces of steel, iron, or brass wire, round, square, or any other shape suitable, in connection with frame and guide, and bottom letters, or designs.

Fifth. I claim the combination of points, so as to form a letter or letters, and solidifying them by casting type or other metal around them in a mould and double matrix, as described.

Sixth. I claim the mould, in connection with the matrix, slide, and pin, as described.

No. 30,294.—PARTICK BURKE, of Helena, N. Y.—*Improvement in Stabling Cows*.—Patent dated October 9, 1860.—This invention consists in making a raised bed or floor, upon which the cow lies, movable by placing the same upon rollers, and in perforating this movable floor for the purpose of allowing urine, &c., to pass through it, instead of depending upon the inclination of the floor to carry off the liquids.

Claim.—The arrangement of the perforated floor G, and the rollers E, with the tight floor D, and manger A, as and for the purposes set forth and described.

No. 30,295.—N. C. CARTER, of Union City, Ind.—*Improvement in Cultivators*.—Patent dated October 9, 1860.—This invention consists of a peculiar device for the purpose of regulating the distance between the cultivator teeth, for the purpose of enabling the same instrument, or implement, to be used successively on different crops where the distance between the drills is various.

Claim.—The arrangement of rods *c c*, rods *e e*, with the looped heads *e¹ e¹*, and terminal screw bolt *d¹*, in connection with rods *g* and *h*, and screw link *i*, all constructed and operated in the manner as and for the purpose set forth.

No. 30,296.—EZEKIEL CASNER, of Penn Yan, N. Y.—*Improved Mill Bush*.—Patent dated October 9, 1860.—The inventor says: To use my implement secure the case within the eye of the bedstone in position, so that the top of the cover will be on the plane of the top of the bedstone with the centres of each at the same point. The spindle being in place, put the bush blocks in their place, and secure them by the bottom and the bolts, lubricate the blocks and spindle, and then place some textile or fibrous substance, saturated with oil, about the spindle upon the blocks. When the cover is put on, the bush and spindle are ready for operation. The bush blocks may be loosened or tightened by the screws F F, and the same may be done while the spindle is in operation.

Claim.—The combination of the case A, bush blocks E E E E, bottom plate C, and bolts F F, when made and used substantially as specified.

No. 30,297.—ROBERT CATHCART, of Baltimore, Md.—*Improved Light for Cars*.—Patent dated October 9, 1860.—This improvement consists in the relative position assigned to the signal lamp upon the car, and the means of illumination employed in the interior thereof, so that whilst all the rays of light which pass to the inner part of the carriage have their full effect, those which are directed upward are economized and striking on the conical reflector are dispersed in the space outside.

Claim.—The arrangement in the manner specified of the conical reflector and lantern, relatively to the lamp and roof of railway and other cars, for the purpose described.

No. 39,298.—LEWIS S. CHICHESTER, of New York, N. Y.—*Improved Mill for Grinding Coffee*.—Patent dated October 9, 1860.—This invention consists of an oscillating grooved cylinder, combined with adjustable cheek pieces that are grooved on their inner faces with inclined furrows, and the cutting edges on the grooves on the cylinder standing in the reverse direction to those on the cheek pieces, and at an angle to the same, produces a shearing cut that is specially adapted to cutting, or cracking up grains of coffee into fine particles without the compressing and rubbing operation so usual in mills.

Claim.—The adjustable cheek piece *c c*, formed with converging grooves, in combination with the oscillating or vibrating cylinder *b*, as and for the purpose specified.

No. 30,299.—D. W. CLARK, of Stratford, Conn.—*Improvement in Stirrups*.—Patent dated October 9, 1860.—This invention is to render the sides of the stirrups adjustable in respect to their distance apart, so that any stirrup may be adjusted to suit the size of the boot or shoe of the rider, and so that the foot of the rider will also, when desired, be prevented from passing too far through the stirrup, thereby preventing liability to accident in case of the rider's fall from the saddle.

Claim.—I claim the making of the side pieces of stirrups adjustable in the manner and for purposes substantially as shown and described.

I also claim the spring G, between the side pieces, when arranged and operating as set forth.

No. 30,300.—T. COTRELL CLARKE, of Camden, N. J.—*Improved Filter*.—Patent dated October 9, 1860.—This invention consists of a self-cleaning filter, that allows the sediment to pass off from the filter, each time the water is drawn, or whenever desired, so that the filtering medium is cleansed, without reversing, and an accumulation of sediment prevented.

The inventor says: I claim, first, in a filter for water, an opening or escape on the supply side of the filtering medium, controlled in the manner set forth and for the purposes specified.

Second. I claim the slide *l*, in combination with the valve *h*, for opening said valve to clean the filter or draw unfiltered water, as specified.

Third. I claim the construction of the divided case *c d*, kept together by the turn buttons *e e*, and provided with the ribs *l l*, forming the water channels, in the manner and for the purposes specified.

No. 30,301.—C. P. CROSSMAN and J. B. BROWN, of Warren, Mass.—*Improvement in Stove Radiators*.—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A heat radiating attachment for stoves, which is composed of an outer case A, flanged opening C, inner conical chamber B, filling B¹, top plate *a*, cold air pipe D, smoke pipe E, oven above the chamber B, with openings *b F*; the whole being constructed as set forth and described, so as to be capable of application to the top plates of common cooking and other stoves, all as set forth.

No. 30,302.—CYRUS DEBOLT, of Ottawa, Ill.—*Improvement in Cultivators*.—Patent dated October 9, 1860.—This invention consists in providing the means by which, in a corn plough or cultivator, part of the shovels or ploughs of which may cultivate one side of a row of grain, and the other part, of the other side, to vary the line of the furrow of the two inner

ploughs, and thereby to avoid the danger that would exist if no such means were provided, of cutting up, or otherwise injuring the hills of the row of corn, or other product over which the cultivator should pass.

Claim.—The arrangement of the handles C C, the joints K K, the brackets F, and the up-rights D D, for the purpose set forth and as described.

No. 30,303.—CHARLES DOOLITTLE, of Oswego, and ALFRED CARSON, of New York, N. Y.—*Improved Fruit Case.*—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The construction of the fruit case with a receptacle B, springs C, and an ice chamber f, the whole arranged and operating as and for the purposes set forth and described.

No. 30,304.—A. M. DYE, of Clinton, Ill.—*Improved Folding Bedstead.*—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Constructing the bed post in two sections D and F, when made to be conjoined by the ring C, or its equivalent, and secured in an upright position for use by the screw bolts c c, and thumb nuts g g¹, and when made to fold or turn upon said screw bolts c c, for the purpose of making the whole bedstead compact and portable, substantially as described.

No. 30,305.—LEWIS EVANS, of Morgantown, Va.—*Improvement in Breech Loading Ordinance.*—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, locking the breech piece F, in the breech end of the barrel A, by means of a hinged lock bar J, passing through a slot in the breech piece, and corresponding slots in the breech end of the barrel, as and for the purposes described.

Second. Operating the hammer F¹, by means of a hinged dog E, and the crank shaft B, as and for the purposes described.

Third. Adjusting the breech piece in line with the barrel, by means of toothed brackets L, moving in vertical ways, as and for the purposes described.

Fourth. The combination of the breech piece F, with a sliding standard R, spring catch O, pin A, incline T, and rack W V, for the purposes described.

No. 30,306.—JOHN ERICSSON, of New York, N. Y.—*Improvement in Air Engines.*—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the equilibrium cylinders a b, the equilibrium pistons f g, and the working piston o, when used substantially in the manner and for the purposes set forth.

Second. The combination of the equilibrium cylinders a b, the equilibrium pistons f g, the valves 5 and 6, the vessel k, and the tubes therein contained, when used substantially in the manner and for the purposes set forth.

Third. The combination of the equilibrium cylinders a b, the equilibrium pistons f g, the valves 3 and 4, and the heat deposit vessel h, when used substantially in the manner and for the purposes set forth.

Fourth. The combination of the equilibrium cylinders a b, the equilibrium pistons f g, the valves 5 and 6, and the heater i, when used in the manner and for the purposes set forth.

Fifth. The combination of the equilibrium cylinders a b, the equilibrium pistons f g, the valves 1 and 2, and the cooler n, when used in the manner and for the purposes set forth.

Sixth. The combination of the equilibrium cylinders a, the equilibrium piston f, the valve 5, and the bent pipe h¹ h¹ h¹, when used for the purposes set forth.

No. 30,307.—LEONARD Y. GARDINER, of Amsterdam, N. Y.—*Improvement in Window Sash Supporters.*—Patent dated October 9, 1860.—This invention consists in the employment of the India rubber ball or roller a, to hold the sash in place, said ball or roller travelling in grooves or guides b, formed in the sash or frame, or both.

Claim.—The India rubber (travelling) ball or roller a, and the groove or guide b, when constructed and arranged substantially as set forth.

No. 30,308.—WILLIAM M. GAREE, of Cox, Ohio.—*Improvement in Seeding Machines.*—Patent dated October 9, 1860.—This invention relates to that class of machines which are operated manually, and carried in the hands of the operator.

Claim.—The arrangement of the spring B, jaws D E, and board C, with the slide F, box A, guard plate j, and brush h, all as set forth and described, for the purposes set forth.

No. 30,309.—A. J. GIBSON, of Worcester, Mass.—*Improvement in Revolving Fire Arms.*—Patent dated October 9, 1860.—This invention consists in the employment, in combination with a cylinder, having its chambers opening into its rear face, of a recoil shield, made sepa-

rate from the frame of the arm, and movable transversely thereto, in such a manner as to expose the rear openings of the chambers to permit the insertion of cartridges thereat.

Claim.—The transversely movable recoil plate D, applied in combination with the chambered cylinder, substantially as and for the purpose specified.

No. 30,310.—WASHINGTON L. GILROY, of Philadelphia, Penn.—*Improved Paint Can.*—Patent dated October 9, 1860.—This invention consists in the manner of constructing the upper or chine end of the paint vessel, provided with a drop handle or bale for applying and securing thereto the head or cover.

Claim.—Constructing the upper end of the body of the vessel A, with the wired boundary edge or rim *d*, and the inner bead *f*¹, substantially in the manner and for the purpose set forth and described.

No. 30,311.—C. GLOYD, of Wynant, Ohio.—*Improved Frame for Bill of Fare.*—Patent dated October 9, 1860.—This invention consists in the arrangement of two arms, supported by three or more legs, and provided with suitable slots or recesses to receive the frame in which the bills of fare are adjusted, in such a manner that when adjusted in frames and placed in the arms, they are visible to persons sitting around the table, and can be examined by different persons from different sides of the table at the same time.

Claim.—The arrangement of the arms A, supported by legs B, and provided with recesses *b*, in combination with the frames D, constructed and operating substantially in the manner and for the purpose set forth.

No. 30,312.—G. W. GRADER and A. C. WURZBACH, of Memphis, Tenn.—*Improved Steam Gauge.*—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment of an air chamber, connected with the water space of the boiler, and interposed between it and the indicating gauge, substantially as and for the purpose shown and described.

No. 30,313.—JAMES T. HAM, of Senatobia, Miss.—*Improvement in Cotton Seed Planters.*—Patent dated October 9, 1860.—This invention consists in the employment of a bi-conical roller or seed hopper, placed within a suitable frame, which is provided with an adjustable furrow opener, covering device, and cleaver.

The inventor says: I *claim* the combination of the bi-conical roller or hopper C, with the adjustable rod G, arranged for joint operation, as and for the purpose set forth.

I further claim, in connection with the roller or hopper C and rod G, the adjustable arm E, provided with the furrow openers F C, and the adjustable bar H, all being arranged substantially as and for the purposes set forth.

No. 30,314.—LUDWIG H. HASSE, of New York, N. Y.—*Improvement in Sub-Marine Lamps.*—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the construction and arrangement of the sub-marine lamp, substantially as described, with a double bottom of the casing, containing caustic potash, and with an exhaust pipe, for the purpose of easily removing the products of combustion.

And I also claim the sub-marine lamp, substantially as specified, in combination with the tubes O and P, and with the piston Q, working on a detonating compound for the purpose of igniting the same, substantially as set forth.

No. 30,315.—ANDREW A. HENDERSON, of Portsmouth, N. H.—*Improvement in Caloric Engines.*—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the flame space *a*^{*}, between the cylinder A and G, substantially as and for the purpose set forth.

Second. The arrangement of the eccentric frame P, and reversible eccentric N, in combination with the supply piston J, constructed and operating substantially as and for the purpose specified.

Third. The combination of the regenerator J^s, with the supply piston J, constructed and operating substantially as and for the purpose described.

Fourth. The arrangement of the reversible eccentric X, in combination with the spring rod *d*, and the exhaust valve *b*, constructed and operating in the manner and for the purpose set forth.

No. 30,316.—DANIEL HERR, JOHN HERR, and JOSEPH F. HERR, of Lancaster, Penn.—

Improvement in Corn Planters.—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination and arrangement of the cogged cam M, slotted sliding ledge D, connecting blocks C C², sliding valves A, with their openings 3 3 and pegs 2, together with the hopper and shovel support E, on the pivotted side pieces F and cam support L, simultaneously operated by the lever Z, substantially as set forth and specified.

No. 30,317.—JOSEPH HILL, of Brooklyn, N. Y.—*Improvement in Galvanic Plates for Medical Use.*—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The galvanic foot plate or battery, formed of the sections *a b c d*, hinged or jointed together in the manner and for the purposes specified.

No. 30,318.—JAMES HOBBS, of Columbus, Ind.—*Improved Fire Escape.*—Patent dated October 9, 1860.—The speed of the descent may be checked at pleasure, either by the person descending or persons attending the operation from the ground, by exerting a more or less powerful strain on the end of the rope A, which is suspended from the friction plates B B¹.

Claim.—The arrangement of the clamping plates B B¹, with the screw C, crank *c*, and spring *b*, as shown and described, for the purpose set forth.

No. 30,319.—REUBEN W. HOYT, of Boston, Mass.—*Improvement in Apparatus for Burning Gas.*—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, carrying off the unconsumed products of combustion of the flame or jet by forming within the apparatus itself ventilating flues, arranged and operating as described, the same consisting of the main stock *a a*, and branch pipe *c*, terminating in a bell shaped mouth extending over the flame or jet as set forth.

Second. So arranging and locating the gas supplying pipes, or the reservoir from which all the branch pipes for conveying gas to the burners receive their supply that they or it shall receive, and be exposed to the upward heated currents that proceed from the flames or jets, substantially as described, and for the purposes specified.

No. 30,320.—LEWIS HOLCOMB, of Granby, Conn.—*Improvement in the Method of Oiling Leather.*—Patent dated October 9, 1860.—The claim explains the nature of this invention.

Claim.—The method of treating leather described, which consists substantially in submitting the leather, after it has been tanned, finished, and covered with tallow, to the action of a hot smoothing iron, all as set forth.

No. 30,321.—GILBERT HUBBARD, of Montville, Mass.—*Improvement in Measuring Faucets.*—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the piston and piston rod D¹, inlet and discharge valve orifices, with their valves *a c¹ c¹*, arranged as described, in combination with the rods C and C¹, wheel H, and pawls G I, operated alternately by the rising and falling of the piston, the whole being arranged relatively with each other and operating substantially in the manner set forth.

I further claim the wheel M, with its notches and teeth *i i*, and stop pin *j*, in combination with the index registering hand L, spring *k*, wheel *h*, pinion and shaft *g*, and ratchet wheel H, arranged substantially in the manner and for the purposes set forth.

No. 30,322.—CHARLES HUGHES, of New Orleans, La.—*Improved Machine for Straightening Bale Hoops, &c.*—Patent dated October 9, 1860.—In operating this machine the two pairs of rollers B C are rotated in the direction indicated by the arrows, power being applied to a pulley J attached to the axis of the upper roller B; the trough I is supplied with paint of any suitable kind, and as the rollers rotate, the hoops are passed between the rollers B C, the former straightening them and the latter covering them with paint.

Claim.—The arrangement of the rollers B B C C and platforms F F, with the paint trough I and drip box G, as and for the purposes shown and described.

No. 30,323.—KELLOGG T. HURLBURT and HOWARD THOMPSON, of Port Byron, N. Y.—*Improvement in Operating Gates of Canal Locks.*—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

Claim.—In combination with a vertically rising and falling lock gate, a moving frame for receiving and carrying said gate around out of the way of passing boats or craft, substantially as described.

No. 30,324.—GEORGE C. JENKS, of New York, N. Y.—*Improvement in Letter Boxes.*—

Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

Claim.—So notching or otherwise forming the edge of the ledge or ledges placed in the channel to the receptacle that the withdrawal of a letter shall be thereby prevented, substantially as described.

No. 30,325.—AMOS JONES, of Lebanon, N. H.—*Improvement in Roof Brackets.*—Patent dated October 9, 1860.—This invention is a new and improved bracket for pitched roofs, to be used thereon for roofing, slating, or for any kind of work where men are required to remain on roofs any length of time.

Claim.—The employment of the adjustable clamping plates *a a* and screws *b b c*, in combination with the strips A, hinged resting bar B, rack plate C, and hinged prop D, all in the manner and for the purpose shown and described.

No. 30,326.—JOHN JOHNSON, of Biddeford, Me.—*Improvement in Steam Generators.*—Patent dated October 9, 1860.—The operation of the pumps requires to be regulated so that the casing A is not overflowed and that the tubes are supplied from the said casing no faster than the steam is generated and used; the lower tubes B B are heated by radiation from the incandescent fuel on the grate, and all of the said tubes are heated by the circulation between, among, and around them, of the flame and heated gaseous products of combustion, the lowest tubes being heated most intensely, and those above gradually less, according to their distance from the fire.

Claim.—The arrangement of the tubes B and valves *f* with each other and with the independent water heating case A, in the manner shown and described.

No. 30,327.—F. W. KROEBER, of Forbestown, Cal.—*Improved Gate and Door Swing.*—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The application of the inclined plane, the wheel, the lever, and the spring, to the adjusting of gates and doors to any required position.

No. 30,328.—TRUCKSON S. LA FRANCE, of Elmira, N. Y.—*Improvement in Pistons for Steam Engines.*—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the hollow piston rod A with the rod B, when the said rod B is provided with inclined planes which act upon radial studs, in the manner and for the purpose specified.

Second. Elevating or depressing the rod B by means of nuts acting upon the screw bolts *f* and *g*, when the latter are placed at the extremities of the cross bar K, in the manner and for the purpose set forth.

No. 30,329.—ANDREW J. LAIRD, of Middletown, Pa.—*Improved Arrangement for Operating the Valves of Steam Engines.*—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The vibrating and sliding bar C, in combination with the rocker arm D, substantially as set forth, for operating the valve motion of steam engines.

No. 30,330.—SALEM T. LAMB, of New Washington, Ind.—*Improvement in Harvesting Machines.*—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, in combination with the pulley and crank and the semi-clutches formed thereon, and the spring for holding them together, the several devices that enable the driver, from his seat, to unclutch them for the purpose stated, said devices being arranged substantially as described.

I also claim, in combination with an automatic rake, the making of the teeth three sided, and presenting one of the sides thereof to the grain, when said teeth are inclined on the rake head from its heel towards its point, for the purpose of allowing the rake to clear itself from the grain, substantially as described.

I also claim, in combination with a sweeping rake, such as is represented, the interposing of the springs *f* and *g* (the former travelling with the rake and the latter stationary on the platform) between the rake and the part or point upon which it drops, when said springs are so arranged as not to retard the movement of the rake by their recoil, and so that the raising or lowering of the rake shall not be injuriously affected by any sudden jarring of its parts, but have a free and easy movement, as described and represented.

I also claim, in combination with a travelling rake, the travelling support *f*, substantially as and for the purpose specified.

No. 30,331.—ANDREW F. LAPHAM, of New York, N. Y.—*Improved Washing Machine*.—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The air-tight cylinder *d*, when constructed with transverse circular ribs *e*, as described, and arranged to revolve endwise together with the loose balls *f*, substantially as set forth.

No. 30,332.—JOHN PARKER LINDSAY, of New York, N. Y.—*Improvement in Locks for Fire Arms*.—Patent dated October 9, 1860.—This invention consists in the use of a detent which is operated by one of the hammers, so as to arrest the trigger and prevent action on the second sere until the trigger has been released by the finger and thrown forward by the action of the detent, when the detent is vibrated by its proper spring, and then by again pulling on the trigger it will act on the second sere, to release the second hammer to ignite the next charge.

Claim.—The use of the detent, in combination with the hammer and trigger, when the whole is constructed, combined, and made to produce the required result, substantially as set forth.

No. 30,333.—DENNIS G. LITTLEFIELD, of Albany, N. Y.—*Improvement in Furnaces*.—Patent dated October 9, 1860; ante-dated July 3, 1860.—This improvement is a combination of a stove and furnace, and consists in the employment of a cold air channel or inlets at the base, a perforated space in the covering opposite the most intensely heated part of the stove, and a top fixture to the covering to control the passage of the heated air, a device that can be used as a parlor furnace, warming the room where placed by heated air combined with direct radiation, or, as a double heating furnace, warming the room where placed by direct radiation, and rooms above by heated air.

Claim.—The combination of the cold air channel *H*, the perforations *s s s s s s s s s s*, the register top to covering *L L L L*, and the damper *R*, the whole being constructed and arranged in the particular manner specified.

No. 30,334.—FREDERICK H. MANNY, of Rockford, Ill.—*Improvement in Winnowing Machines*.—Patent dated October 9, 1860.—This invention consists in the employment of certain devices and arrangements for effecting a thorough winnowing of grain, and the improvement consists in suspending the shoe by means of springs at the sides thereof in such manner that each end of the shoe shall vibrate freely with a transverse movement through openings left for the purpose in the sides of the frame of the machine, and arranging below this shoe an inclined screen suspended by radius bars, and having a longitudinal vibratory movement imparted to it, both sides and screen being driven by a peculiar arrangement of mechanism.

Claim.—The combination of the driving shaft *C*, pitman rod *c*¹, parallel bar *H*, connecting rods *h h*¹, and bell cranks *h*², with the removable nest of sieves *F*¹, and screen *G*, when the whole are constructed, arranged, and operated in the manner described, for the purpose set forth.

No. 30,335.—THOMAS J. MAYALL, of Roxbury, Mass.—*Improvement in Breech Loading Ordnance*.—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, "thumbing" the touch holes of the chamber automatically by means of the plate *o*¹, operating as described, or any other equivalent arrangement of mechanical devices for accomplishing the desired result.

Second. Preventing the accidental non-discharge of any one chamber from disorganizing the apparatus by means of devices, operating as described, to throw the rammer out of gear and preventing its inserting another cartridge, and then throwing it into gear again to be in readiness to perform its functions for the next succeeding chamber.

Third. In combination with the rotating magazine, the needle rod *N*¹, operated automatically as described, and connected with a galvanic battery, so as to ignite the charges at the proper times, as set forth.

Fourth. The arrangement of the gears *N O* and *P*, and their swinging arms, operating together as described, so as to permit the gun carriage to travel back and forth without disconnecting the devices which communicate motion to the machinery from the driving shaft.

Fifth. The sponging or "swabbing" of the chambers of the magazine by means of the devices operating as described, the same consisting of the rod *D*¹, carrying a suitable sponge jointed to a right angular lever, actuated by a suitable cam, as set forth.

No. 30,336.—CHARLES MCCARTHY, of New York, N. Y.—*Improved Safety Apparatus for Steam Boilers*.—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement and combination of the pipe *E* with a safety valve, in such a

manner that, by any excess of pressure in the boiler, the water from the lower part of the boiler shall be forced up said pipe E to open said valve and pass upon the fire, or made to give an alarm, the whole being constructed substantially as set forth.

No. 30,337.—JAMES McMAHAN, of Amelia, Ohio.—*Improvement in Window Sash Supporters*.—Patent dated October 9, 1860.—This invention relates to the employment of strips of an elastic substance placed in the grooves of window frames in which the top and bottom parts of the sash slide, and the use of small rollers let into the edges of the sash, but projecting therefrom sufficiently to press against and insert themselves into the elastic lining strips.

Claim.—The elastic lining strips *a a* and the rollers *d d*, when employed in a window frame and sash, substantially as and for the purposes described.

No. 30,338.—GEORGE R. MENEELY, of West Troy, N. Y.—*Improvement in Hanging Bells*.—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, in uniting the bell to the rocking or revolving yoke, the employment of the flanged and slotted, round, tapering neck F cast on the bell, the round tapering hole G made in the yoke, the movable perforated cap H, and the series of screw belts K; all constructed and arranged in combination substantially as described.

Second. I also claim securing the supporting bolt C of the clapper to the yoke D by means of a key Q, formed and applied to the clapper bolt and to the yoke, and arranged with the parts by which the bell is united to the yoke, as described, so that the clapper will be thereby prevented from being turned in the yoke with the bell when the parts by which the bell is secured to the yoke are turned in the yoke with the bell about the clapper bolt.

No. 30,339.—TITUS MOLINIER, of New Orleans, La.—*Improvement in Apparatus for Skimming*.—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The described crank skimming machine, consisting in three essential parts—a frame A, a pushing and drawing screw B, and a movable basin C, at the end of the box D, sliding in frame A, said box D having in its interior a system of paddles, by which machine the cane juice contained in the last kettle of a set of sugar kettles may be skimmed clean in any easy, prompt, and efficacious manner.

No. 30,340.—CHARLES NEWCOMB, of New York, N. Y.—*Improvement in Apparatus for the Ventilation of Railroad Cars*.—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination, with the main pipes running along the train of cars, as described, of perforated pipes within the body of the cars and below the ceiling, together with their dampers, the whole being arranged to be operated as described, so that each car may be supplied with the requisite quantity of fresh air free from dust, smoke, or cinders, and without such ventilation of one car interfering with that of the other.

No. 30,341.—JOHN W. PALMER, of Port Republic, and JOHN K. LEEDY, of Tom's Brook, Va.—Patent dated October 9, 1860.—*Improvement in Bee Hives*.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the combination of the partitions B B, and the slides C C, each being provided with openings which correspond, the partitions being provided with dovetail grooves upon one side for receiving the slides, two being placed back to back with the slides together, substantially as and for the purpose specified.

Second. The funnel-shaped box E, the pipe F, and the bag C, when the same are arranged in the manner and used for the purpose of making a bee feeder, substantially as set forth.

No. 30,342.—J. Y. PARCE, of Fairport, N. Y.—*Improved Packing Press*.—Patent dated October 9, 1860.—This invention has for its object the packing of articles of manufacture in a pulverized or finely reduced state, in papers of uniform size and appearance, and facilitating the process over the methods heretofore employed.

The inventor says: I *claim* the combination and arrangement of the foot lever B, stirrup rods *b b*, jointed elbow lever *d*, and pawl *g*, operating conjointly, substantially as set forth and described.

I also claim the folder plate *m*, attached to the packing box K, substantially as and for the purposes set forth.

No. 30,343.—EDMUND PAGE, of New York, N. Y., assignor to himself and CORNELIUS H. DELAMATER, of said New York.—*Improved Forge Hammer*.—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* an elastic or yielding connecting rod, constructed as described, or in some equivalent manner.

I claim an elastic or yielding connecting rod, or its substantial equivalent, in combination with the vibrating arm or lever that operates it to work the hammer.

I claim connecting the connecting rod to the arm or lever that operates it by means of a slide, arranged to traverse on said arm, so as to vary the length of the stroke and the force of the blows struck by the hammer while in operation, and without stopping it.

I claim the crank which operates the hammer, in combination with an elastic or yielding connecting rod.

I claim balancing the helve and hammer by springs arranged on one or both sides of the fulcrum.

No. 30,344.—JACOB MARSH PERKINS, of Chicago, Illinois.—*Improved Picnic or Excursion Seat*.—Patent dated October 9, 1860.—The object of this invention is to provide a strong, light, and reliable seat, which can be conveniently carried, and which will occupy but a small space whenever it may be expedient to pack or store it away.

Claim.—The portable picnic seat, constructed as set forth.

No. 30,345.—JOHN PETTINGELL, of Lowell, Mass.—*Improvement in Iron Chimney Tops*.—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The construction of the chimney top with the inclined plate *a*, to direct the air upward, the rim *b*, to assist the draft, the rim *d*, to bind the brick work between it and the lower rim *c*, and the moulding *e*, to connect the said lower rim *c*, with the plate *a*; the said moulding being joined to the plate a little inside of the edge thereof, so as to leave a dripping edge; the whole being intended to be cast of metal in one piece, all as shown and described.

No. 30,346.—JOHN J. PIKE, of Chelsea, Mass.—*Improved Carriage Jack*.—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* my improved carriage jack as constructed with the extra bearing lever *C*, combined and arranged with the lifting lever *B*, and the supporting frame *A*, substantially in the manner and so as to operate as described.

And I also claim the combination and arrangement of the two spring stopping levers *k l*, and the pin *P*, with the levers *B* and *C*, applied within the frame *A*, and with respect to one another as specified.

No. 30,347.—JOSEPH PINE, of New York, N. Y.—*Improved Apparatus for Heating Railroad Cars*.—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the heaters *F F*, with the outside end platforms *B B*, plates *b b*, boxes *J*, and gratings *d*, as shown and described, whereby the driver and conductor, and others standing upon platforms outside of the car, will receive the benefit of the heaters as well as the passengers occupying the interior.

No. 30,348.—WILLIAM G. POLLOCK and J. W. SENER, of Fredericksburg, Va.—*Improvement in Seed Planters*.—Patent dated October 9, 1860.—This invention consists in the arrangement and combination, in a suitable frame, of the revolving seeding cylinder *C*, adjustable rake frame *F*, spring rake teeth *t*, and compound pressure roller *R*.

The inventors say: We *claim*, first, the vibrating, adjustable rake frame *E*, constructed and arranged and operating as described.

Second. In combination with a seed planter, fixing the central pressure roller to the shaft *S*, while the slide rollers are loose upon it, in the manner and for the purpose set forth.

Third. The combination and arrangement of the cylinder *C*, frame *F*, and pressure rollers *R R*¹, in the manner set forth and shown, when used in a seed planting machine.

No. 30,349.—DAVID S. QUIMBY, of Brooklyn, N. Y.—*Improved Fireplace Heater*.—Patent dated October 9, 1860.—The large space between the outer shell *I*, and the fire box *F*, is for the purpose of heating a large amount of air to a moderate degree, not so high as to injure its quality for warming purposes.

Claim.—The arrangement of the fireplace box *F*, perforated plates *A B C D*, with the flues *G G*¹, and flue *E*, arranged and operated as described.

No. 30,350.—C. L. REHN, of Philadelphia, Pa., assignor to J. LUCAS & Co., of said Philadelphia.—*Improved Fastener for Metallic Kegs*.—Patent dated October 9, 1860.—This invention consists of a plate having the projecting arms, one or both of which has a rounded

end, both having notches, and the whole being otherwise constructed for attachment to, and detachment from, certain staples on the edge of the keg.

Claim.—The fastener E, composed of the plate *f*, and its two arms *e* and *e*¹, when one or both of the said arms has a rounded end *x*, and each arm has a notch *y*, and when the whole is constructed as set forth for attachment and detachment from the staples D and D¹ on the edge of the keg, by the method and for the purpose described.

No. 30,351.—J. K. ROBINSON and J. M. CLARK, of Bell Air, Ohio.—*Improvement in Pistons for Steam Engines.*—Patent dated October 9, 1860.—This invention consists in constructing the bolts which hold the piston and follower together with valve seats in their small ends, so that they shall serve the double purpose of holding the plates together and of constituting an adjustable seat for the ball valve; also in providing a flange around both piston head and follower, in combination with a key across the piston head to support the packing ring.

The inventors say: We *claim*, first, the valve seat bolts constructed substantially in the manner and for the double purpose described.

Second. The combination of the key *b*¹, with the rims *b c*, on the piston head and follower, substantially in the manner and for the purpose described.

No. 30,352.—HENRY D. ROGERS, of Grafton, Ohio.—*Improvement in Securing Points to Ploughs.*—Patent dated October 9, 1860.—This invention consists in providing the forward portion of a plough with a steel or hardened point, the upper lip of said point extending back and above the forward portion of the plough, and the under portion of said point extending the entire length of the lower portion of the landside of said plough, and there secured by means of lips and set screw.

Claim.—The securing the points B by means of the shoe A, hook D, and set screw E; the whole being arranged in the manner and for the purpose as described.

No. 30,353.—JOHN RUEGG, of St. Louis, Mo.—*Improvement in Brush Machines.*—Patent dated October 9, 1860.—The frame of the machine is shown at A; it consists of iron shears, similar to the shears of a turning lathe. Upon the shears a sliding head B is mounted. In the lower side of this head a dovetail groove is made to fit over the V-slides which compose the upper part of the shears. To the under side of head B a pinion rack H is fixed into which the pinion S is made to mesh, so as to move the head to and fro upon the application of power to the shaft L upon which the said pinion is fixed.

The inventor says: I *claim* the combination of what I have above denominated the "adjusting head," with what I have above denominated the "cutting or trimming head," in the manner described; and I also claim making the said adjusting and trimming heads in the manner described for the purpose specified.

No. 30,354.—MICHAEL E. RUDASILL, of Shelby, N. C.—*Improvement in Pumps.*—Patent dated October 9, 1860.—This invention consists in constructing and arranging the several parts of the pump.

Claim.—The arrangement of the plate A, box C, and cylinders B B, with the pistons I I, springs F F, hollow shaft D, and cam cylinder E; the several parts being connected and made to operate substantially as and for the purpose specified.

No. 30,355.—C. J. SCHOEDER, of Astoria, N. Y.—*Improved Propeller.*—Patent dated October 9, 1860.—Motion is imparted to the frame D by means of a reciprocating rod F which connects with the sleeves G H, the sleeve G being pivotted to the end of said rod, and the sleeve H being attached to it by means of the lever joint *g*. The sleeve H connects by means of a series of stay rods *h* with the bars *c*.

Claim.—The arrangement of the rod H, lever *g*, rods *h*, and braces *i*, with the two sleeves G H, bars *c d*, and sheet E, as and for the purposes shown and described.

No. 30,356.—ROBERT SCOTT, JR., of Madison, Ind.—*Improved Cotton Press.*—Patent dated October 9, 1860.—This invention consists in constructing and arranging the different parts of the press.

Claim.—The arrangement of the lever B, arm K, connecting piece J, and head D, with the cords G H, lever C, head E, lever *e*, connecting piece F, and cords I and L; the whole being constructed and operating in the manner and for the purpose specified.

No. 30,357.—MATHEW G. SLEMMONS, of Cadiz, Ohio.—*Improvement in Ploughs.*—Patent dated October 9, 1860.—This invention consists in the arrangement of the several parts of the machine.

Claim.—The arrangement of the two curved shoulder beams A A *a*, clevis B, transverse

bar D m, slotted, adjustable, forked handles E E b, and notched and mortised shovels C C e, in the manner and for the purpose described.

No. 30,358.—C. SNYDER and S. M. SMITH, of Hawley, Pa.—*Improved Portable Crane*.—Patent dated October 9, 1860.—This invention consists in combining, with an extension mast and adjustable crane arm, an extension brace for supporting the arm at any elevation to which it is capable of being placed.

Claim.—The combination, with the extension mast and adjustable crane arm E, of the extension braces, when the same are constructed and operate substantially as and for the purposes set forth.

No. 30,359.—HENRY SNYDER, of Dayton, Ohio.—*Improvement in Machines for Pulling and Cutting Stalks*.—Patent dated October 9, 1860.—This invention consists in the employment or use of two rotating wheels placed on a mounted frame and obliquely to its line of draught, said wheels being provided with hooks or cutters, rotated from the ground wheels of the machine, and used in connection with rotary cleavers.

Claim.—The employment or use of the wheels J J having an oblique position with the wheels B B, and provided with hooks or cutters O, in combination with the bars or knockers P, or their equivalents, essentially as and for the purpose set forth.

No. 30,360.—HENRY STANLEY, of Troy, N. Y.—*Improved Propellers in their Application to Vessels*.—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the employment of two propellers having conical hubs and blades, as described, at the bow or stern of a vessel, substantially as and for the purposes set forth.

I also claim, in combination with the cone-formed hub and spiral blades, as above set forth, the backward inclination of said blades at the bows and the forward inclination at the stern, of those blades, as and for the purposes described.

I also claim the combination of twin bow and stern propellers, as described, attached to the same boat, for the purposes set forth.

No. 30,361.—ACHILLES ST. DIZIER, of Plaquemine, La.—*Improvement in Cane Harvesters*.—Patent dated October 9, 1860.—This invention consists in the employment of a rotating cutter in connection with a mould board and guide plates; all being attached to a suitable frame, and arranged in such a manner as to constitute a simple and economical machine for the desired purpose.

Claim.—The combination of the rotating cutter wheel G, mould board H, and guides or plates d f, the latter being attached to the runners E I, and all arranged as and for the purpose set forth.

No. 30,362.—ISAAC STODDARD, of Great Bend, Pa.—*Improvement in Propelling Machinery by Horse Power*.—Patent dated October 9, 1860.—This invention consists in applying conical friction rollers to the underside of the ordinary inclined rotating tread wheel.

Claim.—The arrangement of rollers R R, wheel W, standards s s s, block B, cranks c c, band wheels D D, pinions G G, and segments o o, the whole combined and operating substantially as set forth.

No. 30,363.—S. D. STOUT, of Charleston, Tenn.—*Improvement in Pumps*.—Patent dated October 9, 1860.—This improvement consists in the employment of compressed air in a novel manner, for forcing water up through a pipe from the bottom of a well or other low level in a continuous stream.

Claim.—The three-chambered box A, with its valves b b and d, and leader pipe B, in combination with the air pipes C C, cut-off box E, and bellows G, or its equivalent; the whole being arranged substantially as and for the purpose described.

No. 30,364.—JAMES B. SUITT, of Indianapolis, Ind.—*Improved Device for Operating Tilling Tables in Shingle Machines*.—Patent dated October 9, 1860.—This invention consists in the construction and arrangement of the different parts of the machine.

Claim.—The folding lever spring K, with shoe J, and weight L, with weighted table F, when operated in connection with the wheel B, cam C, connecting arm P, or their equivalents, as and for the purposes set forth.

No. 30,365.—GEORGE W. VAN DEREN, of Big Flatts, N. Y.—*Improved Valve for Steam Engines*.—Patent dated October 9, 1860.—The object of this invention is to construct an oscillating steam valve, in which the pressure of the steam has little or no effect to increase

the friction of the valve, so that the same works with equal facility when under pressure, as it does before the steam is let on

Claim.—The construction of the valve with a shoulder *a* at its extremity, and with a projection *B*, extending beyond its periphery, and otherwise made as shown and described, for the purposes set forth

No. 30,366.—M. W. WARNE, of St. Louis, Mo.—*Improvement in Filters.*—Patent dated October 9, 1860.—This invention consists in arranging the parts of a filter in such a manner that the water will pass through a proper filtering medium and cause the impurities to settle at the bottom; the filtering medium being placed within suitable boxes or receivers in a cooler, and raised in connection with iron and sulphur, so that the water, while being purified and cooled, will also be medicated.

Claim.—The employment or use of a cylinder *C D E*, one or more, placed within a water cooler *A*, and provided with a suitable filtering medium *F*, and iron and sulphur *H G*, essentially as and for the purpose set forth.

No. 30,367.—J. L. WELLS, of St. Louis, Mo.—*Improvement in Composition for Tanning.*—Patent dated October 9, 1860.—This compound consists of the following ingredients used in the proportion specified: catechu, one hundred pounds; soft water, one hundred and twenty-eight gallons; native sumac, one hundred and fifty pounds.

Claim.—The compound composed of the constituents specified.

No. 30,368.—GEORGE WHEELER, of New York, N. Y.—*Improved Keyhole Guard.*—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The guard *D*, constructed so as to be attached to an ordinary key, and operate substantially in the manner and for the purpose set forth.

No. 30,369.—JOHN R. WILLIAMSON, of Washington, D. C.—*Improvement in Stirrups.*—Patent dated October 9, 1860.—This invention consists in making stirrups with the step movable on pivots, so that it can vary at any angle, or turn over and change sides in the bow, the rods or support for the foot being friction rollers, as also the sides of the bow as high as is necessary for the sides of the foot to bear against, thereby making it an anti-friction stirrup.

Claim.—The rotating and oscillating step, having friction rollers, or their equivalents, on both the step and sides of the bow, constructed and arranged in the manner and for the purposes specified.

No. 30,370.—ISAAC WISWELL, of Springfield, Vt.—*Improvement in Combined Window Net and Sash.*—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the arrangement of the nettings and rollers *D D*¹, with the sashes *B B*¹, in the manner shown and described, so that when either of the sashes is opened, the netting will follow the sash and protect the space, and when either sash is closed, the netting appended thereto will be rolled up, all as set forth.

No. 30,371.—SAMUEL WISWALL, of Hyde Park, Vt.—*Improved Extension Wash Bench.*—Patent dated October 9, 1860.—This invention consists in the combination of two extension shelves and an elevated frame with the ordinary wash bench.

Claim.—The combination of two extension shelves *B* and *C*, and an elevated frame or posts *A*, with the ordinary wash bench; all the parts being constructed and arranged as and for the purposes set forth.

No. 30,372.—CORBIN O. WOOD, of Worcester, Mass.—*Improvement in Breech-loading Fire Arms.*—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, limiting the amount of motion of the barrel by the catch or lever *G*, when constructed and operating substantially as described.

Second. I claim making the lever *G* serve the double purpose of withdrawing the cartridge and limiting the amount of motion of the barrel, as set forth and described.

No. 30,373.—RICHARD C. BARTON, of Troy, N. Y., assignor to E. D. BARTON and W. J. HARLAN, of Jersey City, N. J.—*Improvement in Steam Engines.*—Patent dated October 9, 1860.—This invention consists in connecting the piston rod and crank of an engine by means of a system of toggles, and connecting rods applied and arranged so that an engine possessing fine qualities for driving a screw propeller is obtained.

Claim.—The connection of the piston rod and crank of an engine by means of side rods J J and toggle rods K K L, applied and arranged in combination with the cylinder, piston rod and crank, substantially as specified.

No. 30,374.—CHARLES C. CROSBY, of Nantucket, Mass., assignor to himself and WILLIAM C. GARDNER, of the same place.—*Improved Machine for Punching Nail Holes.*—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the described application or arrangement of a sheet carrier and discharger S, and a series of rollers H H H H¹ H¹ H¹, with respect to the movable carriage K, its supporting frame A, and edge punching and bearing wheels G E, applied to and operating with other punching and bearing wheels, substantially as explained.

And in combination with the carriage K and its discharging device S, I claim the inclined struts arranged on both ends of the frame A, in manner and so as to receive and guide a discharged and punched sheet of sheathing, as specified.

No. 30,375.—JOHN GRAY, of Melrose, N. Y., assignor to himself, J. R. WEED, and C. M. CLAY, of New York City, and J. W. DANFORD, of Brooklyn, N. Y.—*Improved Washing Machine.*—Patent dated October 9, 1860.—This invention consists of a revolving cylindrical drum, with slats set at an angle to the axis of said drum, so as to throw the water off by the centrifugal force at the same time that the inclined slats tend to elevate the water, this drum being combined with a conical tub, the inner surface of which is fitted with inclined ribs, standing in the same direction as those on the drum, but being stationary.

Claim.—The hollow vertical cylinder having open inclined slats and ribs *b*, to cleanse clothes or other materials by rinsing, in the manner specified.

No. 30,376.—E. T. GREEN, of Stoneham, Mass., assignor to himself and J. R. FOLSOM, of the same place.—*Improvement in Machines for Cutting Boot and Shoe Heels.*—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of a heel cutting mechanism, operating substantially as specified, with a mechanism for relatively adjusting, in the direction of the length of the shoe, the tread and seat formers, by which the rake or pitch of the rear of the heel may be varied without substitution of other formers.

Also, so arranging, in the heel shaping machines, which operate substantially as described, the forming and holding mechanisms, that each is distinct in itself, and removable one from the other, substantially in the manner and for the purpose set forth.

Also, the employment of the heel seat portion of the sole for a former of the heel and guide for the knife, either with or without the use of the tread former.

No. 30,377.—ALBERT KLEINSTEIBER, of Milwaukee, Wis., assignor to W. MUSGROVE, of New York, N. Y.—*Improvement in Lamps.*—Patent dated October 9, 1860.—The object of this invention is to obtain a lamp for burning lard, grease collected in cooking, &c.

Claim.—The tube E and piston F, the latter being adjusted by the screw C, or other device, in combination with a hollow wick formed of a straw G, or its equivalent, and twist H, essentially as and for the purpose set forth.

No. 30,378.—H. L. McNISH, of Lowell, Mass., assignor to himself and D. C. BUTLER, of the same place.—*Improved Barrel Head Machine.*—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, giving the saw a vibrating movement in a direction longitudinally with its axis and simultaneously with its rotation, by means of the cam V, bars P S, and spring U, or their equivalents, for the purpose of cutting the heads in an oval or elliptical form, to compensate for the shrinking of the same, substantially as set forth.

Second. The arrangement of the slide Q, cam V, and screw R, substantially as shown, for the purpose of varying, in a slight degree, the diameter of the heads, as set forth.

Third. The arrangement of the plate Z and circular plate D¹, the former being attached to the latter by the bolt *g*¹ passing through the slot *r*, and the plate D¹ attached eccentrically to the bar S, as and for the purposes specified.

Fourth. Connecting the shaft K with the bar J, which is fitted loosely on the tubular upright *f*, and arranged substantially as shown, to admit of the turning and adjusting of shaft K, in a proper relative position with the saw shaft A, for the purpose of driving both said shafts from one and the same counter shaft.

No. 30,379.—FRANK S. SIBLEY, of Brooklyn, N. Y., assignor to himself and W. E. DOUBLEDAY, of the same place.—*Improved Method of Curling Hat Brims.*—Patent dated October 9, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The rope, strap, or band *c*, in combination with the dies *a* and *b*, for drawing upon and curling the material forming the hat brim, as specified.

No. 30,380.—SYLVENUS WALKER, of Boston, Mass., assignor to himself and S. S. HEMENWAY, of the same place.—*Improved Sash Fastener*.—Patent dated October 9, 1860.—This invention consists in the adaptation of one metallic plate, having a dovetailed mortise, to another plate consisting of a dovetailed tenon, and these are so arranged with regard to each other that when the tenon is slid into the mortise the sash is duly and firmly fastened.

Claim.—In combination with the cross bars of window sashes, the arrangement of plates A and B, when these are locked together by the hook of D, in the manner and for the purpose set forth.

No. 30,381.—JOSHUA E. AMBROSE, of Batavia, Ill.—*Improvement in Lamps*.—Patent dated October 16, 1860.—The claim and engravings explain the nature of the invention.

The inventor says: I *claim*, first, the arrangement of the heaters G H, with a space between them communicating directly with the external air, in connection with the collar *p* and plates *q q*, fitted on the top of the wick tube E and the perforated cap C, substantially as and for the purpose set forth.

Second. In combination with the parts aforesaid, the vapor tube F, placed within the cap C, and adjoining or contiguous to the wick tube, as and for the purpose specified.

Third. The shaft *e*, provided with the rod *f* and spurs *g*, which are within the chamber *d* of the wick tube, in connection with the plates *h j k* and spring *i* on said shaft, all being arranged to operate as and for the purpose set forth.

No. 30,382.—JAMES BAIN and SAMUEL C. BROWN, of Richmond, Ind.—*Improvement in Dovetailing Machines*.—Patent dated October 16, 1860.—This invention is more especially designed for cutting dovetails for window sashes, but it may be used for cutting dovetails for the manufacture of other articles.

The inventors say: We *claim*, first, the arrangement of the guides *v* and bearings *a*¹ of the cutter arbors J, substantially as shown, to admit of the adjustment of the cutters, for the purpose specified.

Second. The combination of the tilting or adjustable bed E, with the adjustable arbors J J, arranged for joint operation, as and for the purpose set forth.

No. 30,383.—JAMES BOYD and JAMES BELFORD, of Philadelphia, Pa.—*Improvement in Door Spring*.—Patent dated October 16, 1860.—This invention consists in the combination of two springs with a door, so hung as to be opened in either direction, the said springs being rendered adjustable on the door, connected with the door frame, and otherwise so arranged as to restore the door to its closed position after it has been opened, and so that either of the springs may be readily tightened; it also consists of a device for retaining the said springs and setting them at liberty at pleasure.

The inventors say: We *claim*, first, the combination of the two springs F F with the door B, when the said springs are arranged as set forth, and when they are adjustable on the door by the devices described, or their equivalents, for the purpose specified.

Second. We claim the plate G, with its hinged bar H and bolt I, when constructed and applied for the retention and release of the spring, as set forth.

No. 30,384.—JOHN A. BURNAP, of Albany, N. Y.—*Improved Regulator for Steam and other Engines*.—Patent dated October 16, 1860.—This invention consists of a stationary segment rack, provided with fine teeth on its upper surface, and secured to a suitable frame; a pendulous lever with a cross piece on its lower end, having two studs, one on each side, on which the pawls play freely, is suspended on a stud which slides in a guide secured to the frame, for the purpose of keeping it a proper distance to allow the pawls to work in the rack.

The inventor says: I *claim* the movable pendulous lever or ratchet arm C, working on a fixed rack B, said lever being constructed and operating substantially as and for the purpose specified.

Second. I claim the friction jointed arm P, for adjusting the relative position of the guard O, substantially as set forth.

No. 30,385.—GEORGE BUTTERFIELD and DANIEL BOWKER, of Boston, Mass.—*Improved Window Curtain*.—Patent dated October 16, 1860.—This invention consists in attaching to window curtains or blinds two elastic bands or cords, one on each side, and so that the curtain, on being released from its fastening at the bottom, will be carried up to the top of the window.

Claim.—The application to a window curtain of the elastic bands or cords E E, substantially in manner and to operate as above described.

No. 30,386.—CHARLES CARLISLE, of Woodstock, Vt.—*Improved Nail Hammer*.—Patent dated October 16, 1860.—This improvement consists in combining with a nail hammer a link-shaped angular lever *c*, of the proper proportions, by means of suitable fulcrum pins which pass through the opposite angles of said lever into the head of the hammer.

Claim.—Combining an angular lever with a nail hammer or hatchet, substantially in the manner and for the purpose set forth.

No. 30,387.—A. P. CASSEL, of Wataga, Ill.—*Improvement in Shrinking Tire*.—Patent dated October 16, 1860.—The object of this invention is to obtain a simple and portable device for upsetting or shrinking wheel tires, so that the latter may be made to fit the wheels, without cutting and rewelding, after being once formed.

Claim.—The arrangement of the adjustable bars F G and dogs H H with the curved bar A, jointed bars B B¹, slide D, spring E, and eccentric C, as and for the purposes shown and described.

No. 30,388.—ROWLAND CHAPMAN, of Darlington District, S. C.—*Improvement in Sowing Machines*.—Patent dated October 16, 1860.—This invention consists in the combination of devices for drilling, distributing, and covering guanoes and other fertilizers, and planting and covering cotton and other seeds.

Claim.—The arrangement of the frame A, the furrow opener B, the furrow smoother C, the uprights D D, the wheel E, and the spokes e e e e, operating in conjunction with the spokes i i i i, the spur L, cup G, and ring I, the whole being constructed for operation conjointly, in the manner and for the purpose set forth.

No. 30,389.—KENYON COX and THEODORE COX, of New York, N. Y.—*Improvement in Rotary Engines*.—Patent dated October 16, 1860.—This invention consists principally in a certain construction of the sliding piston and mode of applying the same, in connection with arc-formed revolving guide plates arranged between the heads of the inner and outer cylinder, whereby the pistons are caused to present themselves with their outer faces concentric with the inner periphery of the outer cylinder, and in proper contact with said periphery, throughout the whole of their revolution, and the escape of steam, water, or other fluid, between the pistons and the outer cylinder, and between the said cylinder and the rotating drum, is prevented, without any necessity for stuffing boxes around the shaft.

The inventors say: We claim, first, the jointed pistons G H G H and arc-formed guide plates F F, constructed, combined, and applied, in connection with the stationary cylinder A and rotating drum D, substantially as and for the purpose described.

Second. The ports a a, elongated in the manner and for the purpose described.

Third. The construction of the packing piece C, with bevelled projections fitted in the cylinder, substantially as and for the purpose specified.

No. 30,390.—BOSWELL CRANE and WILLIAM BALDWIN, of Anamosa, Iowa.—*Improvement in Tanning*.—Patent dated October 16, 1860.—The claim explains the nature of this invention.

Claim.—The process of tanning leather shown and described, consisting in the use of a compound of terra japonica and lye, in the proportions and manner specified.

No. 30,391.—SAMUEL F. DEXTER, of Paris, N. Y.—*Improvement in Boots and Shoes*.—Patent dated October 16, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The formation of an air chamber in or on the sole of a boot or shoe, substantially as set forth.

No. 30,392.—ANDREW DIETZ, of New York, N. Y.—*Improvement in Tanning*.—Patent dated October 16, 1860.—The distinguishing features of this invention consist in swelling the tissues of the skin previous to and during the process of tanning, by the use of saline liquors, so as to fit the skin to receive the tannic material, and in using, in connection with the substances employed to swell the tissues, tannic liquors of different and increasing strengths, whereby the centre and inner parts of the skin are tanned as quick, or nearly so, as the outer surfaces.

Claim.—Tanning leather by the use of saline solutions, as set forth, when used in combination with tannic liquors of different and increasing strengths, for the purposes as set forth.

No. 30,393.—ANDREW DIETZ, of New York, N. Y.—*Improvement in the Treatment of Tanned Leather*.—Patent dated October 16, 1860.—This invention consists in applying to leather, during the process of tanning, or after it has been tanned, a material or preparation which imparts suppleness, softness, and pliability.

Claim.—The use and application of honey in the tanning or treatment of leather during the last stages of the process of tanning, or in the finishing of leather, or after the leather is tanned and finished, as set forth.

No. 30,394.—SOLON DIKE, of Columbia, S. C.—*Improved Cotton Press*.—Patent dated October 16, 1860.—This invention consists in arranging and constructing the several parts of the press.

The inventor says: I *claim*, first, the employment of the guide rod H, operated and secured in the manner represented, for the purpose of directing the press block R and for keeping the levers F and D in proper position, substantially as specified.

Second. The trucks E E, secured between the bars L L and operating in connection with the levers F F and D D, frames G and C, guide rod H, and cords K and J, substantially as and for the purpose specified.

Third. In combination with the subject of the second claim, I claim the arrangement of the capstan M, operating substantially as specified.

No. 30,395.—N. T. EDSON, of New Orleans, La.—*Improvement in Metallic Hubs for Carriage Wheels*.—Patent dated October 16, 1860.—The claim and engravings explain the nature of this invention.

Claim.—So constructing the two metallic flanches C and B, which are provided with grooves A A A and projections, as represented, that they will clamp and hold the spokes separate and distinct from each other on their edges, while they are allowed to bear and press against each other on their faces, forming a wheel of dodged spokes, substantially as and for the purpose specified.

No. 30,396.—E. W. FERRIS, of Macon, Miss.—*Improvement in Astringent Medicines*.—Patent dated October 16, 1860.—Recipe No. 1, referred to in the claim, is as follows: Bark of wild cherry, pulverized, one and a half ounce; poplar bark, pulverized, one and a half ounce; refined loaf sugar, eight ounces; pure French brandy or alcohol, eight ounces; with an addition of pure water. Recipe No. 2, carbonate potasse, two ounces; compound spirits of lavender, one ounce; spirits of hartshorn, one ounce; essence of peppermint, one ounce; tincture of opium, one ounce; and sulphuric ether, one half ounce.

Claim.—The combination of recipes No. 1 and No. 2, substantially as stated.

No. 30,397.—ALFRED T. FINCH, of Meriden, Conn.—*Improvement in Window Blind Fasteners*.—Patent dated October 16, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Forming a blind fastener by casting the hooks solid with their axis pins and combining them together by clamping plates, as set forth.

No. 30,398.—JAMES R. FLOYD, of New York, N. Y.—*Improvement in Making Burglar Proof Safes*.—Patent dated October 16, 1860.—The claim explains the nature of this invention.

Claim.—The employment of the described franklinite, or other similarly constructed metal, in forming cast metal safes, substantially as and for the purposes set forth.

No. 30,399.—JOSEPH FOSTER, of Richmond, Va.—*Improvement in Gas Regulators*.—Patent dated October 16, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the load or weight on the inverted cup below the said cup and between the said cup and the valve, substantially as described.

Second. The arrangement of the guides of the inverted cup outside of or beyond the circumference of the said cup, substantially as and for the purpose set forth.

No. 30,400.—ELLIOTT P. GLEASON, of Providence, R. I.—*Improvement in Socket Couplings*.—Patent dated October 16, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* a socket coupling having a hollow cylindrical cushion of caoutchouc, or other similar elastic gum, adhering to the inner walls of the socket shell, and having the surface of the opening through the same moulded in a proper form by compression, and made elastic by the action of heat applied thereto, in the manner and for the purpose substantially as specified.

I also claim, in combination with such a cushion, a socket piece or nipple having a bulb or swelling ridge upon the end which passes through the opening in said cushion, by the contraction of which opening the nipple is held securely within the socket, as set forth.

No. 30,401.—RICHARD WRIGHT, of London, England.—*Improvement in the Evaporation of Cane Juices*.—Patent dated October 16, 1860; patented in England September 6, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of rotating disks with a vessel *a* and vessel *b*, so arranged that the water in the vessel *b*, cannot rise above the vessel *a*, or the water in the vessel *b*, be raised to a higher heat than boiling water, (212° Fahrenheit,) substantially as described.

No. 30,402.—EZEKIEL GULE, of Waverly, Mo.—*Improvement in Hemp Brakes*.—Patent dated October 16, 1860.—This invention consists in arranging four slatted cylinders in such

a relation to each other, and to two crushing feed rollers and a brake bar, so that the stalks of hemp will be acted upon on both sides simultaneously, after they are crushed and broken in the operation of separating the shoves from the fibres.

Claim.—The combination and relative arrangement of the feed and crushing rollers B B¹, the upper roller B¹ being transversely fluted, and brake bar D, with the beating cylinder E, and cleaning and beating drums G H J, all arranged and operating in the manner and for the purposes described and represented.

No. 30,403.—GEORGE W. HATHAWAY, of Tioga, Penn.—*Improvement in Corn Shellers.*—Patent dated October 16, 1860.—This invention consists in the arrangement of two endless revolving screws, in combination with a rotary disk having teeth on its under surface, and attached to a vertical axle which rises and falls by the action of the screws; the ears are fed under and exposed to the action of the rotary disk, which accommodates itself to the varying diameters of the ears, thereby shelling the same from end to end.

Claim.—The arrangement of two endless revolving screws A A, in combination with the rotary toothed disk K, constructed and operating substantially as and for the purpose specified.

No. 30,404.—DAVID B. HEDDEN, of Newark, N. J.—*Improvement in Wood Bending Machines.*—Patent dated October 16, 1860.—The claim and engravings explain the nature of this invention.

Claim.—My mode of applying the end pressure, by means of an adjustable weight, as superior to all other modes, being a self-acting, perfectly graduating, and equalized pressure.

No. 30,405.—R. HUMPHREY, of Unionville, Conn.—*Improvement in Punches.*—Patent dated October 16, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Constructing the punch and die plate in the manner substantially as shown, to wit: the punch A, having an interior cavity with rounded edges to form a cutting edge, and a solid punch B, projecting from the upper part of the cavity, and the die plate D, having a central hollow mandrel G, rising through its centre, so that when the sheet metal is placed between the die plate and punch A, the latter, on descending, will first cut out the blank, then bend the same into the form of a ferule, and then punch an opening in the upper end thereof, thus completing the ferule, all at one operation or motion of the punch A, as set forth.

No. 30,406.—J. J. HUTCHISON and J. D. BRANDBERY, of Cape Girardeau, Mo.—*Improvement in Brick Moulding Machines.*—Patent dated October 16, 1860.—This machine is intended to mould twelve bricks every time the shaft E makes a revolution, the relation of the cogs and spaces on the wheels K and R, being so arranged as to cause the wheel K to move forward as soon as the arms D have pressed the plunger F down, so as to fill the moulds, and they are, also, so arranged as to cause the wheel K to move far enough forward to bring a succeeding mould under the plunger every time it moves.

Claim.—The combination of the wheel K and R, the clay box B, the press box H, and the plunger F, when these several parts are constructed, arranged, and operated substantially in the manner described.

No. 30,407.—EDWARD J. HYDE, of Philadelphia, Penn.—*Improvement in Grinding Mills.*—Patent dated October 16, 1860.—The central portion of the disk forms a concave C, to which grain, or any other substance, which is to be ground, is introduced by means of a hopper box, in the usual manner; said concave is arranged with a series of ridges *a*, and it fits over a cone D, which forms the centre of the rotary disk E, and which is rigidly attached to the shaft or spindle F.

Claim.—The arrangement of the eccentric ridges *ff*, concentric ridges *e*, and notched flanges *h*, with the disks B F, and concave C, as and for the purposes shown and described.

No. 30,408.—EDWARD M. JUDD, of New Britain, Conn.—*Improved Window Fastener.*—Patent dated October 16, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination, with a bolt pivotted intermediately of its length or depth, and mortise box or case for carrying the same, and for imbedding it, as specified, of a spring or spring back plate to the box, arranged to act upon the rear of the pivotted bow or bolt by a jog or jogs, or their equivalents, to hold or lock the bolt, both in its open and close conditions, and so as to cause the spring to adjust the bolt to lie, when closed, flush or thereabouts, at its front or opposite finger surfaces, with the mouth of the mortise or face plate of the box, essentially as specified.

No. 30,409.—JOHN W. KELLBERG, of Pittsburgh, Penn.—*Improvement in Churns.*—Patent

dated October 16, 1860.—The operation of this churn is as follows: When the shaft *h* is made to revolve quickly the curved wings cause the cream to be thrown from the centre to the circumference of the churn with so much force as to create a large amount of friction, when it is pressed between the wing or dasher extensions and the sides of the churn, and at the same time a strong current of air is carried through the body of the cream, and any cream, that is forced out over the disk *i*, flows back into the centre to be worked over.

Claim.—The dasher and disk, made and operating substantially as described.

No. 30,410.—GUSTAVUS KLEINWORT, of Albion, Ill.—*Improvement in Uterine Supporters.*—Patent dated October 16, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The ring, or its equivalent, to support the uterus, in combination with the flaps, connected with each other by a hinged joint, and with the ring by hinged braces, so that the instrument may be folded up for insertion, and then spread out, that the instrument may be retained in place without external supporters.

No. 30,411.—SALEM T. LAMB, of New Washington, Ind.—*Improvement in Fastening Blades of Churn Dashers.*—Patent dated October 16, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The interlocking or overlapping of the shanks of the blades *J*, so that they shall serve to hold each other firmly in the staff as described and represented.

No. 30,412.—SALEM T. LAMB, of New Washington, Ind.—*Improvement in Washing Machines.*—Patent dated October 16, 1860.—The roll *F* is turned by a crank *J*, and its fluting taking into those of *E* and pressing the apron therein causes the apron and all the rolls to turn on their journals. By unhooking the bar *I* from the rods *g*, the two levers *G*, with the roller *F* supported on them, can be raised up and swung back clear of the machine.

Claim.—Hanging the roller *F*, in the weighted levers *C*, for the purpose and in the manner set forth.

No. 30,413.—GEORGE SANDERS and HENRY LAMPTON, of Afton, N. Y.—*Improvement in Grain Separators.*—Patent dated October 16, 1860.—This invention relates to a new and improved grain separating device, to be used simultaneously with the grinding mechanism, and interposed between the grain hopper and the eye of the stone.

The inventors say: We claim the arrangement of the spout *F*, with the shoe *E*, screen *f*, trunk *A*, and divided spout *D*, as and for the purposes shown and described.

We also claim the arrangement of the curved partition plate *c*, and shelves *e e*, with the spout *D*, trunk *A*, spout *g*, screen *f*, and hopper *F*, as and for the purposes shown and described.

We also claim the construction of the interior surface of the spout *D*, with the convex sides *i i*, the convex portions made to approach each other, and with enlarged concave ends *i j*, as and for the purposes shown and described.

No. 30,414.—JOHN H. LILLY, of Bardstown, Ky.—*Improvement in Straw Cutters.*—Patent dated October 16, 1860.—This invention consists in the arrangement of three sickle-edged knives in straw cutters, with rests or supporters for the projecting straw while the knives are cutting it off.

Claim.—The arrangement of the three sickle-edged knives *a b* and *c*, with the steel bars *d* and *e*, all the parts being constructed and operating in the manner set forth.

No. 30,415.—JOHN J. LEFFINGWELL, of Newark, N. J., (formerly of St. Louis, Mo.)—*Improvement in Gas Regulators.*—Patent dated October 16, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, interposing between the flanges of the cups or sections of the regulator and the elastic diaphragm, the non-corrosive metal for protecting the flanges and the diaphragm.

Second. I claim clamping the diaphragm between the edges of the metal plates, constructed and operated substantially as described.

Third. I claim connecting the extended part of the regulator, to which the exit or education pipe is attached to the induction pipe by a syphon, constructed and arranged and operating as set forth.

Fourth. I claim the independent valve seat, made of non-corrosive metal, and fitted to the regulator by a grooved joint, in combination with a non-corrosive metal valve, as described.

Fifth. I claim the lever valve *r*, in combination with the tube or opening *g* of the upper section of the regulator, for the purpose of regulating the condition of the atmospheric pressure upon the upper side of the diaphragm as set forth.

No. 30,416.—JOSEPH MARKS, of Boston, Mass.—*Improved Method of Lubricating Engines, &c*—Patent dated October 16, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The mode or process described of saturating, mixing, or impregnating steam, air, gas, &c., with lubricating material for the lubrication of the various working parts of engines and machines operated by steam, air, gas, or vapor, by means of any impregnating, mixing, or saturating apparatus, containing any proper lubricating material through which the steam, &c., is made to pass, and arranged and operating substantially as described.

No. 30,417.—THOMAS J. MAYALL, of Roxbury, Mass.—*Improvement in the Manufacture of Tiles for Flooring*.—Patent dated October 16, 1860.—The claim and engravings show the nature of this invention. The engravings exhibit a top and vertical view of the tiling.

Claim.—The new manufacture of tiles or slabs for flooring, the same consisting of an India rubber or gutta percha composition, which, when combined with various coloring ingredients, made into sheets of suitable thickness, cut or moulded into desired patterns, and vulcanized, produce tiles of the peculiar softness and nature described.

No. 30,418.—HENRY L. NICHOLS, of New York, N. Y.—*Improvement in Slivering Machines*.—Patent dated October 16, 1860.—This invention consists in setting the bevelled cutting point of each slitting cutter at an obtuse angle, more or less, with its shank, so that instead of their cutting perpendicularly into the wood they will make a slanting cut. It also consists in using the slivering cutters in stocks, which are allowed to have a lateral play, so that the point of these slivers will have the grain of the wood where it is not perfectly straight.

The inventor says: I *claim* the slanting pointed cutters $c\ c^1$, when they are arranged in the relation to the two plane irons $d\ d^1$, and operate in the manner described.

I also claim allowing a lateral yielding motion to slitting cutters $c\ c^1$, for the purpose and substantially as set forth.

No. 30,419.—HENRY PORT and EUGENE SURGI, of New Orleans, La.—*Improvement in Boots and Shoes*.—Patent dated October 16, 1860.—By this invention the upper part of the boot or shoe is secured to the sole by means of the tapering metallic rivets passing through holes in frames of metal c , and through the uppers and soles. The holes in the frames are punched with suitable machinery, so that they shall correspond with each other. A last of metal, or faced with metal, is used, against which the rivets are driven and firmly clenched.

Claim.—The metallic skeleton plate or frame C , when used in combination with the sole and upper leather, in the manner and for the purpose specified.

No. 30,420.—LEMUEL POSTLEWAIT, of Russellville, Ohio.—*Improvement in Lathes*.—Patent dated October 16, 1860.— C represents a pulley, which is secured upon the shaft D in such a manner that it may turn freely or revolve upon it; $a\ a$ represent pins, attached to the pulley C , which enter the material to be turned for holding it in a proper position.

Claim.—The combination of the movable pulley C , with the stationary spindle or shaft D , when the same are used in the manner and for the purpose specified.

No. 30,421.—DANIEL R. PRATT, of Worcester, Mass.—*Improvement in Trucks for Locomotives*.—Patent dated October 16, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, attaching the locomotive to the truck by means of the king bolt and swaging bed C , said bed being hung upon the shafts $c\ c$, by means of the connecting rods or bars $d\ d$, substantially as and for the purpose specified.

Second. The employment of the springs and levers, used in connection with the truck as represented, whereby the forward and rear ends of the truck are guided at the same time by the movement of the locomotive substantially as specified.

No. 30,422.—JOHN B. PRESSEY and DANIEL SHEETS, of Suisun City, Cal.—*Improvement in Carriage Springs*.—Patent dated October 16, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A compound spring, composed of two elliptical portions $A\ A$, two scroll portions B and C , shaped portion c , the whole arranged in the manner and for the purposes set forth.

No. 30,423.—A. I. PRESTON, of East Guilford, N. Y.—*Improvement in Machines for Raking and Pitching Hay*.—Patent dated October 16, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the vibrating pitcher, with a rotary rake having an intermittent motion, the whole arranged and operating substantially as described, and for the purposes set forth.

Second. I claim the arms J , and shipper fingers j , on the pitcher, in combination with the

retaining levers K, and springing vibrating arm H, the whole constructed and arranged substantially as described, for the purpose of causing the rake to rotate automatically, for the purpose set forth.

Third. I claim, in combination with the vibrating pitcher and automatically rotating rake, the sliding gears, or their equivalents, for changing the speed of the pitcher, substantially as and for the purpose specified.

Fourth. I claim the hinged guides i, in combination with the intermittently rotating rake teeth g, arranged as and for the purpose specified.

Fifth. I claim, in combination with the rotating self-shipping shaft a, the mechanism specifically as set forth, for imparting to the pitcher the vibrating self-reverse motion, as and for the purpose described.

No. 30,424.—WILLIAM W. REID, of Rochester, N. Y.—*Improved Churn*.—Patent dated October 16, 1860.—n is an annular tube attached to the underside of the lid B; this tube is rectangular and made of tin; it is perforated with small holes a a a on its inner and outer face. The diameter of the tube must be small enough to come within the inner edges of the bars I.

Claim.—The annular perforated tube n, in combination with the bars I I and dasher o, for the purpose specified.

No. 30,425.—SHERIDAN ROBERTS, of Cleveland, Ohio.—*Improved Method of Making Barrels*.—Patent dated October 16, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Making the cylinder part or body of barrels from hollow cylinders turned off or rounded from solid cylinders, and then slitted, and a piece taken from or added to, as may be required, to bring the body to the proper dimensions and completed, as set forth.

No. 30,426.—JOHN A. ROEBLING, of Trenton, N. J.—*Improvement in Metallic Railroad Cars*.—Patent dated October 16, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the longitudinal pieces, ribs or uprights, straps and plates which constitute the frame work of the sides and roof of a metallic railroad car, with curved and flat panels, in such manner as to leave a partial space between the panels, and thus forming a non-conducting wall and affording a receptacle for window sashes when required, while the curved and flat panels may be united with any part of the framing with which they come in contact by one single rivet.

No. 30,427.—L. C. ROGERS, of Danvers, Mass.—*Improvement in Tools for Trimming Boots*.—Patent dated October 16, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the knife g, or cutter, and the socket c, so as to allow the knife to travel on the arc of a circle and to admit of its being adjusted or moved toward the guard as fast as it becomes worn, substantially as described.

No. 30,428.—CHARLES H. SAYRE, of Utica, N. Y.—*Improvement in Straps for the Handles of Shovels*.—Patent dated October 16, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Malleable cast iron straps, with pins formed on their inner sides to serve as rivets, and countersunk holes on their outer sides, in the manner and for the purposes described.

No. 30,429.—H. B. SMITH, of Lowell, Mass.—*Improved Blind Slat Machine*.—Patent dated October 16, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, the combination of the apparatus for boring the stiles with the apparatus for driving and setting the staples in the rods, in manner substantially as described, and for the purpose of producing the effect set forth in the specifications.

Second. I claim a sliding rack, having adjustable teeth, when used for the purpose of giving the spaces between the holes in the stiles or the staples in the rods for rolling slat window blinds, substantially as specified.

Third. I claim the hopper or feeder, having a space inside fitted to the staples, and made so as to open substantially as specified.

No. 30,430.—D. SQUIER, JR., and E. A. PRESTON, of Battle Creek, Mich.—*Improvement in Grain Weighing Machines*.—Patent dated October 16, 1860.—In connection with the automatic weighing and discharging apparatus there are arranged an index hand and plate N for registering the quantity weighed during a day, week, or month. This registering is effected

by a rocking plate L pivotted by a shaft *g*, which is alternately moved back and forth by the weight D as it rolls from one end of its lever to the other; from the plate L to a ratchet P motion is communicated by pawls *h h*, and thus at every movement of the weight D the index hand is moved a certain distance, which registers the quantity weighed.

Claim.—The arrangement of the adjustable head blocks G G, slotted lever D¹, and valve C with the rods *i i*, arms J J, valves H H, boxes E E, plate L, wheel P, and index plate N, as and for the purposes shown and described.

No. 30,431.—GEORGE C. TAFT, of Worcester, Mass.—*Improved Screw Wrench.*—Patent dated October 16, 1860.—A is the stationary jaw; B that portion of its shank upon which the movable jaw H slides; C that portion of the shank which is provided with the screw thread *a*, into which the female screw *c* of the nut I works, and D is that portion of the shank upon which the handle F is placed, and where it is securely held between the iron pieces G and nut E.

Claim.—The combination of nut I with its reverse screws *c* and *d*, with screw *a* on the shank part C, and screw *b* on the rear part of the sliding jaw H, substantially as and for the purposes set forth.

No. 30,432.—WILLIAM H. TAMBLING, of Berlin, Wis.—*Improved Bed Bottoms.*—Patent dated October 16, 1860.—When the canvass becomes slack and loose it is readily tightened by turning the screws *c c c*, which cause the slats to recede from the bed rails, thus stretching it tightly over the sides of the rails. By removing the screws the slats can readily be taken out and the bed cleaned.

Claim.—The employment of the slats *a a*¹ and screws *c c* in connection with the canvas B and the side and end rails of the bed, arranged and constructed substantially as and for the purpose specified.

No. 30,433.—D. C. TELLER, of Beaver Dam, Wis.—*Improvement in Sowing Machines.*—Patent dated October 16, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the vertically sliding plates I and turning beams H, from which the shares are suspended, in combination with the hopper D and discharge tube F, constructed and operating substantially as and for the purpose set forth.

No. 30,434.—CHRISTOPHER H. THOMAS, of New Orleans, La.—*Improvement in Prophylactic Remedies.*—Patent dated October 16, 1860.—This medicine is composed as follows: salicine, half an ounce; elixir of vitrol, three drachms; old Bourbon whiskey, ten ounces; tincture of galsaminum, one ounce; the whole to be mixed and bottled for use.

Claim.—The above composition of matter or compound of medicines, as a preventive of yellow fever.

No. 30,435.—JOSEPH W. THORN, of Courtland, Ala.—*Improvement in Cotton Cleaners.*—Patent dated October 16, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, constructing the beater chamber S, as described, of the close box G, and the grid C, springing from a common point at or near the feed rollers, and diverging from each other as and for the purposes set forth.

Second. I claim the combination of the beater chamber S, containing a series of beaters, with the trap door H and the devices for opening and closing the same, and for putting the feed rollers in and out of action, substantially as and for the purposes described.

No. 30,436.—J. EUGENE THOURNE, of New Orleans, La.—*Improvement in Drying Chambers.*—Patent dated October 16, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a desiccating apparatus, composed of a chamber for the reception of the substance to be desiccated, a feeding apparatus for conveying the substance to and from and through said chamber, and a vessel containing metal or alloy, fusible at a low temperature, to serve as a heating medium; the whole combined to operate substantially as described.

Second. Furnishing the interior of the desiccating chamber with inclined plates *i i*, applied in combination with gutters *k k* and *l l*, substantially as and for the purpose described.

Third. Making the feeding apparatus vertically adjustable along with the removable heads H H of the chamber, and in relation to the box of fusible metal, substantially as and for the purpose specified.

No. 30,437.—NATHAN S. WARNER and HENRY S. BENEDICT, of Bridgeport, Ct.—*Improve*

Ladle with Fork Attached.—Patent dated October 16, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The movable framework C C, attached to the fork, which, in combination with said fork, composes a skimmer, as set forth.

No. 30,438.—JOHN J. WATSON, of Buffalo, N. Y.—*Improved Churn Dasher.*—Patent dated October 16, 1860.—This invention consists in constructing and arranging the dasher.

Claim.—The arrangement of the main dashers D D, with the auxiliary dashers *a a*, and the spiral flange E, when the same are used as and for the purpose specified.

No. 30,439.—SAMUEL WETHERILL, of Bethlehem, Pa.—*Improvement in the Manufacture of Glass.*—Patent dated October 16, 1860.—The inventor says: The proportions which I use in a pot, or batch of glass of 2,000 pounds, are prepared of a mixture of sand 6 parts by weight, oxide of zinc, 4 parts; soda, 2 parts; then add 2 pounds of white oxide of arsenic; 12 to 14 pounds of black oxide of manganese; $\frac{1}{2}$ to $\frac{3}{4}$ ounce of oxide of nickel.

Claim.—The use of the oxide of nickel in the manufacture of glass, substantially in the proportions and manner, and for the purpose set forth.

No. 30,440.—HENRY Y. WILDEY, of Philadelphia, Pa.—*Improvement in Apparatus for Sealing Cans.*—Patent dated October 16, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the socket C and screw plunger D, with the nipple *b*, and air pump A, as shown and described, so that when the air has been exhausted from the can by the pump, the plunger D may be screwed down and cause the wax plug to seal the aperture *a*, all as set forth and described.

No. 30,441.—EEMUND H. GRAHAM, of Manchester, N. H.—*Improvement in Picker Staff Motion.*—Patent dated October 16, 1860.—This improvement has for its object the producing of an accurate and sure motion for picker staves, by an arrangement of devices which, while giving great accuracy of motion, so guides and holds the rocker shaft in its play back and forth as to cause it to operate with the least possible friction and lateral disarrangement or wobbling.

Claim.—The arrangement of the rocker *a a*, and guiding shaft or bar *g g*, travelling in suitable journals or bearings *h h*, and operating together substantially as described.

No. 30,442.—SAMUEL YEATMAN, of Providence, Ala.—*Improvement in Filing Gin Saws.*—Patent dated October 16, 1860.—In the operation of this invention the teeth of the several saws being acted upon consecutively, and the carriage E moved first in one direction and then in the other, the whole length of the line of saws, or each saw, may be finished at once, and the carriage E moved only as each saw is finished.

Claim.—The arrangement of the saw shaft G, saws H, and carriage E, with the saw D, saw shaft C, swinging frame B, and spring stop bar I, as and for the purpose shown and described.

No. 30,443.—H. O. AMES, of New Orleans, La., assignor to himself and F. W. AMES, of the same place.—*Improvement in Evaporating Pans.*—Patent dated October 16, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the partition *a*, in the main box B, substantially as described, in relation to the evaporating pipes D D D¹, the induction and eduction pipes E F, and box C, whereby only one or a limited number of the said pipes D D D¹ are brought into communication with the exhaust chamber *c*.

No. 30,444.—H. WILLIAM DOPP, of Buffalo, N. Y., assignor to J. B. WHITE, of the same place.—*Improvement in Lamps.*—Patent dated October 16, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, the employment of a bellows or elastic diaphragm, operated by a spring or equivalent, for the purpose of driving or forcing the fluid from the body of the lamp toward or in the direction of the burner, substantially as specified.

Second. I claim operating the valve S, and needle point *x*, for graduating and cleaning purposes, by means of a cam groove, or its equivalent, in the stop cock F, in combination with the nozzle *n*, whereby I avoid the necessity of packing, substantially as specified.

Third. I claim the rod *a*, or its equivalent, when used as described, by means of which I am enabled to place the cam stop cock, or its equivalent, beyond the reach of the surplus heat, substantially as set forth.

Fourth. I claim the valve S, in combination with the rod *a*, spring *d*, and cam stop cock F, for the purpose of graduating the size of the flame, substantially as specified.

No. 30,445.—J. W. HARBIN, of Delaware Station, Ind., assignor to himself and R. S. WILLIS, of the same place.—*Improvement in Corn Planters*.—Patent dated October 16, 1860.—This invention relates to an improved mechanical arrangement of devices for operating the agitator and slide of the seed hopper.

Claim.—The arrangement of the spring lever *b*, supported by the standard *F*, and operated by the projecting pins *a a*, upon the traction wheel *D*, in connection with the rod *d*, operating the spring slide *k*, and the rod *c*, operating the agitator *g*, in the manner and for the purposes set forth.

No. 30,446.—B. TYLER HENRY, of New Haven, Ct., assignor to OLIVER F. WINCHESTER, of the same place.—*Improvement in Magazine Fire Arms*.—Patent dated October 16, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, in combination with the hollow breech pin *N*, and the piston *I*, working through and with it, the giving of said piston additional end motion for the purpose of exploding the fulminate, substantially as described.

Second. I also claim, in combination with the hollow breech pin and the piston working through it, the spring catch and rest on the breech pin, and the fillets on the piston, substantially as and for the purpose set forth.

Third. I also claim, in combination with the carrier block *c*, and the spring *s*, placed on top of the breech pin *J*, the so forming of the top of said carrier block near the rear end (as shown at *z z*) as to strike the cartridge forward of the centre, and thus raising the forward end of the cartridge while the rear end is held down by the spring catch, tripping it over and freeing it from the spring, and ejecting it from the gun, substantially as described.

No. 30,447.—WILLIAM MAY, of Winchester, Ohio, assignor to himself and JEROME DE BRUIN, of the same place.—*Improvement in Cultivators*.—Patent dated October 16, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The curved bar *P*, carrying weight *Q*, pressing on the roller *o*, in connection with the curved bars *T* and *O*, substantially as and for the purposes shown and described.

No. 30,448.—JOHN McCARTY, of Philadelphia, Pa., assignor to LEYFERT, McMANUS & Co., of Reading, Pa.—*Improved Horse Shoe Machine*.—Patent dated October 16, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the upper die *N*, with its projection *n*, of the form of the inside edge of the shoe, in combination with the lower die *M*, with its recess of the form of the outer edge of the shoe, the dies being so constructed and arranged that when the said projection penetrates the said recess a space of the desired form of the shoe shall be enclosed by the two dies.

Second. I claim the weighted lever *I*, its rods *K K*, the latter passing through the guides *e e*, of the frame, and being connected to the ram, as specified, and the whole being arranged and combined with the revolving cam *F*, substantially as and for the purpose set forth.

Third. The block *P*, with its rods *q q*, passing through the lower die *M*, and into the recess of the same, in combination with the arm *Q*, lever *S*, and revolving cam *G*; the whole being arranged and operating substantially as described, for the purpose specified.

No. 30,449.—SAMUEL ALDRICH and ALEXANDER ALDRICH, of Washington, D. C.—*Improvement in Devices for Elevating Water from Wells, &c.*—Patent dated October 23, 1860.—This invention consists in the arrangement and combination of the brake lever, pawl, and ratchet, for the special protection of the mechanism.

Claim.—The arrangement of the brake lever *H*, with the sliding rod *h*, and movable pawl *f* attached, in combination with the ratchet crank handle *B*, for the purposes set forth.

No. 30,450.—T. F. ALLEN, of Dyersville, Iowa.—*Improvement in India Rubber Railway Car Springs*.—Patent dated October 23, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The use, in the construction of railway cars, of India rubber balls resting on the truck and supporting the car body, and held between concave plates, substantially as described.

No. 30,451.—FRANCIS ARNOLD, of Middle Haddam, Conn.—*Improved Clothes Squeezers*.—Patent dated October 23, 1860.—The nature of this improvement is shown by the claim and engravings.

The inventor says: I *claim*, first, making the India rubber roller *H*, with a central division *I*¹, in its aperture *I*, to receive a corresponding slitted shaft *I*², substantially as and for the purpose described.

Second. I claim the combination of the oscillating frame *C*, rollers *H*, studs *B*, arranged and operating substantially in the manner as and for the purpose described.

No. 30,452.—WILLIAM H. BABCOCK, of Homer, N. Y.—*Improved Printing Press*.—Patent dated October 23, 1860.—This invention consists in supporting a bed which vibrates in a line or arc, perpendicular or nearly perpendicular to the plate of its face, upon two or more parallel radius rods, in such a manner that the bed shall remain parallel to the face of the platen in all portions of its motion.

The inventor says: I *claim*, first, supporting the vibrating bed C, upon one or more parallel radius rods E E, substantially as and for the purpose described.

Second. The peculiar form of the distributing table P, attached to the vibrating bed C, and arranged relatively to the sweep motion of the inking rollers M, substantially as described and for the purpose set forth.

Third. Operating the gauge T to release the printed card, by means of the catch V, and tripper W, substantially in the manner specified.

No. 30,453.—URIAH BAKER, of Brooklyn, N. Y.—*Improved Egg Beater*.—Patent dated October 23, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The use of the two independent spirals C and E, in combination with the spindle A, and reciprocating agitating slide H, having attached to its ends pins, or other equivalent devices, for rotating the egg beaters simultaneously in opposite directions, as described.

No. 30,454.—DAVID A. BALMER, of Lexington, Ind.—*Improvement in Levelling Mill Stones*.—Patent dated October 23, 1860.—The object of this invention is to arrange the sweeps over the face of a mill stone in such a manner that all the inequalities existing in said face can be easily detected and mended.

Claim.—The arrangement of the ring D, with the set screws E, and central screw B, in combination with the inner ring B, yoke F, and arms I; the whole being constructed and operating as and for the purpose set forth.

No. 30,455.—J. W. BARNES, of Murfreesboro', N. C.—*Improvement in Attaching Horses, &c., to Two Wheeled Vehicles*.—Patent dated October 23, 1860.—This invention consists in a certain combination of parts for the purpose of equalizing the burden and draught of carriage horses.

Claim.—The combination of the fore bar or breast tree *f*, the side bars or shafts *e e*, and swingle tree *b*, with the pole or tongue of a two wheeled cart or carriage, in the manner and for the purposes set forth.

No. 30,456.—HENRY BARTH, of Cincinnati, Ohio.—*Improved Printing Press Feeder*.—Patent dated October 23, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* "feeding out" the paper from a printing press by means of the tape rollers *a b c d*, frame H, receiving table G, and tapes *f*, when combined, arranged, and operating substantially in the manner described, that is, when the rollers *b c* are caused to traverse above the stationary table G, depositing the printed sheet thereon, or when the table G is caused to reciprocate under the stationary tape rollers *b c*, for the purpose of receiving the printed sheet therefrom, in the manner essentially as described.

Second. I claim the elastic supports *e e*¹, carrying the auxiliary tape rollers *d d*¹, when used in combination with the reciprocating tape rollers *a a*¹, *b b*¹, or the reciprocating table G G¹, substantially as described.

No. 30,457.—S. L. BOND, of Greenwood, S. C.—*Improvement in Harnesses*.—Patent dated October 23, 1860.—This invention consists in attaching the collar to the shafts and also the back strap.

Claim.—The combination of the collar B or G, with the back strap I, when both are attached to the thills A A, as and for the purpose specified.

No. 30,458.—GEORGE S. BOSWORTH, of Troy, N. Y.—*Improvement in Car Wheels*.—Patent dated October 23, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The described cast-iron car wheel cast in one piece with the chilled rim connected to the hub by means of a single undulating concavo-convex plate, which has two or more annular waves concentric with the hub and rim, substantially as represented in the drawings.

No. 30,459.—D. R. BROWN and A. C. BABCOCK, of New Haven, Ct.—*Improved Shaft Tug*.—Patent dated October 23, 1860.—This invention consists in making a shaft tug of metal with the upper part hinged to the lower part, so that the tug can be opened to receive the shaft from above, and then cased and clasped securely to enclose the shaft, the whole being capable of being made highly ornamental.

Claim.—A hinged shaft tug, constructed and operating substantially in the manner described.

No. 30,460.—J. H. H. BENNETT, of Hunt's Hollow, N. Y.—*Improvement in Gates.*—Patent dated October 23, 1860.—The gate A is operated by the bent lever D which passes through the hinges of the gate, and which is fastened to the top rail *b* by means of a staple *c* and link *d*. The lower hinge E of the gate consists of two loops *e e'*, the loop *e* being rigidly fastened to the post B, and being provided with a small projecting tube *e** which forms the guide for the upright portion of the lever D for the loop *e'*, firmly attached to the back edge of the gate.

Claim.—The arrangement of the lever D, with the hinge E E, gate A, post B, arm G, cords *h h*, pulleys *i i j j*, posts H, shafts K K, traps J, and plates I I, all as set forth and described for the purposes specified.

No. 30,461.—THOMAS BYRNE, of Baton Rouge, La.—*Improvement in Refrigerators.*—Patent dated October 23, 1860.—This invention consists of a pipe or pipes enveloped with cloth, or any fibrous substance, in combination with a water reservoir for keeping the cloth moist and with a refrigerator or other closed room in which a current of cool air is to be created.

Claim.—The arrangement of a pipe A, which is higher than the refrigerator, and is enveloped with cloth or any fibrous substance F, and has a water reservoir B C on its upper end, and a drip funnel D E encircling it, in combination with a refrigerator G, in the manner and for the purposes described.

No. 30,462.—WILLIAM S. CARR, of New York, N. Y.—*Improvement in Valves for Water Closets.*—Patent dated October 23, 1860.—This invention consists of a sliding plunger valve, that either allows the water to run through it to the closet, or effectually, but gradually, shuts off the flow of water, and said valve is operative only when relieved of pressure by the person rising from the seat, or otherwise.

Claim.—A hollow plunger valve moving within a cylinder and controlled substantially as specified, to form both a water way and valve, as set forth.

No. 30,463.—JOHN C. CLINE, of Camden, N. J.—*Improved Arrangement of Mechanism in Sawing Machines.*—Patent dated October 23, 1860.—This machine is designed for use in places where steam power cannot be economically employed, all parts of it being arranged with a view to the use of as little gearing as is consistent with the peculiar capacity in the machine of speedy adaptation to the circular or scroll saw, as occasion may require.

Claim.—The arrangement of the fly-wheel, pinion, circular saw, crank J, and scroll saw, in the manner and for the purpose substantially as set forth.

No. 30,464.—JAMES B. COFFIN, of Hayesville, Ohio.—*Improvement in Washing Machines.*—Patent dated October 23, 1860.—This invention consists in the arrangement of two disks operating in an ordinary wash-tub, one for pounding and the other for rubbing and squeezing the clothes, on the opposite ends of a vertical shaft, in combination with a swivel head to which said shaft is fastened by a spring-catch, and which has its bearings in the arms of a double slotted oscillating lever in such a manner that either one of the disks can be brought to operate on the clothes, and that the rubber may be used for rubbing or squeezing, as may be desired.

The inventor says: I *claim* the arrangement of the disks F and G, one being provided with pins *i*, and the other with squares *b*, attached to the opposite ends of an arbor *f*, in combination with the swivel head E, and with the oscillating double slotted lever D, constructed and operating substantially as and for the purpose set forth.

I also claim the arrangement of the spring catch *h*, in combination with the grooves *g*, in the arbor *f*, for the purpose described.

No. 30,465.—CHARLES W. CURTISS, of New Haven, Ct.—*Improved Collapsible Bucket.*—Patent dated October 23, 1860.—The claim and engravings explain the nature of this invention.

Claim.—As a new article of manufacture, a portable bucket made of a skeleton or frame composed of a bottom and one or more rims, and covered with India rubber cloth, or any other suitable material, when the whole is constructed and fitted for use, substantially as described.

No. 30,466.—FRANCIS B. DEKRAVENAN, of New York, N. Y.—*Improvement in Lamps.*—Patent dated October 23, 1860.—This invention consists in the application to the flame of a lamp of an impelled current of air driven by suitable mechanism, and striking the flame at or near the base in such a manner that the carbon is entirely consumed; and said current of air being independent of the flame itself is not affected by changing position or moving the lamp from place to place.

Claim.—A lamp supplied with an impelled current of air from a suitable blowing apparatus, effecting the new and useful results specified.

No. 30,467.—ABRAHAM DENNY and EDWARD MAYNARD DENNY, of Waterford, Ireland.—*Improved Apparatus for Singeing Pigs.*—Patent dated October 23, 1860; patented in England February 2, 1860.—This invention relates to singeing off the hairs, bristles, and other matter on slaughtered hogs which are converted into bacon, in a cheaper manner than heretofore, by the action of flame or heat in a stove or heated chamber.

Claim.—The apparatus for singeing off the bristles, hairs, and other superfluous matters upon the surfaces of the carcasses of pigs, by the action of flame or heat in a stove or heated chamber, substantially as specified.

No. 30,468.—ISAAC DETHERIDGE, JR., of New York, N. Y.—*Improved Knife Cleaner.*—Patent dated October 23, 1860.—This invention consists in the construction and arrangement of the parts comprising the machine.

Claim.—The operating parts, to wit: the lever and cams L and E working the bar I, in combination with the adjustable bar J; the whole constructed and arranged substantially as and for the purposes described.

No. 30,469.—ARTHUR DE WITZLEBEN, of Washington, D. C.—*Improved Envelope Ruler.*—Patent dated October 23, 1860.—The lines *g h i k* and the two other sizes in Fig. 1 are ruled to suit business directions, with the lines far apart; the opposite side of the card, shown by Fig. 2 has lines *a b c*, &c., ruled close together, to suit the handwriting of ladies or others writing small hands.

Claim.—A card A, ruled as described, and used as an envelope ruler.

No. 30,470.—HENRY H. DODGE, of Georgetown, D. C.—*Improvement in Gas Burners.*—Patent dated October 23, 1860.—This invention consists in an improved apparatus for making the pressure of the gas regulate the quantity of gas allowed to flow to the burner, so that where the pressure is very great the volume allowed to pass will be small, and vice versa. The apparatus is intended to be applied directly to each gas burner, or to the service pipe after it has passed through the meter.

Claim.—Regulating the flow of gas to the burner, in the manner and for the purposes described.

No. 30,471.—WILLIAM A. DUDLEY, of Petersburg, Va.—*Improvement in Apparatus for Removing Calculi.*—Patent dated October 23, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the bag E and arms D, for the purpose of catching and enclosing the stone to be subjected to the action of a solvent, substantially as described.

Second. The detachable segmental head B, applied to the catheter or canular of an instrument of this description, for the purpose of facilitating its introduction, as set forth.

Third. The combination of the tube *c* and its arms D and bag E with a catheter A, forming a new and useful instrument for the enclosure, dissolution, and removal of calculi from the human bladder, substantially as set forth, without resorting to the use of the knife.

No. 30,472.—J. H. FISHER, of Placerville, Cal.—*Improvement in Railroad Car Seats and Couches.*—Patent dated October 23, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the jointed back E of the seat B and the removable cushion *g*, in connection with the supplemental hinged cushion *h*, the above parts being arranged in relation with the seats A A, as described, to form the lower berth.

Second. The platform D, guides C C, and uprights *o o*, arranged and combined as shown, to admit of said platform being adjusted in a horizontal position for use, or being removed out of the way when not required.

Third. The side guard F, attached to the platform D by means of the arms *r*, substantially as shown, to admit of the guard being adjusted to the platform, so that the latter may be shoved down between the guides C C, as set forth.

Fourth. Connecting the curtain E to the platform D by means of the cords *q q*¹, arranged substantially as shown, so that the curtain may be raised and lowered automatically by the movement of the platform.

No. 30,473.—PERRY G. GARDINER, of New York, N. Y.—*Improvement in Cotton Presses.*—Patent dated October 23, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of toggle joints, in combination with segments situated opposite each other, the faces of said two segments forming together a nut and operated simultaneously together by a screw or worm fast on an upright shaft, in the manner and for the purpose substantially as specified.

Second. I claim the arrangement and construction of the top frame C in combination with the upright shaft E and segments L L¹, and so arranged that said top frame shall receive the whole strain of the press and contain all the mechanism which operates the top platen D, substantially as described.

Third. I claim the arrangement and combination of the different parts, constructed and operating together in the manner set forth and for the purposes substantially as described.

No. 30,474.—JOHN GILCHRIST, of Berlin City, Wis.—*Improvement in Spoke Machines*.—Patent dated October 23, 1860.—The cutter of this machine consists of a horizontal shaft to which are fastened two or any suitable number of blades B; these blades are each as long as the spokes to be cut, so as to cut the whole length of the spoke at one operation; the cutting edge of each blade is slightly curved where it is intended to cut the thicker end of the spoke in order to produce the slightly curved outline of the end of the spoke.

Claim.—The combination and arrangement of the revolving cutter B, spoke carriage I, lever H, spring G, slot S, pivot W, pattern C, guard E, screw wheel O¹, and screw D, substantially in the manner and for the purposes described.

No. 30,475.—COLLINS W. GRIFFITH, of Dayton, Ohio.—*Improved Device for Adjusting the Rake of Muley Saws*.—Patent dated October 23, 1860.—This invention consists of scroll saws, and in fastening the saw to the stock in such a manner that it may be readily adjusted so as to cut more or less at a stroke, and so that it will work without a guide or sash, and without being strained.

Claim.—Fastening one end of the saw to the stock, substantially in the manner described, so that it may be adjusted to give it the desired rake or cut.

No. 30,476.—DAVID A. HOPKINS, of Bergen, N. J.—*Improvement in Railroad Chairs*.—Patent dated October 23, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the chair constructed with a longitudinal key seat below the rail, in combination with the key C, as described.

Second. The combination of the wedge C with a tapered key D, substantially as shown, by which the wedge C is adjusted and kept in place, as described, and also the mode of securing the key in place by means of a curve in the end of the mortise through which it is driven, as stated.

Third. So forming the chair as to leave space immediately at the ends of the rails between their lower flanges and the lips of the chair, as set forth, for the purpose specified.

No. 30,477.—JOHN M. JONES, of New Orleans, and JOSEPH CHARPENTIER, of Pattersonville, La.—*Improvement in Bagasse Furnaces*.—Patent dated October 23, 1860.—This invention consists in adapting an ordinary bagasse chimney to the double purpose of burning bagasse as a waste and as a fuel for heating steam boilers, by providing a damper in the chimney just above the feed opening and extending to the base of the chimney horizontally in the form of an arch, said arch having two diameters and having the same communication with the boiler by means of a valved passage.

Claim.—The combination and arrangement of the chimney F with bagasse burning chamber A, at its base, horizontal arch B, boiler furnace C d, and dampers E c, substantially in the manner and for the purpose set forth.

No. 30,478.—ALBERT F. JOHNSON, of Boston, Mass., assignor to A. B. ELY, of Newton, Mass.—*Improvement in Sewing Machines*.—Patent dated October 23, 1860.—The nature of this improvement is shown by the claim and engravings.

The inventor says: I *claim*, first, interlacing two endless threads and forming the double thread chain stitch by means of a revolving hook, substantially as set forth.

Second. I claim a revolving hook or looper, so constructed as to make a series of double thread chain stitches, when operated in connection with a reciprocating needle.

Third. I claim the peculiar construction of a hook, with its hollow shaft or groove, substantially as described.

No. 30,479.—D. A. JOHNSON and F. M. GIBSON, of Boston, Mass.—*Improvement in Carriage Wheels*.—Patent dated October 23, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Making the felloe joints in wooden wheels by halving the ends of the felloe together, surrounding the joint by a metallic band, provided with an inner projecting socket

piece or thimble, and inserting the outer end of the spoke through the thimble and band into the inner half *n* of the felloe, substantially as shown and described.

No. 30,480.—W. J. JOHNSON, of Newton, Mass.—*Improvement in Pumps*.—Patent dated October 23, 1860.—The foot piece A terminates in a collar B, which embraces the cylinder and may be slid up and down upon it; it can be secured in any desired situation by turning the clamp screw C and thus tightening the collar B around the cylinder.

Claim.—The arrangement, with the cylinder of a portable pump having a suction orifice E at its bottom, of an adjustable stirrup A B, whether the part A is hinged or not, substantially as and for the purposes set forth

No. 30,481.—FREDERIC KETTLER, of Milwaukee, Wis.—*Improved Rotary Engine*.—Patent dated October 23, 1860.—This invention consists of a stationary cylinder, which is in the form of a circular ring, and a revolving disk with inserted pistons, the latter working as throttle valves in the inner periphery of the cylinder during the rotary motion of the disk; also, machinery to regulate the alternate motion of the rotary engine.

Claim.—A rotary engine, constructed and operating substantially as described.

No. 30,482.—FRANCIS L. KIDDER, of Brooklyn, N. Y.—*Improvement in the Running Gear of Vehicles*.—Patent dated October 23, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Connecting the axle to the lower segment of the fifth wheel by the clip eyes 2 2, and gudgeons 1 1, for the purposes and as specified.

No. 30,483.—DAVID LANDIS, of Lancaster, Penn.—*Improvement in Screens for Flour Bolts*.—Patent dated October 23, 1860.—This invention consists in the use of a rotating screen and box, placed above the bolt chest, and so arranged as to effect the desired end.

Claim.—The rotating cylinder D, and screen E, the latter being placed within the former, and both arranged essentially as shown, and in such relation with the bolt to operate as and for the purpose set forth.

No. 30,484.—WILLIAM J. LANE, of Chappaqua, N. Y.—*Improvement in Lifting Jacks*.—Patent dated October 23, 1860.—This invention consists in the use of a sliding clamp attached to a lever having a movable fulcrum, and fitted in a suitable stock, in connection with a slide bar which passes through the clamp and has its lower end fitted in the stock; all the parts being arranged, so that a portable lifting jack is obtained which may be readily manipulated and applied to its work.

Claim.—The employment or use of the plate or clamp E, lever D, arm C, and bar F, applied to a stock or upright A, and all arranged essentially as and for the purpose set forth.

No. 30,485.—JOSEPH F. LETELLIER, of Grand Rapids, Mich.—*Improvement in Steam Valves*.—Patent dated October 23, 1860.—This invention consists in the peculiar construction of the shell; also, in combining therewith the governor and throttle valves.

Claim.—The shell as constructed, and in combination therewith the throttle valve C, and governor valve B, all arranged substantially as and for the purposes set forth and described.

No. 30,486.—SYLVESTER MARSH, of Roxbury, Mass.—*Improvement in Grain Bins*.—Patent dated October 23, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement, in grain bins of suitable form and otherwise ordinary construction, of a series of perforated tubes, open at both ends, secured to and inserted in corresponding holes in the bottom of said bins, so that the external air may penetrate and pervade the whole mass or body of grain, substantially in the manner and for the purposes set forth.

No. 30,487.—WALLACE LYON, of Deep River, Conn.—*Improved Bit Stock*.—Patent dated October 23, 1860.—The object of this invention is to obtain a bit stock that will allow the bit to be rotated with varying degrees of speed under the same speed of the crank, or driving shaft, thereby enabling the implement to be adapted to different kinds of work, and rendering one and the same implement capable of more general adaptation than usual.

Claim.—The arrangement of the permanent and shifting gearing *f h i j k*, placed respectively on the shafts C E F, and within the stock A, substantially as and for the purpose set forth.

No. 30,488.—JAMES MACDONOUGH, of New York, N. Y.—*Style of Engraving Bank Notes, &c.*—Patent dated October 23, 1860; antedated April 23, 1860.—The object of this inven-

tion is to produce additional guarantee against the counterfeiting of bank notes, stocks, bonds, certificates, coupons, and all other papers printed from engraved plates representing value, and requiring such protection.

The inventor says: I *claim* as a new art in bank note, bond, and other document engraving, the combined use in repetition of the value or denomination, and of the configuration, substantially as and for the purpose described.

And I also claim the combined use in repetition of the value or denomination of the bank note or other document, the name or title of the person, corporation, or institution, and the configuration of geometrical, cycloidal, waved line, or rosette work, substantially as described and set forth.

No. 30,489.—DANIEL LOMBARD, of Boston, Mass.—*Improvement in Rice Hulling Machines*.—Patent dated October 23, 1860.—The object of this invention is to remove the husk from the grains of the rough rice, or "paddy," and its nature consists of the mechanical devices employed for that purpose.

Claim.—The arrangement of a wire studded belt passing over drums and between serrated metallic plates, or their equivalents, and the back *m*, and supported on the ledges secured to *l*, all operating together, substantially as and for the purpose described.

No. 30,490.—JOHN McARTHUR, of Aurora, Ill.—*Improved Method of Elevating Water from Wells, &c.*—Patent dated October 23, 1860.—This invention consists in the employment of a swinging balanced spout, in connection with a windlass and buckets and two stationary spouts, all being arranged in a suitable curb or box, to effect the desired end.

Claim.—The swinging and balanced spout *I*, in combination with the two stationary spouts *C C*, in the curb *B*, and the shaft *D*, provided with the pulleys or wheels *E E*, over which the bucket chains *F F* pass, the arms *H H*, of the spout *I*, being placed on the shaft *D*, and all arranged essentially as and for the purpose set forth.

No. 30,491.—JAMES B. MOHLER, of Pekin, Ill.—*Improvement in Grain Weighing Machines*.—Patent dated October 23, 1860.—The object of this invention is to obtain, by a simple arrangement of means, a device which will receive a continuous flow of grain from a hopper, weigh and register the grain, and discharge it into any proper receptacle, the whole device working automatically, the gravity of the grain being the only motor.

Claim.—The arrangement of the pivotted rhomboidal and divided receiving box *F*, cam *H*, lever *I*, and rod *J*, with the scale beam *B*, rods *C D*, shaft *E*, ratchet wheel *K*, index *L*, and plate *M*, as and for the purposes set forth and described.

No. 30,492.—F. MOORE, of Panola, Miss.—*Improved Fan Ventilating Bedstead*.—Patent dated October 23, 1860.—This is an improvement in bedsteads whereby a fan is kept in motion for any desirable length of time, for the purpose of fanning the sleeper, and keeping flies and mosquitoes away.

Claim.—The arrangement of the pendulum fan *K K*, rod *L*, gearing *G h F*, and arms *b*, and cords *a*, with the bar *D*, bed frame *B*, and bedstead *A*, as and for the purposes shown and described.

No. 30,493.—MURDOCH MURCHISON, of Denmark, Tenn.—*Improvement in Cotton Presses*.—Patent dated October 23, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the arrangement of a horizontal and tilting press box *B*, with a horizontal follower *H*, levers *M*, tackles *d*, and windlass *E*, when constructed and arranged substantially in the manner and for the purpose described.

I also claim hanging the cotton box *B*, by its trunnions in the horizontal slots *h* of the frame, so that the press box, when in its horizontal position, can be moved longitudinally towards the resisting sill, and thus relieve said trunnions from all strain while the cotton is pressed, substantially in the manner described.

No. 30,494.—FREDERICK D. NEWBURY, of Albany, N. Y.—*Improvement in Revolving Fire Arms*.—Patent dated October 23, 1860.—In using this invention, after being loaded and capped in the usual manner, draw back the hammer by the thumb, then the hook end at the notch, seizing upon the projecting shoulder of pawl *P*, draws the rear end of the trigger upwards, until the shoulder fits into the notch in the position shown in the engravings, blocking the hammer there. At the same time, pawl *K* having been lifted upwards, turns the plate *D* with the cylinder, bringing one of its chambers in range with the barrel, and its cone in range with the hammer, holding it firmly there as long as there is any pressure upon the trigger.

The inventor says: I *claim*, first, the cocking notch lying at the base of the hook or claw of the hammer, as described, in combination with the shoulder *y*, of the pawl *P*.

Second. The spring *v*, so arranged as by one operation to regulate the pawl *P*, and at the same time act as a spring upon the trigger.

Third. Ratchet pawl *K*, pivotted to the trigger, fitted and formed to act as a pawl and bolt, in combination with the holes *j j*, in plate *D*.

No. 30,495.—W. H. OAKES, of New York, N. Y.—*Improvement in Plate Printing*.—Patent dated October 23, 1860.—The nature of this invention is explained by the claim and engravings.

The inventor says: I *claim*, first, printing from engraved plates by having the sunken portions thereof, which form the design to be printed, charged or filled with fluid ink from below the plate, the ink being forced up through perforations in the plate against the paper or substance to receive the impression, while said paper or other substance is pressed upon or against the plate.

Second. The arrangement of the ink reservoirs *J K*, with the pipes *I H*, tubes *T G*, pump *M*, and grooves *a* j*, in the block *F*, and bed *U*, in connection with the perforated plate *V*, substantially as and for the purpose set forth.

No. 30,496.—ADAM OOT, of Minetto, New York.—*Improvement in Car Couplings*.—Patent dated October 23, 1860.—*A A* is the bumper or draw head of a car. The socket *B B* is made flaring at its front end in every direction, so as to readily admit the coupling link *D*. The socket at the front end is made larger than at its rear end, or from the front to the rear ends of the socket it diminishes in size.

Claim.—The combination of the peculiarly constructed draw head, *A B a b c*, with the peculiarly constructed gravitating lever hook *C m f g*, in the manner and for the purpose described.

No. 30,497.—N. A. PATTERSON, of Kingston, Tenn.—*Improvement in Cotton Gins*.—Patent dated October 23, 1860.—The case or box *A*, adjoining the rollers *B*, is of curved form, approximating to the curve in which the rollers are placed; the lower part, however, of the curved part *b* of the case is brought quite near to the lowermost roller *B*, a space *c* being left sufficient to just admit the cotton seed passing out.

Claim.—The combination, with the combined fan and brush cylinder *C* of the rollers *B*, when the above parts are arranged to operate together in the manner and for the purpose shown and described.

No. 30,498.—GEORGE P. PLANT and JULIUS RATH, of Saint Louis, Mo.—*Improvement in Ventilating Mill Stones*.—Patent dated October 23, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement together, as shown and described, of the sucking and drawing fan *B*, settling room *J*, hung with cloths *K*, dust tube *G*, curb *A*, tube *F*, stone *E*, spout *H*, and clapper *I*, so that a current of air will be drawn down the eye of the stone through the furrows to ventilate the stone, and so that the dust will, at the same time, be drawn up away from the stones and driven into the settling room *J*, where it will be received by the cloths *K*, all as set forth.

No. 30,499.—MILES PRATT, of Watertown, Mass.—*Improvement in Cooking Stoves*.—Patent dated October 23, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment of the independent return flue *G*, in combination with the independent oven *B*, when the whole is so constructed and arranged that the products of combustion shall first pass entirely around the oven, in direct contact with it and surrounding the return flue *G*, and then through the said return flue, as specified, for the purpose set forth.

No. 30,500.—A. RANDEL, of New York, N. Y.—*Improvement in Presses*.—Patent dated October 23, 1860.—The object of this invention is to obtain a press of simple and economical construction, which will admit, under the same application of power, of giving two different degrees of pressure, so that the substance may be compressed expeditiously and in a proper manner.

Claim.—The rack bars *E E*, provided with the racks *a a b*, and actuated through the medium of the pinions *c c*, in connection with the cross head *F*, provided with the pawls *j*, and actuated through the medium of the eccentrics *m m*, all being arranged essentially as and for the purpose set forth.

No. 30,501.—MICHAEL E. RUDASILL, of Shelby, N. C.—*Improvement in Machines for Cutting Stalks, &c.*—Patent dated October 23, 1860.—This invention consists in the use of the revolving cutter, in connection with the stationary frame provided with knives.

Claim.—The employment of the revolving reel, composed of the rims or disks *H H*, and

knives *a a*, in combination with the stationary reel composed of the rims *I I*, and knives *c c c*, the same being arranged and used substantially as and for the purpose specified.

No. 30,502.—PHILANDER SHAW, of Abington, Mass.—*Improved Boot Crimping Machine*.—Patent dated October 23, 1860.—The following is the operation of this machine: The leather *K*, to be crimped, is cut of the proper size and form, and is placed under the brake *C*; the corners *p* are caught between the jaws of the nippers *F*, and there secured by turning the screws *f*; the handle *r* of the brake is then brought down, and the leather is forced between the jaws *B*. As the crimping proceeds, the slack of the leather is taken up by moving the handle *k*, in the direction of its arrow, which moves the cam *G*, under the pin *l*, and raises the block *E*; this draws up the corners *p*, of the leather *K*.

The inventor says: I *claim*, in combination with the sliding block *E*, and nippers *F*, the eccentric arc *G*, with its hand piece *k*, ratchet wheel *H*, and retaining pawl *n*, the whole arranged and operating as described, for the purpose set forth.

I also claim the employment of an index on the ratchet wheel *H*, in combination with the stretching device, substantially as described, for the purpose set forth.

No. 30,503.—MILES J. SHINN, of Richmond, Ind.—*Improved Apparatus for Detecting Fraud in Ballot Boxes*.—Patent dated October 23, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the “detector” described, or any equivalent for the same, attached to a ballot box, to indicate and expose tampering with the lock or cover of the same

Second. I claim the device described as a “register” for registering the number of votes polled, consisting of ratchet wheel *R*, index wheels *O* and *P*, slide *U*, rocking shaft *N*, with arms *11 11* and *b*, and thumb lever *H*, together with lock pin *M*, falling lever *k*, stops *L L*, all arranged substantially as and for the purpose set forth.

No. 30,504.—ABIJAH SMITH, of Kingston, N. Y.—*Improvement in Machines for Dressing Stone*.—Patent dated October 23, 1860.—The nature of these improvements are shown by the engravings and claim.

Claim.—The combination of vibratory beams *A B C*, connecting rods *c d e*, crank *K*, of the shaft *W*, lever *E*, having the stay rods attached thereto, and the serrated iron tools and rubbers; these several parts being constructed and arranged for operation in the manner described, for the purpose set forth.

No. 30,505.—IRA A. STAFFORD, of Essex, N. Y.—*Improved Furniture Castor*.—Patent dated October 23, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Making a joint in the castor stirrup, so as to enable it to reverse its position and form an angle right or left, in the manner described, and for the purposes specified.

No. 30,506.—IRA A. STAFFORD, of Essex, N. Y.—*Improvement in Machines for Elevating, Cleaning, and Bagging Grain*.—Patent dated October 23, 1860.—This invention relates to cleaning and sacking grain, and consists in the construction of an endless belt, frame, and screen, which may be attached and secured to any fanning mill, in such a manner as to receive the grain as it is separated from the chaff, elevating it, and screening off the heavy impurities and depositing it in a sack.

Claim.—The peculiar construction and attachment of the elevating and screening mechanism as applied to a fanning mill, for the purpose of sacking grain, as set forth.

No. 30,507.—NATHANIEL M. STRATTON, of New York, N. Y.—*Improvement in Fences*.—Patent dated October 23, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The construction of fence described, consisting of the rails *C C*, and pickets *B B*, united by means of hooks *A A*, on the one part and corresponding notches or slots in the other part, the hooks and recesses being adapted to fit together so that the parts are kept in their proper positions without any additional means, and so as to cause the pickets to stand erect when the line of the fence is inclined, all substantially as set forth.

No. 30,508.—JOHN S. STUART and ASHEL L. CORSON, of Marblehead, Mass.—*Improved Machine for Dressing Boot and Shoe Heels*.—Patent dated October 23, 1860.—The nature of this invention is shown by the claim and engravings.

The inventors say: We *claim* the explained mode of applying the knife carrier *E*, to the spring lever *I*, viz: by the pivot *i*, and the arm *f*, adjustable with respect to the lever and connected with the knife carrier, substantially as described.

We also claim the combination and arrangement of the regulating lever *N*, and screw *O*, with the knife carrier *E*, its guide roller *M*, and pattern *a*

We also claim the arrangement of the bearing faces of the heel supporting jaws with respect to the plane of movement of the cutter in making the bevel of the sides of the heel.

No. 30,509.—A. E. TAYLOR, of Ogdensburg, N. Y.—*Improved Bell Attachment*.—Patent dated October 23, 1860.—This invention consists in arranging with a stationary bell, attached to a door, or door post, a striking mechanism in such a way that by rotating a crank in either direction a hammer will be actuated and the bell struck.

Claim.—The hammers *g*, operating through the medium of the revolving arbor *E*, studded disk *F*, lever *D*, and the lever or levers *d*, with the spring or springs *f* and *h*; the above parts being arranged relatively with the bell *C*, to operate as and for the purpose set forth.

No. 30,510.—J. D. TRACY, of Springfield, Mass.—*Improved Attachment for Bridle Bits*.—Patent dated October 23, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The construction of the bit with the lower parts of the cheek pieces *B B*, made in loop form, and provided with muzzling rods *e e*, so as to prevent the animal from biting, all as shown and described.

No. 30,511.—NATHAN B. WEBSTER and ROBERT W. YOUNG, of Portsmouth, Va.—*Improvement for Preventing the Incrustation of Steam Boilers*.—Patent dated October 23, 1860.—The claim explains the nature of this invention.

Claim.—Connecting with the interior of a steam boiler a metal electro-negative to the metal of the boiler, substantially as and for the purpose set forth.

No. 30,512.—JESSE B. WHEELER, of Chicago, Ill.—*Improved Machine for Drying and Cooling Grain*.—Patent dated October 23, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the inclined perforated bottom *C*, and the hot air passages connecting the chamber above it with the air heating chamber, substantially as described.

Second. I also claim, in combination with the drying chamber, the external perforated trunk *G*, and the fan blower *D*, for drawing the moistened and heated air from the grain and returning it to the heating chamber, whilst cooler air takes its place among the grains, substantially as described.

No. 30,513.—JOHN P. WILSON and FREELove V. WILSON, of Ilion, N. Y.—*Improved Revolving Spool Stand*.—Patent dated October 23, 1860.—This invention consists in constructing and arranging the several parts of the spool stand.

Claim.—The described article of manufacture, constructed and arranged substantially in the manner and used for the purpose specified.

No. 30,514.—GURDON G. WOLFE, of Troy, N. Y.—*Improvement in Cooking Stoves*.—Patent dated October 23, 1860.—The nature of this improvement is shown by the claim and engravings.

Claim.—The combination and arrangement of the air heating chamber *G*, hot air passage *H*, opening *J*, flue space *K*, opening or openings *L*, and aperture or apertures *M*, with the oven *A*, fire box *B*, and smoke flues *C*, along the top, back, and bottom of the oven, substantially as shown and described.

No. 30,515.—RICHARD B. WRIGHT, of Norfolk, Va.—*Improved Ventilator for Railroad Cars*.—Patent dated October 23, 1860.—The claim and engravings show the nature of this invention.

The inventor says: I *claim*, first, hinging a dust and spark deflector between two car windows, so that it may be applied to either of the windows, according to the direction in which the car travels, as set forth.

Second. A V-shaped frame *C C*¹, hinged at *J*, and provided with a sash *D* in the centre of the said V-shaped frame, in combination with a wing of wire gauze *H*, hinged to the edge of the sash, so as to shut against either of the arms *C* or *C*¹ of the V-shaped frame, substantially as and for the purposes set forth.

No. 30,516.—A. T. BALLANTINE, of New York, N. Y., assignor to himself and T. O. CONKLING, of same place.—*Improved Box for Dropping Sugar*.—Patent dated October 23, 1860.—This invention consists in arranging at the bottom of a hopper, of any desirable shape or capacity, a discharging device, whereby a definite quantity of sugar will be discharged from the hopper by the movement of a lever suitably applied to the box. It further consists in the employment of a wire agitator, which is operated by the dropping device so

as to keep the sugar loose in the hopper and prevent it from clogging up the throat of said hopper.

The inventor says: I *claim*, first, the combination, with a suitable hopper A, of a rotary dropping wheel C, spring *c*, lever D, pall *e*, and ratchet wheel, or their equivalents, arranged and operating as and for the purposes set forth.

Second. I claim the vibrating wire frame G placed within the hopper A, and operating as and for the purposes set forth.

No. 30,517.—EDWARD BURKE, of Philadelphia, Pa., assignor to himself and ABRAHAM SULGER, of the same place.—*Improvement in Seats and Couches for Railroad Cars*.—Patent dated October 23, 1860.—This invention consists in a peculiar construction of seats for sleeping cars, whereby they may be readily converted into couches without in any degree detracting from their utility as seats with reversible backs; also in certain platforms arranged to slide on vertical rods, connected permanently to the side of the car, the said platforms being connected to each other and the roof by jointed rods.

The inventor says: I *claim*, first, the described arrangement of the sliding boards H and H¹, with their legs *a a*, the hinged leaves I, when the whole is combined with the base D of a car seat having the usual reversible back G, as set forth.

Second. I claim the platforms J and K, guided and retained in position by the permanent rods M and L, connected together by the jointed rods P, and to the roof by the jointed rods N, the whole arranged and operating as and for the purpose specified.

No. 30,518.—GEORGE FELTER, of Philadelphia, Pa., assignor to S. PANCOAST, of the same place.—*Improvement in Sewing Machines*.—Patent dated October 23, 1860.—This invention relates to improvements in that class of sewing machines in which discoidal shuttles or spool cases containing ordinary spools of cotton are used.

The inventor says: I *claim*, first, the combination of the hollow spindle G, carrying the hook N, with the stationary shaft I, the hollow disk J, and annular cap L and discoidal spool case, the whole being arranged and operating substantially as set forth and for the purpose specified.

Second. I claim the guard M, or its equivalent, carried by the hollow spindle G, and arranged in respect to the needle *x* and hook N as specified.

No. 30,519.—GEORGE C. GOURLAY, of New York, N. Y., assignor to himself and ANDREW HUNTLEY, of the same place.—*Improvement in Port Lights for Vessels*.—Patent dated October 23, 1860.—The object of this invention is to obtain a port light that may be applied to vessels, either iron or wooden ones, with facility, and so fast as to form a perfectly water-tight joint.

Claim.—The construction of the face of the rim A with one or more annular grooves *c*, as shown and described.

No. 30,520.—CALEB H. GRIFFIN, of Lynn, Mass., assignor to WALTER D. RICHARDS, of Boston, Mass.—*Improved Machine for Cutting Boot and Shoe Soles*.—Patent dated October 23, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of the travelling pressure bar F and block with the rotating die block J and dies *g*, when such are held stationary during the operation of cutting, substantially as described.

I also claim the stop bolt K, as operated, and notched disk Q, or their or either of their equivalents, in combination with the rotary die block J, for the purposes described.

I also claim the described combination of the disk *l*, spring catch *o*, and notched ring gear wheel H, as operated, or their or either of their equivalents, with the rotary die block J and its pinions R and shaft *p*, for the purpose set forth.

And, lastly, I claim the gauges *y*, as arranged, constructed, and operated, for the purpose described.

No. 30,521.—FERDINAND F. MYER, of New York, N. Y., assignor to himself and AUGUSTUS SCHELLER, of the same place.—*Improvement in the Manufacture of Chloride of Lead*.—Patent dated October 23, 1860.—The inventor says: I take sulphate of lead and mix it into a thin paste with a concentrated solution of chloride of sodium, or common salt, and in this state it is introduced into a saturated hot solution of chloride of sodium, where the same is decomposed. The largest portion of the lead precipitates as chloride of lead, and another portion, together with the impurities, remains in solution.

Claim.—The method, substantially as described, of treating sulphate of lead with chloride of sodium, for the purpose set forth.

No. 30,522.—THOMAS A. MORRIS, of Green Bay, Wis., assignor to himself and T. K. SCHETTLER, of the same place.—*Improvement in Crushing and Pulverizing Quartz*.—Patent dated

October 23, 1860.—This invention consists in the use of one or more pairs of crushing rollers of a peculiar form in connection with a rotating cylinder provided with a bed of novel construction, and with drags.

The inventor says: I *claim*, first, the rotating cylinder E, provided with a bed or bottom formed of rocks *g*, in connection with the drags H, one or more, arranged substantially as and for the purposes set forth.

Second. The combination of one or more pairs of crushing rollers B B with the rotating cylinder E and drags H, one or more, arranged for joint operation, as and for the purpose specified.

No. 30,523.—JOHN J. WATSON, of Buffalo, N. Y., assignor to himself and SOLON DIKE, of Columbia, S. C.—*Improved Method of Adjusting the Rake of Reciprocating Saws*.—Patent dated October 23, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The movable head timber M, to which the top of the saw is connected by means of the guide O, said timber being provided with tenons which pass through openings in the frame pieces A A, and being adjusted by wedges or keys, substantially as and for the purpose specified.

No. 30,524.—ROBERT H. GRATZ and CHARLES C. LLOYD, of Philadelphia, Pa.—*Improvement in Dry Gas Meters*.—Patent dated October 23, 1860.—This invention consists in placing the inlet at the bottom of a dry gas meter, and in placing the outlet at the top of the meter; thus dispensing with side tubes.

Claim.—Placing the inlet A at the bottom of a dry gas meter, thereby producing simplicity in the attachment and permitting the liquid condensation to flow direct into the main, substantially as set forth.

No. 30,525.—GEORGE S. BOSWORTH, of Troy, N. Y.—*Improvement in Moulding Cast Iron Wheels*.—Patent dated October 30, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Forming a mould by means of a flask consisting of three parts, to wit: a cope, a nowel or drag and cheeks, or chill, the two former being open to ram up the sand to form the mould on face patterns which can be printed back, the mould being formed in the manner and by the means set forth, and the thickness and weight of the wheel being determined by the depth of the cheeks, which can be varied in the same sized wheel, and with the same pattern, and same cope and nowels.

No. 30,526.—ZERAH B. BROWN, of Simsbury, Ct.—*Improvement in Seeding Hoes*.—Patent dated October 30, 1860.—*d* is a box or receptacle for holding the seed, and is secured to the handle *b* of the hoe in a proper manner by the use of screws. In the lower end of said box is arranged a device for adjusting and dealing out the seed from the box *d* in the desired quantity; *e* is the sliding bar, nearly in the centre of which is fitted an elastic plate *f*.

Claim.—The seed box *d*, hoe handle *b*, and seed slide *e*; the latter being provided with the adjustable plate *f* and spring *k*, and arranged at right angles to said box and handle for operation conjointly, in the manner and for the purpose described.

No. 30,527.—WESLEY A. COE, of Greensborough, N. C.—*Improved Peach Parer*.—Patent dated October 30, 1860.—This invention consists in the peculiar arrangement of the two prongs of a peach paring and slicing machine and crank, in combination with a lever hinged at one end and hung to an oblique rack by a link; also in a curved and elastic slicing knife and curved guide rods, in combination with a reciprocating stirrup.

The inventor says: I *claim*, first, the peculiar arrangement of the two prongs A B of a peach paring and slicing machine and crank C, in combination with a lever F hinged at one end at I and hung to an oblique rack H by a link G; all constructed substantially as and for the purposes set forth.

Second. A curved and slicing knife P P¹ P, and curved guide rods R R¹ R R¹ R, in combination with a reciprocating stirrup M M¹ M, constructed and operating substantially as set forth.

No. 30,528.—HORACE COLLIER, of Smithville, Ark.—*Improved Machine for Delineating the Course of Rivers*.—Patent dated October 30, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A "plotter" rotating at a speed corresponding with that of the boat, or other object upon which it is carried, and marking upon a sheet which is held in position corresponding with the points of the compass, substantially as and for the purposes set forth.

No. 30,529.—J. A. COWDERY, of North Middletown, Ky., and G. W. COWDERY, of Great Bend, Ohio.—*Improvement in Straw Cutters*.—Patent dated October 30, 1860.—This invention

consists in the construction and arrangement of the cutting and feeding apparatus of a straw cutter.

The inventors say: We *claim*, first, the combination of the cam M, lever N, and fork O, constructed and arranged as described, for the purpose set forth.

Second. The combination of the lever V, with its spurs *c* and *d*, with the fork O, and spring pawls *s*, as and for the purpose set forth.

Third. The combination with the top W of the lever Y, and its spring *i*, arranged and operating as described

No. 30,530.—ELLIOT DICKERMAN, of Richmond, Vt.—*Improved Clothes Dryer*.—Patent dated October 30, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment in clothes dryers of the arms P and clothes lines K, in combination with the arms D and clothes lines J, and with suitable stops on D, substantially as specified

No. 30,531.—ROBERT B. DONALDSON, of Washington, D. C.—*Improved Door Spring*.—Patent dated October 30, 1860.—The lever C works between the casing plates A and B, and the inward movement of said lever is arrested by the central lug *i*. The ratchet wheel *h* upon the axle *a*, and the pawl *q*, which is pivotted to the inner surface of the lever C, retain the spring which actuates the said axle in any desired state of compression.

Claim.—The arrangement of the respective parts of said apparatus, which enables its actuating spring to exert its power upon a door through the medium of the axle *a*, the lever C, and the cord or chain *d*, substantially in the manner set forth.

No. 30,532.—HENRY EVANS, JR., of Baltimore, Md.—*Improved Machine for Bending Sheet Metal*.—Patent dated October 30, 1860.—The claim and engravings explain the nature of this invention

Claim.—A bed and hinged tongue provided with grooves or shoulders H for the bent edges of the tin, in combination with two levers hinged to said bed for bending the sheet of metal, as described

No. 30,533.—LEWIS EVANS, of Morgantown, Va.—*Improved Flask for Casting Packing around Cannon Balls*.—Patent dated October 30, 1860.—This invention consists in the means described, whereby two or more rings of soft metal packing are introduced into circumferential and longitudinal grooves of cast iron projectiles.

Claim.—The use of the flasks A B connected together by a vertical hinge, and having semi-cylindric shouldered recesses L L formed on their inner faces, in combination with cast iron projectiles, which have circumferential and longitudinal grooves J J J formed in them, and with or without the bar D and pins F F; all substantially as and for the purposes set forth.

No. 30,534.—WILLIAM HEPPENSTALL, of Springfield, Mass.—*Improvement in Skirts*.—Patent dated October 30, 1860.—This improvement consist in weaving into the selvage of the fabric a waistband, the warp threads of which are larger and stronger than the threads which compose the filling, and larger than the other warp threads of the fabric, for the purpose of drawing up the cloth to form the waistband and adapt it to the size of the wearer, together with weaving into the fabric openings for hoops, cords, or tape.

Claim.—As a new article of manufacture, a skirt, constructed substantially as described.

No. 30,535.—EUGENE MACK, of the United States Navy.—*Improved Machine for Stretching the Straps of Ships' Blocks*.—Patent dated October 30, 1860.—The inventor says: In carrying out my improvement I arrange on the fid A my strap B, and, by the arms or levers attached, turn the screw attached to the wedge C, until the graduated marks in the wedge coincide with a mark on the fid, which signifies that the strap is stretched to its proper size.

Claim.—The fid, wedge, screw, and gauges on the fid, when combined and arranged, substantially as and for the purpose specified.

No. 30,536.—JAMES W. LYON, of Brooklyn, N. Y.—*Improved Machine for Finishing Gas Fittings*.—Patent dated October 30, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, interposing between the jaws and body of the chuck spindles or joints, substantially as described, whereby the jaws may be turned on axes at right angles to the axis of the spindle and chuck, for the purpose of presenting different parts of the fitting, clamped between them to the action of the cutting tools, substantially in the manner and for the purposes described.

Second. In combination with the jaws of the chuck, the adjusting screws, substantially as described

Third. In combination with the jaws of the chuck, the mechanism whereby they are clamped and locked together on the fitting at one operation, to wit: the cams, levers, and rack-sliding bars, substantially as described.

Fourth. In combination with the cams operating the jaws of the chuck, a collar wrench not removable from the chuck and spindle, substantially as described.

Fifth. In combination with the jaws of the chuck, the indices and self-acting detents, substantially as described.

Sixth. In combination with the indices and detents, the locking cams or wedges, substantially as described, and when in connection with the chuck and jaws, substantially for the purposes set forth.

Seventh. The chuck constructed substantially as described, and containing the improvements separately specified in the first, second, third, fifth, and sixth claims.

Eighth. The combination of a friction brake directly with the chuck, substantially as described.

Ninth. The combination of the brake chuck and clutch shifter, or its equivalent, when so arranged as to communicate motion to the chuck spindle when the brake is released from the chuck, substantially as described.

Tenth. The sliding carriage and series of mandrels, in combination with the spindle and chuck, substantially as described.

Eleventh. The division plate, self-acting clamp, and releasing lever, in combination with the sliding carriage, substantially as described.

Twelfth. The latch bolts in the mandrel bearings, in combination with the mandrels, substantially as described.

Thirteenth. Constructing the sliding carriage mandrels in two parts, arranged and combined together, substantially as and for the purposes described.

Fourteenth. The combination of the adjustable drill with the adjustable facing tool constituting the cutting tool *k*, substantially as described.

Fifteenth. Alternating taps or dies with cutting tools, in combination with two or more pairs of parallel mandrels, arranged in combination with a chuck, substantially as described.

Sixteenth. The driver, in combination with the sliding carriage and mandrels, substantially as described.

Seventeenth. In combination with the driver and spindle through which it slides, the pulley, brake, and clutch shifter, substantially as described.

Eighteenth. In combination with the mandrel socket of the driver, the spring latch and releasing cam, substantially as described.

Nineteenth. The employment of an adjustable friction plate, in combination with the chuck and tap or die to hold the fitting against the action of the tap or die by a yielding pressure sufficient for the purpose of cutting the screw thread, but yielding to prevent stripping the thread or breaking the tap when requisite, substantially as described.

Twentieth. And finally, I claim combining together in one machine a series of parallel mandrels, carrying cutting tools, driver, sliding carriage, and chuck, substantially as described, and arranged so as to operate substantially in the manner and for the purposes set forth.

No 30,537.—EDWARD MAYNARD, of Washington, D. C.—*Improvement in Breech-Loading Fire Arms*.—Patent dated October 30, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim the employment of a solid-headed hinged cone seat *B*, for closing the lateral opening between the mouth of the chamber of the barrel and the solid head at the after end of said opening, when the proportions of the said cone seat and the lateral opening which receives the same are such that a thin-sided metallic cartridge, (either loaded or unloaded,) can be readily placed within the chamber of the barrel when the cone seat is in its open position, and then be securely retained in said chamber by throwing the cone seat into its closed position, substantially as set forth.

When the mouth of a chamber of a breech-loading fire arm is closed by the head of a hinged block *B*, which forms the cone seat of said arm, I also claim the placing of a thin-sided metallic cap within the said chamber, for the purpose of forming a tight joint between it and the said hinged block, substantially as set forth.

I also claim giving the bottom of the thin-sided chamber cup *f* of my improved fire arm, such a degree of thickness and strength that either a laterally projecting arm or a looped thong or cord may be combined therewith, of such a size and shape as shall enable the said cup to be readily withdrawn from the chamber of the barrel, substantially as set forth.

When the lateral opening between the mouth of the chamber of the barrel and the solid head at the after end of said opening is closed by a properly proportioned hinged cone seat, I also claim so proportioning the hinges of said cone seat that the recoil thereof, at the instant of firing the arm, will be wholly exerted against the solid head opposite the after end of said cone seat.

No. 30,538.—H. L. PIERCE, of Millport, N. Y.—*Improvement in Smut Machines*.—Patent

dated October 30, 1860.—R R are the scouring rods, F ff are the fans or blowers, s s s¹ the draught spouts, P the feed hopper, a the main shaft, and c c the inside cylinder.

Claim.—The adjustable metallic scouring rods R R R, fluted, notched, or grooved, in combination with the cylinder D, and cap M, constructed and operating substantially as described.

No. 30,539.—C. A. McEvoy, of Richmond, Va.—*Improved Sabre Bayonet Fastening.*—Patent dated October 30, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, fastening a sabre or other bayonet to the muzzle end of a rifle by a lock located in the rear of the handle of said bayonet, substantially as and for the purposes set forth.

Second The arrangement of a stationary and slotted plate F, movable and slotted disk L, and spring stop M, all located in the rear end of the handle of a bayonet, in combination with a T-shaped projection B C C, near the muzzle end of a rifle, substantially as and for the purposes set forth.

No. 30,540.—JOHN OUTRAM, of Elmira, N. Y.—*Improvement in Machines for Cleaning Grain.*—Patent dated October 30, 1860.—This invention consists in the form, construction, and operation of the machine.

The inventor says: I *claim*, first, the arrangement of blast and suction fans on a horizontal shaft, in connection with separating chamber F, and pipes E, D, and G, as described and shown.

Second. The movable double acting deflector i, in the pipe G, constructed and operating in the manner described and shown, for the purpose of dividing and directing the currents of air upwards and downwards.

No. 30,541.—JOHN PARSONS, of Cleveland, Ohio.—*Improvement in Brick Machines.*—Patent dated October 30, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, as my invention, first, the wheel B, fitted to the cams c c c, and studs d d d, in combination with lever G, rack e, hub f, friction wheel I, substantially as described and for the purposes set forth.

Second. The escape door, figure 3, with slide t, formed hollow at the back part, inclined planes x x, spring w, latch u, guide u*, substantially as described and for the purposes set forth.

Third. The arrangement of the parts of the driver 4, the plates 6, 7, and 8, the regulating screws and punch nuts in connection with the guide rods 15 15, guides 16 16, operated substantially as described for the purposes set forth.

Fourth. The arrangement of the bevel wheel y, and pinion wheel z, in combination with rollers m and m, band o, spring n, or its equivalent, the mould table l, and driver p, substantially as described and for the purposes set forth.

No. 30,542.—WILLIAM H. PECKHAM, of Hoboken, N. J.—*Improved Heel for Boots and Shoes.*—Patent dated October 30, 1860.—This invention consists of a hollow metallic heel, with a screw and nut, by which it is firmly connected to the boot or shoe sole, said heel being also formed with serrations, taking the leather to prevent the same from moving, and with a cavity at the front part of the heel to prevent injury by striking the pavement.

Claim.—The hollow metallic heel formed with the cavity b, and connected to the boot or shoe by the nut c, in the manner specified.

No. 30,543.—ROBERT PILSON, of Laurel, Md.—*Improvement in Machines for Dressing Warp.*—Patent dated October 30, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the sectional warp beams c d d², the racks or guides g² g², the distributing cylinders e e, and squeezing rollers ff, the brushes h h, the copper metal comb-like guide or rack K K, the copper metal harness m² m², the lease rods z z², the drying drums N O P, the loom beam T u, the smoothing controlling cylinder X, and fan Y, when so arranged relative to each other, as shown, forming one individual machine, and through all of which intermediate auxiliary cones and cog gearing are dispensed with, and all undue drag, strain, and tension of the threads of the warp are prevented, and the several improved results in the manufacture of cotton fabrics are attained, substantially as set forth and described.

No. 30,544.—JAMES M. PITTS, of Sumter, S. C.—*Improvement in Fences.*—Patent dated October 30, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination and arrangement of the long and short battens and braces with the semi-dovetails, which are formed in reverse positions on the upper and lower rails of the panels, substantially as and for the purposes set forth.

No. 30,545.—EUGENE M. ROXFORD, of Indianapolis, Ind.—*Improvement in the Manufacture of Square Pans of Sheet Metal*.—Patent dated October 30, 1860.—The claim and engravings explain the nature of this invention.

Claim.—An adjustable arrangement of plates C and D, for raising and folding the metal overlapping them, which at the same time compress the slack in the corners, and in connection with plate H, bends the compressed slack against the sides, the whole constructed and operating as set forth.

No. 30,546.—WILLIAM H. RACEY, of St. Augustine, Fla.—*Improvement in Lamps*.—Patent dated October 30, 1860.—This invention consists in the employment or use of perforated plates placed within the cone or cap, and in such relation therewith as to control the action of the air upon the flame within the said cap or cone, and render the lower part of the flame merely a gas generator, the gaseous vapor passing up between the plates and uniting with the oxygen within and at the apex of the cone.

Claim.—The employment, or use, of the perforated plates F F, placed in relation with the cap C, wick tube E, and inner deflector D, to operate as and for the purposes set forth.

No. 30,547.—DANIEL R. PRATT, of Worcester, Mass.—*Improvement in Bearings for Railroad Cars*.—Patent dated October 30, 1860.—This invention consists in constructing and arranging the bearings.

The inventor says: I *claim*, first, the employment of the enclosed circular plates E E¹, or the quadrantal boxes F F¹, constructed and used as and for the purpose specified.

Second. In combination with the enclosed plates and boxes, I claim the balls and rollers I and L, as and for the purpose specified.

Third. The use of the division plate *d*, in the manner and for the purpose specified.

No. 30,548.—SILAS STEVENS, of Worcester, Mass.—*Improved Tool Holder*.—Patent dated October 30, 1860.—The object of this invention is to economize in the material used in the construction of turning and planing tools, and also to facilitate the construction of the same as well as keeping them in proper working order.

Claim.—The arrangement of the adjustable head *c*, tool D, and rod R, with the hollow bar A, screw *f*, and nut E, as and for the purpose shown and described.

No. 30,549.—WILLIAM WATTS, of Newark, N. J.—*Improvement in Hangers and Boxes for Shafting*.—Patent dated October 30, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A box adjusted and supported in an open bottomed hanger, (said hanger having the flanges *c c*,) by means of the bolts *g g*, the bolt E, and sliding caps *f f*, substantially in the manner and for the purpose described.

No. 30,550.—HENRY E. WOODFORD, of Watertown, N. Y.—*Improvement in Valves for Steam Engines*.—Patent dated October 30, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment of valves C that have an increasing radius from one end to the other, and that are adjustable with their axis of motion, in combination with cylinder A and chest B, when said valves are constructed and arranged to operate in the manner substantially as shown and described.

No. 30,551.—JOSEF JOHNSON, of New York, N. Y., assignor to himself and JOHN WARD, JR., of Brooklyn, N. Y.—*Improved Clothes Dryer*.—Patent dated October 30, 1860.—This invention is a new article of manufacture, consisting of two series of arms, each supporting several series of clothes lines hinged to each other and to connecting blocks, and provided with a tension cord, or its equivalent.

Claim.—The arrangement of the blocks A B, arms C D, and joints *e*, lines G H, and tension cord J, in the manner substantially as described, so as to produce the effects set forth.

No. 30,552.—C. W. SHEDD, of Addison, Ala., assignor to himself and ROBERT JAMISON, JR., of Tuscaloosa, Ala.—*Improvement in Grinding Mills*.—Patent dated October 30, 1860.—This invention relates to an improved mill of that class which is designed for grinding corn and cobs in the husk.

The inventor says: I *claim*, first, the arrangement of the plate J, tubes M, tube K, sleeve L, provided with nut *r*, and cutter disk H, essentially as and for the purpose set forth.

Second. The notches *o o* in the cutter disk H, when used in connection with the cutters *ll*, and the plates J, provided with the tubes M, for the purpose specified.

No. 30,553.—SIDNEY S. TURNER, of Westboro, Mass., assignor to himself and OTIS F.

VINTON, of said Westboro.—*Improved Machine for Splitting Leather.*—Patent dated October 30, 1860.—The rotary cutter or circular knife C is fixed on one end of a horizontal shaft e, that is sustained in balls f f, and bears a pulley g, about which and a driving pulley h, an endless belt i works; this wheel h is carried by a driving shaft l, and bears against a periphery of a wheel m, fixed on the shaft D.

Claim.—The improved welt-splitting machine, as constructed, with a rotary circular knife, the shaft e thereof, and conical feed rollers, arranged with respect to each other, and so as to operate therewith, substantially as specified.

No. 30,554.—SIDNEY S. HOGH, of Cuyahoga, Ohio.—*Improvement in Rotary Harrows.*—Patent dated October 30, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Combining two or more harrow-toothed wheels, or frames, with a draught frame, or with a draught beam in such a manner to cause the forward movement of said draught frame, or beam, to impart positive rotary movements to the said harrow-toothed wheels, or frames, substantially as set forth.

No. 30,555.—FEDERAL C. ADAMS and JOSEPH PECKOVER, of Cincinnati, Ohio.—*Improved Hinge.*—Patent dated November 6, 1860.—This invention consists in casting a recess in one piece and a projection upon the other piece, the recess being enough larger than the projection that is to lie and turn in it, that molten zinc or other suitable metal may be poured into it and surround the projection, and closely and neatly fill up the depression.

Claim.—Forming a hinge by the combined use of the large cut under recess on one part, and the projection b c d, or its equivalent, on the other part, and the molten zinc, or other easily fused metal, run in between them, substantially as and for the purpose set forth.

No. 30,556.—CHARLES E. ATHERTON, of Paterson, N. J.—*Improvement in Vapor Lamps.*—Patent dated November 6, 1860.—The heat from the flame acting upon the receiver A A, made of cast iron, causes the wire a a, made of soft brass, to expand, which, acting upon one end of the lever b, forces the bevelled end of the lifting pin c into the horizontal hole g of the valve e e e, thereby raising the valve and admitting the gas generated in the tube K into the receiver, and from thence through the burning tubes i i to the burner.

Claim.—The combination and arrangement of the gas receiver, the self-acting valve or gauge at the top of the generating tube, with the use of the metal rod and bevelled pin, substantially as and for the purpose set forth.

No. 30,557.—MINER H. BACON, of Mystic, Conn.—*Improvement in Machines for Dressing Stone.*—Patent dated November 6, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the vibrating frame G with the lever M and the spring K, for increasing the force of the blows at pleasure, beyond that due to gravity alone.

Second. The employment of the checking spring J, in combination with the vibrating frame G and lever M, or their equivalents, substantially as described, for diminishing the force of the blows at pleasure, below that due to gravity.

Third. The arrangement of the recess r in the vibrating frame G, the stop R on the sliding frame C, and of the gearing H and O, substantially as and for the purpose set forth.

Fourth. The employment of the sleeves T, operated by the screws U, or their equivalents, for adjusting the height of the cutters S in the cutter frame F, in combination with the means for adjusting the inclination of the several cutters S, in their respective sleeves T, substantially as set forth.

No. 30,558.—WILLIAM B. BARNES, of Forestville, Conn.—*Improvement in Clocks.*—Patent dated November 6, 1860.—This improvement in clocks relates to the manner of constructing and arranging all, or nearly all, of old parts, in a new manner and in a close, compact form, having three pointers to indicate time for a pendulum clock.

The inventor says: I *claim* the arrangement of the verge g, detent k, triangular shaped escape wheel tooth o, in combination with a pendulum n, substantially as and for the purpose described.

I *claim*, in combination with the arrangement above described, the arrangement of the pointer spindles and gearing attached thereto, substantially as and for the purpose described.

No. 30,559.—JOHN BEAUMONT, of Hartford, Conn.—*Improvement in Coffee Pots.*—Patent dated November 6, 1860.—This invention consists in providing a tea or coffee receptacle, with a riddled bottom, upon which to place the tea or coffee, and a perforated cover laid over the tea or coffee.

Claim.—The arrangement, in the manner and for the purpose specified, of the coffee pot a,

provided with the liquid joint *f*, the receptacle *b*, having the perforated bottom *c* and perforated cover *e*, and the condenser *d*, provided with the cavity *i*.

No. 30,560.—N. BRITTAN, of Lockport, N. Y.—*Improvement in Lightning Rods*.—Patent dated November 6, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The construction of lightning conductors, with parallel continuous strips or tubes of metal held at a distance apart and united by intervening washers or blocks, substantially in the manner and for the purposes specified.

No. 30,561.—M. A. BUTLER, of Mariana, Fla.—*Improvement in Compositions for Soap*.—Patent dated November 6, 1860.—This invention consists in a compound of white soap, known as "opedeldoc soap," and commonly used by druggists for liniments, and of a small quantity of salt water soap, such as is used by sea-going persons, mixed with spirits of ammonia, in a certain proportion, and colored, if desired, so as to produce a soap that has the appearance of ordinary or fancy soap, and which can be used in water containing mineral or metallic substances without inconvenience.

Claim.—The described soap, composed of the ingredients specified, and mixed together in about the proportion described, for the purposes set forth.

No. 30,562.—CHARLES F. CHAMBERS, of Chambersburg, Ind.—*Improved Washing Machine*.—Patent dated November 6, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of upper rubber D, adapted to reciprocate on stationary ways C, and the swinging lower rubber or board F, adapted to be elevated from the tub, and to hold the clothes stationary for the upper rubber to act upon, or to be depressed at will, as and for the objects set forth.

No. 30,563.—ALBERT B. COLTON, of Athens, Ga.—*Improved Spike for Threshing Machines*.—Patent dated November 6, 1860.—This invention consists in the employment of reversible spikes, having a hole through their centre, in combination with flanged plates or rings, having diagonally set rollers and the longitudinal screw rods.

Claim.—The combination of reversible spike A A s, flanged and shouldered plates or rings C a g h d, and screw bolts B, substantially in the manner and for the purposes described.

No. 30,564.—JAMES DAVIES, of Schuylkill Haven, Pa.—*Improvement in Canal and River Locks*.—Patent dated November 6, 1860.—The claim and engravings explain the nature of this invention.

Claim.—In combination with a lock chamber, a passage or passages through which the water may flow back into the upper level, when a boat enters the lock from above, and through which water may flow into the chamber from the level below, when the boat is leaving the lock, substantially in the manner and for the purpose set forth.

No. 30,565.—SARAH N. DAVIS, of Muskegon, Mich.—*Improved Clothes Sprinkler*.—Patent dated November 6, 1860.—This invention consists in combining, with a cylindrical bellows, small enough to be conveniently used with one hand, a syphon-shaped tube and a small barrel with a hole in one end, which hole is stopped by a simple valve when a pressure is put upon the bellows, the end of which barrel is finely perforated around the central hole, for allowing water to issue from the barrel in fine jets of spray.

Claim.—The combination, with a suitable bellows, of the syphon tube C and the barrel G, with its perforated end orifice *b*, and valve H, arranged and operating as and for the purposes set forth.

No. 30,566.—JOHN DAVIS, of Elmira, N. Y.—*Improvement in Apparatus for Detaching Horses from Carriages*.—Patent dated November 6, 1860.—This invention consists in providing an apparatus for easily and instantly detaching a horse from a vehicle.

Claim.—The arrangement of the whiffle tree, as constructed, with the thills, provided with the hooks H H and springs I I, substantially as and for the purpose specified.

No. 30,567.—A. K. EATON, of New York, N. Y.—*Improved Gold Amalgamator*.—Patent dated November 6, 1860.—This invention consists in the construction and working of a gold amalgamator, so as to secure the minute particles that are usually carried away in suspension.

The inventor says: I claim, first, the use of an inferior amalgamated surface, substantially as specified, in contact with the superior surface of a body of mercury.

Second. I claim the combination of the rotary disk, with the hollow shaft and receiving bowl, substantially as described.

No. 30,568.—MOSES W. DILLINGHAM, of Charlestown, Mass.—*Improvement in Vapor Lamps*.—Patent dated November 6, 1860.—The claim and engravings explain the nature of these improvements.

The inventor says: I *claim* the application of the valve O and cup E to the wick tube, in such manner as to enable both valve and cup to turn together on the wick tube, and with respect to the lateral, discharging orifice thereof as described.

Also, the arrangement and combination of the cup or thimble E, the gas heater C, the wick tube A, and its burner, the whole being as specified.

Also, the arrangement of the conduits or passages leading from the wick tube through the cap B, the heater C, and into the burner D, as described.

Also, the arrangement of the jet holes *ff*, of the slit *e*, of the burner, viz: at the termini of such slit, as and for the purpose described.

No. 30,569.—MOSES DEPUY, of Pittsburgh, Pa.—*Improvement in Making Hoes*.—Patent dated November 6, 1860.—This invention consists in attaching the shank or tang and eye of the hoe to a blade.

Claim.—The combining and fastening of a steel or iron blade and a malleable wrought or cast iron tang A, by means of the groove or furrow *b* and the flanges *c* and *e*, and the rivet *k*, substantially in the manner set forth and described.

No. 30,570.—SYLVENDER ELLIS, of New Britain, Conn.—*Improvement in Washing Machines*.—Patent dated November 6, 1860.—This invention consists in the combination of a perforated, toothed, or corrugated plate, fitted to and turning upon a fixed shaft or spindle, secured in the bottom of a tub, and having a toothed or corrugated revolving conical cylinder, the shaft of which is secured in boxes, one on the centre shaft of the tub, and the other on a shaft secured on the side of the tub.

Claim.—The combination of the conical cylinder *g*, with the revolving plate *d* arranged within a tub *a*, having the adjustable features described, arranged and operating together for the purpose specified.

No. 30,571.—JACOB FRICK, of Philadelphia, Penn.—*Improved Shutter Fastener*.—Patent dated November 6, 1860.—This invention consists of a turn buckle or bar, having a spring with a projection, in combination with certain plates, one of which has recesses for receiving the projection of the spring, and projections for limiting the movement of the bar.

Claim.—The bar F, and the spring *d*, with its projection *e*, in combination with the plates C and D, the latter having the recesses *h* and *f*, and the projections *i* and *j*, or their equivalents, and the whole being arranged and applied to the shutters as and for the purpose set forth.

No. 30,572.—FRANKLIN GETZ, of Amherst, N. Y.—*Improvement in Driver's Seats for Mowing and Reaping Machines*.—Patent dated November 6, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, suspending the seat board E, from the spring F, by means of the swivel strap G, and rod G¹, the seat board having a free movement upon the bolt j¹, so as to allow of a lateral swinging movement of the seat board, for the purpose and substantially as described.

Second. I claim the post M, in combination with the "Kirby machine," for the purpose of supporting the rear end of the seat board, in order to locate the driver's seat in front for reaping, substantially as described.

No. 30,573.—A. I. HARDIN, of Shelby, N. C.—*Improvement in Machines for Cleaning Cotton Seed*.—Patent dated November 6, 1860.—This invention consists in constructing and arranging the different parts.

The inventor says: I *claim*, first, the arrangement of the cylinder E, provided with arms or pins *d d*, with the cylinder C, composed of a series of square bars *c c c*, placed in the position represented, and with the external gauze casing D, the same being used and operating in the manner and for the purpose specified.

Second. In combination with the subject of the first claim, I claim the inclined plane J, spout L, and revolving screen I, when used as and for the purpose specified.

No. 30,574.—GEORGE C. HINMAN, of Portageville, N. Y.—*Improvement in the Seats of Water Closets*.—Patent dated November 6, 1860.—This invention relates to the application and use of a movable seat for water closets, which is brought into place and used when needed, but which is to be removed or elevated from the stationary seat automatically when a person rises from it.

Claim.—The combination of the cord C, pulley D, and weight E, with the seat B, for the purpose of making the seat B self-elevating, substantially as described.

No. 30,575.—J. MORRISON HUNTER, of New York, N. Y.—*Improvement in Apparatus for Trying Oils*—Patent dated November 6, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the described arrangement and combination of the press and boiler, the former being placed within the latter, for the purpose of rendering oils or other fatty matters, by thoroughly pressing the scraps while the same are exposed to the boiler heat or steam heat, substantially in the manner and for the purposes described.

Second. I claim the use of the crib for preventing the scraps from coming in contact with the boiler, substantially in the manner described.

Third. I claim the employment of the pressure heads, and right and left hand screws, by means of which the oil may be separated from the scraps, substantially in the manner described.

No. 30,576.—WARREN IDDINGS, of Warren, Ohio.—*Improvement in Embalming Dead Bodies*.—Patent dated November 6, 1860.—This mode of embalming human bodies after death embraces both external treatment and the injection of substances into the blood vessels.

Claim.—The described process or mode of embalming the same, consisting of the three steps combined, the different compositions of matter being employed substantially in the manner and for the purposes set forth.

No. 30,577.—JONATHAN L. JONES, of St. Louis, Mo.—*Improvement in Truss Bridges*.—Patent dated November 6, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the flexile curved splice in the lower chord, when said splice is formed of broad flat plates $c\ c^1\ b^1\ b^2$, with lateral curved offsets or lugs $c^3\ b^3$, formed on their ends, said offsets pulling against one another and allowing a free independent movement of each plate in the path of a vertical circle, substantially as set forth.

Second. The combination of the convex or arched surface of blocks $d\ k\ s\ e\ d^1\ e^1\ x^1$, with similarly convex or concave flanges t , at the ends of the tubular braces o and z , substantially as and for the purposes set forth.

Third. The metallic clamps or recessed blocks $d\ e\ d^1\ e^1$, for retaining and holding together the tension joints of the upper and lower chords or stringers, in the manner and for the purposes set forth.

Fourth. The grooved shoe W , which connects and ties the lower chords and floor beams together, substantially as and for the purposes set forth.

Fifth. The septum or longitudinal partition 2 , and transverse tubes p , combined within the bore of the tubular brace o , in the manner and for the purposes set forth.

Sixth. The shoe j , as constructed and combined with the lower end of the tubular diagonal brace and the extreme end $a\ a$, of the lower chords, substantially as and for the purposes set forth.

No. 30,578.—HENRY JOHNSON, of Washington, D. C.—*Improvement in Vapor Burners*.—Patent dated November 6, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* so placing the reservoir or fountain in relation to the burner that the lowest point of the fluid shall be at or about the level of the burner, and the highest point below the level of the top of the generator or gas pipes $b\ c$, in the manner and for the purposes set forth.

I claim covering the upper ends of the gas pipes b and c , by the screw cap e^1 , constructed as set forth, so as to embrace the open ends of these pipes in one open common cavity in the cap and screw over them, in the manner set forth.

I claim the elevated conductor $n\ n^1$, rising above the highest level of the fluid in the fountain, as set forth.

No. 30,579.—WILLIAM KEARNEY, of Union, N. J.—*Improvement in Wrenches*.—Patent dated November 6, 1860.—This invention consists in giving facility and certainty to the operation of the wrench, by means of a jaw of a peculiar construction and arrangement.

Claim.—The jointed jaw $C\ D$, with its rule joint foot, when combined with the spring E , and the inclined plane f , and constructed substantially in the manner and for the purpose set forth.

No. 30,580.—WILLIAM S. KIRKHAM, of Brantford, Conn.—*Improvement in Locks*.—Patent dated November 6, 1860.—The object of this invention is to obtain an equal action of the knob hub upon the slide of a lock, when the knob is turned in either direction, and it consists in the use of a yoke, lever, spring, and slide.

Claim.—The arrangement of the sliding yoke F , lever G , spring H , and slide or latch C , essentially as and for the purpose set forth.

No. 30,581.—WILLIAM S. KIRKHAM, of Brantford, Conn.—*Improved Blind Fastener*.—Patent dated November 6, 1860.—The object of this invention is to facilitate the application of the fastening to a shutter or blind, provision being made for its adaptation to the varying thickness of shutters and blinds, as also to insure a firm and durable connection of the fastening thereto.

Claim.—The tube or socket B having the bar D and spring *f* secured within it, and provided with the tapped flanches *c c*, in connection with the plate C provided with lugs or projections *e* and screws *d*, all being arranged essentially as and for the purpose set forth.

No. 30,582.—JOHN LEWIS, of Elizabeth, N. J.—*Improvement in Attaching Sails to Ships' Yards*.—Patent dated November 6, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the clamps *c c*, fitted and acting substantially as set forth, to retain the sail to the yard or spar, or allow of its being disconnected, as specified.

Second I claim the ear ring formed of the chain *f*, fork *h*, and screw *m*, to firmly clamp or grasp the yard or spar, regardless of the size, as set forth.

Third. I claim the hasp *f f*¹, in combination with the ear ring, in the manner and for the purposes specified.

No. 30,583.—LEVI LORING, of Saco, Me.—*Improved Milking Stool*.—Patent dated November 6, 1860.—This invention consists in attaching to a milking stool, of the ordinary construction, a platform or stand, on which the pail is to rest during the process of milking, which platform or stand is made to open for the reception of the pail, and is closed by a spring.

Claim.—The application to a milking stool of the platform or stand provided with a spring for fastening when closed, constructed as described and for the purpose specified.

No. 30,584.—WILLIAM H. LIVINGSTON, of New York, N. Y.—*Improved Device for Sustaining Trees*.—Patent dated November 6, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the segmental tree supporter *b*, constructed and operating substantially as specified.

I also claim the hook *e*, formed with the loop 3, by which said hook, and the wire or brace connected thereto, may be lifted upon or off a limb or branch, for the purposes and as set forth.

No. 30,585.—WALTER W. PADDOCK, of Cincinnati, Ohio.—*Improvement in Sealing Preserve Cans*.—Patent dated November 6, 1860.—This invention relates particularly to a combination of automatic valve and permanent sealing device.

Claim.—The combination of the automatic valve C, exhaust chamber D, and permanent sealing cup E, constructed and arranged to operate substantially as and for the purposes set forth.

No. 30,586.—J. EDWARD PARKER, of West Meriden, Conn.—*Improved Door Lock*.—Patent dated November 6, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The described mode of constructing a reversible door lock—that is to say, by so making the head of the latch bolt in a separate piece, and connecting it with the follower, that the said head may be taken out and reversed at pleasure, without disturbing any of the other parts, substantially as set forth.

No. 30,587.—HENRY PENNIE, of Buffalo, N. Y.—*Improved Stop Hinge*.—Patent dated November 6, 1860.—This invention consists in the combination of a compound hinge for carriage and other doors with an ordinary hinge, thereby constituting a stop hinge which prevents the door from being opened beyond a certain angle.

Claim.—The combination of the compound hinge J with an ordinary hinge D, both being arranged and operating substantially in the manner and for the purpose set forth.

No. 30,588.—J. M. PITTS, of Sumter, S. C.—*Improvement in Apparatus for Fractured Limbs*.—Patent dated November 6, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* one or two pair of staples secured to the bed frame—one pair at the sides of the mattress, and the other pair at the sides of the head pillow—in combination with straps and a shoe or gaiter, or its equivalent, fastened to an adjustable foot board, and with bandages for securing the upper part of the patient's body to the said staples, substantially as set forth.

Second. In combination with the staples, straps, shoe, and bandages, making the mattress

of a bed for the treatment of invalids in four parts, when the two central parts are secured to two slides, movable in lateral ways in the bed frame and over an evacuation aperture, substantially as and for the purpose set forth

No. 30,589.—HENRY H. ROBERTSON and CYRUS G. CARR, of Kingston, Mo.—*Improvement in Cultivators*.—Patent dated November 6, 1860.—The machine represented in the engraving is a cultivator with the shears G G in front, and two C C behind.

Claim.—The arrangement for united operation, in a cultivator, of two or more ploughs G, or scrapers N, a series of cross bars L L¹, a series of adjustable buttons J, perforated loops E, and stop pins I, substantially in the manner and for the purposes described

No. 30,590.—JOSEPH ROLLS, of New York, N. Y.—*Improved Carpet Duster*.—Patent dated November 6, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the beaters A A¹, brushes C C¹, and take-up roller F, substantially as described, so that, while the carpet is drawn through between the beaters and the brushes, both sides of the same are first exposed to the action of the beaters, and afterwards to the action of the brushes, and a thorough dusting of the carpet is effected.

No. 30,591.—JOHN G. ROSS, of New York, N. Y.—*Improved Arrangement of Gates for Directing the Flow of Water upon Tide Wheels*.—Patent dated November 6, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the gates b d d¹, for directing the flow of water, in combination with the swinging gates h h and i i, for regulating the filling or emptying of the pond, and with the gates f f¹ to regulate the supply to the wheel, in the manner and for the purpose specified.

No. 30,592.—CHARLES A. SHAW, of Biddeford, Me.—*Improved Pie Crimper*.—Patent dated November 6, 1860.—The claim and engravings show the nature of this invention.

Claim.—The knife and wheel, when combined, to crimp and trim a pie at one operation, constructed substantially in the manner set forth and specified.

No. 30,593.—LOUIS SIMONET, of New York, N. Y.—*Improvement in Water Proof Fabrics*.—Patent dated November 6, 1860.—The varnish used in manufacturing this cloth is composed of the following ingredients: Raw linseed oil, two thirds of a pound; boiled linseed oil, one third of a pound; ground plaster of Paris, one pound and a half; alcohol, one sixth of a gallon; brown shellac, one eighth of a pound; bone black, one sixth of a pound. These substances form a varnish.

Claim.—The varnished water proof cloth, as described.

No. 30,594.—THOMAS SLAIGHT, of Newark, N. J.—*Improvement in Door Latches*.—Patent dated November 6, 1860.—The object of this invention is to facilitate the operation of the slide so that the same may, when its outer end comes in contact with the nosing on shutting the door, be readily forced back into its case; due provision being also made for the shrinking of the door and jamb, so that all play of the former will be avoided in consequence of any shrinking of the parts aforesaid.

The inventor says: I claim, first, the segment F attached to the end piece d of the case A, and connected to the slide B, essentially as and for the purpose set forth.

Second. Having the end a of the slide B fitted in the segment F, so as to prevent any play of the latch consequent on a shrinking of the door or jamb, as described.

No. 30,595.—WILLIAM G. SMITH, of Elizabethport, N. J.—*Improvement in the Cutting Apparatus of Harvesters*.—Patent dated November 6, 1860.—This invention consists in the employment of a cutter bar which has a slot horizontal from the back to the front edge, in combination with dovetailed ends to the cutter sections and adjustable securing shoe pieces, and a triangular wedge.

Claim.—The slotted bar B and adjustable securing block C, in combination with the securing wedge or key D, and the removable sections A, with the tail pieces a, the whole constructed and operating substantially as described, for the purpose set forth

No. 30,596.—GEORGE D. TRUMPORE, of Newark, N. J.—*Improved Clothes Squeezer*.—Patent dated November 6, 1860.—The operation of this machine is as follows: The straps F F being thrown back into the position shown in the engravings, the screw H and cross bar D are removed, and the disk K is lifted out by means of the handle m. The wet clothes are then placed into the tub E, upon which is then placed the disk K; the cross D and screw H are

then placed on E, and the straps F F with rod *n* adjusted. The pressure is then applied by means of a screw, and the water effectually pressed from the clothes.

Claim.—The arrangement of the tub B, platform C, press tub E, perforated in its circumference with holes, movable bar D, screw H, plunger K, straps F F, elbow rods *r r* and *n*, and elbow screw *p*, when used as and for the purposes specified.

No. 30,597.—T. H. WILLSON and D. T. WILLSON, of Harrisburg, Pa.—*Improvement in Machines for Cutting Hay, &c.*—Patent dated November 6, 1860.—The claim and engravings show the nature of these improvements.

The inventors say: We *claim*, first, casting a cutter head composed of two sets of radial arms united by a sleeve, all in one piece, and around a wrought iron axle, substantially as described, for the purpose set forth.

Second. The combination of the cutter head with adjustable knees, when arranged on the face of both sets of arms, substantially as described, for the purpose set forth.

Third. Constructing the lower feed roller with transverse and longitudinal ribs upon its surface, for the purpose set forth.

Fourth. Attaching the stud carrying the intermediate pinion K to the side plate G, substantially in the manner described, for the purpose set forth.

Fifth. Constructing the guides of the feed roller shaft with a curved slot, as described, in connection with the stud plate, arranged as described.

Sixth. Arranging the intermediate double pinion *q* on an adjustable stud, and supporting said stud by means of a radius bar W, pivotted to the shaft of the feed roller, substantially as described, for the purpose set forth.

Seventh. The combination of the slotted stud plate with the double pinion, arranged as described, for the purpose set forth.

No. 30,598.—JESSE S. WHEAT, of Wheeling, Va.—*Improvement in Apparatus for Tanning* Patent dated November 6, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the relative arrangement of the suction pipes A A¹, force pumps C, supply pipes D D¹, communication pipes D² D³ D⁴ F F¹ F² F³, exit pipes D⁵ D⁶ D⁷ D⁸ D⁹ D¹⁰, and emptying pipes G G¹ G² G³ G⁴, in combination with reservoirs E E¹ E² E³ E⁴, E⁵, vats X¹ X² X³ X⁴ and weighted valve T¹, for the double purpose of effecting a complete circulation of the tanning liquid and pressure upon the hides through all the vats, and allowing any of the vats to be shut off from the circulation going on through the other vats, and to be emptied if desired, substantially as set forth.

Second. The frames H, in the vats, in combination with two eccentrics I I and connecting rods L L¹ L² L³ L⁴ L⁵, so arranged that all of the frames may vibrate simultaneously, or any one of them remain at rest, if desired, while the others vibrate, substantially as set forth.

No. 30,599.—DAVID C. WILKINSON, of Sidney, Ohio.—*Improved Flood Fence.*—Patent dated November 6, 1860.—This invention consists in a construction of worm fences with interlocking panels supported securely at top without the use of stakes, braces, or high posts, either rigid or pivotted, and so hinged to ground posts as to yield readily to the current.

Claim.—The combination of the alternate zigzag panels B C and B¹, gudgeons E, oblong bearings F, and cylindrical bearings F¹, the said parts being so constructed and arranged as to operate in connection, substantially in the manner and for the purposes set forth.

No. 30,600.—DAVID WADSWORTH, JR., of Nashua, N. H.—*Improved Gate Hinge.*—Patent dated November 6, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the described combination and arrangement of the fastening plates A B, the cam C, the stud D, the rod E, and the spring G, the whole constituting an improved gate hinge, as explained.

I also claim the combination and arrangement of the groove F with the said fastening plates, the cam, stud, rod, and spring applied and made to operate together, substantially as specified.

No. 30,601.—L. B. WRIGHT, of New York, N. Y.—*Improvement in Spinal Braces.*—Patent dated November 6, 1860.—In using this brace the lower spring clasp A is fastened to the top of the pelvis and rests on the crest of the ilium; the other, B, is fastened around the chest immediately beneath the arms. The head rest, which consists of the upright piece E, spring clasp F, and strap O, having been adjusted, the clasp F passes around the back portion of the head of the wearer and the strap rests upon the forehead.

The inventor says: I *claim*, first, the combination of the spring clasps A and B with the head rest, composed of the parts E F and O, when the same shall be combined and operated as set forth, and for the purpose specified.

Second. In combination with the same, the plates Q and R, arranged and operated as set forth and for the purpose described.

No. 30,602.—JOHN ADAMS, of Dalston, England, assignor to THOMAS POULTNEY, of Baltimore, Md.—*Improvement in Revolver Fire-Arms*.—Patent dated November 6, 1860; patented in England November 7, 1857.—This invention relates to revolver fire-arms of that kind whose chambers are in a cylinder rotating on an axis parallel to the bore of a fixed barrel.

The inventor says: I *claim*, first, the construction of the body of a revolver of two pieces of the form described, fitted and secured together substantially as specified.

Second. The link L, constructed and applied in combination with the trigger, and operating in combination with the notch *o* of the hammer, substantially as set forth.

Third. In combination with the link L, applied as described, I claim the arrangement of the cocking dog and the sear, substantially as described.

No. 30,603.—BENJAMIN DOUGLAS, of Middletown, Conn., assignor to W. and B. DOUGLAS, of the same place.—*Improvement in Pumps*.—Patent dated November 6, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The use of tube *a a*, for encasing the piston rod and preventing the escape of air through the stuffing box around the piston rod, when it also controls the upward movement of the check valve, substantially as set forth.

No. 30,604.—DYER GREENE, of Boston, Mass., assignor to himself and JOHN H. W. PAGE, of said Boston.—*Improvement in Rice Hullers*.—Patent dated November 6, 1860.—The principal parts of this mill consist of a screw and a mortar, the former being made to revolve within the latter. In these respects the machine is not new, it consisting in an improved arrangement of the screw, its shaft, and the pivot and step of the latter with respect to the bottom and the discharging valve or valves of the mortar.

Claim.—My improved arrangement of the screw C, the shaft B, and the pivot and step D of the latter with respect to the bottom *a* and the discharging valve or valves F of the mortar.

No. 30,605.—THOMAS KING, of Troy, N. Y., assignor to IRA A. PULSIPHER, of said Troy.—*Improvement in Machines for Moulding Candles*.—Patent dated November 6, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the piston-like tip moulds D, made movable unequal distances on the sliding frame F, and provided with the springs *v*, or their equivalents, substantially as and for the purpose described.

Second. The clamp or clamps G, or any equivalent therefor, applied to the projecting portion of the partly expelled candles, and elevated by means of a hoisting apparatus combined with the stand of moulds, for the purpose of drawing the candles out of the moulds, substantially as described.

Third. The combination and arrangement of the movable arms M, on the tip mould frame E, with the seats *k* and guides *l*, on the stand of moulds, and the seats *m*, on the sliding frames H H¹, as and for the purpose set forth.

Fourth. The wick holders P, constructed and arranged upon the stand of moulds, in the manner described.

No. 30,606.—LEWIS LAYMAN, of Westfield, N. Y., assignor to E. P. WHITNEY, of said Westfield.—*Improvement in Locks*.—Patent dated November 6, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment or use of a hub E, provided with four arms *f*, projecting in pairs from opposite sides of it, in connection with a reversible slide C, having the prongs of its yoke or fork provided with heads or cross pieces *e e*, the hub being applied to the yoke, and all arranged essentially as and for the purpose set forth.

No. 30,607.—SAMUEL P. PATTEN, of New York, N. Y., assignor to himself and S. A. NICKERSON, of Brooklyn, N. Y.—*Improvement in Capstan Windlasses*.—Patent dated November 6, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Combining the capstan with the barrel of the windlass by means of a worm wheel F on the said barrel and an endless screw L on the shaft G, which has the capstan barrel J and pawl rim I fitted to it, substantially as described, the so fitted pawl rim being furnished with one or more movable stops K to permit the operation of either of the modes specified.

No. 30,608.—ELLIOT ANDRUS, of Geneva, N. Y.—*Improvement in Apparatus for Drawing Water from Wells*.—Patent dated November 13, 1860.—This invention consists in providing

a bucket for raising water, the diameter of whose base is greater than the top, with a detach-ment bottom so constructed that it may be kept in its place by means of a spring; also a curb or case, to be placed over the mouth of the well or other place from which the fluid is to be drawn or elevated, with a diaphragm or division, so constructed that when the bucket is drawn up through the opening in this diaphragm the projecting flange on the movable bottom of the bucket will be caught by the diaphragm and held while the body of the bucket is drawn up from the bottom, and thus an aperture or opening is made, through which the fluid will be discharged from the bucket upon the upper side of the diaphragm and through a spout into a pail or other vessel.

Claim.—The arrangement and combination of the several parts, for the purpose, and to accomplish the result, as specified, of employing a bucket.

No. 30,609.—S. F. ATHERTON, of Fitchburg, Mass.—*Improvement in Hoop Machines.*—Patent dated November 13, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of a gauge cutter with a cutter head, constructed substantially as described, and having continuous rests *a* and *b*, for the support of the hoop upon each side of the finishing cutter, as set forth.

Second. I claim the crimping roll *L*, for giving form to the hoop, as described.

No. 30,610.—ANDREW J. BARTLETT, of Romulus, N. Y.—*Improvement in Excavators.*—Patent dated November 13, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement and combination of the hollow scoop or shovel *D*, endless apron or elevator *I* and trough *N*, when hinged or jointed together, so as to allow the required adjustments of the said scoop, and operating together substantially in the manner and for the purposes specified

No. 30,611.—RICHARD C. BRISTOL, of Chicago, Ill.—*Improvement in Slide Valves.*—Patent dated November 13, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, in combination with a valve carried upon rolling supports, the use of bearing pieces of metal, above and below such supports, capable of being detached from the valve and cylinder face, in order that such bearing pieces may be made of a more durable material, or be taken out and replaced when worn or injured.

Second. In valves, mounted as above described, the wedge form of the bearing pieces *E*, in combination with the corresponding inclines *C*¹ upon the valve or cylinder face, for the purpose of adjusting the valve to its seat or to the diameter of the rolling supports *G*, substantially as described.

No. 30,612.—BENJAMIN F. CHAPPELL, of Norwich, Conn.—*Improved Plumb Bob.*—Patent dated November 13, 1860.—This invention has for its object applying to the bob the string by which it is suspended, in such a manner that it can be lengthened or shortened at pleasure, and that when the bob is not in immediate use the string may be run into the body of the bob out of the way and not liable to be broken.

Claim.—As an improved article of manufacture, a plumb bob, provided with a train of wheels, spring, and stop, and otherwise made, as shown and described.

No. 30,613.—A. F. COBB, of Chapel Hill, Mo.—*Improvement in Fire Alarms.*—Patent dated November 13, 1860.—This invention consists in the arrangement of a crank shaft, alarm bell, rattle, lever, gun, and cord, in combination with independent crank shafts, dogs, and cords, leading to various parts of a building.

Claim.—The arrangement of a crank shaft *A*, alarm bell *H*¹, rattle *C D*, lever *L*¹, gun *O*¹, and cord *J*, in combination with independent crank shafts *L W*, dogs *M Y*, and cords *P T*, leading to various parts of a building, substantially as and for the purpose set forth.

No. 30,614.—LEWIN A. COLBERT, of Baltimore, Md.—*Improvement in Warming Apparatus.*—Patent dated November 13, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The adaptation and arrangement of a warm air reservoir or receiver *A*¹, of box or niche form, and furnished with a door *B*, a bottom passage *C*, a side dampered passage *E*, and a top dampered passage *F*, all for use in combination with the ordinary furnace, hot air flue, draught or chimney flue, and flue leading into elevated chambers, substantially in the manner and for the purposes set forth.

No. 30,615.—LYMAN P. COLLINS, of Sacramento, Cal.—*Improvement in Loop Catches for Sewing Machines.*—Patent dated November 13, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* a metallic or other hard loop catcher for sewing machines, composed of a hub or main nut *a*, in Figs. 1 and 2, also an adjusting screw *e*, also check nut *f*, also rib or latch 2, so that the catch, being hard and unyielding, against which the loop comes in contact, can be so adjusted by the screw *e*, and firmly held by means of check nut *f*, that the finest thread cannot pass between said catch and the rotary hook until the proper time for its release, the whole being constructed, arranged, and operating as set forth and explained.

No. 30,616.—G. D. COLTON, of Galesburg, Ill.—*Improvement in Apparatus for Drawing Water from Wells*.—Patent dated November 13, 1860.—This invention consists in constructing and arranging the several parts.

Claim.—The employment of the shaft D, the cylinder E, the lever F, the ratchet wheel *a*, and ratchet *c*, together with the stop *n*, the several parts being constructed and arranged substantially as and for the purpose specified.

No. 30,617.—JAMES W. CRAWFORD, of Rockport, Ill.—*Improvement in Grafting Machines*. Patent dated November 13, 1860.—This invention consists in arranging on the top of a suitable standard a weighted cutter which works between two perpendicular ways operated by a foot lever for splitting the stock, and it also consists in arranging by the side of this stock splitter a reciprocating knife and inclined adjustable bed pieces for preparing the wedge on the scion.

The inventor says: I *claim*, first, the knife *a*, with its weight C, and the device described for operating it, in combination with the slotted bed plate E, stops *d d*, and gauge *y*, as and for the purposes set forth.

Second. In connection with the above, and on the pedestal A, the sliding knife *g*, its frame F, and slide rests G G, with the adjustable inclined bed pieces *e e*, arranged and operating as and for the purposes set forth.

No. 30,618.—PERRY DAVIS, of Providence, R. I.—*Improved Boat, Convertible into a Land Carriage*.—Patent dated November 13, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of the clamps C D and rubber springs *a*, formed as shown, with the axle B and boat A, in the manner and for the purposes set forth and described.

I also claim the combination of the peculiarly formed rubber spring clip G and plates *g g*¹ with the axle H, hook F, and bow of the boat, in the manner and for the purposes shown and described.

I also claim the arrangement of the wheels E with the clamps C, as and for the purposes shown and described.

No. 30,619.—SAMUEL S. DAY, of New York, N. Y.—*Improvement in Fly Traps*.—Patent dated November 13, 1860.—This invention consists in the use, or employment, of a shelf, by which means the flies which shall have collected on the roller, or cylinder, and been carried round upon the same, and driven into a cage or cages, prepared for their reception, are retained in the same.

Claim.—The use or employment of the shelf F, in combination with the lever H, catch G, spring I, and lifter J, when the same shall be combined and operated in the precise manner specified, or by means substantially the same or in an equivalent manner.

No. 30,620.—JOHN DICKINSON, of Painesville, Ohio.—*Improved Last Holder*.—Patent dated November 13, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The mode of securing immovable, or nearly so, the turntable in any position of its vertical axes, by means of the bolt I, provided with reversed screws on its ends, and operating in combination with the tapering journals of the lower plate Q of said turntable, as described, and for the purpose stated.

No. 30,621.—H. WILLIAM DOPP, of Buffalo, N. Y.—*Improvement in Vapor Lamps*.—Patent dated November 13, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Mingling the vapor formed with atmospheric air above the burner, as at *a a*, Figs. 1 and 3, the vapor and the air descending through the pipe A, to be burned at the burner B, as and for the purpose specified.

No. 30,622.—DAVID F. DUNHAM, of Brook, Ind.—*Improvement in Spelling Boxes*.—Patent dated November 13, 1860.—This invention consists in enclosing within a suitable box, having a small opening in one side of its top, two or more wheels or cylinders, each of which has a movement independent of the other, and covering the peripheries of said wheels

with vowels and consonants, or combinations of vowels and consonants, making a perfect word, or an imperfect word, and arranging on the next wheel the alphabet of any language, so that by rotating one of the wheels, the letters may be grouped together to form words, or parts of words.

Claim.—The spelling box with wheels, having letters printed on them, as set forth, constructed as described, for the purposes set forth

No. 30,623.—ELBRIDGE G. DYER, of Hamilton, Ohio.—*Improved Feed Motion for Head Blocks of Saw Mills.*—Patent dated November 13, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, in combination with the ratchet wheels F F, by means of which the head blocks B B are operated, the described arrangement of the pawls *h h*¹, vibrating pieces H H, connecting rod I, hand lever L, and pivotted bars J J, whereby the operator is enabled to move the log readily, and with precision, towards the saw, so as to produce either parallel or tapering cuts, as the same may be desired, in the manner as and for the purposes specified.

No. 30,624.—E. EHLIN, of Boston, Mass.—*Improvement in Fire Alarms.*—Patent dated November 13, 1860.—This invention consists in the use of a fuse connected with an alarm, whereby the fuse, in case of a building taking fire, will conduct the flame to a thread or fuse, which holds a weight connected with the alarm mechanism, and igniting the weight-sustaining thread, or fuse, will cause the weight to be liberated, the alarm mechanism to be actuated, and the alarm sounded.

The inventor says: I *claim*, first, the employment or use of a fuse K, in connection with a weight-sustaining combustible thread or fuse *u*, applied to a lever and weight E F, connected with an alarm, to operate substantially as and for the purpose set forth.

Second. In connection with the fuse K, applied as shown and described, the perforated pipe H, one or more, and water supply pipe G, connected by a tube *m*, provided with a cock which is connected to the lever E, to operate as and for the purpose set forth.

No. 30,635.—JOHN H. ELWARD, of Ottawa, Ill.—*Improvement in Mole Ploughs.*—Patent dated November 13, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The sectional mole *e d c*, the coulter *a* and *b*, the coulter *a* being movable, with their respective loops and joints, in combination with the side draught of the plough from the link or loop at *f*, on the side of the beam A, through one of the slots in the transverse piece, for the purpose of giving any desired curvilinear direction to the ditch or drain, when the several parts are arranged and operated together as represented, and substantially as described.

No. 30,626.—ROBERT GAMBLE, JR., of Tallahassee, Fla.—*Improvement in Channel Excavators.*—Patent dated November 13, 1860.—This invention is designed to deepen, or excavate, the channels of running streams, or tide ways, by deflecting the running water against the bottom of the same.

Claim.—The employment or use of a float A, provided with an adjustable plate or platform C, and side pieces F F, substantially as and for the purpose set forth.

No. 30,627.—JOHN R. GIBBS, of Boston, Mass.—*Combined Skate Shoe, and Foot Check.*—Patent dated November 13, 1860.—This invention consists of a skate shoe, having a groove for the reception of the skate runner, and suitable means for attaching the skate shoe to the foot, so that it and the skate previously fastened to the foot may be kept in contact.

Claim.—The grooved skate shoe, constructed substantially as described, for the purpose specified.

No. 30,628.—LUTHER W. HARWOOD, of Troy, N. Y.—*Improvement in Stove Grates.*—Patent dated November 13, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, so forming and arranging an arm D, fast on the grate A, and in line, or nearly in line, with the rocking support B, of the grate, substantially as described, that the grate may be both vibrated horizontally on its central pivot C, and tilted into a vertical position upon its rocking support B, by the use of the arm D alone, substantially as represented.

Second. I also claim the combination and arrangement of a perforated sliding plate M, with the slotted casing G, of the stove or furnace, the arm D, and grate A, pivot C, and rocking bar B, substantially as and for the purpose described.

No. 30,629.—JOSEPH M. HEARD, of Prairie Station, Miss.—*Improvement in Railroad Joints.*—Patent dated November 13, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the arrangement of the tongue F, to pass into a cavity in the bar D, so as to be supported thereby, as shown and described, when said tongue is made in one piece with the bar E, and when the rails are notched and slotted, and all the parts constructed and combined, all as set forth and represented.

No. 30,630.—DE WITT C. HITCHCOCK, E. B. LARCHAR, and E. M. LARCHAR, of New York, N. Y.—*Improvement in Relief Printing Plates, &c.*—Patent dated November 13, 1860. The claim and engravings explain the nature of this invention.

Claim.—The method of producing printing plates, blocks, &c., in relief, by employing liquid silex, or other material that has a hardening effect upon chalk, clay, or other analogous substance, or that has an affinity for, or the capacity to affiliate with, the silex as a marking material, medium, or ink, to delineate lines, figures, or any desired device, upon the surface of said chalk, clay, or other material susceptible of thus becoming hardened or petrified, and then removing the intervening and unacted on soft material next the surface, by brushing or rubbing, so as to leave the said lines in relief, and finally solidifying, in a greater degree, hardening and petrifying the whole body, substantially in the manner and for the purpose set forth.

No. 30,631.—DANIEL JOHNSTON, of Eddyville, Iowa.—*Improvement in Water Elevators and Carriers.*—Patent dated November 13, 1860.—In the middle of the carriage is a wheel, or pulley A, over which a cord or rope passes, that draws the carriage and suspends the bucket. On this cord, or rope, is a knot, or lump of lead, which rests on the wheel or pulley, when the bucket is up to the carriage, and is held fast to that place by a catch D, on the side of the latch, which catch D lies on it and over it, while the bucket is carried on the track.

Claim.—The arrangement of the track, carriage, hollow pin, bucket, knot, rope, pulley A, and latches B and D, when the whole is constructed, arranged, and operated in the manner and for the purpose set forth.

No. 30,632.—JOHN P. KIRK, of Austin, Texas.—*Improved Chain Link.*—Patent dated November 13, 1860.—The claim and engravings show the nature of this improvement.

Claim.—The two pivotted hooks A A¹, constructed and put together in such a manner that the ends of one hook will abut against or lap on the ends of the other hook, substantially as and for the purposes set forth.

No. 30,633.—EDWIN B. LARCHAR, of New York, N. Y.—*Improvement in Fire Escapes.*—Patent dated November 13, 1860.—This invention consists of a hydraulic, or pneumatic elevation for raising a platform to the desired height and retaining it there, or lowering it at will; the whole being governed by proper stop cocks.

The inventor says: I *claim*, first, elevating a platform, or other equivalent device, by means of a telescope column, substantially as and for the purposes set forth.

Second. I also claim the piston joint, composed of the fast and loose collars and elastic packing, as described.

No. 30,634.—RUFUS LEAVITT, of Melrose, Mass.—*Improvement in Sewing Machines.*—Patent dated November 13, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, in a sewing mechanism, the arrangement and combination of the spool *h* with the lever C, or other moving part of the mechanism, whose movement is uniform with and relative to that of the needle, and with the screw K, or other equivalent means of adjustment, and spring *n*, all operating together in relation to the movement of the needle, substantially as and for the purpose specified.

Also, the employment of the "take-up," for the specified purpose, in combination with a spring and cam, both arranged and operating together to give the take-up the movement due to the form of the cam except when, from strain upon the thread, it is requisite for the take-up to yield to avoid breakage of the thread, which yielding the spring, as applied, permits.

No. 30,635.—MEIER ROSENBERG and HENRI SCHEUERLE, of New York, N. Y.—*Improved Spring Bed Bottom.*—Patent dated November 13, 1860.—On the side rails *a a* of the bedstead are attached side pieces *n n*, running the whole length of the bed, and which support the spiral springs *d d*, on the top of which springs the bed bottom B rests. The springs *d* may be let in some distance into the side pieces *n n*, as well as into the under side of the bed bottom B. By this arrangement the bed bottom is supported on both sides on springs.

Claim.—The arrangement and combination of hinges, with a bed bottom supported by springs, in the manner and for the purpose substantially as described.

No. 30,636.—NATHAN MAXSON, of Wilmington, Ohio.—*Improvement in Harvesters.*—Patent

dated November 13, 1860.—The claim and engravings explain the nature of this improvement.

Claim.—The arrangement of the automatic intermittently rotating platforms, V, between the finger bar R, and dividing axle C, as shown, so that the cut grain will fall over the fingers upon the said rotary platform and be discharged, as set forth.

No. 30,637.—THOMAS J. MAYALL, of Roxbury, Mass.—*Improvement in Machinery for Making India Rubber Hose.*—Patent dated November 13, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The use of a series of rollers having curved peripheries, which bear upon and work the coating or covering of India rubber or gutta percha into the surface of the woven tube placed upon a suitable mandrel, substantially as described.

No. 30,638.—WILLIAM McALLISTER, of Gerry, N. Y.—*Improvement in the Manufacture of Cheese.*—Patent dated November 13, 1860.—This invention consists in the discovery of the use of sour whey, in combination with rennet and brine, in making cheese, for the purpose of rendering the curd susceptible for the whey to escape sufficiently in the operation of pressing, thereby preventing rancidity and other damage in curing, and for improving the quality of the cheese in other respects, and saving a portion of the rennet that would be required when sour whey is not used.

The inventor says: I *claim*, first, the use of sour whey in combination with rennet, as and for the purpose set forth; and in connection therewith, I *claim*,

Second. The use of brine in the manner and at the period in the process of making cheese, for the purposes set forth.

No. 30,639.—HUGH MOROHAN, of Brooklyn, N. Y.—*Improvement in Fire Escapes.*—Patent dated November 13, 1860.—The frame A, of a sofa or other article of common household furniture B, is fitted up with hinged braces C in its bottom, and on one of its sides are two set screws D, which, together with said braces, serve to secure the frame to the sill of an ordinary window. The arbor E bears the chain-wheel F, and a chain G, which runs over said chain-wheel, and from which the baskets H are suspended, serves to lower persons or articles from the window to which the frame is secured. A brake-wheel I, arranged with a friction brake J, serves to regulate the speed of the descent.

Claim.—The arrangement and combination, as shown and described, of the brakes J K, gears L M, shaft E, drums F I, chain G, and rod d, as and for the purpose shown and described.

No. 30,640.—L. W. NICHOLLS, of North Brookfield, N. Y.—*Improvement in Odometers.*—Patent dated November 13, 1860.—This invention consists in the arrangement of a square tubular socket or sleeve, in combination with the vertical arbor which serves to communicate motion to the registering wheels, in such a manner that the said arbor is allowed to rise and fall with the motions of the carriage, and that sudden jerks or other violent motions have no injurious influence on the correct action of the register.

Claim.—The arrangement of the tubular sleeve J, in combination with the shaft I, carrying the ratchet wheel H, and with the shaft K, giving motion to the registering wheels, substantially as and for the purpose specified.

No. 30,641.—R. S. PAYNE, of Chicago, Ill.—*Improvement in Sewing Machines.*—Patent dated November 13, 1860.—This invention consists of a reciprocating disk and two loose feed rings, arranged upon the circumference of said disk, in connection with a needle working between the two feed rings.

Claim.—A reciprocating disk and two loose feed rings, arranged upon the circumference of said disk, and operated by mechanism, substantially as described, in combination with a needle working between the two feed rings, substantially as and for the purposes set forth.

No. 30,642.—CHARLES W. PEARSON, of Charlestown, Mass.—*Improvement in Swifts.*—Patent dated November 13, 1860.—This invention consists in forming the arms of hollow tubes, into the ends of which are inserted spring wires, which may be drawn out to lengthen the arms, when required, and in a convenient method of holding the arms in position after they have been adjusted with respect to each other.

The inventor says: I *claim* the combination of the hollow arms C C¹ E E, and spring wires G, for extending the same, substantially in the manner and for the purpose specified.

Second. I *claim*, in combination with the above, the hubs B and D, and thumb screw F, for holding the arms in any required position, substantially as described.

No. 30,643.—JULIUS POLLOCK, of Morrisania, N. Y.—*Improvement in Ventilating Sweat*

Leathers for Hats.—Patent dated November 13, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* making single sweat leathers for hats, with embossed protuberances at any desired distance apart filled in on the side next the hat with some light and elastic substance, substantially as described, to form yielding cushions against the forehead, as set forth.

And I also claim making such single embossed sweat leathers with crimped or embossed corrugations at the sides, when the same are stiffened by coating the inside next the hat with shellac or other water proof cement, substantially as described.

No. 30,644.—SERVETUS LONGLEY, of Cincinnati, Ohio.—*Improvement in Street Sweeping Machines.*—Patent dated November 13, 1860.—This invention consists in hanging the broom shaft in such a manner that it may be raised or depressed, so that the brooms or scrapers may be raised entirely free from the ground, if desirable; it also consists in attaching by a crank arm each broom, or scraper head or stock, to an eccentric ring, which will keep the brooms or scrapers always in a position perpendicular to the surface of the street, at the same time all the brooms are allowed to yield and accommodate themselves to the unevenness of the surface of the street.

Claim.—The eccentric ring H, arranged and combined with the brush heads, substantially in the manner and for the purposes set forth.

No. 30,645.—GEORGE S. ROUDEBUSH, of Natchez, Miss.—*Improvement in Cotton and Corn Stalk Cutters.*—Patent dated November 13, 1860.—This invention consists in the employment of a biconical roller, provided with flanches and cutters, used in connection with stationary scrapers and a rotating cutting cylinder, all the parts being placed in a suitable frame and arranged for joint operation.

Claim.—The biconical roller D, provided with the knives E, in connection with the knife cylinder H, and with or without the bars or scrapers G, all being placed in the frame A, essentially as and for the purposes set forth.

No. 30,646.—GEORGE RUGG, of Potsdam, N. Y.—*Improvement in Turning Machines.*—Patent dated November 13, 1860.—This invention consists in providing a hollow mandrel with cutting tools, and adjusting and operating the same for turning wood in various patterns.

The inventor says: I *claim* a new mode of constructing, arranging, and operating devices, for the purpose as specified.

I claim, first, the tube stock F, as attached and operated by means of the arm d, the revolving pattern L, and clutch J, as connected and operated in the manner and for the purpose specified.

Second. I claim the guard c c, as adjusted, for the purpose specified.

No. 30,647.—CHRISTIAN SHARPS, of Philadelphia, Penn.—*Improvement in Forming Cartridge Cases.*—Patent dated November 13, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Forming cases for metallic cartridges by placing a hollow cylinder in chambers of the desired form, and expanding the said cylinders within the chambers by means of plungers, through the medium of water or other suitable fluid, substantially as set forth.

No. 30,648.—D. E. SOMES, of Biddeford, Maine.—*Improved Heel Shave.*—Patent dated November 13, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The described heel shave, constructed substantially in the manner set forth, being provided with guides a a, gauge E, adjusting screws C C, set screws D D, and double-edged knife B, arranged as and for the purpose described.

No. 30,649.—GUSTAV WEDEKIND, of Philadelphia, Penn.—*Improvement in the Preparation of Transparent Pictures.*—Patent dated November 13, 1860.—The nature of these improvements is shown by the claim.

Claim.—Affixing and preserving lithographic pictures upon glass, mica, or other similar transparent substances, to be used for gas or lamp shades, screens, &c., by means of a mastic composition and a solution of silicate of soda or potassa, prepared and used as set forth and described.

No. 30,650.—THOMAS J. WEEKS, of New London, Conn.—*Improved Harness Saddle.*—Patent dated November 13, 1860.—The object of this invention is to obtain a harness saddle that will conform to the movement of the animal without galling or injuring the same by rubbing or friction, even when made to sustain a heavy load.

Claim.—The disk E, and bars D D A B, constructed, combined, and arranged substantially as and for the purpose set forth.

No. 30,651.—SAMUEL W. TYLER, of Greenwich, N. Y.—*Improvement in Harvesters.*—Patent dated November 13, 1860.—The claim and engravings explain the nature of this invention

The inventor says: I *claim*, first, the combination of the automatically adjustable head piece G, and twin plate M, or their equivalent, with the cutting apparatus arranged and operating substantially as described.

Second. I claim the iron hanger D, for a common support for the journals of the pinion and pitman shafts of a harvesting machine, when used as a strong iron brace of a light wooden frame, in combination with such frame, substantially as described.

Third. I claim the hand lever L, when constructed and used as specified, in combination with the cutting apparatus, for the purpose set forth and substantially as described.

Fourth. I claim the adjusting rod l, or its equivalent, by the use of which the driver, while on his seat, may bring the cutting apparatus to a position at right angles to the head piece, where it may be held, in combination with the head piece and cutting apparatus, for the purposes set forth and substantially as described.

No. 30,652.—ISAAC ANGELL, of Pawtucket, R. I., assignor to the PAWTUCKET HAIR CLOTH COMPANY.—*Improvement in Looms for Weaving Hair Cloth.*—Patent dated November 13, 1860.—The claim and engravings explain the nature of this improvement.

Claim.—The reopening of the shed after the failure of the hook to take a hair, without stopping or disconnecting the heddles from their source of motion, in the manner substantially as shown and described.

No. 30,653.—HORATIO N. BLACK, of Philadelphia, Pa., assignor to himself, H. KORN, JR., and E. S. BODINE, of said Philadelphia.—*Improvement in Machines for Hulling and Cleaning Rice.*—Patent dated November 13, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the huller, made of plates of metal or other suitable material, the plates being detachable and having an elastic bed as the exterior hulling surface, and the solid cone for the inner hulling surface, as set forth.

Second. I claim the combination of a rubber, constructed and operated as described, with the cylinder for chafing the grain, as set forth.

Third. I claim the brushers or polishers, constructed and operated as described, in combination with a cylinder of solid surface for polishing the grain, as set forth.

No. 30,654.—JACOB KINGER, of Pittsburgh, Pa., assignor to C. ADAMS, of said Pittsburgh *Improvement in Door Locks.*—Patent dated November 13, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* combining the roller E with the latch bolt B, for the purpose of lessening the friction when forcing the bolt back into the lock, substantially as shown and described.

No. 30,655.—FREDERICK LANDON, of Brockport, N. Y., assignor to BYRON E. HUNTLEY, JOHN M. BOWMAN, CHARLES SILLIMAN, and LAFAYETTE SILLIMAN.—*Improvement in Harvesters.*—Patent dated November 13, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the traction yoke or lever D, the rods L, the pinion shaft and the gudgeon I, as fixed fulcrum of the traction lever, in combination with the axle of the drive wheel, to secure a rolling or traction draught of the drive wheel, while making descents, and especially, when it may be necessary, in the use of the machine, to pass from declivities of greater or less degrees, for the purpose specified.

Second. The traction lever D, the rods L, the pinion shaft and gudgeon, as fixed fulcrum of the traction lever, and the axle of the drive wheel, in combination with the frame and finger bar, to secure an automatic adjustment of the finger bar to the periphery of the drive wheel, for the purpose specified, substantially as described.

Third. The combination of the traction lever D, the rod r, and the frame A, to secure an adjustment of the finger beam with respect to the periphery of the driving wheel, when the machine is used for harvesting grain, substantially as described.

No. 30,656.—JOHN McCARTY, of Philadelphia, Pa., assignor to LEYFERT McMANUS & Co., of said Philadelphia.—*Improved Horse Shoe Machine.*—Patent dated November 13, 1860. The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the stripper P, weighted lever L, and

carriage E, the latter having a plane parallel with that in which it moves, for receiving the weighted end of the lever, and the said plane terminating in an inclination *h*, so that the said stripper may have the desired dwell between its upward and downward movements, as and for the purpose specified.

Second. The combination of the stripper P, lever L, and rods Q and Q, or their equivalents, arranged and operating substantially as set forth, for the purpose set forth.

Third. The combination of the stripper P, the former K, and the projection *d*, of the platform B, the said projection being of the same form as, but somewhat less than the end of the former K, and arranged to coincide with the latter during the operation of the stripper, as set forth.

No. 30,657.—H. F. PHILLIPS, of Seneca Falls, N. Y., assignor to DOWNS & Co., of said Seneca Falls.—*Improvement in Apparatus for Drawing Water from Wells*.—Patent dated November 13, 1860.—This invention consists, in part, in the employment of a pivotted frame A, which is attached to the sides of the well curb B by the pivot *c*. The frame A supports the crank shaft *f* and main pulley G, in suitable bearings, provided for that purpose on each side thereof; it also carries the pall *h*, which is pivotted to an arm on the frame, in a proper position to act upon the ratchet wheel *i* on the crank shaft, to stop the motion of the bucket, should it even be required.

Claim.—The combination and arrangement of the pivotted movable frame A, or its equivalent, for sustaining the shaft *f*, and main pulley G, with the stationary pulley *j*, weight K, and bucket D, and catch lever L, substantially as and for the purposes set forth.

No. 30,658.—D. E. SOMES, of Biddeford, Me., assignor to JAMES S. ANDERSON, of said Biddeford.—*Improvement in Curing Provisions*.—Patent dated November 13, 1860.—The claim explains the nature of this invention.

Claim.—Salting and curing food and hides, in latitudes too warm for the ordinary processes to be carried on, by means of operating in excavations made in the earth, to a depth sufficient to attain the minimum temperature, and further cooled by artificial refrigeration, as set forth.

No. 30,659.—OWEN STURDEVANT, of Maquon, Ill., assignor to himself and J. S. GREGORY, of said Maquon.—*Improvement in Mole Ploughs*.—Patent dated November 13, 1860.—The object of this invention is to drain wet clay soils, by which they may be rendered profitable as arable land.

Claim.—Forming a circular hole or suitable space under the end of coulter E, in combination with a groove in the top surface of the mole tooth *a* and the closing portion *a*¹, placed behind the mole tooth, substantially as described and for the purposes set forth.

No. 30,660.—GEORGE WILLIAMSON, of Newark, N. J., assignor to L. S. GOBLE and H. E. RICHARDS, of said Newark.—*Improved Clamp for Holding Cylinders to be Polished*.—Patent dated November 13, 1860.—The flange K of the main block A prevents the sections B from springing out further than required, and said sections are cut at the point K to permit the necessary movement.

Claim.—The combination of the section B, flange K, spring *s*, screw *c*, and band *d*, substantially in the manner and for the purpose described.

No. 30,661.—RUSSELL ARNOLD, of Hartford, Conn.—*Improved Machine for Moulding Parched Corn Balls*.—Patent dated November 20, 1860.—This invention consists in so constructing the frames A and B as that they shall be operated by the revolution of the crank shaft C, and having the cup E attached to the cross bar of the frame B, directly over the cup F, which is in like manner attached to the cross bar of the frame A, so that by the revolution of the crank shaft C connected to the frame B by the rod C, the parched corn, when placed in the cup F, is compressed into balls.

Claim.—The arrangement, in combination of the frames A and B, together with the cups E and F, the pins G and H, the spiral spring *h*¹, the crank shaft C, and the connecting rod C¹, to be used for the purpose specified, substantially as described.

No. 30,662.—THOMAS B. ATTERBURY and JAMES S. ATTERBURY, of Pittsburgh, Pa.—*Improvement in Covers for Fruit Jars*.—Patent dated November 20, 1860.—This invention consists in a metallic ring, constructed with a circular shoulder, a vertical screw, and a vertical narrow slotted lug, in combination with a shouldered and lipped cover, a rubber gasket, a clamping nut, and a preserve jar with a straight neck.

Claim.—The arrangement and combination of the preserve jar H, metallic ring B, constructed with a shoulder *a*, lug *b*, slot *c*, and screw A, rubber ring gasket G, clamp nut D, and cover E, constructed with a curved lip F and shoulder *d*, all in the manner and for the purposes described.

No. 30,663.—ACHILLE BERTHOUD, of New York, N. Y.—*Improvement in Electroplating with Alloys of Gold*.—Patent dated November 20, 1860.—This invention consists in a preparation or means by which the operator is enabled to deposit a compound metal of gold and copper, or gold and silver, or gold, copper, and silver, upon a metallic surface, to resemble an alloy of gold of any desired color or fineness, and of any required thickness.

The inventor says: I *claim*, first, the employment of the solution of copper prepared substantially in the manner as above set forth.

Second. The employment of solutions of gold and silver, prepared substantially as above set forth, in admixture with the described solutions of copper.

Third. The above described process of electroplating metal with alloys of gold, so as to produce any desired color.

No. 30,664.—L. D. BROWN, of St. Louis, Mo.—*Improvement in Harvesters*.—Patent dated November 20, 1860.—In the upper part of the guide bar E a bent lever G is fitted, and to the angle of this lever is attached by a pivot *h* a bar H, which is secured to the draught pole F; the lever G is fitted on a rod *h*¹ in the part of the guide bar, and is allowed to work freely thereon.

Claim.—The arrangement of the adjustable guide loop *f* and diagonally hinged bar I with the pole F, frame A, platform B, slotted guide bar E, lever G, and bar H, as and for the purposes shown and described.

No. 30,665.—GEORGE F. BUCKLEY, of West Barnstable, Mass.—*Improved Settee or Chair*.—Patent dated November 20, 1860.—Settees are often required for public halls and other places which may be folded up when not in use, so as to occupy but little space and be easily transported or moved when necessary, and this invention has for its object to supply this want.

Claim.—The combination of the hinged back F with the hinged and pivotted legs, operating as set forth, for the purpose specified.

No. 30,666.—JOHN CHAPPELL, of Green, N. Y.—*Improvement in Horse Rakes*.—Patent dated November 20, 1860.—This invention consists in the construction and arrangement of the crank handle, levers, and spring catch, operating together to elevate the rake.

Claim.—The arrangement and combination of the prongs *g*¹ *g*¹, the rollers *f f*, levers G G, crank handle F, and spring catch I, in the manner described, for the purposes set forth.

No. 30,667.—JACOB L. CLEWELL, JR., and WILLIAM F. SCHATZ, of Nazareth, Pa.—*Improved Apple and Potato Parer*.—Patent dated November 20, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the combination of the rotary fork G with the travelling and rotary cutter Z, arranged substantially as and for the the purposes set forth.

Second. In connection with the travelling and rotary cutter Z, and rotary fork G, the sliding or adjustable wheel E, operated through the medium of the levers H J, and shaft I, for the purpose of stopping the rotation of the article D¹, when necessary to allow the cutter to pass into depressions or sunken places in the surface of said articles.

Third. The combination of the two frustrums of cones N O with the adjustable elastic ring or band Q, arranged substantially as shown, to vary the speed of the travelling movement of the cutter Z, as circumstances may require.

No. 30,668.—SAMUEL W. COLLINS, of Canton, Ct.—*Improvement in the Manufacture of Edge Tools*.—Patent dated November 20, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the casting of axes and other tools and implements partly of iron and partly of steel, or of different qualities of steel, by pouring in a melted state, first one of these metals and then the other, thus superseding the necessity of welding or otherwise attaching the different metals together in the way heretofore practised, all of which is done in the manner and for the purpose set forth.

Second. The casting of edge tools from steel, or from steel and iron combined, by leaving the steel edges thick in the first instance and afterwards drawing them down under a hammer, in the manner described.

No. 30,669.—ISAAC CRESSMAN, of Philadelphia, Pa.—*Improvement in Gas Stoves*.—Patent dated November 20, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination, with gas stoves, ovens or heaters having double walls or plates at two opposite sides and top and bottom thereof, so as to constitute a continuous jacket or hot air chamber, in which the products of the combustion of gas may be allowed to circulate at pleasure, of a burner or burners surmounted with inverted truncated cone-shaped cups having air openings in the bottom and a flange on the top, so that the said cups may be supported in corresponding holes in the bottom plate of the oven, in such a manner as that

it or they shall be flush or nearly so with said bottom plate, and that an unobstructed circulating medium for the heated gases may be obtained.

No. 30,670.—JULIUS C. DICKEY, of Saratoga Springs, N. Y.—*Improved Gold Washer and Amalgamator*.—Patent dated November 20, 1860.—The operation of this machine is as follows: The quartz, sand, or other matter, being put into the hopper *g*, passes through the same into the opening as shown by the dotted line in the upright *b*, and through the openings in the base of said upright into and between the adjustable plates *c* and *d* where it is crushed, ground, or pulverized, and forced by said plates *c* and *d* into outlets *x* which lead to channel No. 1, said outlets being under the circular channel in which the bearing *k* works in. When channel No. 1 becomes full of pulverized quartz, sand, or water, it flows over the circular projections *s* into channel No. 2, and so on through the channels; the stop-cocks being turned as aforesaid to let out the water or mercury when it is desirable to remove the gold.

The inventor says: I *claim*, first, the bearing *k*, for the purpose specified.

Second. The arrangement and use of the adjustable plates *c* and *d*, for the purposes set forth

No. 30,671.—OREN C. DODGE, of Brooklyn, N. Y.—*Improved Adjustable Table*.—Patent dated November 20, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the racks *d d*, in the standards *b b*, combined with the pawls *g g*, and rope or cord *h*, in the manner and for the purposes specified.

In combination with said racks *d d* and pawls *g g*, I *claim* the sector *i* and clamp *k* for regulating the inclination of the table, as set forth.

I also *claim* the table *m* on the bracket *l*, connected by the eyes *3 3*, the rack *d*, in the manner and for the purposes specified.

No. 30,672.—DAVID ELDRIDGE, of Philadelphia, Pa.—*Improved Method of Hanging Circular Saws*.—Patent dated November 20, 1860.—The claim and engravings explain the nature of this invention.

Claim.—So arranging the driving and driven pulleys *O* and *T* as to transfer the strain caused by the resistance while sawing from the saw arbor to the arbor of the driving pulley, for purposes set forth.

No. 30,673.—DAVID EYNON, of Philadelphia, Pa., assignor to CHARLES E. SMITH, of Philadelphia aforesaid.—*Improvement in Making Railroad Chairs*.—Patent dated November 20, 1860.—The claim and engravings explain the nature of this invention.

Claim.—In combination with the horizontal and vertical bars that are to compose the pile, the central plug, core, or brace of wood, and the external tie of wire, so that the pile may be inverted and charged and heated in this inverted position in the furnace, substantially as described.

No. 30,674.—DEWITT C. FARRINGTON, of Lowell, Mass.—*Improvement in Cooking Stoves*.—Patent dated November 20, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Dividing the oven space by such a form of bent flue communicating with the fire chamber, as to form thereby two separate ovens, each containing a deep and shallow portion or compartment, substantially as described.

No. 30,675.—HENRY B. GOODYEAR, of New Haven, Ct.—*Improvement in Vulcanizing India Rubber Tips*.—Patent dated November 20, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment of a cast iron tip mould or former, made hollow or otherwise equivalently constructed, to establish a pinned connection of it with the tray or platform which serves to carry the moulds and tips, substantially as specified.

Second. Providing the tip mould or former with a hook or pin, to which the tip may be hitched, and which serves to keep the tip to its place on the mould, essentially as set forth.

Third. In the vulcanizing of India rubber shoe tips or other like articles, the process described of holding the tips to their places and the moulds in their position, substantially as specified.

No. 30,676.—JOHN J. GWYNN, of Plainfield, N. J.—*Improvement in Valve Gear of Steam Engines*.—Patent dated November 20, 1860.—*a* represents a slotted arm fast to the rock shaft *a*¹; *b* is a curved cam slot in the friction plate *c*, which turns freely in the rock shaft. The valve wrist pin *d* passes through both the slot in the rock shaft arm and the curved cam slot in the friction plate, the relative position of the wrist pin in the slotted arm being determined by the curved cam slot in the friction plate.

The inventor says: I *claim*, first, the friction cam plate, in combination with the slotted arm and movable wrist pin, substantially as described.

Second. I claim, in combination with the governor of a steam engine, the movable wrist pin, slotted arm, friction cam plate, ratchet and pawl, substantially as described and substantially for the purposes set forth.

No. 30,677.—HORACE R. HAWKINS, of Akron, Ohio.—*Improvement in Hay and Straw Cutters*.—Patent dated November 20, 1860.—This invention consists in using the hooked bolts, in connection with a right angled shaft, for the purpose of making the knife adjustable.

Claim.—The use of the hook bolts $H H^1$, in connection with the right angled shaft, for making the knife adjustable.

No. 30,678.—BIRDSILL HOLLY, of Lockport, N. Y.—*Improvement in Hose Coupling*.—Patent dated November 20, 1860.—This improvement is designed more especially for the connection of sections of hose and other pipes together, and with pumps, hydrants, engines, boilers, &c., so as to dispense with the use of a wrench for connecting and disconnecting.

Claim.—A nut constructed with gears or teeth a , and fulcra c , surrounding its hub or centre, substantially in the manner and for the purposes shown and described

No. 30,679.—CHARLES B. HUTCHINGS, of Rochester, N. Y.—*Improvement in Grain Separators*.—Patent dated November 20, 1860.—This invention consists in an improved arrangement and combination of parts, whereby wheat may be cleaned and separated from oats, small grain, &c., with ease.

Claim.—The arrangement of the tubes $T^1 T^2$, and sieves S , with the spouts $E n m$, chamber I , and fan F , all constructed and operating substantially as and for the purpose set forth

No. 30,680.—J. BURROWS HYDE, of Newark, N. J.—*Composition for Supports in Blow-pipe Operations*.—Patent dated November 20, 1860.—This invention consists in the manufacture of cakes, or plates, or blocks, for surface heating under the blow-pipe flame from a lamp, or gas made of a mixture of charcoal dust and fine plaster of Paris, made by water into a thick paste, and pressed into moulds of proper size and shape. The plaster setting and hardening, the cast gives it, under pressure, proper tenacity.

Claim.—The described alchemist plates as an article of manufacture, made in the manner and for the purpose set forth.

No. 30,681.—JAMES JOHNSON, of Garysburgh, N. C.—*Improvement in Metallic Hubs for Carriage Wheels*.—Patent dated November 20, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination and arrangement of the hub A , cap D , and the screw shaft on the shoulder of the spoke, whereby the spoke is securely held in its position.

I also claim the combination and arrangement of the screw nut k , on the arm of the axle, with the pivot N , in the cap D , as described, for the purpose of preventing the oscillation of the hub on the arm of the axle

No. 30,682.—SIMON P. KASE, of Danville, Pa.—*Improvement in Machines for Cleaning Rice*.—Patent dated November 20, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the circulation of a stream of cold water around the pot or vessel in which the rice is contained while being cleaned, substantially in the manner and for the purpose described.

Second. The bell-mouthed hub C , when arranged to operate in relation to the bottom of the pot, substantially as set forth.

Third. The grooves c^1 in the bottom of the hub C , when arranged and operating as described, for the purpose set forth.

Fourth. The combination of a stream of water flowing around the pot with a stream of air passing through the grain, substantially as and for the purpose set forth.

Fifth. The combination of the elevator E , hopper boy g , and cooling tub F , when arranged for joint operation, substantially as set forth.

Sixth. The combination of the scoops d , with the flange 6 , as described.

No. 30,683.—J. C. LOVELAND, of Springfield, Vt.—*Improvement in Spring Hooks for Clothing*.—Patent dated November 20, 1860.—This invention consists of a hook constructed in a peculiar manner, with a spring point, which yields for the passage of the eye, or loop, in hooking, and retains said eye or loop sufficiently to prevent the same unhooking by the ordinary movements of the body and springs, as the eye is pressed through the hook in the act of unhooking by hand.

Claim.—The spring hook for clothing, formed as specified, with the springing point 4, for the purposes and as set forth.

No. 30,684.—J. W. MOFFITT, of Harrisburg, Pa.—*Improvement in Artificial Teeth.*—Patent dated November 20, 1860.—This invention consists in the combination of different materials, whereby, says the inventor, I am enabled to produce artificial teeth and gums, in the condition which I term "non-sectional" block work, or a full set of the same for either jaw, in one homogeneous, solid, and continuous block upon the plate, with scarcely any appreciable shortening, or shrinking, in the length or form of the curve of the set.

Claim.—As an improved article of manufacture, the artificial teeth and gums, made as described.

No. 30,685.—HIRAM MOORE, of Brandon, Va.—*Improvement in Seed Drills.*—Patent dated November 20, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the conduit or passage H, arranged between the bottom of the hopper and the discharge, in combination with the oblique discharge I, and the toothed distributing cylinder C, substantially as described and for the purposes specified.

Second. I claim the combination of the separate bearings of the cylinder with a single shaft bearing in the cylinder, shorter than the cylinder and larger than the shaft, in the manner and for the purposes substantially as specified.

Third. I claim a distributing cylinder for seeding machines, having a bevelled bearing, substantially in the manner and for the purposes specified.

No. 30,686.—HENRY A. NEVERS and CHARLES ROSS, of Claremont, N. H.—*Improvement in Churns.*—Patent dated November 20, 1860.—This invention consists in causing the rotary motion applied to a shaft to operate an eccentric pin, which plays in a groove or slot cut in a gate or slide attached to the dash rod, by which means the dash is raised and lowered vertically within the churn as required.

Claim.—The combined arrangement of the driving shaft F, face plate and crank pin H C, with the vertically reciprocating carriage I, provided with a horizontal slot d, and the rod J of the dasher, the whole being constructed and operating as specified, for the purpose set forth.

No. 30,687.—JOHN NORTH, of Middletown, Ct.—*Improved Mousing Hook.*—Patent dated November 20, 1860.—This invention consists in so constructing and arranging it as to be applied to the rigging of the vessel quickly, and to be adjusted securely to the rigging of a vessel by hooking to it and of pressing the tongue against the end of the hook which locks it fast.

Claim.—An improved mousing hook, when arranged substantially as and for the purpose described, forming a new and improved article of manufacture.

No. 30,688.—CHARLES G. PAGE, of Washington, D. C.—*Improvement in Aural Instruments.*—Patent dated November 20, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the deflector A B E, to be applied to the ear, substantially as described, said deflector consisting of a simple reflecting surface applicable to the ear, and conveying vibrations to the external meatus directly, without the aid of a pipe or tube, and being constructed without reverberating cavities; and also so constructed as to intercept all aerial vibrations except those coming in one direction, viz., those which enter the open space at its expanded portion, all substantially in the manner and for the purposes set forth.

I also claim the combination of the deflecting instrument with hats, caps, or bonnets, in the manner set forth.

No. 30,689.—CHARLES H. SMITH, of Providence, R. I.—*Improved Machine for Punching Horse Shoes.*—Patent dated November 20, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the punching lever with a series of jointed punches, each of which can be adjusted independently of the others, so that a series of holes can be punched in different directions of obliquity to the plane of the surface of the shoe or other object to be acted upon, substantially as described.

Second. I also claim the adjustable pronged holder, Fig. 6, for the purpose of securing the object to be punched firmly to the table, and thereby preventing the breaking of the punches as they are withdrawn.

No. 30,690.—S. PETTIBONE and O. PETTIBONE, of Corunna, Mich.—*Improvement in Grain Separators.*—Patent dated November 20, 1860.—This invention consists in connecting the shoe of the separator with its fan case, and hanging the same in such a way as to admit of their adjustment both longitudinally and transversely.

Claim.—Hanging the shoe of a grain separator, when connected with the fan case as

shown and described, by means of the pins *e g*, arranged substantially as and for the purpose set forth

No. 30,691.—F. F. SMITH, of Momence, Ill.—*Improvement in Making Plough Plates from Molten Steel*.—Patent dated November 20, 1860.—The claim and engravings show the nature of this invention.

Claim.—Making plough plates of irregular forms and of variable thicknesses by pouring molten steel into iron moulds, in the manner and for the purpose set forth.

No. 30,692.—MICHAEL E. RUDASILL, of Shelby, N. C.—*Improvement in Hatchets*.—Patent dated November 20, 1860.—This invention consists in the employment of a revolving spring claw in combination with the hatchet.

Claim.—The employment of the rotating spring claw C in combination with the hatchet A, the same being used substantially as and for the purpose specified

No. 30,693.—JOHN RUEG, of St. Louis, Mo.—*Improved Brush Making Machine*.—Patent dated November 20, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the use of the nozzle, constructed substantially as described, in combination with the needle, for the double purpose of opening the loop and feeding the bristles through.

Second. I claim the combination of the spring clamp H with the head *u*, whereby the brush block is held up against the said head while the needle operates through it.

Third. I claim the combination of the pincers with the needle bar, substantially in the manner described, for the purpose specified.

Fourth. I claim opening and closing the pincers by means of a cam lever T and spring C, as set forth.

Fifth. I claim the combination of the levers S and R with the needle bar and the pincers, whereby those two devices are made to operate as described.

Sixth. I claim the combined use of the hopper or feeder box and the claw wheels M, and also the combined use of the gauge T with the said claw wheels, and the use of the claw wheels in combination with each other, all for the purpose specified.

Seventh. I claim the lever R in connection with the claw wheels and the needle bar, whereby the bristles are divided into tufts, and the tufts put into the brush back simultaneously.

No. 30,694.—WILLIAM A. SANDS, of Brooklyn, N. Y.—*Improvement in Ship Sails*.—Patent dated November 20, 1860.—This invention consists in making sails for vessels with corded or roped seams.

Claim.—The arrangement of the ropes *a* with the edges *c c* of the sail, in the manner shown and described, when the said edges are attached to said ropes by stitching so as to avoid lapping or banding, all as set forth.

No. 30,695.—JACOB SCIEFFERLIN, JR., of Tioga, Pa.—*Improvement in Straw Cutters*.—Patent dated November 20, 1860.—This invention has for its object the feeding of the substance to be cut, with a positive movement, or with a device that will insure its proper movement towards the knife at each vibration of the same.

Claim.—The arrangement of the rack bar L, with the pinions *l l*¹, the latter having ratchets *n*, attached, into which pawl *o* of shaft M¹ engages, feed roller P, reciprocating bottom O, and lever K attached to yoke G of shaft H, as and for the purpose set forth.

No. 30,696.—ARCHIBALD G. SHAVER, of New Haven, Conn.—*Improvement in Scalpels*.—Patent dated November 20, 1860.—This invention consists in forming the blade of a cutting instrument double concavo-convex, or spoon shaped, the outline being in general configuration like the bowl of an ordinary spoon, the under side being convex and the upper side concave, the rim being either plain or chamfered off to a cutting edge.

Claim.—The double concavo-convex or spoon-formed cutting instrument, constructed in the manner and for the purposes described.

No. 30,697.—ADAM R. REESE, of Phillipsburgh, Pa.—*Improvement in Fodder Cutters*.—Patent dated November 20, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the feed rollers G and H, the endless chains F and O, arranged as described, for the purpose of varying the speed of the rollers, and for the purpose of causing the two rollers to revolve at different rates of speed, substantially as set forth.

No. 30,698.—ROBERT S. STUBBS, of Claremont, N. H.—*Improvement in Attaching and*

Detaching Ships' Boats.—Patent dated November 20, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment of a capstan barrel, to which the endless rope or chain E is applied to take up the slack in raising a boat, and which barrel is operated on by a worm pinion H and wheel H¹, between which and the capstan the pawl 7 and wheel 6 are fitted, the whole acting in connection with the brake F, to raise or lower the boat, as specified.

Second. I claim the latches 4 in the inverted position shown, to take the bolt heads M M, in the manner specified, when combined with the lever 3 and rod L, for disconnecting said latches, and with the lowering apparatus, for the purposes and as set forth.

No. 30,699.—HORATIO N. WILBUR, of Keokuk, Iowa.—*Improvement in Soap Composition.*—Patent dated November 20, 1860.—This mixture is composed of the following ingredients: One and a half gallon of soft water, six pounds of shaving soap, six ounces of sal soda, two ounces of turpentine, two ounces of olive oil, two ounces of ammonia, two ounces of alcohol, two ounces of marble dust, one ounce of dissolved camphor, one ounce of white rosin, one ounce of dissolved alum, one fourth ounce of Prussian blue or Chinese vermilion, one fourth ounce of oil of sassafras; boil till well dissolved.

Claim.—The mixture composed of the materials in the proportions and manner and for the purposes set forth.

No. 30,700.—STEPHEN WILCOX, JR., of Westerly, R. I.—*Improvement in Air Engines.*—Patent dated November 20, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination and arrangement of the two single acting working cylinders and pistons, with the two changing cylinders and pistons, so as to operate together, substantially as described, for the purposes set forth.

Second. The combination and arrangement of the eccentric H, short connection h, idle lever I, link g, and the changing piston or pistons b, together with suitable means for communicating the motion to the latter, for the purpose of giving the proper periods of rest and motion to the changing pistons b, substantially as specified.

No. 30,701.—STEPHEN WILCOX, JR., of Westerly, R. I.—*Improved Air Engine.*—Patent dated November 20, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, in combination with an air engine in which the air and gases are heated by combustion within the cylinder, or in a chamber leading thereto, the use of a regenerator F, substantially as and for the purpose described.

Second. Gradually supplying the combustible gas or vapor for a gas engine, operating substantially as described, as it is consumed, and in the proper quantity for each stroke, by means of the pump G, or its equivalent, for the purpose set forth.

Third. Combining a quantity of cooler air with the products of combustion, by the combined action of piston b and valve M, or their equivalents, substantially as described, for the purpose of preserving a safe degree of heat within the cylinder, as set forth.

Fourth. The supplemental valve m, arranged and operating substantially as and for the purpose specified.

Fifth. The arrangement of the evaporator N, reservoir O, and heater P, substantially as described and for the purpose set forth.

Sixth. Placing a piece of fire brick L, or equivalent substance, in close proximity to the burner j k, for the purpose specified.

No. 30,702.—SAMUEL M. WITMER, of Cincinnati, Ohio.—*Improvement in Securing Railroad Rails to the Cross Ties.*—Patent dated November 20, 1860.—This invention has for its object a cheap and secure mode of joining T rails to the customary wooden cross tie, by means of an arrangement of peculiarly formed confining plates, in a transversely joined tie.

Claim.—The combination of the deep vertical gain l, gib E e, shoe D d, and bevelled sides 2, the whole being constructed and operating in the manner and for the purposes set forth.

No. 30,703.—M. L. CALLENDER, of New York, N. Y., assignor to himself, the WARREN CHEMICAL AND MANUFACTURING COMPANY, and ELBERT PERCE, of said New York.—*Improvement in Hydro-Carbon Burners.*—Patent dated November 20, 1860.—This invention consists in providing a hydro-carbon air-mingling vapor burner, with appliances, by which sufficient heat is generated in the burner to evaporize coal oil and other hydro-carbon fluids.

Claim.—The employment of the auxiliary jets and cap or heater D, in combination with the air-mingling chamber C, substantially as and for the purposes shown and described.

No. 30,704.—WILLIAM CROTZER, of Spruce Creek, Penn., assignor to himself and SAMUEL

BEAMER, of said Spruce Creek.—*Improvement in Grain Cleaning Machines*.—Patent dated November 20, 1860.—This invention relates to grain cleaning machines of that class which are designed to separate smut and other impurities from the grain, and consists in a novel construction and arrangement of screens, fans, blast spout, and a scouring device, whereby the desired work is performed.

The inventor says: I *claim*, first, the arrangement of the hopper S, shoe Q, boxes O N, and fan box C, as shown, the hopper, shoe, and box O, being provided respectively with the screens T R P, as described, all constructed and operating as and for the purpose set forth.

Second. The scouring device, formed of the cylinder I, perforated as shown, and having the projections and knobs *j k*, at its inner side, and the rotating disks J R, provided with the beaters L, and the fan H, on the shaft B, in combination with the boxes N O, shoe Q, and the spout E, the latter communicating with the fan boxes C G, and all arranged for joint operation, as and for the purposes set forth.

No. 30,705.—ARBA SEAMANS, of Bowmansville, N. Y., assignor to MARION SEAMANS, of said Bowmansville.—*Improvement in Washing Machines*.—Patent dated November 20, 1860.—This invention has for its object the construction of a machine which shall, by mechanical action assimilating the motion of human hands, perform the operations of rubbing, squeezing, or pounding, and turning the garments at the same operation.

Claim.—The combination and arrangement of the several rubbing and pounding blocks H H, attached to the spring slats or arms G G, and acting simultaneously, but separately, the concentric bottom D having its upper portion corrugated, and its lower portion plain or smooth, and the butting "board or back" *m*, substantially as and for the purpose specified.

No. 30,706.—V. VAN VLECK, of New York, N. Y., assignor to himself and RALPH LOCKWOOD, of said New York.—*Improvement in Dental Chairs*.—Patent dated November 20, 1860.—This invention consists in the arrangement of a longitudinally sliding bolt, in combination with the seat of a chair and with two hemispheres, one working inside the other in such a manner that by depressing said bolt the seat of the chair may be retained in any desired position, whether horizontal or inclined; also in the combination with said longitudinally sliding bolt, and with the two hemispheres of two toggle arms on the head of the bolt and acted upon by a treadle in such a manner that by depressing the treadle the two hemispheres are locked and the seat retained in its position.

The inventor says: I *claim*, first, the arrangement of the longitudinally sliding bolt G, in combination with the seat A, and the hemispheres B and F, constructed and operating substantially in the manner and for the purpose set forth.

Second. The arrangement of the toggle arms H, and slotted treadle I, in combination with the bolt G, seat A, and hemispheres B and F, constructed and operating substantially as and for the purpose specified.

No. 30,707.—ALBERT M. WHITE, of Hartford, Conn., assignor to ROGER & BROTHER, of Waterbury, Conn., and the HARTFORD MANUFACTURING COMPANY, of Hartford, Conn.—*Improvement in Burnishing Machines*.—Patent dated November 20, 1860.—This improvement consists, first, in making a revolving cylindrical head, securing it upon a shaft in a proper manner, and arranging a series of yielding pressure burnishers; and second, in combination therewith, arranging a sliding holder stock, made in a proper manner, so as to present the surface of the work to be burnished, (held by said sliding holder stock,) in a proper manner to the action of the burnishers, and being more especially adapted for burnishing concave and convex surfaces.

The inventor says: I *claim*, first, the revolving burnisher head *a*, substantially as described, whereby I am enabled to present the surface to be burnished to the ends of a series of burnishers, arranged substantially as and for the purpose described.

Second. I claim the arrangement of the sliding stock *d*, holder *c*, cam or pattern *f*, in combination with the head *a*, substantially as and for the purpose described.

No. 30,708.—WILLIAM H. ADLE, PRESTON D. MILES, and GEORGE CUSTER, of Norristown, Pa.—*Improvement in Corn Planters*.—Patent dated November 27, 1860.—This invention consists in the employment and combination of different devices.

The inventors say: We *claim*, first, the combination of the two frames A and D, standards *a a*, shaft *m*, and chains *o o*; all being arranged substantially as and for the purpose set forth.

Second. We claim hoppers K, trough H, slides *c c*, pitman J, connecting rods L L, automatic discharge spouts R R, and clutch coupling *r*, when the whole shall be constructed and arranged substantially as and for the purpose set forth and described.

No. 30,709.—JAMES H. ANDERSON and EDWARD H. ANDERSON, of Easton, Md.—*Improve-*

ment in Cultivators.—Patent dated November 27, 1860.—In this invention there is employed a cast metal, or a wooden shoe, shod with metal, provided with suitable handles, and having a toothed cylinder behind it, all arranged to operate and effect the desired end.

Claim.—The combination of the shoe A, and toothed cylinder E, constructed and arranged to operate substantially as and for the purposes set forth.

No. 30,710.—HAINES AUSTIN, of East Liberty, Ohio.—*Improvement in Water Carts.*—Patent dated November 27, 1860.—This invention consists in the arrangement of devices.

Claim.—As a new agricultural implement, a cask, with journals, draught frame and wheels, the whole being constructed and arranged in the manner and for the purposes specified.

No. 30,711.—LUTHER B. BENTON, of Penn Yan, N. Y.—*Improvement in Cultivators.*—Patent dated November 27, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the tooth C, shares and land side D, frame A, and bars E; the whole being constructed as described, for the purpose set forth.

No. 30,712.—ANDREW BEUKELMANN, of Langford, N. Y.—*Improvement in Ploughs.*—Patent dated November 27, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Connecting the forward portion of the bottom A, of the plough, with the beam, by means of the adjustable coupling arms C D, the arm D being secured to the beam by the face *c* and bolts *d d*, as specified, and connecting the rear portion of said bottom A, with the beam, by means of the pivotted connecting bar G, and hand screw H, the connection of the said bottom with the handles being effected by the eye *n*, and projection *o*, or their equivalents; the whole arranged, combined, and operating substantially as set forth.

No. 30,713.—BENJAMIN BOWER, of Millersburg, Ohio.—*Improvement in Corn Planters.*—Patent dated November 27, 1860.—This improvement relates to a corn dropper that can be held in the hand with the hoe, so arranged with a slide and levers that a certain number of grains of corn, no more or less, will drop into a hill, which are then covered with a hoe.

Claim.—The vessel A, in combination with the slide F, levers M and R, and connecting rods I and P, or their equivalents, when these several parts are constructed, arranged, and operated as and for the purpose set forth.

No. 30,714.—JOHN BOYNTON, of East Hartford, Conn.—*Improvement in Breech Loading Fire Arms.*—Patent dated November 27, 1860.—This invention consists in the peculiar method of forming the breech part and attachments of a rifle, or other fire arm.

Claim.—The rack *c*, pinion D, main spring H, in combination, actuated by the lever B, in the manner as described.

No. 30,715.—ERNEST W. BRIDING and FRANCIS G. MAXWELL, of Baltimore, Md.—*Improvement in Horse Collars.*—Patent dated November 27, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The new article of manufacture described, viz: a horse collar, constructed of glazed canvas and leather, in the manner and for the purpose specified.

No. 30,716.—EDWIN LEE BROWN, of Brooklyn, N. Y.—*Improved Regulator for Heating Apparatus.*—Patent dated November 27, 1860.—This invention consists of a tight air vessel placed within the hot air chamber, the expansion and contraction of the air within said air vessel, caused by the changes of temperature in the air chamber, being employed through the intervention of suitable mechanism to operate one or more dampers for regulating the fire, to keep the hot air chamber as near as possible at the predetermined temperature.

Claim.—The air vessel H, with its stop cock *i*, and regulator *m*, as combined and arranged with the dampers *e* and *b*, and the pipes G and *d*, for the purpose specified.

No. 30,717.—J. SILAS BROWN, of Green Point, N. Y.—*Improved Baby Jumper, Couch, and Carriage.*—Patent dated November 27, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, the frame for holding the baby, composed of four posts A A A A, bottom and top B and B¹, grooved and perforated side boards C C, for supporting respectively the back E, and table D, all arranged substantially in the manner described.

Second. I claim the spring arms *c c*, and straps *f f*, in combination with the posts A A A A, and perforations *e e e*, in the side boards C C, as and for the purposes set forth.

Third. I claim the post F, arranged as set forth, and secured to the seat by a spring bolt *j*, and tenon *i*, as and for the purposes described.

No. 30,718.—C. H. BURBRIDGE, of Middletown, Conn.—*Improvement in Cotton Scrapers*.—Patent dated November 27, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Attaching the scraping wing of a cotton scraper to a suitable carriage or plough frame by a hinged joint and pivotted brace rod K, so as to allow said scraping wing to rise and fall with the uneven surface of the ridges, substantially as set forth.

No. 30,719.—CYRUS CHAMBERS, JR., of Philadelphia, Pa.—*Improvement in Machines for Folding Paper*.—Patent dated November 27, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, in folding a sheet where an inset is to be cut off, placing the inset by automatic mechanism on the outset and in proper position to receive the last fold.

Second. Combining in one machine the mechanism for cutting off the inset, placing it on the outset or main sheet in proper position, and folding it therewith.

Third. The combination, with folding rollers, of rotating cutters, when both are adjusted in the manner as and for the purposes described.

Fourth. The supplemental stop H¹, against which the inset comes when made adjustable with, as well as independently of, the stop H, as and for the purpose specified.

No. 30,720.—C. A. CLARK, of Bloomfield, Iowa.—*Improvement in Cultivators*.—Patent dated November 27, 1860.—This invention consists in the arrangement of the crank, axle, gauge, or propelling wheels, lever, rear shares, forward shares, longitudinal bars, perforated transverse bars and handles.

Claim.—The arrangement of the crank axle D, gauge or propelling wheels F F¹, lever G, rear shares h¹ h¹ h¹, forward shares h h, longitudinal bars A a b c d, transverse perforated bars c c, and handles m m¹, all in the manner and for the purposes described.

No. 30,721.—I. W. COLLINS and R. Y. WILKINSON, of Clinton, La.—*Improvement in Cotton Scrapers*.—Patent dated November 27, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* the arrangement of the hoe wheel E and shaft D with the yielding bar F and spring K, for the purpose of automatically raising the hoe wheel after it has been depressed by the operator, substantially in the manner described.

We also claim, in combination with a spring or yielding rotary hoe wheel for thinning cotton, the adjustable and non-yielding mould ploughs secured to the rear supports of the machine, for the purpose of thinning and moulding cotton at one operation, substantially in the manner described.

No. 30,722.—JOHN COLLMAN and HARM FEENDERS, of Freeport, Ill.—*Improvement in Glass Cutters*.—Patent dated November 27, 1860.—This invention consists in the use of a regulator or adjustable bearing on the face of the bit, to cause the diamond to bear upon its highest or sharpest point; in a pivotted and spring connection between the handle and bit; and also in the construction and application of an adjustable breaker.

The inventors say: We *claim*, first, the adjustable regulator E, applied to the face of the bit B, substantially as and for the purposes set forth.

Second. The combination of the cavity b, spring S, and pivot connection a, between the bit and handle, operating in the manner and for the purposes explained.

Third. The described combination of the fixed jaw F, sliding jaw F¹, and set screw G, with the handle A of a glass cutting instrument, for the object stated.

No. 30,723.—TULLY R. CORNICK, of Cap au Gris, Mo.—*Improvement in Ploughs*.—Patent dated November 27, 1860.—This invention consists in the arrangement and combination of parts.

Claim.—The combination and arrangement of the cross piece w, tongue m, axle z, wheels x, pieces c, cross piece w, pieces k, cross pieces h, helves n and P, chains S, ploughs O Q Z Y, rod v, levers c e f, and seat l, substantially as described, for the purposes set forth.

No. 30,724.—CHARLES F. CORY, of Lebanon, Ill.—*Improvement in Furnaces*.—Patent dated November 27, 1860.—This invention consists in the construction of a furnace having for the desired object economy of fuel, more perfect combustion, greater equality of heat, together with greatly diminished labor in the management and in economy of time.

Claim.—The special construction and arrangement of a furnace, having one or more open fronts e e f f, Fig. 1, and the cold air chamber e² e², Fig. 2, with the perforated or ventilating fire back g g, hot air chamber I, and valve K L, the diaphragm drop guard or suspension back P P, the cut-off n, and check wall q, as fully set forth and described.

No. 30,725.—TRUMAN ESTES, of North Bennington, Vt.—*Improvement in Friction Brakes*.

for *Bobbins*.—Patent dated November 27, 1860.—The nature and object of this invention are shown in the claim and engravings.

Claim.—A self-adjusting or regulating brake *c*, constructed and operating substantially as described and represented, for giving an equal and proper tension to threads or yarns that are being drawn off.

No. 30,726.—R. H. EWING, of Clives, Ohio.—*Improvement in Hillside Ploughs*.—Patent dated November 27, 1860.—The claim and engravings explain the nature of this invention.

Claim.—In a hillside plough, with two mould boards *F F*¹, the manner of securing and of operating the mould boards, viz: by means of horizontal arms *q q*, catch *t*, and groove in point *k*, together with the rods *v*, or their equivalents, all arranged and operating substantially as and for the purposes set forth.

No. 30,727.—SAMUEL FISHER, of West Windsor, N. J.—*Improvement in Ploughs*.—Patent dated November 27, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of the pivotted beams *G* with the pivotted ploughs supported by a pin, when arranged to operate in the manner and for the purpose set forth; and this I claim whether the ploughs be made adjustable, and be raised or lowered, or held by the devices described, or by others accomplishing a similar object by substantially the same means.

No. 30,728.—PETER GIVEN and ELI FOREMAN, of Summer Hill, Pa.—*Improvement in Rotary Harrows*.—Patent dated November 27, 1860.—In the rollers *K* is a groove, as shown at *N*, and when the wheels are turned in a perpendicular position these grooves *N* are in such a position that the cross pieces *F F H H* will enter them at *w k*; these cross pieces then act as braces and also form a bottom of the wagon on which sacks of grain may be laid.

Claim.—The construction of the frame, with the cross pieces *H H F F*, in combination with the sliding bands *G J* and the grooved rollers *K K K K*, constructed as described.

No. 30,729.—W. W. GRAVES, of Fort Adams, Miss.—*Improvement in Cotton Ploughs*.—Patent dated November 27, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The scraping plate *F*, when the same is attached to the end of a long and narrow landside bar *E*, and otherwise arranged, so as to cut and throw the scrapings down into the centre of the furrow, as set forth.

No. 30,730.—JOHN J. HENRY, of North White Creek, N. Y.—*Improvement in Blind Fastenings*.—Patent dated November 27, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The eccentric form of a socket *C*, as described, so that the movements of the bar *B*, after detaching the catch, may press the block *A* which carries the catch apart from the socket *C*, substantially as set forth in the specification.

No. 30,731.—FREDERICK HEYER, of Richmond, Va.—*Improvement in Sewing Machines*.—Patent dated November 27, 1860.—The leading feature of this invention is a device for adjusting the shuttle race to suit shuttles of various sizes.

Claim.—The pivotted levers *R*, operating in combination with the shuttle race *O*, substantially as and for the purposes set forth.

No. 30,732.—J. HOLYLAND and J. C. HOLYLAND, of Rochester, N. Y.—*Improved Cracker Machine*.—Patent dated November 27, 1860.—This improvement relates to the manner of feeding the dough to the cutters and the regulation of the feeding, to compensate for the different degrees of shrinking possessed by different kinds of dough, and the adaptation of the feed to the requirements of different sizes of cutters.

Claim.—Giving an intermittent motion to the pressure rollers *D D*, by means of the clutch and lever *H O*, connecting rod *G*, and crank *F*, or their equivalents, substantially in the manner and for the purposes shown and described.

No. 30,733.—HOSEA HUNTLEY and WILLIAM CAVEN, of Cincinnati, Ohio.—*Improvement in Cooking Stoves*.—Patent dated November 27, 1860.—This invention relates to a peculiar combination and arrangement of fire chambers, air passages, flues, &c., with respect to the oven and boiling places, having for its object the most effective and uniform disposition of heat, for the purposes of cooking.

Claim.—The combination, with the central longitudinal fire box *C*, of supply passages *E e*¹, arranged to receive external air in front and admit it to the fire at the rear, in the manner and for the purposes set forth.

No. 30,734.—HENRY M. JACOBS, of Hartford, Conn.—*Improved Machine for Burnishing Spoons*.—Patent dated November 27, 1860.—This invention relates to an improved double-acting machine for burnishing the bowls of spoons, both inside and outside, and other articles, and consists in a novel method of using and graduating two sets of burnishers at one time.

Claim.—The arrangement of the horizontally sliding and vibrating shafts K K and the transverse travelling and reciprocating toothed ratch F, to actuate the same in combination, in the manner and for the purpose substantially as set forth and described.

No. 30,735.—CHARLES L. JONES, of Richmond, Va., assignor to himself and WILLIAM H. TYREE, of said Richmond.—*Improved Carpenter's Clamp*.—Patent dated November 27, 1860.—This invention consists in the arrangement of a stationary jaw and jaw frame, and a sliding piece provided with oblique slots, in combination with a detachable jaw and a screw.

Claim.—The arrangement of a stationary jaw and jaw frame B B¹ B² B³ and a sliding piece A A², provided with oblique slots A¹, in combination with a detachable jaw G and a screw C, all the parts constructed and operating substantially as and for the purposes set forth.

No. 30,736.—SAMUEL KEEN, of East Bridgewater, Mass.—*Improved Machine for Skiving Leather*.—Patent dated November 27, 1860.—In operating this machine place the end of the piece of leather to be operated upon between the spring M and notched surface of the feed segment N; then, by means of treadle a, revolve the feed segment in the direction of the arrow b; this will cause the leather to be forced against the sharp edge L of the knife and be skived or split, as desired.

Claim.—The application and arrangement of the reciprocating feed segment N O P, substantially as and for the purpose set forth.

No. 30,737.—HIRAM J. LAKE, of Conquest, N. Y.—*Improvement in Cultivators*.—Patent dated November 27, 1860.—The claim and engravings explain the nature of this invention.

Claim.—In combination with a cultivator, the swivelling of the thills thereto, so that they may assume a horizontal position when the cultivator is working on a hillside, for the purpose of relieving the horse from the pressure or gouging of the thills on his sides, and enable the operator to better guide and direct the cultivator as set forth and described.

No. 30,738.—JOSEPH LEEDS, of Philadelphia, Pa.—*Improvement in Hot Air Furnaces*.—Patent dated November 27, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim providing a surface of water over the lowest part or floor of the warm air chamber, and below the heater thereof, substantially in the manner described, and for the purpose specified.

And in combination therewith, I also claim discharging spray or minute jets of water through the rising air in the warm air chamber, substantially as described, and for the purpose specified.

No. 30,739.—ALONZO LIVERMORE, of Fremont, Penn.—*Improvement in Chutes for River or Canal Navigation*.—Patent dated November 27, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, dividing the natural or artificial fall to be overcome in a stream into several smaller falls, in combination with the interposing between said smaller falls of a series of basins, pools, or chambers, substantially as described.

I also claim, in combination with a series of basins, pools, or chambers that are interposed between a series of falls, the current breakers H, for the purpose set forth and explained.

I also claim, in combination with a series of basins, pools, or chambers that are interposed between a series of falls, the lips K K, for retarding the ingress and egress of the water to and from said basins, pools, or chambers, substantially as set forth.

No. 30,740.—THOMAS S. LOCKHART and JOHN A. LOCKHART, of Wellington, Mo.—*Improvement in Ploughs*.—Patent dated November 27, 1860.—This invention consists in the arrangement of a bent rod serving as a standard, a collar fastened to the inside of the mould board, and a curved brace, in combination with the perforations, in the standard and nuts.

Claim.—The arrangement of a bent rod C C¹ C², serving as a standard, a collar I, fastened to the inside of the mould board J, and a curved brace e, in combination with the perforations H H, in the standard and the nuts G G, substantially as and for the purposes set forth.

No. 30,741.—R. G. MATHENY and L. R. BARNES, of De Kalb, Miss.—*Improvement in Ploughs*.—Patent dated November 27, 1860.—This invention consists in a peculiar arrangement of turning ploughs and scrapers.

Claim.—The arrangement of the bars B B, connected with the beam A by the clamps G, in connection with the adjustable feet or standards F F and bars J J, attached to the bars B B, and having the ploughs and scrapers respectively secured to them, the handles C C being attached to the bars B and landsides b b, and all arranged as and for the purpose set forth.

No. 30,742.—THOMAS J. MAYALL, of Roxbury, Mass.—*Improvement in Ordnance.*—Patent dated November 27, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: First, in combination with the swinging frame supporting the cannon, as described, I *claim* transverse braces provided with suitable bearing for so holding the shaft operating the automatic machinery referred to as that its proper relation to said machinery shall not be disturbed by any movement imparted to the cannon, substantially as set forth.

Second. I claim the arrangement of the three levers g h i, relatively to each other, in combination with the studded shaft e, imparting to, and the spring clutch j receiving from, said levers the requisite motions, whereby, at proper intervals of time, the breech is firmly grasped and released, substantially as described, and for the purposes set forth.

Third. I claim arranging, upon one and the same crank shaft at either side of the barrel, connecting rods for operating the devices for automatically loading and swabbing the chambers of the breech, essentially as set forth.

Fourth. I claim the arrangement and application of the several devices for automatically revolving and locking the breech, firing and thumbing its chambers with respect to one common cam shaft, substantially as described, so that the said devices shall all be operated by said cam shaft in perfect unison and with unfailing accuracy, as set forth.

Fifth. I claim the arrangement of springs of equal power, and capable of compression and tension at either end of the platform, whereby the gun, in recoiling, will be acted upon equally and simultaneously at each extremity of the carriage, and be accurately reset in position for the next discharge.

No. 30,743.—C. W. McCLANAHAN, of Victoria, Texas.—*Improvement in Cotton Seed Planters.*—Patent dated November 27, 1860.—In using this machine, as the wheel revolves, the stirrer is reciprocated and the distributor revolved, and the former caused to agitate the seed while the blades of the latter carry the agitated separated seed out through the passage B and into the drill tooth, from whence it falls into the drill formed by said tooth. As fast as the seed is planted it is covered by the coverers H and rolled in by the wheel D.

Claim.—The combination and arrangement of the reciprocating stirrer J t t, rotary distributor I r, crank arms c K L, pitmans M N, pin d, slotted guide plate m n, hopper A, drill tooth F, and coverers H, substantially in the manner and for the purpose described.

No. 30,744.—WILLIAM J. MCCOY, of Cartersville, Ga.—*Improvement in Cultivators.*—Patent dated November 27, 1860.—This invention consists in the arrangement of the different parts of the plough or cultivator.

Claim.—The arrangement of the reversible beam A, stock B, with its braces E C, ploughs F, cutter K, landside j, standard b, handles D, and springs H, substantially as and for the purposes set forth.

No. 30,745.—NELSON MESSENGER, of Newark, Ill.—*Improvement in Cultivators.*—Patent dated November 27, 1860.—This invention consists in the employment of four shoes, which are arranged and applied to the frame and stock of the implement so as to effect the desired end.

Claim.—The arrangement of the horizontal boss G G, with the pendant feet or bars H, having the shares I attached in connection with the standards F, being based by the rods a, and the bars G, braced by the rods D, as and for the purpose set forth.

No. 30,746.—WILLIAM L. MILHOLEN, of Centre, Ala.—*Improvement in Cotton Scrapers.*—Patent dated November 27, 1860.—This invention consists in the arrangement of the parts named in the claim and shown in the engravings.

Claim.—The arrangement of the beam 1, braces 5 5, bolts 6 6, arms 7 and 8, nuts 10 and 11, shares 4 4, hinge joint 9, standard 3, handle 2, as described, for the purpose specified.

No. 30,747.—R. C. MILLINGS, of Charleston, S. C.—*Improved Thill Coupling.*—Patent dated November 27, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Having the goose neck E bent or curved so as to extend around the axle A, at its back, and form a hook to catch against the axle in case of the breaking of the coupling or clip, substantially as set forth.

No. 30,748.—M. H. MOORE and ALEXANDER SATTERWHITE, of Rome, Ga.—*Improvement*

in Cultivators.—Patent dated November 27, 1860.—This invention relates to a new and improved arrangement of means, whereby two ploughs may be readily adjusted nearer to or farther apart, as circumstances may require, and also adjusted so that they may have a greater or less inclination to vary their depth in the earth as may be desired.

Claim.—The arrangement of the bars D D D E E, beam A, and feet F, with the bars G¹ attached, the two latter parts being secured to the bars E E, as and for the purpose set forth.

No. 30,749.—JAMES MORRISON, of Clinton, Me.—*Improvement in Seeding Machines.*—Patent dated November 27, 1860.—This invention consists in the employment of a vibrating spout or trough, a stationary screen, a hopper and shoe, whereby the desired work may be performed.

Claim.—The vibrating spout or trough I, stationary screen H, hopper E, and shoe F, arranged for joint operation, essentially as and for the purpose set forth.

No. 30,750.—J. N. NEFF, of Strasburg, Pa.—*Improvement in Hay and Straw Cutters.*—Patent dated November 27, 1860.—This invention consists in a novel and improved arrangement of a reciprocating knife and feed mechanism.

Claim.—The reciprocating V-shaped knife C, in connection with the feed rollers H I, arranged to operate conjointly, as shown, to wit: the roller I being fitted in loaded bars J J, and the roller H, actuated through the medium of the pawl M, lever N, rod O, and eccentric P, as and for the purpose set forth.

No. 30,751.—JOHN NEIDICH and ELIM R. GIRVIN, of Lancaster County, Pa.—*Improvement in Cultivators.*—Patent dated November 27, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The gauge or guide rod K, with the sliding and binding plates H, set or binding screw I, in combination with the shovels F, and their projecting screw ends *f*, secured on said plates by the nuts *h* for adjustment, when made substantially in the manner and for the purpose specified.

No. 30,752.—OSCAR PADDOCK, of Watertown, N. Y.—*Improvement in Hot Air Furnaces.*—Patent dated November 27, 1860.—The claim and engravings explain the nature of this invention, which is a combination and arrangement of parts.

Claim.—The combination of weighted arm K, connecting rods G and J, and valves C C¹, arranged in the relation to each other and to the door B, herein set forth, and operating substantially in the manner and for the purposes described.

No. 30,753.—WILLIAM PAULI, of Alexandria, Va.—*Improvement in Heaters for Railroad Cars.*—Patent dated November 27, 1860.—The claim and engravings show the nature of this improvement.

Claim.—The arrangement of a heater provided with an upper chamber *c* above the fire box A, side chamber B, smoke pipe E, tubes F, when employed with tubes D D, provided with upper and lower registers and rods *b b*, operating substantially in the manner and for the purpose of heating railroad cars.

No. 30,754.—SEWALL PEARSON, of Boston, Mass.—*Improved Sofa and Bedstead.*—Patent dated November 27, 1860.—This invention has for its object the construction of a neat and cheap article of furniture which may be made to serve the purposes of a bed with a spring bottom and a sofa with a spring bottom, the same to be constructed in such a manner that the use of a sofa as a bed will not injure it in the least, and *vice versa*.

Claim.—The arrangement of the hinged arms D D, back board H, hinged back E, and part B, with the part A, mattress *g*¹, and springs *d d*¹; all as shown and described for the purposes set forth.

No. 30,755.—CHARLES PERLEY, of New York, N. Y.—*Improved Hawser Pipes.*—Patent dated November 27, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The movable cap or shutter applied to the inner end of the hawser pipe and clamped thereto, for the purposes and as specified.

No. 30,756.—JOHN P. PETTIT, of Cold Spring, Ky.—*Improvement in Ploughs.*—Patent dated November 27, 1860.—This invention relates to the class of ploughs in which one or more rollers are employed to take the place of the mould board, for turning the furrow slice, and consists in a peculiar construction and combination of roller, coulter, brace, sole, and landside.

Claim.—The combination of the single conical, flaring roller E, coulter C, sole D, curved

brace F, and bar G; the said parts being constructed and arranged in the manner and for the purposes set forth.

No. 30,757.—H. D. J. PRATT, of Washington, D. C.—*Improved Marine Propeller*.—Patent dated November 27, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the cutwater A, and heel B, or either of them, constructed and applied, substantially in the manner set forth, as a support to the propelling apparatus.

Second. In combination with a propeller hung and operated as described, the stationary vanes I, whether placed on the sides or bottom of the vessel, or at one or both ends of the propeller, or within a cylinder surrounding it, as and for the purpose specified.

Third. Giving to the edges of the stationary vanes an undulating form, the prominences of which pass between prominences of corresponding form on the edges of the propeller vanes, as shown.

No. 30,758.—HARRISON C. RAVENSCRAFT, of Kingwood, Va.—*Improvement in Cultivators*.—Patent dated November 27, 1860.—This invention consists in the arrangement of the several parts.

Claim.—The middle portion A, in combination with the outer sliding rings D and E, arranged and operating as above set forth.

No. 30,759.—FRANCIS RAYMOND, of Sandusky, Ohio.—*Improvement in Rotary Harrows*.—Patent dated November 27, 1860.—This improvement relates to a certain arrangement of devices for the purpose of preventing side draft.

Claim.—The finger P, and roller R, in combination with the adjustable box L, when these several parts are arranged and operate substantially as set forth.

No. 30,760.—JOSEPH S. REEDER, of Canton, Ohio.—*Improvement in Breech Loading and Magazine Fire Arms*.—Patent dated November 27, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, broadly, the vibrating charger K for the purpose of carrying powder to the chambered breech J.

Second. The cut-offs *k* and *k*¹, or their equivalents, for the purpose of retaining the powder in the vibrating charger and in the magazine while the powder is being carried to the chambered breech.

Third. The combination of pinion 12 and rack 11, with levers 10 and 8, for transmitting motion to the vibrating charger K, for the purpose stated.

Fourth. The magazine D, in combination with the vibrating charger K, for the purpose stated.

Fifth. Plate *b*, in combination with piston *r*, as and for the purposes stated.

Sixth. The combination of the hammer 6 with chambered breech S, as and for the purposes stated.

Seventh. The combination of chambered breech J, with barrel C, and vibrating charger K, as and for the purposes described.

Eighth. The vibrating cut-off *a*, or its equivalent, in combination with chambered breech J and ball magazine E, as and for the purposes stated.

Ninth. The combination of lever 2, projection 2¹, with spring catch *j*, and curved projection 4, as and for the purposes described.

Tenth. The combination of trigger protector G with chambered breech J, as and for the purposes described.

Eleventh. The combination of keys *jj* with the side plates B and chambered breech J, as and for the purposes described.

Twelfth. The combination of the removable hand guard with the trigger protector G, as stated.

No. 30,761.—JOHN W. RICHARDSON, of South Braintree, Mass.—*Improved Machine for Cutting Leather*.—Patent dated November 27, 1860.—The nature of this invention is shown by the claim and engravings.

Claim.—An improved leather cutting machine or arrangement of the windlass, its ratchet-retaining spring, connecting rope or ropes, and impelling pawl, with the table, the carriage, the knife frame, knife, and the holding rod, constructed, applied, and made to operate together substantially as and for the purpose specified.

No. 30,762.—A. W. LELAND RIVERS, of Midway, S. C.—*Improvement in Ploughs*.—Patent dated November 27, 1860.—This invention consists of a screw, or wedge bolt *d*, by which the blade of the plough is secured to the standard.

Claim.—The combination of the bolt *d*, slotted metal plate *e*, wedge *i*, and eye *h*; the whole being arranged as described, for the purposes specified.

No. 30,763.—NOAH ROGERS, of Thomas County, Ga.—*Improvement in Cotton Cultivators*.—Patent dated November 27, 1860.—In using this machine for cultivating corn or cotton when small, there is attached to the shovel the scraper O, which, by its curved shape, will catch the ground and prevent it from falling over the young plants, and thus prevent their being covered up.

Claim.—The arrangement of the handles C, standard B, with slot *f*, rung *h*, link *j*, pin *i*, standard D, adjustable braces *g* and *F*, mould board *a*, wings K and *l*, and movable pieces J and J; the whole operating as set forth.

No. 30,764.—GEORGE SCOTT, of Steubenville, Ohio.—*Improved Machine for Raising and Kneading Dough*.—Patent dated November 27, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a stationary shaft C, having arms or knives D D, and a deflecting flanch or plate E projecting from it, in combination with a revolving dough reservoir H, substantially as and for the purposes set forth.

Second. The combination of the hot water or vapor reservoir J J, dough reservoir H, flanch E, kneading arms or knives D D, substantially as and for the purposes set forth.

No. 30,765.—CHRISTIAN SHARPS, of Philadelphia, Pa.—*Improvement in the Revolving Blocks for Revolving Fire Arms*.—Patent dated November 27, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The breech block B, and detachable cap A, when the latter is so adapted to the former that when the two are fitted together they shall become temporarily a permanent portion of each other, as and for the purpose set forth.

No. 30,766.—FREDERICK SIGRIST, of Napa County, Cal.—*Improved Clevis*.—Patent dated November 27, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Making that end of the clevis A, which is to receive the perforated end of the bolt B, with a hole *b*, closed at the bottom at *d*, for the purpose described.

No. 30,767.—JOSEPH SLOCUM, of Syracuse, N. Y.—*Improvement in Cultivating Harrows*.—Patent dated November 27, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A cultivating harrow composed of the two frames C D, furnished with suitable teeth or plough, the side pieces of which frames are hinged at their ends, and can be spread or contracted at their rear ends, and which are united by a centre beam A I B, composed partially of wood and partially of an arched iron bar, and supported on a pair of wheels; the whole being arranged to operate in the manner and for the purpose set forth and represented.

No. 30,768.—ARNTON SMITH, of Girard, N. Y.—*Improvement in Seed Drills*.—Patent dated November 27, 1860.—To the bar M are made fast the springs O; the lower end of these springs embrace the beams L, and keep them pressed downward with an elastic force, so that when the rolling cutters P, which are rigidly secured by their carriers Q to the seed tubes and ploughs J K, chance to come in contact with a stone or other obstruction too hard to be cut by them, the seed tubes and ploughs may be free to rise and be carried safely by the rolling of the cutter over and past such obstruction.

Claim.—In combination with the seed tubes J J J, and ploughs K K K, I claim the arrangement of the rolling cutters P P P, and springs O O O, when used in connection with the sliding bar M, bolt rods U, and elevator R, in the manner substantially as and for the purpose set forth.

No. 30,769.—ISAAC SMITH, of Albany, N. Y.—*Improvement in Stove Grates*.—Patent dated November 27, 1860.—This improvement consists in the manner of moving, or tumbling, the grate from end to end, so as to clear the coals from the ashes.

Claim.—The combination of the grate, bed, and plate hinge, as described, for the purposes set forth.

No. 30,770.—DANIEL E. SOMES, of Biddeford, Me.—*Improvement in the Construction of Buildings for Packing Meats*.—Patent dated November 27, 1860.—The claim and engraving explain the nature of this invention.

Claim.—Constructing a building whose walls and roof include hollow air spaces, arranged substantially in the manner and for the purpose set forth.

No. 30,771.—L. STEVENS, of Dover, Ky.—*Improvement in Cultivators*.—Patent dated November 27, 1860.—This invention consists in the use of revolving toothed shafts and a share

arranged in a novel way, so as to be adjustable and applied to a frame provided with a driving wheel, from which the toothed shafts are driven.

Claim.—The adjustable revolving toothed shafts E E, in connection with the adjustable plough L; all being arranged essentially as and for the purpose set forth.

No. 30,772.—NELSON P. STRATTON, of Nashua, N. H.—*Improved Method of Winding Watches.*—Patent dated November 27, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the winding barrel *a*, with the winding arbor C attached thereto, in connection with the retaining ratch D, spring S, main gear wheel E, and stationary hub *c*, the outer end of the main spring B being attached to the barrel *a*, and the inner end 3 to the stationary hub *c*, or its equivalent.

Second. I claim attaching the hub *c*, or its equivalent, to the frame of the watch, in combination with the winding barrel, maintaining ratch, and main gear wheel.

Third. I claim the application of the maintaining power directly to the winding barrel, substantially in the manner specified.

No. 30,773.—HENRY G. STREET, of Liberty, Miss.—*Improvement in Cotton Cultivators.*—Patent dated November 27, 1860.—This invention consists in the arrangement of devices.

Claim.—The arrangement of the beam A, handles C C, standards B and E, bar D, share or point *b*, and scraper F, with its curve *f*, the whole being constructed in the manner and for the purposes described.

No. 30,774.—GEORGE C. TAFT, of Worcester, Mass.—*Improvement in Drill Frames.*—Patent dated November 27, 1860.—The claim and engravings explain the nature of this invention.

Claim.—As an improved article of manufacture, a portable drill frame, in which parts A B C G G are all cast in one piece, in combination with coring out the parts A and B.

No. 30,775.—JOHN G. TAYLOR, of Philadelphia, Pa.—*Improved Breast Collar for Horses.*—Patent dated November 27, 1860.—This invention consists in making the arch A and its two plates in separate parts, connected together by means of hinge joints, which, when the usual padded tug straps are secured to the said plates, the collar will readily yield at the said joints, so as to adjust itself to fit properly the shoulders of different sized horses.

Claim.—A breast collar having the projecting metallic arch or bow A articulated or jointed to the tugs B B, substantially in the manner described, and for the purposes set forth.

No. 30,776.—DANIEL E. TEAL, of Norwich, N. Y.—*Improvement in Apparatus for Drawing Water.*—Patent dated November 27, 1860.—This invention relates to a combined stop and brake mechanism, applied to the windlass in such a way that both may be actuated by manipulating the crank, or without taking the band therefrom.

Claim.—The employment of the brake and pawl lifter F G, in combination with the crank D, ratchet C, and drum B, as shown and described for the purposes set forth.

No. 30,777.—CHARLES THURBER, of Brooklyn, N. Y.—*Improvement in Caligraphs.*—Patent dated November 27, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of the means, or the equivalent thereof, for giving the tablet a movement in the direction of the lines to be written, with the means, or equivalent thereof, for giving it a movement at right angles thereto, substantially as and for the purpose specified.

I also claim the tracer and pen, with their connecting mechanism, substantially as described, in combination with the ink cup and guard plate, having a hole into which the tracer is to be inserted, as a guide to insure the entrance of the pen in the ink cup and to protect the point of the pen, substantially as described.

I also claim, in combination with the tracer and pen and their connecting mechanism, substantially as described, connecting the ink cup with the movable plate on which the point of the tracer acts by a free lever, or the equivalent thereof, to enable the writer to regulate the dip of the pen in the ink, as described.

I also claim connecting and combining the pen with the mechanism operated by the tracer, by means of a rocking or vibrating arm and interposed spring, substantially as and for the purpose described.

And, finally, I claim connecting the writing and the inking apparatus with the frame on which the tablet moves by means of a swivelling or turning frame, substantially as described, and for the purpose set forth.

No. 30,778.—J. B. VAN DEUSEN, of New York, N. Y.—*Improvement in Sounding Appa-*

ratus.—Patent dated November 27, 1860.—The claim and engravings explain the nature of this invention.

Claim.—So combining the screw F with the registering and indicating mechanism that, during the descent of the apparatus through the water, the said screw is kept in gear with the said mechanism by the resistance of the water to its descent, but that when the apparatus touches bottom the said screw drops out of gear, and that as the apparatus is drawn up the said screw is kept out of gear with the said mechanism, and permitted to revolve freely without affecting the said mechanism, substantially as described.

No. 30,779.—SMITH R. WARNER, of London, Ohio.—*Improvement in Seeding Machines.*—Patent dated November 27, 1860.—This invention consists in constructing the several parts of the machine.

Claim.—The arrangement of the frames A and B, the one hinged upon top of the other, the seed boxes F, the seed slides I, the discharge spouts G, the valves Q, the levers M and N, and the ploughs S S, the several parts being constructed and arranged as and for the purpose specified.

No. 30,780.—O. H. WOODWORTH, of Upper Marlborough, Md.—*Improvement in Fences.*—Patent dated November 27, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Uniting the panels of portable fences by means of the reversed wedge-shaped or alternate scurf joints, in connection with the jaws of the bracket or brace, to securely hold the joints A together, substantially as described.

No. 30,781.—SELIM E. WOODWORTH and JAMES S. WETHERED, of San Francisco, Cal.—*Improved Amalgamator.*—Patent dated November 27, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the combination of steam pipes *k* with the hollow shafts I, of the scrapers S, and drag frames C, of the amalgamating and separating pans, for the purpose of introducing steam into said pans, all the parts constructed and operating in the manner described.

Second. The arrangement of a swinging frame H, adjusting wedges R, and ball joints G, in combination with the pan E of an amalgamating and separating apparatus, all the parts constructed and operating in the manner described.

Third. The sliding sleeves *e*¹, of the side discharge pipes *e*, of the pan E, in combination with swinging pans B B, so that the said sleeves may be moved back out of the way of the edges of the pans B B when the latter or either of them are to be tilted, the whole constructed as described.

No. 30,782.—JOHN WRIGHT, of Sheffield, England.—*Improvement in Rolling Steel and Iron Wire.*—Patent dated November 27, 1860.—This invention consists in winding the wire to be reduced on an iron bobbin or reel, which is then placed in a box of the same metal and the whole placed in a furnace and heated to the required degree; after heating, the box and wire together are placed in close proximity to the rolls by which the wire is to be reduced.

Claim.—The employment, substantially as described, in the heating and rolling of wire or other long lengths of steel and iron, of a box or chamber B and a bobbin or reel A, combined substantially as set forth.

No. 30,783.—JOHN N. WYCKOFF, of Brooklyn, N. Y., and THOMAS M. FELL, of Melvin Mines, Va.—*Improved Amalgamator.*—Patent dated November 27, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The application of steam internally in jets through stirrers or frames G G placed in a vessel B containing the pulp and mercury, substantially as and for the purpose set forth.

No. 30,784.—GEORGE C. BOVEY, of Chillicothe, Ohio, assignor to himself and D. C. RUGGLES, of Cincinnati, Ohio.—*Improvement in Farm Gates.*—Patent dated November 27, 1860.—The operation by which the gate is traversed is such that, by the pressure of the wheels of a vehicle upon the levers *a*, which are firmly fixed upon a shaft, being the extension of the levers *b*, these levers, in connection with the levers *d* and *n*, with the rack and pinion *f*, serve to open and shut the gate, while the bar *c* is brought forward so that the latch *m* catches upon it to hold the gate firmly when opened.

The inventor says: I do not claim broadly the use of the levers and rack and pinion for operating the gate, but I *claim* their arrangement when used in connection with the catch *m* and bar *c*, for holding the gate firmly when open, all as set forth, for the purposes described.

No. 30,785.—WILLIAM S. BULLEN, of Indianapolis, Ind., assignor to himself and STEPHEN

A. CLARK, of said Indianapolis.—*Improved Machine for Creasing*.—Patent dated November 27, 1860.—This invention consists in substituting chased rotary disks of metal for the creasing tool, and so operating said disks as to make the whole design at one passage over the leather by the simple process of turning a crank.

Claim.—The combination and arrangement of a series of creasing disks E upon and with spool or thimble I, when these are made to revolve upon the axle J, substantially as and for the purposes designated.

No. 30,786.—JACOB R. BYLER, of Salisbury, Pa., assignor to himself and HUGH W. BLACK, of Lancaster County, Pa.—*Improvement in Rakes for Reaping Machines*.—Patent dated November 27, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, the combined vertical and horizontal tripper D C and arm E, in combination with the peculiarly slotted shifting lever H, for operating the up and down motion of the rake.

Second. I also claim the sliding and turning rocker shaft B², in combination with the cross-head base S and independent crank lever O and connecting rod N, together with the grooved guides F F and clipper ridge f, combined and arranged substantially as set forth, for the purpose specified.

No. 30,787.—FRANCIS D. HAYWARD, of Malden, Mass., assignor to himself and DANIEL E. HAYWARD, of said Malden.—*Improvement in the Mode of Holding Sockets of Moulds during the Vulcanization of Caoutchouc*.—Patent dated November 27, 1860.—This invention consists in a convenient method of holding the piece of metal around which the rubber is to be vulcanized securely in place in the mould during the moulding and vulcanizing of the rubber.

Claim.—The method described of holding the metal socket or other article around which the rubber is to be moulded and vulcanized securely in the mould, as set forth.

No. 30,788.—RICHARD MARTIN, of Philadelphia, Pa., assignor to himself and ALEXANDER PRIESTLEY, of said Philadelphia.—*Improvement in Machines for Damping Paper*.—Patent dated November 27, 1860.—This invention consists of a revolving roller having a series of longitudinal grooves, in combination with two plain rollers and a trough containing water.

Claim.—The revolving roller D having a series of longitudinal ribs x, with intervening flutes or grooves, in combination with the trough B and the rollers G and C, the whole being arranged substantially as set forth, and applied to the damping of paper as specified.

No. 30,789.—JAMES TEMPLE, of Bellefonte, Pa., assignor to JOSEPH KEYSER, of Philadelphia, Pa.—*Improvement in Harrows*.—Patent dated November 27, 1860.—The claim and engravings explain the nature of this invention.

Claim.—In combination with the adjustable supporting wheels or rollers E, the hinged levers F F, for adjusting the height of the harrow teeth, and raising and lowering either end of the harrow to pass obstructions, substantially in the manner and for the purpose described.

No. 30,790.—WILLIAM S. WILLIAMS, of New York, N. Y., assignor to himself and THOMAS J. O'CONNOR, of said New York.—*Improvement in Machines for Bundling Kindling Wood*.—Patent dated November 27, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, a wood carrier A, formed with several receptacles, into which the wood is packed as set forth, and from which it is delivered to be compressed into a bundle.

Second. I claim the slides a and c to deliver the wood into the trough, and convey the same to the compressing part of the machine, as set forth.

Third. I claim the opening d¹ at the end of the trough b, for the purposes set forth.

Fourth. I claim the inclined side e at the end of the trough, for the purposes and as specified.

Fifth. I claim the shield 2 attached to the follower f, for the purposes set forth.

Sixth. I claim the jaw i, formed and acting as set forth, to receive, hold, and twist the wire that surrounds the bundle, as specified.

No. 30,791.—SOLOMON H. APPLE, BENJAMIN LINDHEIM, and HENRY BAER, of New York, N. Y.—*Improved Apparatus for Shaping Hats*.—Patent dated December 4, 1860.—This invention consists of moving half rings combined with curved dies; said half rings acting to curb the brim of the hat over the upper die, and press the same into shape.

Claim.—The sliding half rings g g, fitting and acting substantially as specified, in combination with the curved parts l of the die c, as and for the purposes specified.

No. 30,792.—ROBERT C. BAILEY, of Greensboro', N. C. *Improvement in Machines for*

Ramming Earth Around Railroad Cross Ties.—Patent dated December 4, 1860.—The object of this invention is to combine with a machine which may be moved about on railroad rails, two reciprocating spring rams, which are operated by gearing, for the purpose of ramming earth about the cross ties of railroad rails in a more rapid and efficient manner than can be done by the means hitherto employed.

Claim.—Combining with a movable truck frame A and D the reciprocating rammers E E, as set forth, when the same are actuated by the gearing J J and H H, and the springs a a, substantially as described.

No. 30,793.—EVERETT BASS, of Pachitta, Ga.—*Improvement in Ploughs.*—Patent dated December 4, 1860.—This invention consists in the arrangement of the parts.

Claim.—The arrangement of the forked and slotted adjustable bar D, beam A, band E, and hinged serrated adjusting rod d, with the guide bar G, all as shown and described for the purposes set forth.

No. 30,794.—LOUIS BAUHOEFER, of Philadelphia, Pa.—*Improved Life Preserving Mattress.* Patent dated December 4, 1860.—This invention consists in the arrangement and combination of an outer frame, an inner frame with a cover of net work, and an additional cover of oiled canvas, or other equivalent water proof material, and a packing of cork cuttings or shavings, and a system of transverse and longitudinal ropes; the whole so constructed as to form a convenient mattress or life preserver.

Claim.—The arrangement and combination of the outer frame A, inner frame C, net work cover h¹, the cover d, of oiled canvas or other equivalent water proof material, the packing of cork cuttings or shavings, and the longitudinal and transverse ropes, the whole being constructed as set forth, for the purpose specified.

No. 30,795.—MICHAEL L. BAUDER, of Cleveland, Ohio.—*Improvement in Rotary Harrows.*—Patent dated December 4, 1860.—This invention consists in the peculiar arrangement and construction of rotary harrows provided with triangular teeth.

Claim.—The triangular teeth D E, frame A, draught beam C, axle B, and plates H I K, when the whole is constructed and arranged for operation conjointly, as and for the purpose set forth.

No. 30,796.—HIRAM M. BELDEN, of Farmington, Ohio.—*Improvement in Cultivators.*—Patent dated December 4, 1860.—This invention consists in forming the frame of a single piece of flat iron.

Claim.—The frame A composed of a single iron bar, bent in the form as and for the purpose set forth.

No. 30,797.—JOHN BLOCHER, of Williamsville, N. Y.—*Improved Chain.*—Patent dated December 4, 1860.—This invention consists in the combination of the knee of one knife-edged link with the slot of another knife-edged link, for the purpose of forming a chain the links of which cannot detach themselves from each other.

Claim.—The combination of the knee D D¹ of one knife-edged link B B¹ with a slot C of another knife-edged link A A¹, for the purpose of forming a chain the links of which cannot detach themselves from each other, substantially as set forth.

No. 30,798.—GEORGE BUCHANAN, of Hickory, Pa.—*Improved Compensating Pendulum.*—Patent dated December 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The continuation of the pendulum wire to a point above the axis of oscillation, there forming a bow, thence descending through a fixed plate, or its equivalent, to a fixed block below on a lever with the pendulum ball, substantially in the manner and for the purpose specified.

No. 30,799.—W. R. CENTER, of Athens, Ga.—*Improvement in Corn Planters.*—Patent dated December 4, 1860.—This invention consists in the arrangement of parts.

Claim.—The arrangement of the guard F, coverers G, plough E, and roller H, with the seed box D, slide b, beam A, lever J, spring J¹, rods K g, bent lever L, and handles B, all as shown and described, for the purposes set forth.

No. 30,800.—SAMUEL S. CHANDLER, of Chelsea, Mass.—*Improvement in the Striking Mechanism of Gongs.*—Patent dated December 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of spring k, the peculiarly shaped latch piece n, slotted guide j, and the guide i, when combined and made to operate with the pawl m, spring d, hammer c, and stop f, of a gong or bell striking apparatus, in the manner substantially as described.

No. 30,801.—EDWIN C. CLEVELAND, of Worcester, Mass.—*Improvement in Machines for Stretching Cloth*.—Patent dated December 4, 1860.—This invention consists in the arrangement of parts.

Claim.—The arrangement of the slotted sleeves C C, and screws g g, with the blocks D, stretching rollers B B, and shaft A, as and for the purpose set forth and described.

No. 30,802.—GEORGE J. COLBY, of Waterbury, Vt.—*Improved Clothes' Wringer*.—Patent dated December 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The construction of the clothes' wringer with tanks E E, pivotted arms I I, and rollers J C, or their equivalents, arranged so that the act of passing the clothes between the rollers will cause the device to clamp itself firmly to the tub or other article, substantially as shown and described.

No. 30,803.—CHARLES M. DABOLL, of New London, Conn.—*Improved Pressure Gauge*.—Patent dated December 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the rock shaft l, and its toes p m, the lifter i, and its guide rod j, and spring n, and the rod h, connecting the said lifter with the sector H, which gears with the pinion on the index shaft, the whole being applied and arranged in combination with the diaphragm and index, substantially as specified.

No. 30,804.—BYRON DENSMORE, of Brockport, N. Y.—*Improved Feathering Paddle Wheel*.—Patent dated December 4, 1860.—The nature of these improvements is shown by the claim and engravings.

The inventor says: I *claim* the eccentric wheel with its radiating arms, and the attachment to the buckets sliding on the arms, substantially as and for the purposes described.

Also, in combination with the above, the arrangement of the friction rollers with the eccentric wheel, by which the wheel is supported, substantially as and for the purposes described.

Also, the connection of the buckets and paddle arms by the two series of brackets and hinges, substantially as and for the purposes described, used in a feathering paddle wheel, substantially as described.

No. 30,805.—C. H. EDWARDS, of Vergennes, Vt.—*Improved Tuyere*.—Patent dated December 4, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the employment or use of the ball E, attached to a suitable shaft F, provided with openings or passages, one or more, which extend entirely through it, and placed in the relation with the bed or plate B, and wind chamber D, as shown, to operate as and for the purpose set forth.

I further claim arranging the shaft F, of the ball E, in such a way that a weight G, may be placed on said shaft to operate as and for the purpose specified.

No. 30,806.—THOMAS EVANS, of Watkins, N. Y.—*Improvement in Wiring Tin Cans*.—Patent dated December 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The described method of strengthening and improving tin cans and other articles formed of sheet metal, by turning the wire upon the inside of the top, whereby the outer surface is left on a plane with the body or neck thereof, substantially in the manner and for the purposes set forth.

No. 30,807.—OSCAR FALKE, of College Point, N. Y., and A. C. RICHARD, of Newtown, Conn.—*Improvement in Vulcanizing Caoutchouc*.—Patent dated December 4, 1860.—The claim explains the nature of this invention.

Claim.—The use of the combination of the sulphuret of antimony and sulphate of soda, for the purpose of vulcanizing caoutchouc, gutta percha, and other vulcanizable gums, substantially in the manner described.

No. 30,808.—W. V. GEE, of New Haven, Ct.—*Improvement in Machinery for Turning Bags*.—Patent dated December 4, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a machine for turning bags, composed of or containing the following three principal elements, viz: First. A device for opening the mouth of the bag; second, a device for extending and keeping extended the mouth of the bag; third, a device for entering and seizing the bottom while the mouth is extended, and drawing the bottom through the entire length of the bag; the whole operating in combination with each other, substantially as described.

Second. The use of smootheners, applied and operating substantially as described, in

combination with the devices for extending the mouth and the device for drawing the bottom through the interior of the bag, for the purpose of taking the wrinkles out of the bag as it is turned.

Third. The arrangement of the nipper frame G, and the nippers *c d c d*, in combination with the rising table B, and the plate F, substantially as described.

Fourth. The arrangement of the extender bar N, and extenders P P, to operate in combination with the nipper frame G, and nippers *c d c d*, substantially as specified.

Fifth. The arrangement of the turning grippers *l m l m*, to operate in combination with the extender bar N, and extenders P P, substantially as set forth.

Sixth. The plate E, applied in combination with the turning grippers, substantially as and for the purpose set forth.

Seventh. The wedges V V, applied in combination with the wiring grippers, substantially as and for the purpose set forth.

No. 30,809.—JOHN GILLELAND, of Athens, Ga.—*Improved Mode of Blasting Rocks*.—Patent dated December 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Blasting rocks by having the hole which receives the charge of two different diameters, the smaller one *b*, to receive the powder, and the larger one *a*, to receive the wadding, and using in connection therewith a plate C, and spindle D, respectively applied and manipulated, substantially as set forth.

No. 30,810.—N. A. H. GODDIN, of Wilson, N. C.—*Improvement in Cotton Cultivators*.—Patent dated December 4, 1860.—When this invention is all put together, it forms a large double-winged turning shovel; by taking off the wings G and H, it is a plain straight shovel plough; by removing the corner pieces I and J, it is a narrow shovel-nosed pointed digger; by removing them and replacing the piece J and wing H, it is converted into a left hand turning shovel.

Claim.—The combination of the curved triangular plate E, or plate F, with the main casting D, pieces I J, and wings G H, substantially as and for the purposes set forth.

No. 30,811.—EDMUND GREENLEE, of Summer Hill, Pa.—*Improved Machine for Finishing the Inside of Barrels*.—Patent dated December 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Having a mandrel so as to admit of a rest through the inside, with tools to howel, bevel, cut the croze, and turn the inside, in the manner described, or any other substantially the same, and which produces the same result.

No. 30,812.—WILLIAM D. GRIMSHAW, of New York, N. Y.—*Improved Mangle*.—Patent dated December 4, 1860.—This invention consists in the combination of three rollers, the upper one being stationary, the lower one pressed up by a spring weight, or similar device, and connected by a hinged table, the centre roller being removable, and having the goods to be mangled wound thereon.

Claim.—Combination of the rollers P F and D, and table E, when the parts arranged and operate in the manner and for the purposes specified.

No. 30,813.—JOHN S. HALL, of Manchester, Pa.—*Improvement in Plough Clevises*.—Patent dated December 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The making of a clevis by bending down and around the piece of metal, so as to enclose and rigidly hold a strengthening plate in its bends or folds, substantially as described.

No. 30,814.—ORIGIN HALL and G. HALL, of Willington, Ct.—*Improvement in Machines for Dressing Thread*.—Patent dated December 4, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We claim, first, an automatic apparatus, substantially such as described, for traversing thread, in combination with rotating polishing felt clothed cylinders, or their equivalents, and with a size vat, when so arranged, substantially as specified, that each thread passes singly over the polishers, so that threads may be sized, traversed, and polished, substantially in the manner described.

Second. We claim, in combination with a size vat, and with rotating polishers, substantially such as described, an automatic apparatus, substantially such as specified, for imparting to the thread a combined traversing and rolling motion.

Third. We claim, in combination with rotating polishers, substantially such as described, a combined apparatus, substantially such as described, one part of which gives to the thread a traversing motion, and the other part of which imparts to the thread a combined rolling and traversing motion, substantially in the manner specified.

No. 30,815.—JOHN HARDICK and CHARLES B. HARDICK, of Brooklyn, N. Y.—*Improvement*

in *Valves*.—Patent dated December 4, 1860.—This invention consists of a three-armed valve, so arranged, in connection with the eduction and induction parts, that the pressure itself will insure the completion of the movement.

Claim.—The valve *f*, provided with wings 1 2 and 3, and arranged relatively to the ports *e d d*¹ and *e*, and operating substantially as and for the purposes specified.

No. 30,816.—R. E. HARTE, of Marietta, Ohio.—*Improved Ellipsograph*.—Patent dated December 4, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the construction and arrangement of a drawing instrument, having the ruler or rulers, or parts designed for holding or directing the pencil, attached by means of a universal joint, or joints, or pivots equivalent thereto, to a bar which is movable around and along a rod or spindle held at any required angle to the plane surface upon which the drawing is to be made, and also the combination therewith of the joint or pivot *g*, the adjustable stem *F*, the indices *g*⁴ and *h*⁶, the graduated tangent bar *J*, and protractor *L*, constructed and operating substantially as described, and for the purposes set forth.

No. 30,817.—GEORGE W. HATHAWAY, of Tioga, Pa.—*Improvement in Feed Cutters*.—Patent dated December 4, 1860.—By bearing down the arm *d* the spring *s* is compressed, and its inclination to recover its natural position, together with the extra weight on that side of the rock shaft *f*, causes the pawl *l* to drop down the instant the arm *d* is relieved by the passing pin *a*. The arm *d* is so connected with the rock shaft *f* as to be turned up without turning the said shaft, by means of which the parts would not be broken if the wheel should happen to turn backwards.

The inventor says: I *claim*, first, the combination, in the manner specified, of the roller *h*, and adjustable arch *g*, with the knives *k*, arranged and operated as set forth.

Second. The combination of the rock shaft *f*, its arm *d*, head *m*, spring *s*, and pawl *l*, with the cam *n*; they all being constructed, arranged, and operating in the manner and for the purpose specified.

No. 30,818.—JOHN HAVEN, of Boston, Mass.—*Improvement in Insect Shields for the Head*.—Patent dated December 4, 1860.—This invention consists in a new article for mosquito nets, of any suitable material, which is impenetrable by insects and perfectly pervious to air, in combination with a suitable sustaining and elastic frame work.

Claim.—The described mosquito guard, constructed to operate as described and for the purposes explained.

No. 30,819.—JOHN P. HAYES, of Hennepin, Ill.—*Improvement in Excavators*.—Patent dated December 4, 1860.—The inventor says: I construct my plough of wood, in a triangular form and of sufficient size to form the channel of the desired width; on the outside I attach the mould board and shares of the ploughs bolted to the frame; the same is propelled by a common steamboat in front of the same, by rods attached to the boat and plough, to be arranged so as to be manageable by an individual standing on the bow of the boat, and elevated or depressed at pleasure.

Claim.—The manner of suspending, adjusting, attaching, and propelling plough, driven by steam, and used in the bed of rivers, for the purpose of removing sand bars therefrom.

No. 30,820.—HENRY ST. J. HILSMAN, of Madison, Ga.—*Improved Peach Parer and Cutter*.—Patent dated December 4, 1860.—This invention consists in the employment of the double knife, and also in the combination and arrangement of the different devices.

The inventor says: I *claim*, first, the double knife *G*, the same being constructed and operated substantially as and for the purpose set forth.

Second. I claim the arrangement of a slide *a*, serrated spring *f*, holders *d* and *e*, and spring *g*, when all shall be used conjointly in the manner described.

No. 30,821.—SAMUEL F. HODGE, of Detroit, Mich.—*Improvement in Stamping Mills for Crushing Quartz*.—Patent dated December 4, 1860.—This invention relates to a new means employed for elevating the plunger or pestle and liberating the same at the desired point.

Claim.—The combination of the eccentric cams *H H*, wedge or V-shaped frame *E*, and stamper shaft *D*, the whole being constructed substantially as and for the purposes set forth.

No. 30,822.—SAMUEL F. HODGE, of Detroit, Mich.—*Improvement in Machines for Breaking Quartz, Rock, &c.*—Patent dated December 4, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, operating or elevating the pestle rod *D* through the medium of the wheels or rollers *H H*¹, the former one (*H*) being on a stationary rotating shaft

E, and the latter (H^1) on an adjustable shaft I, which is actuated by means of a lever M, with any convenient power applied to it, in connection with the springs J J^1 , or their equivalents.

Second. The construction of the mortar R with a central receiving hopper a^* , anvil T, and descending discharge ports c^* , in combination with a pestle S, working within the hopper a^* , and operating, in connection with the anvil T and discharge ports c^* , substantially as and for the purposes set forth.

No. 30,823.—GEORGE HUNZINGER, of Brooklyn, N. Y.—*Improved Extension Table*.—Patent dated December 4, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, constructing the leaves of an extension table so as to slide out horizontally from the centre and stationary part of the table, as the ends of the said table are extended, substantially as specified.

Second. I claim the arrangement of the cross screw d and arms e^1 , combined with the cross pieces $k k$, whereby the act of extending the table elevates the leaves ready to be drawn off, as set forth.

Third. I claim the arrangement of the centre table top l , spring m , and wedges $12\ 12$, in the manner and for the purposes set forth.

Fourth. I claim the arrangement of the cross screw d , nuts $e e$, and cross bars $f f$, in connection with the guide bars $g^1 g^1$ that preserve the parallelism of the table in its extension or contraction, as set forth.

No. 30,824.—HEZEKIAH CONANT, of Willimantic, and LAWSON C. IVES, of Hartford, Conn.—*Improvement in Machines for Dressing Thread*.—Patent dated December 4, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, in combination with a size vat, swinging wipers for making tension and laying fibre, substantially such as described, and this we also claim when the wipers are fitted with adjustable weights, substantially as specified.

Second. We claim, in combination with a size vat and a rapidly rotating brush and nippers, or any proper device for preventing the too rapid withdrawal of thread, a constant take-up motion, consisting of friction rollers, or their equivalents, from which thread passes on to the bobbins, or their equivalents, substantially as specified.

Third. We claim, in combination, when arranged in the order described—First. A vat for size; Second. Nippers or wipers, or their equivalents, for removing surplus size and laying fibre; Third. A steam apparatus, or any equivalent thereof, for the purpose of drying size; and, Fourth. A rapidly revolving brush; all acting in combination, under a mode of operation substantially such as is described; and we also claim these four elements or parts of a whole apparatus, arranged in the order as described, in combination with a traverse apparatus and a constant take-up motion, or either of them.

No. 30,825.—J. B. JOHNSON, of Boston, Mass., assignor to JOHN SPARROW, of Portland, Me.—*Improvement in Pumps*.—Patent dated December 4, 1860.—The claim and engravings show the nature of these improvements.

The inventor says: I *claim* having the outside cylinder divided into three compartments G G F, separated by the abutments D D^1 , which entirely surrounds the moving barrel A, as shown and described, so that the said cylinder A will work in equilibrio.

I also claim the extension of the moving barrel A beyond its outer cylinder, so that said cylinder may be operated by the application of proper force to said exterior end, all as shown and described.

I also claim the arrangement of the chamber N directly over the suction chamber F, so as to conduct the water in a direct line to the vacuum chamber, all as shown and described.

I also claim the combination of the barrel A with the valve rod R, as shown and described, so that the same eccentric that drives the slide valve will also operate the barrel A, all as set forth.

I also claim the employment, within the moving barrel, of the stationary piston head J, when constructed and operating as and for the purpose shown and described.

No. 30,826.—L. W. LANGDON, of Northampton, Mass.—*Improvement in Valves for Oscillating Engines*.—Patent dated December 4, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of a valve r with passages $i i^1$ and $j j^1$, arranged so as to operate interchangeably, simply by altering the position of r , to conduct either full or exhaust steam, substantially as described, for the purpose of changing the direction of the rotation of the crank.

Also, the combination of the flange l , when it is made to oscillate with the cylinder, with the stationary chest f , having ports $i i^1 j j^1$, substantially as described, operating to relieve the cylinder and chest joints from lateral pressure.

No. 30,827.—THOMAS MAHONEY, of Knoxville, Tenn.—*Improvement in Slide Valves*.—Patent dated December 4, 1860.—This invention consists of a partially screw-threaded valve rod, partially screw-threaded tube and clamp nut, in combination with the steam chest and sliding valve of a steam engine.

Claim.—The screw-threaded sleeves or elongated nut F, operating in connection with the valve B, valve rod D, and stuffing box G, substantially as and for the purpose set forth.

No. 30,828.—EBENEZER MATHERS, of Fairmount, Va.—*Improvement in Fountain Pens*.—Patent dated December 4, 1860.—The claim and engravings show the nature of this invention.

Claim.—The use of a hair pencil brush, or other similar arrangement of hair, in contact with a metallic or other writing pen, for the purpose of securing a continuous and spontaneous flow of ink to the pen while writing, arranged and operating in the manner as above, substantially as set forth.

No. 30,829.—ANSEL D. MERRITT and CORNELIUS KEMPLER, of Woodstock, Ill.—*Improvement in Supplying Locomotive Engines with Water*.—Patent dated December 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment of the inverted truck D, placed beneath the truck and made adjustable, as described, by means of which truck the engine drivers are raised from the rails, as and for the purpose specified, substantially as described.

No. 30,830.—JOHN H. MORSE, of Peoria, Ill.—*Improved Combination Lock*.—Patent dated December 4, 1860.—This improvement consists in placing upon an arbor K, within the frame of the lock, one or more slotted wheels E, the slots being filled with balls lettered *x*, and so arranged that the revolving of the knob A will turn the wheels, and a slot being made at the pleasure of the operator by withdrawing the slide B, which is so arranged as to take effect on any one of the balls *x*, and remove it to the position indicated by the dotted line *e*, thus forming a slot and permitting a lug *c* to enter it, and in the act of entering releases the bolt, the dial *m* always showing the position of the slot to the person making it.

Claim.—The balls *x*, or their equivalent, in connection with the slotted wheel E, and slide B, working in the manner and for the purpose specified.

No. 30,831.—ANDREW MURTAUGH, of New York, N. Y.—*Improved Dumb Waiter*.—Patent dated December 4, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim the arrangement of the rope *a*, and cord *d*, in combination with the dumb waiter B, and tightening arbor *m*¹, constructed and operating as and for the purpose described.

I also claim the arrangement of the spring dog *m*, to operate in combination with the weight G, and cord *d*, substantially in the manner and for the purpose described.

And I further claim the arrangement of two or more pulleys *f*, on the top, and two or more pulleys *i*, on the bottom of the dumb waiter B, said pulleys being placed in a position at right angles to each other, in the manner described, to operate in combination with the cord *d*, and rope *a*, substantially as and for the purpose specified.

No. 30,832.—FANTLEY H. NAYLOR and ARMSTRID WARD, of Niles Township, Ind.—*Improvement in Seeding Machines*.—Patent dated December 4, 1860.—This invention consists in the peculiar construction, arrangement, and combination of the seed planter and roller.

Claim.—The arrangement and combination of the above described drill roller and planter; the whole being constructed and operating substantially as set forth.

No. 30,833.—THOMAS L. NICKOLS, of Alexandria, Va.—*Improvement in Constructing Railroad Car Frames with Metallic Joints*.—Patent dated December 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Connecting the sills, bolsters, joints, and cross pieces of a locomotive car body or truck frame by metallic joints and bearings, to save the mortising and consequent weakening of said timbers, as described and represented, said bearings having, as their general characteristics, horizontal flanges on top to catch over the pieces with which they are to connect, horizontal ledges below to support the vertical strain and vertical grooves or gains in their sides to prevent lateral movement, and for the purposes set forth.

No. 30,834.—JOHN GEORGE POPP, of Vienna, Austria.—*Improvement in Medicated Lotions*.—Patent dated December 4, 1860.—This invention is composed of half ounce, each, of spoon root, grape vine root, sage, rose leaves, pellitory, Peruvian bark, abrotænum, and horse radish; all this is mixed with sixteen ounces of alcohol, and a like quantity of pure water,

and to be left standing two weeks in a warm place; it is then mixed with one ounce of anatherin root and one ounce of cloves and left standing two weeks more. It is poured off and filtered, and mixed with one ounce of the tincture of myrrh and one ounce of the tincture of guaiacum.

Claim.—The employment or use of the composition which I term “anatherin water,” and which consists of the described ingredients mixed together in about the proportion and for the purpose specified.

No. 30,835.—ADAM PRITZ, of Dayton, Ohio.—*Improvement in Rakes for Harvesters.*—Patent dated December 4, 1860.—This invention consists in the manner of arranging the hinged independent reel arms G for operation, in connection with the centrally pivotted rake arm A A B, and undulating cam H; also in combining with the ordinary set screw and slotted brace an auxiliary adjustable slotted wing and a set screw; and also in the arrangement of the slotted wings and set screws.

The inventor says: I *claim*, first, the peculiar manner described of arranging the hinged independent reel arms G, for operation in connection with the centrally pivotted rake arm A A B, and undulating cam H, substantially as and for the purposes set forth.

Second. By combining with the ordinary set screw W, and slotted brace Y Y, an auxiliary adjustable slotted wing U, and a set screw X, substantially as and for the purposes set forth.

Third. The arrangement, with the centrally pivotted rake arm A A B, centre shaft C, cam H, and flanged hub I J, independent reel arms G G, circular platform K, pivotted reel bar T, and rakes o, and adjusting braces Y, of the slotted wings U, and set screws X, substantially as and for the purposes set forth.

No. 30,836.—JOHN H. RANKIN, of Versailles, Mo.—*Improvement in Corn Planters.*—Patent dated December 4, 1860.—This invention relates to the apparatus for distributing the seed and to the manner of operating such apparatus.

Claim.—The valves *j k*, spring *n*, shaft K, and arms *g g*¹, when arranged and operating together, substantially in the manner and for the purpose described.

No. 30,837.—JOHN G. ROBINSON, of Biddeford, Me.—*Improvement in Ploughs.*—Patent dated December 4, 1860.—When the ploughs are in operation the frame G is allowed to work longitudinally on the pin o, and the eye of the bar J is sufficiently large to admit of a lateral movement of the frame. When the front part of the frame G is depressed and the ploughs thrown out of the ground, the frame is held steadily and firmly in an elevated position in consequence of the bar J being in the back and narrow part of the slot L. By adjusting the lever K and the frame G the ploughs may be depressed or elevated.

Claim.—The arrangement of the arm *b*, slotted pendant C, and axle A, with the plough frame G, adjustable bar J, and adjustable lever K, as and for the purposes shown and described.

No. 30,838.—DANIEL G. ROLLIN, of New York, N. Y.—*Improvement in Spiral Hoop Skirts.*—Patent dated December 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Making a spiral hoop skirt, in sections, with any suitable number of successive hoops, each section placed right and left to the other, substantially in the manner and for the purpose described.

No. 30,839.—C. A. ROSE, of Columbia, Ala.—*Improvement in Cotton Seed Planters.*—Patent dated December 4, 1860.—This invention consists in the employment of a bi-conical seed barrel provided with a perforated strap, in connection with a swinging, or rising and falling coverer and a furrow share, all being attached to a suitable beam.

Claim.—The described arrangement of the share E, bent arms F, axle G, wheels H, bars *b*, hopper I, hinged coverer L M, and seed box N, the said parts being constructed and combined in the manner and for the purposes set forth.

No. 30,840.—ANSON ROWE, of Atalissa, Iowa.—*Improvement in Grain Riddles.*—Patent dated December 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The construction of the riddle with a reclining board D, and rests B, arranged longitudinally with the course of the grain, and the wires sunk into the edges of said rests and into the face of the frame, and otherwise made as shown and described, for the purposes set forth.

No. 30,841.—ROBERT SCHONE, of New York, N. Y.—*Improvement in Time Registers.*—Patent dated December 4, 1860.—This apparatus is arranged in and on a case A, which, in its turn, is placed in the interior of a box B, the top of which is provided with an ordinary

clock dial C, of glass, or any other transparent material, and which has an aperture *a*, in the centre, to communicate with the funnel-shaped cup, or receiver D, of the apparatus.

Claim.—The arrangement of the lip *e*¹, on the spout *c*, in combination with the cavities *d e*, notched movable disk G, inclined circular channel H, and drawer I, constructed and operating as and for the purpose specified.

No. 30,842.—SAMUEL J. SHAW, of Marlborough, Mass.—*Improvement in Shirt Bosom Expanders*.—Patent dated December 4, 1860.—This invention consists of a metallic or elastic wire provided with a hook *a* and two shoulders *b b*.

Claim.—A shirt bosom expander, constructed substantially as described, and its arrangement and combination with a shirt bosom, in manner and for the purpose specified.

No. 30,843.—EBEN F. STARR, of New York, N. Y.—*Improvement in Revolvers*.—Patent dated December 4, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, the construction of the upper piece A, with the two cheeks *i i*, to hook or lap over the back of the piece B, on opposite sides of a tenon *e*, provided on the latter, and to receive a pin *g* passing also through said tenon, substantially as described.

Second. I claim the arrangement of the ratchet wheel H, with the cylinder G, arbor *l*, and screw *k*, as and for the purposes shown and described.

Third. I claim the arrangement of a collar *m* with the arbor *l*, barrel C, and cylinder G, as and for the purposes shown and described.

Fourth. I claim applying the springs 14 and 16, of the cocking and revolving dogs within a circular groove 17, in one side of the hammer butt, substantially as described.

Fifth. I claim constructing the cocking lever with two teeth or projections 20 and 21, arranged substantially as described, the one to lock the cylinder while the firing is effected by the trigger, and the other to lock the cylinder while it is fired by the said lever, as described.

Sixth. I claim making the channel guide with two distinct depressions or concaves 25, 26, one within the other, so as to guide the fingers in capping, all as set forth.

No. 30,844.—ENOCH THOMAS, of Beverly, and WILLIAM K. HALL, of Phillippa, Va.—*Improvement in Hydraulic Engines*.—Patent dated December 4, 1860.—This invention consists in the arrangement of a swinging gate and concentric seat, in combination with a swinging valve and curved abutment faces.

Claim.—The arrangement of a swinging gate A B and concentric seat D, in combination with a swinging valve F F¹ and curved abutment faces E E¹ H H¹; all being arranged and operated substantially in the manner and for the purpose set forth.

No. 30,845.—HORACE TUPPER, of Buffalo, N. Y.—*Improvement in Railroad Switches*.—Patent dated December 4, 1860.—This invention is intended to obviate the difficulty of a moving rail to give direction to the car; it is also intended to renew that portion of the rail which always receives the shock of the car in turning and which wears very fast.

Claim.—The arrangement of the guards D D, made reversible and with one point fitting in a V-groove in the rail with the snells H H and the rails A A¹, the several parts being constructed in the manner and for the purpose specified.

No. 30,846.—FRANCIS J. VITTUM, of Chelsea, Mass.—*Improved Hand Machine for Pegging Boots and Shoes*.—Patent dated December 4, 1860.—The claim and engravings show the nature of this improvement.

Claim.—A movable centre, in combination with the awl and peg driver, operating as described, for the purpose specified.

No. 30,847.—ALFRED J. WATTS, of Utica, N. Y.—*Improvement in the Manufacture of Dentists' Crystalline Gold*.—Patent dated December 4, 1860.—This invention consists in a new manufacture of gold called "crystal gold," obtained by electricity for the purpose of filling teeth. A description of the mode of making is too long for a place in this report.

Claim.—The crystal gold described, obtained by a process, substantially as specified.

No. 30,848.—LUTHER WENTWORTH, of Burlington, Iowa.—*Improved Apparatus for Elevating Water*.—Patent dated December 4, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim supporting the vertical shaft E of the wind wheel of said apparatus upon the dish-shaped turn table D, when the said table is made to close an opening in the base plate A, which is surrounded by the annular trough *g*, and when the endless series of connected buckets *s s* are made to pass up and down through apertures in the said dish-shaped turn table, all substantially as set forth.

I also claim combining the shaft *h* of the described wind wheel with the hinged vanes *v v*, when the springs *d d* and weight *q* are combined with the said hinged vanes, and when the said wind wheel is made to operate the series of connected buckets *s s*, substantially in the manner set forth.

No. 30,849.—SMITHWICK WHITLEY, of Tallahassee, Fla.—*Improvement in Ploughs*.—Patent dated December 4, 1860.—This invention consists in the arrangement of the different parts.

Claim.—The arrangement of the circular pivotted adjustable share foot *D* with the beam *A*, pivotted adjustable bar *F*, and standard *C*, as and for the purposes shown and described.

No. 30,850.—SIMON WING, of Waterville, Me.—*Improvement in Photographic Cameras*.—Patent dated December 4, 1860.—This invention consists in a mechanical means of moving the plate holder, in combination with a scale or index for defining its position with respect to the lens to accord with the required number of impressions to be taken on the plate. It also consists in the application of convenient mechanism for simultaneously adjusting the several lens tubes in position where two or more of these tubes are used in the same camera.

The inventor says: I *claim* a mechanism for moving the plate holder *H*, in combination with an index for defining its position, operating substantially in the manner described.

Second. I claim the mechanical means described, or its substantial equivalent, for varying the position of the lens tubes *a b c d*.

No. 30,851.—G. W. WOOLLEY, of Philadelphia, Pa.—*Improvement in Fountain Pens*.—Patent dated December 4, 1860.—The claim and engravings explain the nature of this invention.

Claim.—An ink-holding and controlling reservoir *v*¹ for writing pens, constructed and applied within the concave of the pen, substantially in the manner and for the purpose set forth.

No. 30,852.—JACOB R. BYLER, of Salisbury Township, Pa., assignor to himself and HUGH W. BLACK, of Lancaster County, Pa.—*Improvement in Rakes for Reaping Machines*.—Patent dated December 4, 1860.—This invention consists in the arrangement and combination of the parts named in the claim.

Claim.—The arrangement of the upright slide *B* with its lever arm *E*, peg *M*, and headed pins *b*, in connection with the lever arm *R I* and turning shaft *H*, and operated by the rod *G* and cam *N*, in the manner described, for the purpose specified.

No. 30,853.—JOHN S. GALLAHER, JR., of Washington, D. C., assignor to EDWIN CHAMBERS and CYRUS CHAMBERS, JR., of Philadelphia, Pa.—*Improvement in Machines for Folding Paper*.—Patent dated December 4, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the construction and use of traversing gripes, or their equivalents, connected with moving endless belts, for the purpose described, irrespective of any special arrangement or combination of the same or mode of operating them.

Second. I claim the use of the traversing cams, or their equivalents, in combination with moving endless tapes or bands, whether arranged as fixtures or as adjustable devices, for the purposes set forth.

Third. I claim the vibrating pendant counterpoised folding blades, or their equivalents, irrespective of any special manner of arranging or operating the same, as described and shown.

Fourth. I claim the creasing collars on the rollers or cylinders, constructed and operating substantially as and for the purpose specified.

Fifth. I claim the adjustable graduating fork device *W W X X X X*, or its equivalent, for the purpose as set forth, constructed and operating substantially as described.

Sixth. I also claim the invention of the automatic packing box or paper receptacle *b*², when constructed and operated substantially in the manner set forth and shown.

No. 30,854.—JASON W. HARDIE, of New York, N. Y., assignor to JAMES H. STEVENS, of said New York.—*Improvement in Sewing Machines*.—Patent dated December 4, 1860.—This invention relates to single threaded sewing machines, and to that particular class in which a barbed or hook needle is used for drawing thread through cloth, together with a swinging or vibrating guide for hooking the thread into the barb of the needle.

Claim.—The method of communicating the vibratory or swinging movement to the thread guide *G* by means of the bent elastic rod *E*, in combination with the cam *f* on the driving shaft, substantially as set forth.

No. 30,855.—EDMUND MAHER, of New York, N. Y., assignor to himself and MARCUS M.

WILCOX, of said New York.—*Improved Harness Trace*.—Patent dated December 4, 1860.—This invention consists in forming a harness trace, or tug, of vulcanized gutta percha, or other gum having a slightly yielding woven, or other fibrous fabric within it, in such a manner as to enable it to have a slightly elastic elongation and contraction, corresponding with the inequality of the draught of the horse, and thereby giving a corresponding relief to the shoulders.

Claim.—The described new and improved article of manufacture—the same being an elastic harness trace formed of a textile fabric composed of the materials and substantially in the manner set forth.

No. 30,856.—JOHN J. MARCY, of Meriden, Ct., assignor to EDWARD MILLER, of said Meriden.—*Improved Device for Securing Lamp Chimneys*.—Patent dated December 4, 1860.—The claim and engravings show the nature of this improvement.

Claim.—The combination of the two simultaneously acting hooked levers C D with each other and with the lamp top, in the manner shown and described.

No. 30,857.—JAMES MARTIN, of Toronto, Canada, assignor to himself and JAMES E. THOMSON, of Buffalo, N. Y.—*Improvement for Superheating Steam for Locomotive Engines*.—Patent dated December 4, 1860.—The inventor says: The strong draught through the chimney, made by the exhaust, will cause a vacuum to be formed in the annular chamber S, the filling which vacuum will cause a strong draught through the flues R of the chambers A and the pipes B B.

The inventor says: I *claim*, first, the combination and arrangement of the flues R with the steam chambers A, for the purposes and substantially as described.

Second. I claim the annular chamber S, in combination with the steam chambers A, flues R, and pipes B, for the purposes and substantially as set forth.

No. 30,858.—HENRY T. PRATT, of Fitchburg, Mass., assignor to himself, A. DAVIS, and C. E. PRATT, of said Fitchburg, and H. C. CREHORE and C. T. ROGERS, of New York, N. Y.—*Improved Folding Chair*.—Patent dated December 4, 1860.—The object of this invention is to obtain a chair that may be folded compactly, and be provided with a cane or other stiff bottom.

Claim.—The legs A A B B and seat D; the latter being attached to the former by hinges or joints *b b c c*, and the legs A provided with slots *d* to receive pins *e* of the legs B B, substantially as and for the purpose set forth.

No. 30,859.—HENRY WARREN, of Hoboken, N. J., assignor to HENRY BEEBE, of said Hoboken.—*Improved Foot Scraper and Brush*.—Patent dated December 4, 1860.—This invention consists in a novel form and arrangement of brushes for the heel, toe, and both sides of the shoe, in conjunction with scraping blades for the soles of the shoes.

Claim.—The arrangement of the laterally sliding curved brushes F F and springs *g g*, with the brackets D, scraping blades B B, and fixed brushes C C, as and for the purposes shown and described.

No. 30,860.—JOHN WIND, of Thomasville, Ga., assignor to himself and T. J. BOTTOMS, of said Thomasville.—*Improvement in Machines for Husking and Shelling Corn*.—Patent dated December 4, 1860.—In operating this machine, the corn is held against the saw so as to cut off the stem at the end of the ear. The auger saw then loosens the shuck, and the ear falls into the wings C, where it is husked by the pressure of the wings against the edge C¹. The husks being removed from the wings by the brush D, the corn being left on the belt *c* is carried by it into the sheller E, where it is shelled by the action of the cone E¹ against the roughened sides of the sheller E; as the corn passes out of the sheller the fan F winnows it.

Claim.—The arrangement of the circular saw *a*, auger saw *b*, and spiral revolving husker C, in combination with the conveyor band *c* and sheller E, substantially in the manner described, and for the purposes specified.

No. 30,861.—SAMUEL W. ADAMS, of Moultrie County, Ill.—*Improvement in Corn Planters*.—Patent dated December 11, 1860.—G is the plough share; H the shovel, which, in combination with the knife I, covers up the furrow after the corn has been dropped therein. J J are bands of iron, which, in combination with the pins *j j* and braces *j¹ j¹*, hold the two ploughs together firmly. K K are weights to keep the slides in position.

Claim.—The combination and arrangement, as described, of two ploughs, with the slide L, seed boxes B B, levers C C and D, shovel H, and knife I, substantially as and for the purposes described.

No. 30,862.—WILLIAM APPERLY and CALVIN P. JOHNSON, of Memphis, Tenn.—*Improve-*

ment in Cotton Harvesters.—Patent dated December 11, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the reciprocating plate E, pickers *d*, and plate F, when combined and arranged to operate as shown and described, to wit: the pickers *d*, having a rotary and also a reciprocating and rising and falling movement, as and for the purpose set forth.

Second. The arrangement of the crank shaft G, slotted uprights I I, plate F, roller J, and the belts *j k*, or their equivalents, all being arranged, substantially as shown, for the purpose of giving the proper movement to the pickers *d*.

Third. In connection with the plates E F and pickers *d*, the endless straps M, blower or brush L, and the aprons N N, arranged for joint operation, as and for the purpose set forth.

No. 30,863.—H. H. BAKER, of New Market, N. J.—*Improvement in Ploughs.*—Patent dated December 11, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the mounting of the plough shares upon wheels arranged in the manner shown by B and C, through the medium of a frame G, which slides vertically within, and is supported and guided by an exterior or principal frame A as shown and described.

Second. Raising the ploughs 1 and 2, vertically at will, by the motion of the bearing wheel C, through the aid of mechanism, substantially as set forth.

Third. The means, substantially as shown and described, for holding the forward side of the plough frame G, higher than the rear side thereof, when in the act of being elevated, in combination with means substantially as shown and described, for holding the said plough frame level when it is fully lowered for the purpose designated.

Fourth. In combination with the wheels B and C, frame A, ploughs 1 and 2, the employment of the spring E, for the purpose designated.

Fifth. The employment of the adjustable standard S, in combination with the spring E, for adjusting the rigidity of the latter, in the manner and for the purpose shown.

Sixth. In combination with the adjustable spring E, the employment of the wheel M, for the purpose set forth.

No. 30,864.—D. B. BARTHOLOMEW, of Lancaster, Penn.—*Improved Arrangement of Devices in Sawing Machines.*—Patent dated December 11, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the arrangement of the hinged support and rack *h*, with the pressure roller O, and adjustable bar M, in the manner shown and described, so that when the roller passes the end of the stuff, the support N will take to the rack *h*, and prevent the roller from pushing the stuff against the saw, all as set forth.

I claim the arrangement, as shown and described, of the obliquely placed feeding roller J, and adjustable gauge Q, with the platform A, saw G, levers C C, shafts D D, rod F, and roller O, all as shown and described.

No. 30,865.—DEXTER BEAL and WILLARD W. BEAL, of Lester, Iowa.—*Improvement in Seeding Machines.*—Patent dated December 11, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Operating the seed slides E by means of the oval hubs L, provided with the hook projections *f*, the rods O, provided with hooks *h*, the springs P and R, the pinion K and wheel I, the latter being provided at its periphery with the toothed and smooth portions, and all arranged substantially as described.

No. 30,866.—HENRY BELL, of Clinton, Ill.—*Improvement in Seeding Machines.*—Patent dated December 11, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The wheels L L, provided with sliding bars N, having screws *h* at their ends, which are fitted in the holes *i* of the wheels, in connection with the curbs M, which encompass the wheels, all being arranged as and for the purpose set forth.

No. 30,867.—NEWTON BENEDICT, of Aurelius, N. Y.—*Improvement in Swifts.*—Patent dated December 11, 1860.—The arms *a* are connected together by hinges *b*, the axes of which are parallel to the axis on which the machine itself turns when in use. By this means the outer ends of the arms may be separated horizontally to the positions seen in the engravings or brought together into a small space when the machine is not in use.

Claim.—A swift having the various parts constructed, arranged, combined, and operating in the manner and for the purpose described.

No. 30,868.—H. C. BOARDMAN, of Morrisville, Vt.—*Improved Clothes Dryer.*—Patent dated December 11, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the use of a waterproof sliding collar or hub, constructed

as described, in combination with arms B or braces D, when operated in the manner and for the purposes set forth.

Second. The method of folding the clothes dryer, constructed with arms and braces as described, by means of a loop in the line G, passed around the pin *p*, attached to the upper sliding collar E, in the manner set forth.

No. 30,869.—THEODORE BRIGGS, of Philadelphia, Pa.—*Improvement in Explosive Harpoons*.—Patent dated December 11, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Making an explosive harpoon lance, to be thrown by hand, with its forward end constructed and applied to be exploded by the breaking of the wooden pin *e*, as described, its barbs *ff* being pivotted together in the mortise *g*, and turning outward on being released by the backward motion of the armed slide *i*, as described, the whole being constructed and arranged to operate together, in combination with the body of the implement, in the manner described, and for the purpose specified.

No. 30,870.—JEAN COMMUNY, of New Orleans, La.—*Improvement in Apparatus for Supplying Sulphurous Acid Gas*.—Patent dated December 11, 1860.—The nature of this improvement, named in the claim, may be seen in the engravings.

Claim.—The combination, with the discharging pipe F, of the receiving box H, and conducting pipe I, in the manner and for the purposes substantially as shown and described.

No. 30,871.—HORACE CROFOOT, of Tawboro, N. C.—*Improvement in Seeding Machines*.—Patent dated December 11, 1860.—This invention consists in a peculiar combination and arrangement for a roller and rotary harrows, whereby the whole area of the ground over which the machine passes will be fully acted upon, and the seed properly covered with pulverized earth, and the same rolled and compacted on the seed.

Claim.—The arrangement of the roller B with the rotary harrows L L, shaft I, cylinders M M, shafts J I, and lever N, in the manner shown and for the purpose set forth.

No. 30,872.—GEORGE P. EVANS, of Malden, Mass.—*Improved Clasp for Hooped Skirts*.—Patent dated December 11, 1860.—The claim and engravings show the nature of these improvements.

Claim.—As a new article of manufacture, a skirt hoop united at its ends, as described, by elastic or tubular caoutchouc clasps, constructed so as to operate substantially in the manner and for the purpose as set forth.

No. 30,873.—A. L. DENNISON, of Waltham, Mass.—*Improved Method of Regulating Watches*.—Patent dated December 11, 1860.—This invention consists in forming one of the pins eccentric, and attaching to its head a small hand index, which will show the position of the pin and the degree to which the spring is confined between the two pins.

Claim.—The eccentric pin 3, with its index hand *n*, and graduated arc or dial *i*, in combination with the regulating hand D, and hair spring C, arranged and operating in the manner set forth, for the purpose specified.

No. 30,874.—GEORGE B. FIELD, of Saint Louis, Mo.—*Improvement in Glass Coffins*.—Patent dated December 11, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The article of manufacture, viz: a coffin made of blown glass, composed of two or more pieces, in the manner substantially as described.

No. 30,875.—JAMES FITTON, of Cavendish, Vt.—*Improvement in Carding Engines*.—Patent dated December 11, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of an endless traversing apron, with the cylinder of a carding engine, operating substantially in the manner set forth.

No. 30,876.—THOMAS A. GALT, of Sterling, Ill.—*Improvement in Seeding Cultivators*.—Patent dated December 11, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Attaching the seed box I to the cultivator A, by means of the arms N N, fitted on the pintles *h*¹, and having the wheel L placed on the frame M, which is attached to the bottom of the seed box, said wheel having the driving mechanism for the seed slide connected with it, in connection with the V-shaped draught bar H, attached to the frame of the cultivator, and all arranged to operate as and for the purpose set forth.

No. 30,877.—PETER J. HARDY, of New York, N. Y.—*Improved Recumbent Chair*.—Patent

dated December 11, 1860.—The claim and engravings show the nature of this improvement.

The inventor says: I *claim* the reclining back *d*, and hinged bottom *e*, connected by the crank arms 3, and links 4, in the manner and for the purposes specified.

I also claim the stop *h*, on the arm piece *r*, passing through the slotted slide *g*, and provided with the spring 10, and projections 8, to take the notches 9, in the slide *g*, as and for the purposes set forth.

No. 30,878.—THOMAS G. HAROLD, of Brooklyn, and GIBBONS L. KELTY, of New York, N. Y.—*Improved Curtain Fixture*.—Patent dated December 11, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A blind or curtain roller, fitted to receive a lateral or sideways motion at one end, by the action of the cord for connecting or disconnecting said roller from a stop, for the purposes specified.

No. 30,879.—AMOS A. HOTCHKISS, of Monroe City, Mo.—*Improvement in Water Drawers*.—Patent dated December 11, 1860.—The claim and engravings show the nature of this improvement.

Claim.—The arrangement of the weight on the "bite" of the rope, in connection with the bucket and cleet *d*, in the manner described, so as to keep the weight out of the water entirely, and the bucket from descending too low, so that neither of them shall rill the water when used in connection with the drawing apparatus described.—(Suspended.)

No. 30,880.—BEN. JACKMAN, of Louisville, Ky.—*Improvement in Cotton Cleaning Machines*.—Patent dated December 11, 1860.—This invention consists in the employment of revolving screens, in connection with a dust chamber, and with a stationary screen and condensing rollers.

Claim.—The arrangement of the two rotary screens B B, and aprons D E, with the box A, dust chamber C, screen H, and compressing rollers F F, in the manner and for the purposes shown and described.

No. 30,881.—JOHN F. KELLER, of Greencastle, Pa.—*Improvement in Water Elevators and Conveyors*.—Patent dated December 11, 1860.—This invention consists in a peculiar arrangement of railway and water carrier, the latter being operated by means of a windlass.

The inventor says: I *claim* the water carriage D, in combination with the pendent portion of the rail A; said carriage being provided with wheels which clasp the sides of the rail for the purpose of guiding the carriage when descending or ascending the well, substantially as set forth.

I claim the use of the tilting rails B, in combination therewith, for the purposes set forth.

No. 30,882.—STEPHEN A. LINDSAY, of Unionville, Md.—*Improvement in Rakes for Harvesters*.—Patent dated December 11, 1860.—The claim and engravings show the nature of this invention.

The inventor says: I *claim*, in combination with a hinged platform and a hinged revolving reel and rake, the inclined shaft P and universal joint *q*, for the purpose of retaining the rakes and reels in their proper relative positions to the platform when the latter is raised or lowered, substantially in the manner described.

I also claim attaching the rakes or reels to their respective arms by means of the links *n* and springs O, substantially in the manner and for the purpose described.

No. 30,883.—A. S. MARKHAM and DANIEL MARKHAM, of Monmouth, Ill.—*Improvement in Corn Planters*.—Patent dated December 11, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Securing the seed distributing slide H in proper position by means of the slides J, in connection with the adjustable cut offs I, substantially as shown and described, to admit of the application or employment of seed slides of different thicknesses, to regulate as may be desired the quantity of seed to be planted on a given area, or the number of seeds to be planted at a dropping.

No. 30,884.—WILLIAM H. H. MILLEN, of Littleton, N. H.—*Improvement in Steam Ploughs*.—Patent dated December 11, 1860.—The object of this invention is to obtain a light, portable, and efficient ploughing machine; one that may be readily manipulated and the parts placed under the complete control of the operator.

The inventor says: I *claim*, first, the arrangement of the levers G G, sliding pinions *f f*, on shaft F, and the gearings I I k k, on the shafts F J, essentially as shown, whereby the ploughs K¹ may be rotated or stopped instantly at the will of the operator or attendant.

Second. The arrangement of the levers R R with pawls *t* and lips *u* attached, the ratchet Q on the hollow shafts N N, the clutches *p q*, gearing P on the shafts O, on which the hollow shafts N are placed, and the ropes or chains *u n* attached to the cross bar M of the arms *k*, essentially as shown, for the purpose of elevating the shaft J and its ploughs K¹ when desired.

No. 30,885.—SAMUEL MOWRY and ELI DEPPEN, of Womelsdorf, Pa.—*Improvement in Corn Planters*.—Patent dated December 11, 1860.—This invention consists in a peculiar combination and arrangement of certain devices whereby the spaces between the carrying wheels and that between the grain dropping boxes, respectively, as well as the spaces between the said wheels and dropping boxes, collectively, are rendered changeable, so as to enable the operator to more readily convert the same machine for properly dropping any of the various kinds of grain.

The inventors say: We *claim*, first, the arrangement of the divided axle F, the seed boxes G G¹, the disks I I, tubes O O¹, springs 8 8¹, pinions H H¹ and N N¹, shaft M, pinion L, spur wheel K, and wheels A A¹; the several parts being constructed and connected substantially as and for the purpose specified.

Second. In combination with the subject of the first claim, we claim the lever E, bridle Q, furrowing tubes P P¹, covering hooks R R¹, and tie rods S S, arranged and used as and for the purpose specified.

No. 30,886.—JAMES W. LAWRENCE, of New York, N. Y., assignor to HENRY BREWSTER, JAMES W. LAWRENCE, and JOHN W. BRITTON, of said New York.—*Improvement in Road Wagons*.—Patent dated December 11, 1860.—The claim and engravings show the nature of this improvement.

Claim.—Attaching the side bar to the body of the wagon by a rigid central and two elastic supports, when the side bar is so formed that it may have elasticity between the central and the side supports, as set forth.

No. 30,887.—B. PICQUET, of Augusta, Ga.—*Improvement in Machines for Sowing Fertilizers*.—Patent dated December 11, 1860.—The scattering mechanism of this machine is furnished with a plough for loosening the earth and forming a furrow, and a scraper for covering the fertilizer or seed, and levelling the earth.

Claim.—The arrangement of the right and left screw B, variable driving cones *g g*, apertures *e*, and partitioned hopper A, with the slotted beam D, wheel F, and adjustable plough and standard G G¹, as and for the purpose shown and described.

No. 30,888.—GEORGE D. SARGENT, of Boston, Mass.—*Improved Folding Bedstead*.—Patent dated December 11, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* my improved folding bedstead or arrangement and connections of four sets A A¹ B C of progressive levers, in the manner (without the intervention of separate posts) substantially as described.

I also claim, in its combination with such a folding bedstead, a covering chair D, as constructed, with a chambered back opening into the space under the seat and between the legs, and to be applied to such bedstead in the manner as specified.

No. 30,889.—OSWALD SCHEVENELL, of Marion, Ala.—*Improved Tenoning Tool*.—Patent dated December 11, 1860.—The object of this invention is to form round tenons on the ends of spokes by means of an instrument which can be adjusted for cutting tenons of various diameters, and which will be self-centring and require very little manipulation to adapt it to the work it is desired to perform.

The inventor says: I *claim* the portions A A¹ A¹, the circular plate B with its elliptical hole, the parallel bars D D, with the crescent pieces *b b*, in combination with the knives F F, knife boxes E E, and their lugs *g g*, and set screws *e e*, all constructed, arranged, and operating substantially in the manner and for the purposes set forth.

I also claim, in combination with the plate B and parallel bars D D, the bar H, with its centring point *k*, when said bar is attached to the instrument, substantially as and for the purposes specified.

No. 30,890.—J. V. H. SECOR, of New York, N. Y.—*Improvement in Seeding Machines*.—Patent dated December 11, 1860.—This invention consists in an improved seed-distributing arrangement, and parts pertaining to the operating of the same, and to an improved arrangement of the furrow and covering shares; and also an improved means for elevating and lowering the front part of the machine.

The inventor says: I *claim*, first, elevating and depressing the front part of the frame A by means of the eccentric D, fitted in the back part of the draught pole, and arranged essentially as and for the purpose set forth.

Second. The arrangement of the adjustable frame F^1 , provided with the wheel G , and connected with the platform or foot piece H , as and for the purpose specified.

Third. The levers $K K$, bars l , slides L , boxes N , and sides a^* , of the hoppers, arranged and combined to operate as and for the purpose set forth.

Fourth. In connection with the levers K , slides L , and boxes N , the bars or levers O , arranged to operate conjointly with the parts aforesaid, for the purpose specified.

Fifth. The arrangement of the furrow shares Q , with the shafts R , and bars S , as and for the purpose set forth.

Sixth. The arrangement of the covering shares $T T$ with the shafts $U U$, springs $W W$, adjustable pendants X , and buttons Y , as and for the purpose set forth.

No. 30,891.—RICHARD SOLIS, of New Brunswick, N. J.—*Improvement in Machines for Making Shirred Goods*.—Patent dated December 11, 1860.—This invention consists in arranging the toothed guide in shirring machines close to the revolving guide, and in pivoting the said toothed guide for convenience in threading it.

The inventor says: I *claim*, first, arranging the toothed guide b , in machines for manufacturing shirred or other elastic goods, down close to the revolving guide J , as and for the purpose specified.

Second. The pivotted guide $a b c$, constructed, arranged, and operating substantially as and for the purposes set forth.

No. 30,892.—OLIVER SPARKS, of Shelbina, Mo.—*Improvement in Ploughs*.—Patent dated December 11, 1860.—This invention consists in combining in a novel manner a breaking, or sod plough, with a trench, or subsoil plough, whereby both ploughs may be thrown into or out of the ground simultaneously.

Claim.—The two ploughs, arranged one in front of the other, as and for the purposes set forth, in combination with the levers $F G^1 H$ and G , arranged, supported, and operating as described.

No. 30,893.—JACOB D. SQUIRES, of Cold Spring, N. Y.—*Improvement in Apparatus for Raising Water*.—Patent dated December 11, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the ring I , either plain or provided with depressions $c c$, attached to the bucket by ears $b b$, or their equivalent, and leaving a space between the bucket and the ring, when the same is used in combination with the tilting rod H , substantially as set forth.

I also claim the wedge piece N , provided with the wedge-shaped arms j and k and intermediate space l , in combination with the hinged brake L , acting on the windlass, substantially as described.

No. 30,894.—E. SUMNER TAYLOR and H. S. LARNED, of Cleveland, Ohio.—*Improvement in Water Elevators*.—Patent dated December 11, 1860.—This invention consists of a hollow cylindrical shaft, through which the rope passes, secured to and rising upward from the centre of the bucket, having a rib on one side, facing in the direction of the spout of the bucket.

Claim.—The rib L^1 , spirally inclined planes $J J$, and niche I , for facing the spout of the bucket O to the spout B of the curb, as specified, and in combination therewith, we claim the special arrangement of the lip H and box K , for the purpose set forth.

No. 30,895.—J. K. TAYLOR, of Bridgeport, Conn.—*Improved Bolt Cutter*.—Patent dated December 11, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Holding on or against the nut, whilst the cutter is being actuated, by the lever instead of the bolt, for the purpose of leaving that part of the bolt that is to be cut off free from any resistance on the side opposite to the cutter, substantially in the manner and for the purpose set forth.

No. 30,896.—JEREMIAH C. TILTON, of Sanbornton Bridge, N. H.—*Improvement in Temples*.—Patent dated December 11, 1860.—This invention consists in inserting the teeth of the temple into a piece of wood, which is fitted to the plate of the temple in such a manner as to be removable for the purpose of being renewed with a new set of teeth when the teeth are worn out, or for the purpose of renewing the teeth singly, when injured.

Claim.—Inserting the teeth $c c$ into a removable piece of wood C , fitted and secured in the plate A , substantially as and for the purpose specified.

No. 30,897.—BENJAMIN TINKHAM, of Cameron, Ill.—*Improvement in Cultivators*.—Patent dated December 11, 1860.—When this machine is in operation the attendant takes hold of

the handles *g*, by means of which he can swing either of the beams *E*, with its share, inwards or outwards, and thus make the ploughs conform to any inequalities in the hills or rows of corn or other plants.

The inventor says: I *claim*, first, the combination with the axle *B* and plates *c d* of the beams *E*, plates *a b*, and pins or bolts *f*, substantially as and for the purposes set forth.

Second. In combination with the above I claim the pins or supports *h*, with the hounds *D*, as and for the purpose described.

No. 30,898.—PIERRE D. VAN HOESSEN, of New York, N. Y.—*Improved Washing Machine*.—Patent dated December 11, 1860.—This invention consists in the arrangement of a triangular wash tub, in combination with a reversible washboard, in such a manner that said washboard can be used either for the purpose of pounding clothes or in the ordinary manner for hand washing.

Claim.—The combination of the triangular-shaped tub *A* with the reversible washboard *C*, constructed and operating substantially in the manner and for the purpose set forth.

No. 30,899.—FRANKLIN W. WILLARD, of New York, N. Y.—*Improvement in Vapor Lamps*.—Patent dated December 11, 1860.—This lamp is constructed by elevating a fountain, which contains the oil, at such a height above the burner as to give the required amount of pressure on the column of oil which is necessary to resist the backward force of the vapor in the vapor chamber, the flow of oil through the feed pipe from the fountain to the burner being regulated and cut off by means of a stop cock.

Claim.—The combination of the plate *K*, strip of metal *I*, and the wire *J*, constructed and operating for the purposes and uses substantially as set forth in the specification.

No. 30,900.—WILLIAM F. WARBURTON, of Philadelphia, Pa.—*Improvement in Ventilated Hats*.—Patent dated December 11, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A flexible metallic band or strip secured to the inside of a hat, at such a distance from the same and between such points that it will accommodate itself to the wearer's forehead without interfering with the passage of air between said band and the hat, as set forth.

No. 30,901.—JOHN J. WATSON, of Buffalo, N. Y.—*Improvement in Tapping Gas and Water Pipes*.—Patent dated December 11, 1860.—This invention consists in the arrangement and construction of the different parts of the machine.

Claim.—The employment of the wheel *B*, provided with holes *D C E*, and divided in two parts through its periphery, substantially as and for the purpose specified.

No. 30,902.—JOHN ADT, of Waterbury, Conn., assignor to WILLIAM B. BARNARD, of said Waterbury.—*Improved Knob Lock*.—Patent dated December 11, 1860.—The object of this invention is to apply, to one of the knobs of any ordinary mortise latch, or any latch with knobs, to operate it, a simple and reliable means, whereby the latch may be locked and the knobs prevented from turning, or the latch may be unlocked and allowed to turn freely.

Claim.—The arrangement of the spring *c* and a ring *g* that is provided with a depression *i i*, lugs *h h*, and slot *i*, with the shank *E*, box *d*, pin *a*, and notched rose *C*, as shown and described for the purposes set forth.

No. 30,903.—A. J. KRAMER, of Marion, Iowa, assignor to himself, BENJAMIN REECE, and N. W. CLAFLIN, of said Marion.—*Improved Arrangements of Parts in Rotary Planers*.—Patent dated December 11, 1860.—Within the frame *B* there is placed an arbor *F*, at one end of which a circular disk *G* is attached, having planes fitted in it in the usual way. The arbor *F* has a horizontal position, and the planer head consequently rotates in a vertical plane.

Claim.—The arrangement of the vertically sliding rotary planer *G* with the carriage *I*, adjustable clamp frame *J*, clamp *K*, eccentric *L*, jaws *l l m*, and screws *M M M*¹, as and for the purpose herein shown and described.

No. 30,904.—S. A. WORTHEN, of Morrisville, Vt., assignor to himself and WILLIAM WALKER, of said Morrisville.—*Improvement in Cross Cut Sawing Machines*.—Patent dated December 11, 1860.—This is a cross cut sawing machine, in which the log is automatically released at the termination of the cut.

Claim.—The spring ratchet *D*, arm *I*, lever *L*, weight *W*¹, and arm *H*, in combination with the reciprocating saw and frame, arranged and operating substantially as and for the purpose set forth.

No. 30,905.—JOHN ALLEN, of Union, N. Y.—*Improvement in Harrows*.—Patent dated

December 18, 1860.—This invention consists in an improved device for connecting two or more of the sections comprising the harrow together, for the purpose of securing perfect flexibility, with free vertical, longitudinal, and lateral motion, and the ready separation of the parts.

Claim.—The combination of the vertical oblong links *g g* and horizontal oblong hook links *h h*, substantially as described, whereby the double advantage of allowing a free vertical and horizontal play of the sections of the harrow, and a very efficient and convenient means of connecting and disconnecting them readily, is secured at the same time.

No. 30,906.—ELIAS C. ATKINS, of Indianapolis, Ind.—*Improved Method of Attaching the Handles to Saws.*—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The attachment of the ear or tang to cross cut saws by means of a screw and open slot passing in at the end, or on the edge of the saw, near the end.

No. 30,907.—E. G. ATWOOD, of Derby, Conn.—*Improvement in Skeleton Skirts.*—Patent dated December 18, 1860.—The object of this invention is the production of a light, flexible, and symmetrical skirt, with the hoops so arranged and connected with each other as to give it increased stiffness and elasticity in the direction of its length, and so that the hoops will not tend to raise and catch upon each other in sitting, or that when raised by the wind, or in passing through narrow passages, will readily work themselves down into their proper position.

Claim.—The combination of a series of hoops, to form the skirt, with a series of flattened spiral springs, extending from the waistband, or upper hoop, to the bottom of the skirt, crossing the intermediate hoop, and attached to them by any well known means, for the purpose set forth.

No. 30,908.—LEWIS P. BRADY, of Mount Joy, Pa.—*Improvement in Rakes for Harvesting Machines.*—Patent dated December 18, 1860.—This invention consists in the combination and arrangement of parts.

Claim.—The overlapping plate *F*, on the rake handle *E*, and the guide rod *G* on its side, in combination with the slotted swivel *C*, and perpendicular crank pin *H*, when combined and arranged in the manner, described for the purpose specified.

No. 30,909.—LYSANDER BUTTON and ROBERT BLAKE, of Waterford, N. Y.—*Improved Coupling for Hose Pipe.*—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The folding handle, lever or levers attached to a part or parts of such couplings for hose and pipes as require a rotary movement of said part or parts in the act of setting up, as set forth.

No. 30,910.—CYRUS CHAMBERS, JR., of Philadelphia, Pa.—*Improvement in Paper Folding Machines.*—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, sliding or moving the paper between bars, or their equivalents, by means of revolving wheels, or rollers, whose surfaces come in contact with the paper, as and for the purpose specified.

Second. The combination of revolving surfaces with bars and steps, or their equivalents, arranged substantially as and for the purpose described.

No. 30,911.—JOSIAH W. CHURCH, of Cold Water, Mich.—*Improved Fastening for Hame Tugs.*—Patent dated December 18, 1860.—The claim and engravings explain the nature of this improvement.

Claim.—The combination of the self-locking perforated slide with the perforated bed piece, in the manner and for the purpose substantially as shown and described.

No. 30,912.—JOHN ENDE, of Buffalo, N. Y.—*Improvement in Horse Collars.*—Patent dated December 18, 1860.—The claim and engravings explain the nature of these improvements.

The inventor says: I *claim* the manner in which the clips *G G*, Fig. 4, and hold back rings *D D*, Fig. 1, are attached, as described and for the purpose set forth.

I also claim the peculiar construction of the lock *H I*, Fig. 1 and Fig. 2, in the manner and for the purposes specified.

I also claim the arrangement of the welt seamed in with the pad, and the seam covered by the hames, as described and for the purpose set forth.

No. 30,913.—JOHN DURHAM, of Cherry Grove, Ohio.—*Improved Boot Jack.*—Patent dated December 18, 1860.—The claim and engravings explain the nature of this improvement.

Claim.—The combination of the frame A, with the folding indented crotch B b b¹ and the lid C c, adapted to hold the crotch to its open position and to cover it in its closed position, substantially as set forth.

No. 30,914.—GEORGE N. FAIRCHILD and THOMAS JOYCE, of New York, N. Y.—*Improvement in Collimators.*—Patent dated December 18, 1860.—The object of this invention is to obtain a reliable instrument, with which straight lines running from one point to another at a small distance, and running in a horizontal, or an inclined direction, can be determined in an easy and ready manner.

Claim.—The combination of the two wires c d, with each other and with the mirror D, as shown and described.

No. 30,915.—J. P. FISHER, of Rochester, N. Y.—*Improvement in Carriage Wheels.*—Patent dated December 18, 1860.—The wheels D are composed of several metallic "truss" felloes f, the tire t, tubular spokes S, and binding rods c, the hub H, and its enclosing cap C.

Claim.—The combination of the binding rods c, with the hollow spokes S, hub H, and felloes f, in the manner shown and described.

No. 30,916.—E. F. M. FLETCHER, of Georgia Plains, Vt.—*Improvement in Water Wheels.* Patent dated December 18, 1860.—This invention consists in the use of wheels formed by having spiral buckets attached to semi-spherical hubs, and using, in connection with the buckets, springs so applied to the wheels as to regulate the capacity of the issues according to the force or supply of water.

Claim.—The combination of two hemispherical hubs D D, shaft B, coneave and tapering buckets D D, and springs E; the whole being constructed and arranged and operating in the manner set forth.

No. 30,917.—CORNELIUS GODFREY, of Brooklyn, N. Y.—*Improvement in Boilers.*—Patent dated December 18, 1860.—In using this invention, after filling the boiler with water, and before a fire is made, the dampers X² X³ are closed, and the damper X¹ is opened, giving a direct draught from the furnace E, through the flues Q H and M, into the smoke pipe, or chimney. After the fire is well started, the damper X¹ is closed, and damper X² opened, whereby the draught is diverted through the flues F F and H H under and between the ovens G G.

Claim.—The arrangement of boiler and furnace, or furnaces, with the steam chamber, as described, and for the purposes set forth.

No. 30,918.—JOSEPH GRICE, of New York, N. Y., and ROBERT H. LONG, of Philadelphia, Pa.—*Improvement in City Railroad Cars.*—Patent dated December 18, 1860.—This invention relates to certain novel features in the construction of trucks for cars, designed principally to run on city railroads.

The inventors say: We claim, first, the employment, in combination with the rear end of the frame or car body A, of a truck, pivotted in advance of the axle or axles, and so constructed and arranged with an arc d and suitable bearing plate and friction rolls as to have the entire weight supported by the truck brought on the said arc c, substantially as hereinbefore described, for the purpose set forth.

Second. We claim the employment of two trucks, in combination with the frame A, when the two trucks are each constructed with a single arc d, which sustains the entire weight of the car, and both pivotted at points lying between the axles, substantially as hereinbefore described, for the purpose set forth.

Third. We claim the combination of the spring shaft device e f s, with the double inverted incline on frame A, the whole arranged and operating as specified, for the purpose set forth.

Fourth. We claim extending the frame of the truck from the platform, and forming thereon a pole holder m as and for the purpose described.

No. 30,919.—J. F. HAMMOND, of Lynn, Mass.—*Improved Cement for Roofing.*—Patent dated December 18, 1860.—This invention consists in the combination of the following materials: To one barrel of Wilmington wood tar add sixteen pounds of common rosin; then add three gallons of copal varnish, ten pounds of beef tallow, and one quart of raw linseed oil, and mix and boil the whole well together.

Claim.—The combination of the above mentioned ingredients, or their equivalents, in substantially the proportions specified.

No. 30,920.—JACOB HINEY, of Hartford, Conn.—*Improvement in Faucets for Bottles.*—Patent dated December 18, 1860.—This invention consists in applying to the faucet, constructed in a peculiar manner, a pointed valve, which will allow the stem of the faucet to be

passed through the cork while it is in the bottle, and which will also serve as a valve for opening and closing the orifice in the stem of the faucet.

Claim.—The conical and pointed valve *h*, its stem *i*, and the hollow tube *g*, with the screw portion *c*, in combination with the screw stem *a*, substantially for the purpose set forth.

No. 30,921.—RICHARD WILLIAM HIX, of New York, N. Y.—*Improvement in Railroad Car Brakes.*—Patent dated December 18, 1860.—This invention consists in applying to the ordinary brake shafts, instead of the hand wheel at present used, a circular box, with a movable cap, which box contains three or more spur wheels, which have stationary bearings, and which engage with the teeth of a pinion that is keyed to the brake shaft, and also, with inside gearing on movable cap, so that by turning the cap the motion will be transmitted to the brake shaft, and multiplied according to the size of the central pinion.

Claim.—The combination of the brake shaft *B*, of the geared cap *J*, gear wheels *G*, and pinion *H*, in the manner and for the purposes shown and described.

No. 30,922.—JEDEDIAH HOLCOMB, of Brooklyn, N. Y.—*Improvement in Platform Scales.*—Patent dated December 18, 1860.—This invention consists in the method of adjusting the weighing levers upon jointed side bars, each suspended by links at the middle and both ends, so that the weighing levers may vibrate in all directions while under the load, and yet not affect their capacity to weigh accurately.

The inventor says: I *claim*, first, the combination of the jointed rods *c*², connected by link *D* and six links *B*, for supporting the same, with the frame *A* and weighing levers *E* of a platform scale, for the purposes heretofore set forth.

Second. I also claim the use of the extension case *R*, in combination with the stationary case *P*, weighing levers *E*, and scale beam *T*, for the purposes hereinbefore set forth.

No. 30,923.—I. ROBIN JACOB, of Elizabethtown, Ky.—*Improved Valve Gear for Steam Engines.*—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the forked independent rocker *K*, working on the valve rock-shaft, the two arms *I J*, with their studs *c d* rigidly attached to the said rockshaft and the spring *f*, the whole applied in relation to each other, and operating substantially as herein set forth.

No. 30,924.—JOHN JAMISON, of Gateshead, England.—*Improved Apparatus for Expanding and Compressing Elastic Fluids.*—Patent dated December 18, 1860; patented in England, January 11, 1860.—This invention consists in an improvement in compressing and expanding aeriform fluids by the application of heat in such manner as to effect a high degree of compression or expansion, or both.

Claim.—The combination of the apparatus to produce these actions called "borrowing and lending," with the apparatus performing the functions of what the inventor calls compensating apparatus, substantially as described.

No. 30,925.—FREDERICK C. LEYPOLDT, of Philadelphia, Pa.—*Improvement in Apparatus for Cutting Button Holes.*—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—An instrument for cutting button holes, combining the levers *A* and *C*, when arranged and jointed in the manner described, and actuating the cutter *B*, substantially as and for the purposes set forth.

No. 30,926.—ISAAC MIERS, of Clay Lick, Ohio.—*Improvement in Cultivators.*—Patent dated December 18, 1860.—This invention consists in the arrangement and combination of parts.

Claim.—The arrangement of the longitudinally adjustable side beams *C D*, straps *a a*¹ *b b*¹, and adjusting plate *d*, with the centre beam *B*, ploughs *E F G*, adjustable handles *h h*, and standards *y y*, all as shown and described, for the purposes set forth.

No. 30,927.—PHILO P. MILLS, of Washington, Ohio.—*Improvement in Sugar Cane Leaf Strippers.*—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The described leaf stripper for sorghum or sugar cane, consisting of two or more elastic blades *D E*, and the semi-circular plates *E*, the whole being combined and arranged on the block or frame *A*, for the purpose and in the manner set forth and explained.

No. 30,928.—D. K. NIXON, of Sandyville, Ohio.—*Improved Device for Preventing Hogs from Rooting.*—Patent dated December 18, 1860.—This invention consists of an iron, or metallic piece *A*, having a hole *B*, of a proper shape and size, to permit the upper front part of the snout of the hog to be drawn through it, when two iron pins *a b* are passed up through the part of the snout, which is drawn through the hole *B*, and bent over the top of *A*.

The inventor says: I *claim* the combination of the metallic part A, having the opening B, with two or more pins, or wires, substantially as and for the purposes set forth.

I also claim the curved, or projecting points C C, with the lower part of A, as set forth.

I further claim bending the lower ends of the pins *m*, as shown at *c*, for the purposes set forth.

No. 30,929.—W. H. PEASE, of Dayton, Ohio.—*Improvement in Tobacco Cutters*.—Patent dated December 18, 1860.—E represents a shaft which is secured horizontally in bearings attached to the frame A. Upon this shaft are secured the revolving knives F F, and the screw thread G. The thread G works between the teeth, or cogs, upon the gear wheel H, and serves to propel said wheel.

Claim.—In connection with the endless belts C C¹, arranged as described, and the throat *d*, the revolving knives F F, and screw thread G, the same being arranged and made to operate substantially as and for the purpose specified.

No. 30,930.—JOHN PIKE, of Syracuse, N. Y.—*Improved Churn*.—Patent dated December 18, 1860.—This invention consists in the combination and arrangement of parts.

Claim.—The combination and arrangement of the adjustable convex disk D, concavo-convex disk E, with the radial beaters on each, as described, together with the wings *d d*, shaft C, and dashers *x x*, &c., when used for the purposes specified.

No. 30,931.—ROBERT PLEWS, of Smithfield, R. I.—*Improved Cylinders for Spinning Frames*.—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The improvement in the process of manufacturing tin plate cylinders, as described, consisting in perforating the edge of each plate, of which the several sections of the cylinders are composed, with holes, whereby on the application of heat the air is expelled and the soldering metal is permitted to flow over the entire surfaces in contact.

No. 30,932.—F. W. ROBINSON, of Richmond, Ind.—*Improvement in Grain Separators*.—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* obtaining a separate and independent discharge of grain from the grain carrier D, and the straw carrier E, by means of a division board *a*, and the inclined bottom board G, the upper line of the straw carrier E being arranged below the plate of the cellular grain carrier D, so as to obtain a fall between the carriers, substantially as specified.

No. 30,933.—JOHN S. ROYCE, of Cuylerville, N. Y.—*Improvement in Harvesting Machines*.—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the downward curved, arched metallic frame A, constructed as described, in combination with the driving wheel D, the pinion, or pitman shaft P, and its rod, the cutting apparatus and wheel W, for the purpose set forth and substantially as described.

Second. The arched projection of the frame F, in combination with the adjustable cross piece C¹, and its friction wheel W¹, and the rod *r*, for the purpose set forth and substantially as described.

No. 30,934.—GEORGE M. SELDEN, of Troy, N. Y.—*Improvement in Eaves Troughs*.—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The air passages, or flue spaces, with an eaves trough, and its conductor located upon a building as usual, and with a warm air apartment, or hot air furnace, for the purpose of preventing the damage which ordinarily results to the building from the freezing within and consequent overflowing of the conductor and eaves trough by the water which sometimes runs from melting snow, or ice, on the roof, in freezing weather.

No. 30,935.—SMITH A. SKINNER, of West Berkshire, Vt.—*Improvement in Fountain Pens*.—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination and arrangement of a valve *f*, separate from the agitator *h*, with a spring pen carrier B, arranged with respect to the agitator *h* and the branch *e*, provided with a valve opening and extended from the ink fountain, as described.

I also claim the improved mode of making the spring tongue *k*, viz: with corrugations, the same being for the purpose described.

No. 30,936.—J. J. SLOCUM, of New York, N. Y.—*Improved Rotary Engine*.—Patent dated December 18, 1860.—This invention consists in the employment of a rotary winged abutment, in combination with a rotary piston, in such a manner that by imparting to said abutment a rotary motion, at certain intervals, the piston is allowed to pass by unobstructed; it consists also in arranging on the shaft of the piston a notched disk with a spring catch, in combination with two sets of rollers attached at different distances from its centre to a plate that is secured to the axle of the rotary abutment.

The inventor says: I *claim*, first, the arrangement of the rotary winged abutment E, in combination with the rotary piston A, constructed and operating as and for the purpose set forth.

Second. The combination and arrangement of the notched disk I with the spring catch J, plate H, with the rollers *b* and *e*, with rotary abutment F, constructed and operating substantially as and for the purpose set forth.

No. 30,937.—ERASTUS N. STEERE, of Providence, R. I.—*Improvement in Oiling Spindles*.—Patent dated December 18, 1860.—This invention consists in connecting the step and bolster of a spindle by means of a tube, so as to form a reservoir or chamber for containing oil, and in which the lower part of the spindle is enclosed and revolves submerged in oil.

Claim.—The tube B, or its equivalent, constructed and arranged with the step and bolster of a spindle, substantially as described, for the purpose specified.

No. 30,938.—SIDNEY M. STONE, of New Haven, Conn.—*Improved Means for Ventilating Buildings*.—Patent dated December 18, 1860.—This improvement consists in admitting pure air through the external wall at or above the apartment to be ventilated.

Claim.—The use of the pure air passage at A, in combination with the passage E E and smoke pipe G, when the whole is constructed, arranged, and fitted to produce the result described.

No. 30,939.—CLAUDE STUREL, of New York, N. Y.—*Improvement in Fire Escapes*.—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the platforms D alternately on opposite sides of the frame work, and holding them rigidly parallel to the deck of the wagon in all conditions of the frame, by means of the bars *d*, or their equivalents, substantially as and for the purpose set forth.

No. 30,940.—HORACE TUPPER, of Buffalo, N. Y.—*Improvement in Turnouts for Street Railroads*.—Patent dated December 18, 1860.—A B represents a switch rail, embracing the principle of this improvement.

Claim.—The inclined wave or swell D, in combination with the rails A D and F, operating in the manner and for the purposes set forth.

No. 30,941.—D. T. WARD, of Mansfield, Ohio.—*Improved Churn*.—Patent dated December 18, 1860.—This invention consists in constructing and arranging the several parts of the churn.

Claim.—The disk, or wheel C, constructed as described, and in connection therewith the rim, or collar D, arranged in the manner and for the purpose specified.

No. 30,942.—SETH WHEELER, of Albany, N. Y.—*Improvement in Ash Sifters*.—Patent dated December 18, 1860.—This improvement consists in the use of a reciprocating, corrugated sieve, enclosed in a suitable case or box, and placed in a diagonal position, said sieve being hung on pivots, or journals, and agitated by means of a lever or crank, rod and treadle, working on the outside of said case or box.

Claim.—The use of lever G, treadle F, and spring E, when used in combination with the sieve B, substantially as and for the purpose specified.

No. 30,943.—CHRISTIAN K. HOSTETTER, of East Donegal Township, Pa., assignor to JACOB R. HOFFER, of Mount Joy, Pa.—*Improved Bag Holder and Conveyor*.—Patent dated December 18, 1860.—This invention consists in the combination and arrangement of parts.

Claim.—The sliding frame E, held and operated by the cord H, friction and ratchet pulley I, spring pawl J, and cord tightener L, together with the bag rest B, the whole mounted on wheels D, substantially as described.

No. 30,944.—HIRSCH HEINEMANN and JACOB BUSER, of New York, N. Y., assignor to HIRSCH HEINEMANN, aforesaid.—*Improvement in Machines for Covering Cord*.—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the arrangement of the revolving creel *f* to twist the strand, with a revolving carrier plate *e*, for laying the silk or other fibres upon the outside of said strand, when each has a separate revolving motion, so as to make different sizes and characters of strands, as set forth.

Second. We claim the construction of the cap *l*, and jaws *o o*, in combination, to guide the strand, so that the covering material may be laid evenly thereon, as set forth.

Third. We claim the revolving bobbin *t*, and fly frame, acting as specified, in combination with the covering apparatus, to twist in a cord, or "cut" the strand as it passes from the covering apparatus, as set forth.

No. 30,945.—XAVIER KARCHESKI, of New York, N. Y., assignor to LOUIS T. VALENTINE, of said New York.—*Improvement in the Manufacture of Vegetable Parchment*.—Patent dated December 18, 1860.—The claim shows the nature of this improvement.

Claim.—The application, to certain parts of the paper, of starch, or some other gelatinous substance, either plain or colored, substantially as set forth, for the purpose of producing in the parchment an indelible water mark.

No. 30,946.—PETER KEFFER, of Reading, Pa., assignor to himself and D. H. ULRICK, of Berks County, Pa.—*Improvement in Car Brakes*.—Patent dated December 18, 1860.—This invention consists of certain devices for releasing the brakes after the train has been stopped by the movement of the sliding rods; also, in a certain arrangement of levers and rods connected with the brake beams, whereby the brakes may be readily applied, no matter what position the trucks may assume on turning the curves of a track.

The inventor says: I *claim*, first, the spring sliding rod and its projection *q*, in combination with the slotted arms *T* and *T*¹, and the frame *X*, with its roller *e*, the said arms being operated, and motion being communicated from the said frame to the brake bars, by the devices described, or their equivalents.

Second. The levers *K* and *K*¹, hung to the pin *I*, on which the truck turns, in combination with the rods *L* and *L*¹, and rods *M* and *M*¹; the whole being arranged and operated as and for the purpose specified.

No. 30,947.—JOHN L. MAHAN, of Philadelphia, Pa., assignor to D. STUART and R. PETERSON, of said Philadelphia.—*Improvement in Gas Stoves*.—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The inner chamber *D*, diminishing in size towards its mouth *d*, the whole outer chamber *C*, the plain plate *F*, the plate *m* of wire gauze, or its equivalent, and the hot air passage *i*, when the said plain plate forms a continuation of the wire gauze, and when the whole of the above named parts are arranged in respect to each other, as and for the purpose herein set forth.

No. 30,948.—ANDREW PARKINSON, of Norwich, Ct., assignor to JAMES PARKINSON, of Newark, N. J.—*Improvement in Looms*.—Patent dated December 18, 1860.—This invention consists in combining, with the lay and back of the reed, a comb, which passes between the warp threads, and in so doing either lays the broken end, or loose thread, in line parallel with the other warp threads.

Claim.—The employment of a comb, substantially such as described, in combination with the lay of a loom, substantially as and for the purpose specified.

No. 30,949.—C. P. S. WARDWELL, of Lake Village, N. H., assignor to SAMUEL H. DOTEN, of Plymouth, Mass.—*Improved Comb Cleaner*.—Patent dated December 18, 1860.—This invention consists in constructing and arranging the several parts of a comb cleaner, so as to be easily trimmed with thread, and to bring several strands parallel, or nearly so, so as to quickly and effectually clean a comb.

Claim.—As a new article of manufacture, a comb cleaner, constructed substantially as described and set forth.

No. 30,950.—PARKER WELLS, of Middletown, Mass., assignor to ELMER TOWNSEND and WILLIAM WELLS, of Boston, Mass.—*Improvement in Pegging Machines*.—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* changing the supply of pegs of one length for others of a different length by substantially the means described for changing the position of the peg wood channels *v v*¹.

Also the described arrangement of the awl and driver bars *h* and *g*, which consists in permitting them to oscillate in the top of the head *a* when they are connected with a slide *l*, which is made to reciprocate, substantially as and by the means described.

Also the arrangement shown and described of the shaft *e*, both with regard to its direction

of rotation and position, by which the usual gauge on the pegging head *a* is kept pressed against the edge of the sole.

And I claim also the arrangement described by which the whole of the peg-driving mechanism is changed in its position relative to the pinion *b*, which actuates the boot or shoe carrier, for the purpose of altering the angle at which the pegs are set in the work.

No. 30,951.—CHARLES E. BERTRAND, of New York, N. Y.—*Improvement in Tanks for Crystallizing Sugar*.—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim the method described of extracting the crystallizable sugar from the secondary products or drainings of ordinary sugar moulds by the employment of a capacious tank, having combined with it a perforated discharge tube, or plug, or stopper, both or either capable of rotation, the whole being constructed and arranged substantially as set forth, and operated in the manner and for the purpose specified.

No. 30,952.—LEVI BISSELL, of North Bergen, N. Y.—*Improvement in Stove Pipes*.—Patent dated December 18, 1860.—This invention consists in so constructing a stove pipe safe in two parts that it can be readily adjusted to accommodate itself to any thickness of wall; also in the employment of slides between the two pipes for the purpose of affording ventilation to the room.

Claim.—The heads of the safe as constructed in combination with registers and inside pipes *g g*, when said pipes are provided with ventilating holes, and all arranged as and for the purpose set forth.

No. 30,953.—JOHN BLUE, of Covert, N. Y.—*Improvement in Harvesters*.—Patent dated December 18, 1860.—This invention consists in combining a knee joint, having a spring catch for holding the joint in position upon one of the levers forming the joint, with reel standards hinged on bearings of hooks or bolts, arranged in line with the shaft of the wheel directly driving the reel, for the purpose of permitting the movement of the standards on the hinge without deranging the band or gear driving the reel.

Claim.—The combination of the knee joint *i* with the reel standards *f f*¹, shaft *B*, and bearings *k k*¹, when the several parts are arranged for operation in the manner described, for the purpose specified.

No. 30,954.—GABRIEL BOOS, of New York, N. Y.—*Improvement in Machines for Enamelling Mouldings*.—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement and construction of the front piece *A* and side frames *C C*, in combination with the guide pieces *J J*, for the purpose of changing the machine easily to any width of moulding, as well as to make thereby the surface of the moulding to act as guide for the machine, substantially as described.

No. 30,955.—E. D. BOOTMAN, of Janesville, Wis.—*Improvement in Automatic Attachment to Keyed Musical Instruments*.—Patent dated December 18, 1860.—This invention consists in making a machine with a peculiarly constructed cylinder, having mechanical devices for operating the same, that may be attached to any organ, piano, or melodeon, and may be set to play any piece of music that may be desired.

The inventor says: I claim, first, the use and application of the spherical balls *i*, or their equivalents, substantially as described and for the purpose described.

Second. I claim the construction and use of a cylinder made of any suitable material, with a continuous spiral groove cut around the cylinder similar to a screw, which groove is crossed at proper distances by like grooves running parallel with the shaft or axis of the cylinder, thereby forming at the crossings of the grooves proper receptacles for the balls *i*, substantially as described and for the purpose described.

Third. Employing a belt or cloth *v*, in combination with rollers to keep the balls *i* in their places on the cylinder, and to propel the cylinder in performing music, substantially as described, or any arrangement accomplishing substantially the same object.

Fourth. The side or lateral movement of the sliding carriage *G*, in combination with the ways *X X*, substantially as and for the purpose set forth.

Fifth. The combination of the keys or levers *k k*, grooves *l l*, pins *t t*, cups *J*, and conductors *K*, or their equivalents, when used substantially as shown and for the purpose described, or any arrangement accomplishing substantially the same thing.

Sixth. I claim the arrangement of the compound levers *M* in connection with the oscillating lever *K*, or their equivalents, substantially as shown and for the purpose described.

Seventh. The use and application of the screw *x* and slide *t*, or their equivalents, when used in connection with a cylinder to give a longitudinal motion to the same as it revolves, substantially as and for the purpose described.

Eighth. The arrangement and combination of the lever *m*, spring catch *n*, weight *o*, and pulley *X*, substantially as described and for the purpose set forth.

Ninth. I claim the manner of raising the hammer *U* to strike the strings or keys of the piano, substantially as described, or any arrangement substantially the same.

Tenth. I claim the method described of pressing down the keys upon the organ or melodeon by means of the levers *v* and *w*, pins *t t*, wheel *m m*, or any arrangement accomplishing the same thing.

Eleventh. Finally, I claim the application and use of the devices composing my attachment, substantially as described, in combination with an organ, piano, melodeon, or other instrument to which it may be applied to produce or perform music.

No. 30,956.—LEWIS H. BOWMAN, of Norristown, Pa.—*Improvement in Operating the Valves of Steam Engines*.—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, the reciprocating box *C*, its spring sliding bars *F* and *F*¹, with their inclinations, in combination with the valve levers *K* and *K*¹ and their rollers *q*, the whole being arranged as substantially set forth.

Second. I claim the spring sliding bars *E E*¹, each having a projection *m*, in combination with the bell crank levers *G* and *G*¹ and the sliding block *I*, the position of the latter being regulated by the governor, and the whole being arranged for joint action, substantially as and for the purpose set forth.

Third. The vibrating arm *Q* with its segment *b* and adjustable curved blocks *r* and *r*¹, in combination with the exhaust valve levers *N* and *N*, the whole being arranged and operating substantially as specified.

No. 30,957.—BENJAMIN F. CAMPBELL, of Roxbury, Mass.—*Improved Steam Boiler*.—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, the combined arrangement of two wings *E*, containing the tubes *I*, with a single fire box, when the said wings project equally from either side of the fire chamber over the grate, as and for the purposes set forth.

Second. I claim the perforated plate *L*, for bridging the crown sheet *E*, substantially as set forth.

No. 30,958.—J. A. CHAPMAN, of Poquetanuck, Conn.—*Improvement in Machines for Winding Woolen Rovings*.—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, the arrangement of the wheel *L*, bar *Q*, sliding frame *D*¹, swinging frame *D*, guide bar *l*, and sliding bar *S*, operated as shown, or in any equivalent way, for the purpose of shifting the frame *D*¹ and presenting the empty spools consecutively before the guide *N*, to receive the roving *V*.

Second. Operating, for the purpose specified, the bar *Q* through the medium of the spring *a*¹, ratchet *N*^{*} with pin *w* attached, and the pawl *v*, arranged as described.

Third. The employment of a series of spools *F*, when placed on a common shaft *E* and filled or wound consecutively by a continuous roving, substantially as set forth.

No. 30,959.—ELISHA CLARK, of New York, N. Y.—*Improvement in Copying Presses*.—Patent dated December 18, 1860.—This invention consists in the arrangement of the parts of the machine named in the claim.

Claim.—The arrangement of the anti-pressure bridge *C*, studs *a*, screw *S*, and nut *F*, with the plates *B B*¹, rods *f*, and springs *s*, in the manner and for the purpose shown and described.

No. 30,960.—JUD CRISSEY, of Chatfield, Minn.—*Improvement in Water Wheels*.—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, the employment or use, with one or more wheels *D E*, of a series of concentric gates or cylinders, constructed as described, and arranged relatively with the buckets *d*, to operate as and for the purpose set forth.

Second. The arrangement of the wheels *D E*, fitted in a frame or box *B* in a flume or penstock *A*, when provided on one and the same shaft *C*, with concentric cylinders or gates, connected as shown, so that the gates of both wheels will be operated by adjusting the outer one of the upper wheel, essentially as and for the purpose set forth.

No. 30,961.—JOHN G. DUNHAM, of Raritan, N. J.—*Improvement in Mowing Machines*.—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says; I claim, first, the construction of a finger beam *D*, or its equivalent,

with the hinged piece F, its projection K, adjustable piece F, and its shoulder K, for the purpose set forth.

Second. I claim the combination of shoe E, truss rod G³, and piece H, with finger beam D and parts F F¹ and G, arranged in relation to each other and the main frame, substantially as shown and described.

Third. I claim in a mowing machine the combination of the following elements, viz: A main frame, two independent driving and supporting wheels, a castor wheel, a hinged folding finger beam, and a knife reel, said parts being arranged in relation to each other, and operating substantially as described.

Fourth. I claim the mechanism for throwing the cutter out of action, substantially as described, and as shown in Fig. 6.

Fifth. I claim the combination, with the main frame and supporting wheels, of a metallic axle, or journal piece, constructed substantially as described, and as shown in Figs. 1 and 4, for the purpose set forth.

Sixth. I claim the combination, with the main frame of a mowing machine, of a "knife reel" and a hinged folding finger beam.

No. 30,962.—JOSEPH D. TORREY, of Lewistown, Pa.—*Improvement in Machines for Hulling Clover*.—Patent dated December 18, 1860.—The object of this invention is to provide an improved clover huller and cleaner, for beating the heads of the clover, by such improved devices therefor as shall beat out all the seeds, and at the same time avoid breaking any of them; and for cleaning and for clearing the same from chaff and dust.

The inventor says: I *claim*, first, the combination of the peculiarly shaped concave with the peculiarly shaped beaters, or spikes, for the purposes and substantially as described.

Second. I claim the arrangement of the sieves s s, the apron a, and the movable roller R, actuated simultaneously by the means of the eccentric g, all constructed and operated as and for the purpose set forth.

Third. The arrangement of the peculiarly shaped concave and beaters with the endless apron, for the purpose and substantially as described.

No. 30,963.—JOHN B. GEISINGER and D. H. S. WILLIAMS, of Montville, Ohio.—*Improvement in Cultivators*.—Patent dated December 18, 1860.—This invention consists in the arrangement of the devices.

Claim.—The arrangement of the curved slotted bar C, curved slotted braces M M hinged to bar J, standards N N, shares Q Q, eye bolts S S, links R R, bars K, bolt L, beam A, and handles E, the whole being constructed substantially as described.

No. 30,964.—CHARLES GRAHAM, of Scranton, Pa.—*Improvement in Spring Balances for Safety Valves to Boilers*.—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment, in combination with the spring of a spring balance for safety valves, of an eccentric e, and lever F, applied to operate substantially as specified for the purpose set forth.

Second. The arrangement of the eccentric shaft E, spring G, levers B B, cross bar D, and the pressure bar H, with its screws and nuts f f, g g, substantially as described, in combination with each other, and with a bed plate A, or other equivalent base or support.

No. 30,965.—JAMES S. GRAY, of New York, N. Y.—*Improvement in Vapor Lamps*.—Patent dated December 18, 1860.—This invention relates to that class of vapor lamps in which the fluid, from which the vapor is generated, is contained in a reservoir situated at a distance from the burner, and conveyed to it by a pipe, in order that the main body of the fluid may be exposed to the heat of the flame, and thereby prevent accidents.

Claim.—The combination of the wick tube C, bracket D, conductors E, and heater cap F, when arranged for joint operation, substantially in the manner described, for the purpose set forth.

No. 30,966.—JOSEPH GUM and ST. CLAIR GUM, of Marseilles, Ill.—*Improvement in Cultivators*.—Patent dated December 18, 1860.—This invention relates to a new arrangement of parts by which to elevate the several ploughs or cultivators from the ground, and to move them laterally to the right or left, as the irregularity of the planting of the rows of corn may require; also, to such an arrangement of parts as permits the cultivation of two rows of corn at once.

The inventors say: We *claim* the lever E, in combination with the levers L L, the open slot standards S S, and the slots on the lower side of the cross piece H, by which to control the central movement of the ploughs, when arranged as set forth, as is substantially described.

We claim the driver's seat D, in combination with the several elements of the preceding claim, when arranged as set forth and substantially as described.

No. 30,967.—JACOB HÆGE, of Shiloh, Ill.—*Improvement in Gang Ploughs*.—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment or use of vertical pivots passing through the centre of the axle, in combination with chains *c* and *f*, as and for the purpose described.

Second. The arrangement of the hinged slotted standards J, in combination with the screw rods *k*, guards *n*, and nuts *m*, and with the adjustable plough shares D, all constructed and operating in the manner and for the purpose set forth.

Third. The arrangement of the swinging rods *f*¹, in combination with the lever F, and beams C, constructed and operating as and for the purpose specified.

Fourth. The arrangement of the belly strap I, in combination with the lever F, treadle H, and beams C, constructed and operating substantially in the manner and for the purpose described.

No. 30,968.—CHARLES E. HASKINS, of Providence, R. I.—*Improvement in Shirt Studs*.—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—An improved shirt stud, not only with its shank tubular and recessed, as explained, but with a lever applied and arranged with respect to such shank, as described, and provided with a spring arranged in the shank and operating so as to maintain the lever at right angles with the shank, under circumstances as set forth.

No. 30,969.—AUGUSTUS H. HEWS, of Cambridgeport, Mass.—*Improvement in Slides for Watch Ribbons*.—Patent dated December 18, 1860.—This invention consists in making the slide of two parts hinged together at one edge and clasping, or stretching together at the opposite edge, so that it may be opened to introduce the ribbon and then be shut over it, while a pin within the slide serves to secure the two ends of the ribbon together.

Claim.—The slide A and pin *c*, operating substantially as described.

No. 30,970.—JASPER JOHNSON, of Geneseo, N. Y.—*Improved Butt Hinge*.—Patent dated December 18, 1860.—This invention consists in uniting the leaves by a tapering headed pin having a small groove around it and beneath the head to receive the point of a pin and prevent the removal of the tapering pin when inserted.

Claim.—The combination of the leaves A B, tapering and grooved pin P, second pin *i*, stud *a*, and cavity B, constructed, arranged, and operating as and for the purpose set forth.

No. 30,971.—NELSON JOHNSON, of Jasper, N. Y.—*Improvement in Water Wheels*.—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The inclined buckets *f* being of concave form in their horizontal section, and of gradually decreasing width from top to bottom, in connection with the inclined or bevelled lower rim *h*, essentially in the manner and for the purpose set forth.

No. 30,972.—SOLOMON KEPNER, of North Coventry, Pa.—*Improvement in Detaching Horses from Carriages*.—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the bar, figure 9, and the revolving swingle tree, with its two hooks and guide, arranged as described, for the purpose set forth.

No. 30,973.—MOSES KLEEMAN, of Columbus, Ohio.—*Improvement in Glass Cutters*.—Patent dated December 18, 1860.—The inventor says: In making the cutter I fit a cap of brass or other suitable metal *d*, having a hole through it opposite the socket through which the point of the diamond projects, the cap tightly fitting around the diamond and securely holding it in place; the cap is fastened down by one or more rivets, the holes through the cap and stock being "draw bored," so as to draw the cap down tight and fast.

Claim.—The combination of the socket and cap, substantially as and for the purposes set forth.

No. 30,974.—JOSEPH H. KNIGHT, of Newburyport, Mass.—*Improvement in Shoe Tacks*.—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A shoe tack, constructed with an elongated inclined head B, as shown and described.

No. 30,975.—F. W. KROEBER, of Forbestown, Cal.—*Improved Wrench*.—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The application of the lever and the curved ratch to the adjustment of the jaws of the wrench as described.

No. 30,976.—GEORGE W. LATHROP, of Weedsport, N. Y.—*Improvement in Exhaust Pipes for Locomotive Engines*.—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of an adjustable bevelled guide flange or lug G, and adjusting rods I I, which extend out beyond the front of the smoke arch A, with the seat E and stationary bevelled lug F, of the exhaust pipes D D and slide J, that carries the variable exhausting nozzles M, substantially as and for the purpose set forth.

Second. In combination with the exhaust pipes D D, which branch out towards the sides of the smoke arch, and terminate in a slide seat E that runs across the arch, I claim the combined arrangement of a slotted link K, that takes hold of the remotest end of the nozzle slide J, a vertical rod *d*, two horizontal crank arms *e f*, set at right angles to one another, and a horizontal longitudinal lever L, substantially as and for the purpose set forth.

No. 30,977.—WILLIAM MALLERD, of Bridgeport, Conn.—*Improved Gas Burner Regulator*.—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* making the inner tube C vertically adjustable in its socket A, substantially as shown and described, so that the flow of gas through the orifices of said tube may be increased or diminished, so as to bring a greater or less number of the orifices above the head of the socket, all as set forth.

I also claim the arrangement of the escape orifices of said tube C, on varying horizontal planes, as and for the purpose set forth.

I also claim the exterior gradation of said tube C, as shown and described, so that the quantity of gas which issues through the orifices when the tube is set to any given height will be indicated to the eye, all as set forth.

No. 30,978.—R. C. MAUCK, of Harrisonburg, Va.—*Improvement in Machines for Cleaning Grain*.—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the inclined cylinder A, and rotary longitudinal buckets or scoops M N, constructed and operating in connection with a fan blast, substantially in the manner set forth, to subject the grain to a succession of falls in its passage to the lower end of the cylinder, and repel the lighter refuse at the upper end.

Second. The right and left flanges D D¹, in the described combination with the reel B C N and inclined cylinder A, for the purposes explained.

Third. The transverse checks J, in the described combination with the inclined longitudinal buckets M N and fan E, for the purpose set forth.

Fourth. The guard O, applied between the fan E and spout L, substantially as and for the purposes explained.

No. 30,979.—PATRICK FRANCIS MILLIGAN, of Baltimore, Md.—*Improvement in Railway Signals*.—Patent dated December 18, 1860.—This invention consists in the arrangement and combination of parts.

Claim.—The combination and arrangement of the series of wheels A B C D, and pinions *b c d*, axle *a*, ropes or chains *x y*, attached to spans *n n*, lamps or signals E G, pole P, with ratchet rack *s* and spring *r*, with suitable framing, the whole constructed and operating substantially as and for the purpose specified.

No. 30,980.—JOHN B. MURRAY, of New York, N. Y.—*Improvement in Envelopes*.—Patent dated December 18, 1860.—Letters A represent openings in either one or both ends of the envelope. The opening is not quite the width of the end of the envelope.

Claim.—The openings A, in one or both ends of the envelope, substantially as described, and for the purposes set forth.

No. 30,981.—RICHARD C. NASH, of Somerville, Tenn.—*Improvement in Cotton Seed Planters*.—Patent dated December 18, 1860.—This invention consists in the combination and arrangement of parts.

Claim.—The combination and arrangement of the hinged drill tooth G and driving wheel B, of the seeding wheel M, with alternate pins *r r* and blades *s s*, substantially as and for the purposes herein specified.

No. 30,982.—M. F. NORACONK and DANIEL HOATS, of Milton, Pa.—*Improvement in Ma-*

chines for Hulling Clover Seed.—Patent dated December 18, 1860.—This invention consists in the use of a rotating and two stationary hulling disks, and a fan and screen, arranged whereby the desired work is performed.

The inventors say: We *claim* first, the rotating and stationary hulling disks *a d f*, in connection with the screen *G* and fan *E*, arranged for joint operation, as and for the purpose set forth.

Second. Placing the suspended screen *G* on the shaft *H* for the purpose of giving the former the double vibrating movement as described.

No. 30,983.—GEORGE W. PITTOCK, of Union Mills, N. Y., assignor to himself and MERCHANT PERRIGE, of Saratoga, N. Y.—*Improvement in Coal Sifters.*—Patent dated December 18, 1860.—This invention consists in the employment of the screw shaft and lever for operating the revolving sieve, also, the same in combination with other devices.

Claim.—The combination of screw shaft *d*, revolving sieve *B*, lever *a*, and hopper *D*, when the whole shall be constructed and arranged substantially as and for the purpose described.

No. 30,984.—IRA C. PRATT, of Morton, Ill., assignor to himself and THOMAS PARKER, of said Morton.—*Improvement in Bee Hives.*—Patent dated December 18, 1860.—This invention in the use of two sliding, or adjustable boxes, in combination with the main hive; also, the same in combination with a frame which shall be provided with troughs.

Claim.—The main hive *A*, frame *B*, and sliding boxes *E* and *F*, when combined, and for the purpose set forth.

No. 30,985.—THOMAS L. PYE, of New York, N. Y.—*Improved Brackets for Curtain Cords.*—Patent dated December 18, 1860.—This invention relates to the bracket carrying the sheeve, or roller, around which the cord passes, and which bracket keeps the cord tight.

Claim.—The divided, or split pipe *f*, and tapering socket *g*, combined with the rod *e*, carrying the roller *d*, substantially as specified.

No. 30,986.—JOHN REYNOLDS, of New York, N. Y.—*Improvement in Steam Ploughs.*—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement and combination of the plough frame *A* with ploughs *A*¹, vertical slotted standards *c*, link *d*, rock shaft *e f*, grooved disk crank *g*, link *d*¹, chains, or cords *J J*¹, and windlass shaft *K*, substantially in the manner and for the purpose described.

Second. The arrangement and combination of the fast spur wheel *R*, sliding lever clutch *T t t*, and loose wheels *C u u v v*, substantially in the manner and for the purpose described.

Third. The arrangement of the plough frame *A* with the ploughs *A*¹, boiler *D*, engine cylinder *D*¹, wood receptacle *F F*¹ *F*², water tank *E*, specified mechanism for throwing the engine in connection with the carriage *B*, and the mechanism specified for supporting and adjusting the plough frame and ploughs, the whole constructed and operating together in the manner described.

No. 30,987.—EZRA RIPLEY, of Troy, N. Y.—*Improved Wrench.*—Patent dated December 18, 1860.—This invention consists in holding, releasing, and adjusting the sliding jaw of wrenches, by means of a set screw operating in combination with said sliding jaw and an inclined plane.

Claim.—The manner of adjusting, holding, and releasing the sliding jaw *C*, by means of the set screw *E*, in combination with the sliding jaw *C*, and inclined plane *D*, combined and operating in the manner substantially as described and shown.

No. 30,988.—JOHN RUSSELL, of Troy, N. Y.—*Improvement in Stove Covers.*—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A stove cover, composed of an upper supporting and cooking plate *A*, and a lower protecting plate *B*, the lower plate being made with ribs *e* on its upper side, and secured to, but apart from, the upper plate, by means of an interwoven block, or projection *C*, and a bolt or rivet *F*, both arranged together at or near the middle of the plates.

No. 30,989.—JOSEPH RYDER, WILLIAM CARPENTER, and H. R. JOLLEY, of Clinton, La.—*Improvement in Cotton Cleaners.*—Patent dated December 18, 1860.—This invention consists in the combination of three cylindrical chambers with passages, revolving feed knocker, revolving fan blower, revolving beater, and a dust flue.

Claim.—The combination of the chambers *A B C d e f g*, revolving shaft *H*, with feed

knockers *i i*, and fan blades *j j*, and the dust flue *G*, the whole constructed and arranged and operating substantially in the manner and for the purpose described.

No. 30,990.—HORACE SMITH and DANIEL B. WESSON, of Springfield, Mass.—*Improvement in Revolvers*.—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the combination of a revolving cylinder, having its chambers extending entirely through the block, with an unbroken recoil shield having a projection on its face, as described, for the purpose set forth.

Second. The combination of the barrel, hinged to the lock plate with a spring catch *b*, arranged with end projections to grasp the barrel and plate, substantially as described, for the purpose as set forth.

No. 30,991.—JOHN SOLAN, of Fredericksburg, Va.—*Improved Shutter Operator*.—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the levers *E*, having a sliding and vibrating motion on their fulcrum, in combination with the slotted and notched plate *H*, for opening window shutters and securing them when open, substantially as specified.

No. 30,992.—SAMUEL SOLLIDAY, of Sumneytown, Pa.—*Improved Steam Boiler*.—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the elevated fire box, descending flue pipes, and surrounding water space, in combination with the arrangement for the artificial draught, and the exit passages, when located within a tight shell, or jacket, the whole being constructed substantially as and for the purpose set forth.

No. 30,993.—HENRY D. STOVER, of New York, N. Y.—*Improvement in Wood Planing Machines*.—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of cutting cylinder *O* and cross head *M* with two or more screws *E* for raising and lowering the cutting cylinder evenly and parallel to the face of the platen.

I also claim so pocketing or encasing the raising and lowering screws *E* in the uprights *C* that dust and shavings will be effectually excluded, whether the machine is in operation or not.

I also claim so constructing the cutting cylinder *O* as to receive four or more cutting blades *P*, each imparting a shearing or drawing stroke or cut, and at the same time for convenience in construction and ease in sharpening and securing the blade to the head.

I also claim forming the portion of the cutter head; immediately back of the edges of the cutting blades, an angle varying from 50° to 45° from the face of the cutting blades to constitute a solidly variable and efficient cap to the cutting blades.

I also claim so constructing, connecting, and arranging the sliding journal boxes *T* with cross head *M*, which carries the cutting cylinder *O* by means of rods *U*, that when the cutter head is raised or lowered these journal boxes will move, so as to always retain a precisely equal distance between the drive pulleys and the driven pulleys on the cutter head for equal tension of the belts.

I also claim feeding the platen back and forth by friction slide *A* and wheel *D*, and rack *B* and pinion *C*, for the purposes set forth.

I also claim reversing the movement of the platen by means of screw *M* and wheel *O*¹ for forcibly engaging the rack by its pinion on the friction side by its wheel.

I also claim sliding, moving, and attaching the cross head *M*, carrying cutting cylinder *O* on and to the uprights *C*, in and by adjustable gib slides *N*.

I also claim pivoting the journal box *H* for the friction feed shaft and giving it a vertical adjustment to both swing and rise or fall with the feed shaft.

I also claim several dogs, operated independently of each other, to effectually hold several pieces firmly to the platen for dressing at the same time, constructed substantially as described.

I also claim sliding the feed rolls into position for use, and removing them from the machine by means of gib slides, so that these rolls are always secured for use and in position out of use by gib slides alone, and yet allow of a free movement, and to require no additional security.

I also claim suspending and moving cross head for cutting cylinder by screws *E*, which are suspended in universal bearings and by universal nuts, to allow of a free untrammelled movement for adjustment and ease in operation, and to secure the cutter head parallel to platen at any elevation from its surface.

I also claim a conducting spout or trough *A*⁴ so connected with cross head or other part as to receive and conduct the shavings from the cutting cylinder and the machine to any

point desired by means of the current of air set in motion by the great velocity of the cutting cylinder.

I also claim an elastic pressure roll C⁴, so combined with a rigid revolving roll D⁴ and scraper F⁴, that either can be used at pleasure, with the elastic pressure roll to plane straight and out of wind.

I also claim the iron upright C¹, constructed with cavity or pocket for reception of elevating screws when combined with bed piece of wood planing machine; all substantially in the manner, or their mechanical equivalent, for the purposes fully set forth and described.

No. 30,994.—ROBERT THOMPSON, of East Davenport, Iowa.—*Improvement in Smut Machines*.—Patent dated December 18, 1860.—This invention consists in the arrangement of the parts of the machine named in the claim.

Claim.—The arrangement of the divided scouring chamber beaters *a*¹, shaft L, fan M, case H, and spout *d*¹, with the spout B, chamber I, treble and screened shoe C, grain passage D, hopper G, and spout *n*; all as shown and described.

No. 30,995.—B. D. TRIPP, of Moravia, N. Y.—*Improved Device for Guiding Diamonds for Dressing Mill Stones*.—Patent dated December 18, 1860.—The claim and engravings show the nature of this improvement.

Claim.—The bar or straight edge D attached to the bed piece A by the parallel arms *g*, and actuated or adjusted by the ratchet wheel *b*, gearing *c* E, and spring F; in connection with the slide G provided with the diamond cutter H; all being arranged substantially as and for the purpose set forth.

No. 30,996.—JOHN J. WATSON, WILLIAM HARDIKER, and THOMAS TOYE, of Buffalo, N. Y.—*Improved Apparatus for Ventilating and Warming Railroad Cars*.—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment of the fans D D, pipes E and H, flues P P, registers F F, dampers *d* and *e*, together with furnace G and air space J around said furnace, arranged as set forth, for the purpose of supplying heat and for ventilating the car, substantially as described.

No. 30,997.—ADOLPH E. WENZEL, of New York, N. Y.—*Improved Automatic Lathe Dog*.—Patent dated December 18, 1860.—This invention consists in combining a cam or eccentric with an ordinary lathe dog in such a manner that they will adjust themselves to the diameter of the shaft to be turned, and clutch the said shaft and drive it around in the lathe when it is turned.

Claim.—The combination of the lathe dog A and cam B, substantially as described and for the purpose set forth.

No. 30,998.—LYSANDER WRIGHT, of Newark, N. J.—*Improved Circular Saw Gauge*.—Patent dated December 18, 1860.—This invention consists in the arrangement of the parts named in the claim.

Claim.—The arrangement of the slide B, way A, clamp E, plate F, hinge R, and plate L, connected in the manner and for the purpose set forth.

No. 30,999.—McCLINTOCK YOUNG, JR., of Frederick, Md.—*Improvement in Harvesting Machines*.—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, making a finger bar for a harvesting machine out of two bars of about the same size and strength, and placed at a sufficient distance apart to allow the bolts that fasten the fingers thereto to pass through the space between them, and thus save the boring, drilling, and fitting of bolt holes, substantially as described.

I also claim the combination of the yielding plate F, hinged finger bar G, and hinged track cleaver J, for the purpose of allowing the finger bar and track cleaver to be swung around, folded up, and carried upon the machine, substantially as described.

I also claim the combination of the bar E, plate F, lever L, and brace M, for holding the finger bar in a horizontal position, or allowing it to rise at either end independently of the other end, substantially as described.

I also claim a guard, composed of the pieces *j k l*, made and united to a finger beam, such as is described, by a single bolt passing through the space between the two bars of which said finger bar is composed, as set forth and described.

No. 31,000.—HENRY ESSEX, of Haverstraw, N. Y., assignor to THOMAS H. BATES, of New York City.—*Improvement in Sewing Needles*.—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A sewing needle, having a cylindrical head and point, and a body of triangular form, as shown and described.

No. 31,001.—WARREN GALE, Chicopee Falls, Mass., assignor to himself and B. B. BELCHER, of the same place.—*Improvement in Machines for Cutting Straw, &c.*—Patent dated December 18, 1860.—This invention consists in so combining the stud, or centre pin, upon which the lever of the knife is hung, or works, with the mouth piece of the cutting box, that it shall be adjustable, so as to give the knife the necessary side pressure or bearing against the mouth piece of the box, for the efficient performance of its functions.

Claim.—The combination of the stud D, the carrier C, and the mouth piece A A, with the slots for lateral and angular adjustment of the cutter or knife *m m*, to the stationary edges *a a* of the mouth piece A A, substantially as described.

No. 31,002.—FERDINAND WUTERICH, of New York, N. Y., assignor to himself and JOHN M. HATHAWAY, of said New York.—*Improvement in Machines for Making Cigars.*—Patent dated December 18, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of a concave cylinder, to which the two ends of the belt are fastened, and the arched-forming rollers and conical belt stretchers, substantially as and for the purposes described.

I also claim making the arch-forming rollers of a series of segments, or sleeves, that can move independently of each other, so as to accommodate itself to the different pressure on different parts of the belt, substantially as described.

I also claim the pointing and finishing mechanism S T, when operated substantially as described.

I also claim the conical guides and rolls *i* and *o*, for the purpose of keeping the belt in proper position at its edges, and for adjusting the same when necessary, substantially as described.

I also claim forming a chamber in which a cigar of ordinary shape may be rolled up into form, by means of a bag in an elastic belt and two arched rollers, as described—not meaning to lay any claim to the belt, or the bag formed therein, when used separately from the arched rollers.

No. 31,003.—JOHN NORTH, of Middletown, Ct.—*Improved Padlock.*—Patent dated December 18, 1860.—This invention consists in having the hook, or hasp, cast to the tumbler case, and securing the tumbler to the case by the cap having its outer edge bevelled and fastened by compressing the outer edge of the case to the rim of the cap, and neatly securing it without the aid of rivets.

Claim.—The combination, as constructed, the hook case, and the attaching the tongue, or catch, to the tumbler, as a new article of manufacture, as in the manner described.

No. 31,004.—DANIEL P. SHOPE, of Milesburg, Pa.—*Improved Washing Machine.*—Patent dated December 18, 1860.—The movable frame, that controls the pressure of the rubber upon the rollers, is governed by a foot brake W, and two spiral springs attached to the bottom of the box and piece marked G, one on each side; these springs throw the rubber up from the rollers, which is brought down again by the foot brake at pleasure.

Claim.—The arrangement of the perforated soap box C, with the rubbers I and K, elbow brakes or levers V U B and B *b*, and spiral springs, as shown and described, for the purpose set forth.

CLAIMS OF REISSUES GRANTED DURING THE
YEAR 1860.

No. 874.—*Improved Screw Wrench*.—I claim the use of two screws in working the movable jaw of a wrench, so that the said jaw will travel with the united velocities of said two screws, substantially as set forth.

AWRY G. COES.

No. 875.—*Improvement in Grain and Grass Harvesters*.—I claim, first, in combination with the hinged bar H and the finger bar, the intermediate shoe M, hinged to said bar H, substantially in the manner and for the purpose set forth.

I also claim, in combination with the hinged bar H, a lever that, when released, allows said bar to freely swing around its pivotted points, and when fastened, holds said bar firmly in its adjusted position, as described.

I also claim the shoe M, as a hinge and a support both to the cutter bar, substantially as described.

I also claim the socket or recess n, in the shoe M, for the reception of the finger bar, substantially as described.

I also claim, in combination with a finger bar, hinged at one of its ends to an intermediate piece, also hinged to the main frame, and elevating and supporting castor wheel for carrying that end of the machine, when adjusted for reaping or mowing, substantially as described.

I also claim the combination of a brace or support t, on the shoe, and a similar brace or support u, on the bar H, for resisting the strain on the finger bar when reaping, substantially as described, or for transporting it from place to place.

I also claim the flexible connection for elevating the outer end of the finger bar, substantially as described.

CYRENUS WHEELER, JR.

No. 876.—*Improvement in Grain and Grass Harvesters*.—I claim, in combination with the main frame of a grass harvesting machine, a finger bar, so hinged by one of its ends only to the grain side of the main frame that said finger bar, as it is advanced by means of its hinge, shall be free to rise above and fall below the plane on which the carrying or driving wheels are passing, substantially as described.

CYRENUS WHEELER, JR.

No. 877.—*Improvement in Grain and Grass Harvesters*.—I claim so hinging a finger bar by one of its ends only to the main frame as that it may oscillate or turn around its longitudinal axis, for the purpose of raising or lowering the points of the fingers, to adapt the machine to the condition of the ground or the crop to be cut, substantially as described.

And I also claim, in combination with a finger bar, hinged by one of its ends only to the main frame, so that the points of its fingers can be raised or depressed, a connecting rod or pitman, in two pieces, and so connected that one piece can turn independently of the other for the purpose of preventing the cramping or torsion of said rod, when the finger bar is turned, substantially as described.

CYRENUS WHEELER, JR.

No. 878.—*Improvement in Grain and Grass Harvesters*.—I claim a short finger bar, so hinged by one of its ends only to an arm, brace, or support, that is in turn hinged to the main frame in or near the line of the finger bar, as that said finger bar may rock or roll in the line of its length, as well as rise and fall in a line transverse thereto, by being simply drawn over the ground, substantially as described.

CYRENUS WHEELER, JR.

No. 879.—*Improvement in Grain and Grass Harvesters*.—I claim, in combination with a cut-

ter bar the shoe M, and its hinge, and a supporting piece and its hinged connection to the main frame, the arranging of the pivots of said hinges at right angles to each other, and in or near the line of the finger bar, as described.

CYRENUS WHEELER, JR.

No. 880.—*Improvement in Grain and Grass Harvesters.*—I claim the use of two hinges, substantially as described, whereby the finger beam may be folded to the main frame, in the manner essentially as set forth.

CYRENUS WHEELER, JR.

No. 881.—*Improvement in Grain and Grass Harvesters.*—I claim the combination of the dropping main frame, the loose tongue, and a hinged finger bar, substantially as and for the purpose described.

CYRENUS WHEELER, JR.

No. 882.—*Improvement in Grain and Grass Harvesters.*—I claim, first, in combination with the driving wheel, placed inside the gearing as above described, the angular tongue *i*, for preventing side draft, and, at the same time, allowing the horses to walk on the side of the standing grass or grain.

Second. I claim the above described use of the balance dogs *b b*, under the driver's feet, for throwing the cutting apparatus in and out of gear.

Third. I claim making the parting and gathering board *f* hinged and adjustable, as set forth.

Fourth. I claim regulating the size of the sheaves by means of the several ranges of gearing *p p*, within the driving wheel, in combination with the adjustable pinion *r*, as set forth.

JESSE URMY.

No. 883.—*Improvement in Grain and Grass Harvesters.*—I claim, in combination with a closed guard, the projections on the top and bottom of the cutter bar, for the purpose of clearing out the grass and other matter which tends to lodge in said guard, substantially as described.

JESSE URMY.

No. 884.—*Improvement in Bed Bottoms.*—I claim the spring bearers B and rocker links *c*, in combination with the bed frame, essentially as described.

And I also claim combining the spring bearers B B together and with the frame in lateral directions, by means of wire and clasps, in combination with connecting said bearers at their ends to such frame by means of rocker links, all substantially as hereinbefore specified, and for the purpose of forming a mattress foundation of bar springs, whose bars shall readily accommodate themselves to the varied strains induced by a person's body when lying upon them, and this without injurious strain upon one another.

TYLER HOWE.

No. 885.—*Improved Machine for finishing Hair Brush Handles.*—I claim, first, the employment, in combination with the brush clamp G or pattern H, or their equivalents of a wheel D, which is provided with V or gouge-shaped cutters *b*, or their equivalents, and which act upon the wood, substantially as and for the purpose herein shown and described.

Second. The combination with the pattern H of the brush clamp, of a supporting ledge or projection *a**, or its equivalent, as and for the purpose herein shown and described.

Third. The combination of the guide F, with the clamp G and cutter D, as and for the purpose herein shown and described.

Fourth. Centring the unfinished brushes in the clamp G, by means of the bristles *i*, in connection with the strip or plate J, and the inner curved edge H, or its extension H¹, substantially as described.

THOMAS MITCHELL.

No. 886.—*Improved Washing Machine.*—I claim the employment of the bars *a a*, provided with pins *n n*, when used in connection with a box or cylinder provided with buckets, substantially as and for the purpose herein specified.

I do not wish to confine myself to this or any other form of buckets, but claim the whole principle of dipping and pouring water in whatever form the buckets may be made, or in whatever way they may attach to the machine.

WILLIAM H. TAMBLING.

No. 887.—*Machine for Contracting the Circumference of Wrought Iron Bands.*—What we claim as the invention of William Massey is, first, the combination of two clamping jaws,

or their equivalent, arranged substantially so that a band or bar held by these jaws is caused to be contracted or upset in length by their movement towards each other, for the purpose set forth.

We also claim, in combination with the clamping jaws, a mould or matrix, or its equivalent, arranged between the jaws, substantially as described for the purpose set forth.

And we further claim, in combination with the clamping jaws, the adjustable rest E, or its equivalent, arranged substantially as described to support one side of the bar.

C. L. CROWELL,
ROBERT SMITH,
Assignees.

No. 888.—*Machine for Contracting the Circumference of Wrought Iron Bands.*—What we claim as the invention of William Massey is the method of upsetting or shortening by compression, bands or bars of metal by clamping the band or bar rigidly on either side of the point at which it is to be upset, and then moving the clamps towards each other, substantially as described.

We also claim the method of giving the required form and size and shape to a metal band or bar while being upset by clamping it on either side of the point at which it is to be upset, and forcing it by moving the clamps towards each other, in a mould or matrix, substantially as described.

C. L. CROWELL,
ROBERT SMITH,
Assignees.

No. 889.—*Improved Machine for Seaming Sheet Metal Roofs.*—I claim, first, a suit of seaming rollers mounted in a carriage and operating by the described continuous movement, to produce a standing seam of even height on stationary sheets of metal.

Second. Adapting a seaming carriage, substantially in the manner set forth, to produce a standing seam without other guide than the upturned edges upon which it operates.

Third. In the described combination with the seaming mechanism, the "pioneer" rollers *a a*¹, operating in the manner and for the purposes set forth.

Fourth. The described arrangement and application of a folding roller *c*, operating to turn or fold the edge of the metal from a right to an acute angle, preparatory to the action of seaming or closing rollers, as set forth.

Fifth. The burning, folding, and seaming rollers, constructed, arranged, and operating substantially as set forth, to complete a single or double standing seam at one operation.

Sixth. Arranging the seaming rollers against yielding bearings, substantially as and for the purpose set forth.

Seventh. Making the operative mechanism of a seaming carriage, adjustable in height, for the successive operations of a single and double seaming, as set forth.

Eighth. The operator's seat, applied to a seaming carriage, substantially as and for the purposes set forth.

Ninth. The stirrup *i*, constructed and applied substantially as and for the purposes set forth.

LUCIAN FAY.

No. 890.—*Apparatus for Exhibiting Stereoscopic Pictures.*—I claim a stereoscopic apparatus made to contain a number of stereoscopic pictures, said pictures being attached to an endless belt, band, cord, chain, or apron, in such a manner as to project therefrom and to form an angle therewith, the said endless belt being moved by a roller axle, or pulley, connected with an external handle, the rotation of which causes the successive presentation of the said pictures to the eyes, substantially as described; and I also claim the construction of the slides *D D*, substantially as set forth, when combined with a stereoscopic apparatus.

ALEX. BECKERS.

No. 891.—*Improvement in Slide Valves for Steam Engines.*—I claim the construction and arrangement of the partial rollers *E*, when sustained in their respective positions, substantially in the manner and for the purposes herein set forth.

I also claim providing a slide valve with lips *B*², and stops *B*⁴, substantially as herein shown and described, for the purpose of sustaining the pressure of the steam thereon upon the rolling supports *E*, or their equivalents, and of confining the rolling supports to prevent their becoming displaced.

I do not claim the employment of a cut-off valve *D*, sliding on the back of a valve having passages through which the steam is admitted to the ports in the cylinder, under the control of both valves, but I claim the within described arrangement of the supported back piece *B*, loose face piece *A*, cut-off means *D*, and the united passages *a b a b*, in the respective parts *A B*, whereby the parts *A B* are allowed to work to a limited extent, relatively to each other,

without affecting the action of the steam, nor allowing any escape of the same through the joint.

I likewise claim rigidly connecting the parts A and B, after they have been properly adjusted, by means of the set screws C C, or their equivalents, substantially as and for the purposes herein set forth.

R. C. BRISTOL.

No. 892.—*Improved Regulator for Timekeepers.*—*Claim.* The application to watches, and such time pieces as have their vibrations governed by a balance and hair spring, of a compound regulator composed of two or more segments, constructed and operating substantially as described.

And, also, the combination of said compound regulator, with one or more indicating devices, by which the movement of said regulator may be adjusted or defined, substantially as described.

R. S. MERSHON,
JOHN M. HARPER.

No. 893.—*Improved Mode of Attaching Life Preservers to Vests.*—I claim, first, an air tight bag or pad, that may be introduced or removed from between the face and lining of a vest or other similar garment at pleasure, without disturbing any of the seams of said garment, or impairing its utility as a garment to be worn without said bag or pad, substantially as described.

I also claim, in combination with an air bag or pad, to be applied to vests or other garments, the tube or channel C, when said tube or channel is formed by a continuation of the sides or walls of the bag or pad, and without a seam or other artificial connection or union therewith, substantially as described and for the purpose mentioned.

RICHARD L. NELSON.

No. 894.—*Improved Frame for Ladies' Dresses.*—I claim, first, the arrangement and construction of ladies' figures in parts, and the manner of fastening the separate parts together, substantially as described and for the purpose specified.

Second. I claim the arrangement and construction of the stand and feet for ladies' figures, made in parts in the manner described, and for the purpose substantially as set forth.

JOSEPH R. PALMENBERG.

No. 895.—*Improvement in Skates.*—I claim, first, attaching the runner B to the stock A, by means of the posts or knees $c^* c^*$, welded or firmly connected to the runner and passing through the stock, and having screw threads g formed on them, to receive nuts h , in connection with the sockets d , or any suitable shoulder or bearing surface, placed on the posts or knees, substantially as described.

Second. Having the stock A of the skate formed of two parts $a b$, connected by a spring c , when said stock is combined or used in connection with an elastic or spring runner B, for the purpose herein set forth.

N. C. SANFORD.

No. 896.—*Improvement in Reaping and Mowing Machines.*—We claim a tubular finger bar, when constructed in the peculiar manner, and for the purposes substantially as herein set forth.

JOHN T. WHITAKER.
CALVIN D. READ.

No. 897.—*Improvement in Reaping and Mowing Machines.*—We claim the peculiar arrangement and combination of the raker's seat or stand l , and wheel F, with the finger bar and frame A, whereby the weight of the raker is made to counterbalance the weight of the outer end of the latter, platform, and frame, substantially as set forth.

JOHN T. WHITAKER,
CALVIN D. READ.

No. 898.—*Improvement in Reaping and Mowing Machines.*—We claim mounting the driving wheel upon a tubular stud, secured to the side of a single frame beam, in the manner substantially as set forth, whereby the outer frame beam is dispensed with, and the reel still driven by the direct motion of the wheel, as described.

JOHN T. WHITAKER,
CALVIN D. READ.

No. 899.—*Improvement in Reaping and Mowing Machines.*—We claim loosening and tightening the reel belt by means of the pulleys *g* and *g*¹, screw *h*, and guide frame *j*, the whole being arranged upon the harvester frame, and operated in the manner substantially as set forth.

JOHN T. WHITAKER.
CALVIN D. READ.

No. 900.—*Improvement in Endless Chain Horse Powers.*—I claim, first, the combination of the straight links *c*, and odd links *i*, when constructed, arranged, and operating as described. Second. The combination and arrangement of the hubs or pinions *m m*¹, with the band and driving wheels, as described, for the purposes set forth.

GEORGE WESTINGHOUSE.

No. 901.—*Improvement in Making Nuts.*—What I claim is forcing a portion, or the whole of the metal displaced in forming the holes in the nuts, in the bodies of the nuts, by which I am enabled to make the nuts thicker and more compact than the bar from which they are cut, all substantially as hereinbefore set forth.

R. H. COLE.

No. 902.—*Improvement in Nut Machines.*—I claim the arrangement of the round punch *f*¹, within an aperture in the angular punch *d*, at the same time that a round punch *e* is arranged within an aperture in the bottom *j* of the nut box, when the said round punches are combined with the movement, which causes them to act jointly in perforating holes in the nuts formed in said nut box, substantially as described.

I also claim the joint arrangement of the angular punch *d*, and its interior round punch *f*¹, with the bottom *j* of the nut box, and the interior round punch *e*, when the said bottom of the nut box is combined with a spring, or its equivalent, in such a manner, in relation to the said angular punch *d* and the round punches *e* and *f*¹, that the action of the said parts, in forming a nut, will cause the completed nut to be thicker than the bar from which the blank was cut, substantially as herein set forth.

R. H. COLE.

No. 903.—*Improvement in Railroad Frogs.*—I claim combining the four rails, arranged in the manner before described, to form a frog, by attaching them separately to a series of separate chairs, in manner substantially as herein described, so that each part may be removed for repairs, and replaced independently of the other parts, as set forth.

I also claim holding down the movable end of the springing rail of the frog to its chair, so that it shall be free to expand and contract and spring laterally, by combining it with the chair by means of the lip extending under and embracing the chair, substantially as described.

JAMES M. DICK.

No. 904.—*Improvement in Mowing Machines.*—I claim attaching the cutter bar *B*, and cutter *A*, to the front of the frame of the machine, by means of a plate or bar, so arranged that its front end may be raised or lowered by a lever, independently of the main frame of the machine, and thus give to the cutting apparatus a tilting or rocking movement, which will elevate and lower the points of the fingers, said parts being constructed and applied to the patented machine of E. Ball, above referred to, in the manner substantially as described.

GEO. C. DOLPH.

No. 905.—*Improvement in Faucets.*—I claim, first, the application, to the key stem, of the collar *I*, cushion *Q*, and loose collar *R*, or their equivalents, in the manner and for the purposes described.

Second. The valve stem *L*, formed with three bearing surfaces *m m*¹ *m*², when connected by a floor *N*, and operated upon by a suitable cam *h*, in the manner and for the purpose explained.

Third. The elevated or projecting guide *G*, or its equivalent, when combined substantially as and for the purpose set forth, with a valve stem formed and adapted, to be actuated by a cam or other eccentric on the key stem, in both opening and closing the valve.

JAMES POWELL.

No. 906.—*Improvement in Pole Couplings for Railroad Cars.*—First. What I claim is making the mouth or face of the bunter, between the plates *a* and *b*, entirely open at the sides and in

front, so that the coupling of the pole may be easily made, whether it point directly forward or deviate to the right or to the left, substantially as herein set forth.

Second. I also claim sustaining the pole of a horse car in the proper position, by means of the brace G, substantially as herein described.

BLANEY E. SAMPSON.

No. 907.—*Improvement in Steam Engines.*—I claim adjusting the expansion of steam in steam engines, with the aid of an independent motion, to determine when a weight or spring shall commence to close a separate moving cut-off valve for each end of the cylinder.

FREDERICK E. SICKELS.

No. 908.—*Improvement in Steam Engines.*—I claim the combination of a cam, arm, or wiper, moved by an independent motion, with a reciprocating trip and catch to liberate a weight, spring, or other force that acts to close a cut-off valve.

FREDERICK E. SICKELS.

No. 909.—*Improvement in Steam Engines.*—I claim liberating the closing weight or apparatus to cut off, by the aid of an independent motion, in combination with a regulating reservoir, to resist the force and momentum of the rapidly moving parts in cutting off.

FREDERICK E. SICKELS.

No. 910.—*Improvement in Steam Engines.*—I claim imparting a coexisting movement to two reciprocating catch pieces in the operation of trip cut-off valves.

FREDERICK E. SICKELS.

No. 911.—*Improvement in Steam Engines.*—I claim an adjusting mechanism, so arranged that the relative position of its parts, during any portion of its movement by the engine, can be changed to alter the closing action of the weight that operates the cut-offs, without altering the time or encountering the resistance of opening the two separate moving cut-off valves.

FREDERICK E. SICKELS.

No. 912.—*Improvement in Steam Engines.*—I claim counterbalancing the weight of the lifting rods, so as to relieve the engineer in working the engine by hand, and so that when the engine is hooked on, they will exert their full force in descending to overcome any opposing friction.

FREDERICK E. SICKELS.

No. 913.—*Improvement in the Process of Forming Stitches by Machinery.*—I claim, first, in combination, an eye pointed needle carrying one thread, a hook properly shaped and moved, and a bobbin, supporting and giving off a lower thread, the combination, as a whole, being substantially such as specified and acting to make stitches under the mode of operation, substantially as hereinbefore described.

Second. The combination of a hook so shaped and moved as to spread a loop sufficiently to surround a bobbin, with a bobbin acting as specified, the combination being substantially such as recited hereinbefore, and acting so that a loop is seized, spread, and released with a bobbin thread enclosed in it, and then drawn up tight by the hook.

Third. I claim a revolving hook, so shaped as to operate substantially in the manner specified on loop of needle thread.

Fourth. I claim a hook so shaped and moved as to spread a loop substantially in the manner set forth, in combination with an eye-pointed needle actuated by an eccentric or equivalent motion.

Fifth. I claim feeding the material to be sewed step by step by an instrument, operating and constructed substantially as described, for the purposes specified, in conjunction with a presser foot or surface, governed by a yielding force, such as described.

Sixth. I claim a spring or yielding clamping surface when combined with another surface, so as to grasp cloth between them, and also with a feeding instrument, which is out of contact with the cloth when it is thus clamped, the operation being such that the cloth remains clamped, substantially in the manner and for the purposes specified, while the feeding instrument is out of contact or engagement with the cloth.

Seventh. I claim arranging a hook, that operates substantially in the manner specified, in such relative position to a table for supporting cloth, and to an eye-pointed needle, that the former shall extend loops of needle thread in planes perpendicular, or nearly so, to the plane of the cloth or material to be sewed, substantially as specified.

And, lastly, I claim a horizontal shaft, arranged beneath the platform or table of the machine, by which are actuated the needle, the hook, and the feeding instrument, in combi-

nation with a hook which moves in a vertical plane, or nearly so, the combination being substantially such as described.

ALLEN B. WILSON.

No. 914.—*Improvement in the Process of Forming Stitches by Machinery.*—I claim the mode or process, substantially as hereinbefore specified, of making a double thread stitch by means of machinery, its characteristics being as follows:

First. That there are certain periods in the formation of the seam, two loops of needle thread below the cloth at the same time, one being extended and the other being drawn up substantially in the manner and for the purpose specified.

Second. That the stitch is tightened or drawn up by the extension of the next succeeding loop as distinguished from a drawing up of the stitch by the motion of the needle or needle bar.

ALLEN B. WILSON.

No. 915.—*Improvement in Machines for Knitting Stockings, &c.*—What is claimed as the invention of Henry Burt is: The mechanism for "narrowing and widening," the same consisting of the movable stops $a^2 a^2$, combined with a rack of teeth or other suitable contrivance formed upon the shifting bar, and acting upon the carriage O of the yarn guide, as set forth.

Also, the stop rack k^1 , combined with the tube s of the yarn guide, and actuated in the manner and for the purpose as set forth.

Also, the mechanism which effects the changes of the clutches, the same consisting of the shifting bar, the arbor u^2 having a circular depression and radial recesses in its head, and levers and other parts connected to the same, and connecting the same with clutches, the whole being arranged and operating substantially as hereinbefore specified.

Also, the stationary roller y^1 and the projections $t^3 u^3$ and their intervening curve, formed upon the shifting bar, in combination with the spring s^3 , the sliding toggle bars; and also in combination with the rail t^1 and its depressions, the whole being for the object as described.

Also, the cloth bar c^1 , arranged and operating in the manner and for the purpose as set forth.

Also, the particular method by which the depressing bar c is carried and forced down upon the pointed ends or barbs of the needles in order to press them into the grooves in their shanks, viz: by a combination of bent levers $f^2 g^2 h^2$ and arms i^2 , the same being actuated substantially as described.

Also, the manner of raising the stitch hooks, viz: by an elevating plate y, through which they extend, and which is combined with and operates them, as set forth.

Also, the method of cleaning the point or lower end of the yarn guide from the depressing bar when the latter descends upon the needles, viz: by a ledge b on the said bar, in combination with the roller a applied to the T piece of the yarn guide, the whole being as specified.

Also, the method of cleaning the point of the yarn guide from the stitch hooks when the roller r passes by the thread guide, or as soon as the lateral motion of the thread guide is stopped, viz: by the bevelled edge plate k^2 , in combination with the screw, or other contrivance of similar character, projecting from the T piece of the yarn guide.

Also, the mode of adjusting or regulating the distance to which the points of the needles shall retreat, viz: by the movable curved pieces $o^2 p^2$ making part of the cam m^2 , the same being arranged and operating substantially as explained.

Also, the combination of the mechanism, being the arm q and shaft o, supported by pivots p p, which sustains and carries the roller r of the depressing and elevating bar v, raised and depressed by machinery, substantially as described.

DAVID A. HAYS,
President, &c.

No. 916.—*Improvement in Machines for Knitting Stockings, &c.*—What is claimed as the invention of Henry Burt is: the combination, with a knitting machine which is capable of producing a fabric of uniform width, of a pattern cylinder, or equivalent governing device, having upon it a prearranged pattern, in such manner that said device shall control automatically the formation of more or less stitches or loops as the work progresses, whereby variations in the width of the fabric may be effected in accordance with said prearranged pattern, as set forth herein.

DAVID A. HAYS,
President, &c.

No. 917.—*Improvement in Reaping Machines.*—I claim the combination of the finger beam, without a platform, the short open slot fingers, having small projections below the cutter, the scalloped cutter, and the guides for the cutter, these parts being constructed and combined substantially as described, the cutter vibrating in a straight line, each scallop having an edge

sliding in close proximity to an angular corner of the finger, and forming therewith a nipping angle, substantially as described.

OBED HUSSEY.

No. 918.—*Improved Water Wheel*.—I claim the wheel A and rotating breast or abutment E moving with different degrees of velocity, in combination with the apron or concave D; the whole being arranged to operate as and for the purpose specified.

P. H. ROOTS.

No. 919.—*Improvement in Coffins*.—We claim, first, the manufacturing of coffins of cast or raised metal when made substantially in the form and manner above described—that is to say, corresponding nearly with the human form and making the coffin in two parts or shells, united by a flanch, substantially as above set forth.

Second. The manufacture of coffins of raised or cast metal, in two shells each, formed with recesses of greater or less depth, which shall respectively constitute a portion of the receptacle of the corpse, thus approximating the coffin more nearly in shape to that of the human body than could otherwise be done.

J. G. FORBES.
R. SQUIRES.

No. 920.—*Improvement in Machines for Making Paper Bags*.—I claim the machine as a whole composed of mechanism for forming, feeding, cutting, pasting the tube or bag, combined, arranged, and operating substantially as described.

I also claim the use of a supporting bar, or its equivalent, around which paper may be formed into a tube, and in connection with which the said paper tube may be severed, each and the whole substantially as described.

I also claim giving the paper the variable feeding motion, for the purpose and in the manner substantially as described.

I also claim cutting the paper, without waste of material, in such a form as shall have suitable projections for the formation of the bottom lap or seam of the bag, and for the convenient opening of the bag at the mouth, substantially as described.

BENJAMIN F. RICE.

No. 921.—*Improved Valve for Steam Engines*.—I claim the oscillating valve constructed with an opening right through it and with two eccentric faces, and fitted to a double seat of correspondingly eccentric form which contains opposite ports or openings that are covered and closed by the faces of the said valve whenever the said valve is in contact with the said seat, substantially as herein described.

ADDISON CROSBY.

No. 922.—*Improvement in Railroad Chairs*.—I claim the construction of the chair, as herein shown and described, so that the passing weight will cause the jaws of the chair to gripe the rails, as and for the purpose herein shown and described.

D. W. CROCKER.

No. 923.—*Improvement in Fire Proof Safes*.—We claim, first, the employment of hydraulic cement, in whole or in part, as forming the insulating medium or admixture used between the outer and inner cases of safes and chests when said inner cases are formed of iron or metal, substantially as herein described for the purposes set forth.

Second. Joining the outer and inner metallic cases of safes and chests, by means of the door frame c and flanges b, or their equivalents, when said hydraulic cement, in whole or in part, is used as the insulating medium between said metallic cases, as herein described, and also by means of the anchors or bolts d extending from the outer and inner cases into the space between said cases, substantially as and for the purposes set forth.

EDWARD HALL.
JOSEPH L. HALL.

No. 924.—*Improved Burglar's Alarm*.—I claim the making of the knob of a drawer movable, and so combining it with an alarm apparatus as to cause an alarm to be sounded whenever an attempt to open the drawer by pulling on the knob is attempted.

I also claim the combination of the latch or spring bolt, and the secondary bolt, and key or lever, with the movable knob and the drawer, the same being to operate together as specified.

I also claim the combining of the alarm pawl m with the knob rod by means of a movable hanging lever u, to be operated or moved by a stud, or its equivalent, fixed in the knob rod.

I also claim the combination of a decoy key, or an auxiliary alarm springing mechanism,

with an alarm giving apparatus, its springing device and a latching or bolting apparatus applied to a drawer, or its equivalent, the said decoy key or auxiliary alarm springing mechanism, when put in motion, operating to set in movement the said alarm giving apparatus, so as to cause it to sound an alarm as it would be caused to do by reason of any movement of its main springing device.

I also claim connecting the decoy key with the hanging lever, so as to operate as specified; also connecting the said hanging lever to the secondary lever, so that a forward pull on the secondary lever shall move the hanging lever, so as to effect the sounding of the alarm.

I also claim the combination of the counter, or numbered wheel, and its operative mechanism with the knob rod, the same being to exhibit the number of the attempts at opening the drawer, meaning also to claim the so combining the operative mechanism of the counter wheel with the hanging lever that a movement of the latter will effect a movement of the said wheel.

EPHRAIM BROWN.

No. 925.—*Improvement in the Mode of Staying Piles for Wharves, Piers, &c.*—I claim, first, the linked frame S S, constructed and operating as described, for the purpose specified.

Second. In combination with piles, as described, the sleeves *a* and braces *b*, constructed and operating substantially as specified.

E. H. ANGAMAR.

No. 926.—*Improvement in Knitting Machines.*—Claim. First. The use of a hollow circular needle plate, substantially as hereinbefore described, and having grooves in the outer or upper surface, for the purpose hereinbefore set forth.

Second. The loop regulator I, or equivalent thereof, for the purposes and object substantially as hereinbefore described.

Third. The loop regulator, or equivalent thereof, in combination with the needle *a*, and hollow circular needle plate A, having grooves in the outer or upper surface, as hereinbefore described, the said several parts operating in the manner and for the purposes as before set forth.

JONAS B. AIKEN.

No. 927.—*Improvement in the Ventilation of Hats.*—I claim a ventilating piece, having a smooth surface next the head, and grooves or openings next the brim, and made of India rubber, gutta percha, or prepared paper, and firm enough not to crush or close up said openings, and impervious to perspiration, as herein represented, and for the purpose set forth.

JNO. McMANNUS.

No. 928.—*Improved Chain Machine.*—I claim, first, the combination of a punch, plunger, or other equivalent instrument, with a forming guide, or its equivalent, substantially as described.

Second. I also claim the combination of a forming guide, or its equivalent, with the instruments coöperating with said guide, or their equivalents, to effect the bending of the arms, substantially as described.

Third. I also claim the combination of a die *j*, Fig. 6, or its equivalent, for giving the first bend to the link, with a forming guide, or its equivalent, substantially as described.

Fourth. I also claim the combination of a carrier, on which the link is transported, with a forming guide in which the link is deposited, or their equivalents, substantially as described.

Fifth. I also claim the forming guide for holding and transmitting the chain during the formation thereof, or its equivalent, substantially as described.

Sixth. I also claim giving to the forming guide an angular or intermittent rotary movement upon its axis, so as to present the chain to the successive links in such positions that the arms thereof will alternately interlock.

Seventh. I also claim the slender converging rods *r r*, or their equivalent instruments, for holding down the top link while the arms of the link next beneath are being bent over it, substantially as described.

Eighth. I also claim the arrangement and operation of the slides *a a*, or their equivalent, substantially as described, so as to bend the arms of each link successively by pairs and cause the succeeding pair or pairs to overlap the preceding ones, or in case the links have an odd number of arms, to cause the succeeding arms of each link to overlap the preceding ones, singly in succession.

LAWRISTON TOWNE.

No. 929.—*Improved Spring Bed Bottom.*—I claim, first, the method herein described of connecting the spring *b*, or any equivalent means, to the strip *a*, by which the same is secured in place by contact between compressing surfaces, substantially in the manner and for the purposes set forth.

Second. I also claim the use and application of the strip *a*, substantially in the manner and for the purpose specified.

PHILIP ULMER.

No. 930.—*Improvement in Flouring Mills*.—I claim, first, the arrangement of tubes B and C, connected by the supplemental shoe K, with the air tight chamber A, in the manner described, and for the purposes specified.

Second. I do not claim the suction blast or draft as new; but what I do claim is, cleaning grain through a tube or case at the point K, by means of tube or case C and K, and blast fan D, or their equivalent, as set forth.

D. S. WAGENER.

No. 931.—*Improvement in Furnaces for Evaporating Sugar Juices*.—I claim, first, the hemispherical kettle, with alternate converging flutes, as and for the purpose described.

Second. In combination with the said kettle, fluting the surrounding brick work, as described, so as to form an undulating flue around the kettle.

Third. Passing the connecting pipes of the kettles through the flues, whereby they are utilized as evaporators, as set forth.

Fourth. The inclined gutter, in combination with the gutters of the respective kettles, as described.

Fifth. The cylindrical flue enclosing the kettle, connected with the exit flue, and communicating with the undulating flue at top by graduated draft channels, substantially as set forth.

L. LEFEBVRE.

No. 932.—*Improvement in Gas Regulators*.—I claim arranging the graduated lever 4 with the adjustable weight 17, in combination with the gasometer 22, and the valve 10, in such a manner that, by raising the gasometer, the valve is closed and the supply of gas stopped, so that the pressure of the gas in the gasometer can be regulated by adjusting the weight 17.

And, in combination with the lever, gasometer, and reservoir, I claim admitting the gas direct against the gasometer by means of a small tube 8, which is contracted toward its upper end so that impurities carried up by the gas, or any deposit, will fall outside of the said tube without being able to interfere with the working part of the gas regulator.

I also claim arranging the stud 21, in combination with the lever 4, rod 9, and valve 10, in such a manner that, by depressing the stud 21, the supply of gas may be ascertained without raising the cover of the gas regulator.

WILLIAM MALLERD.

No. 933.—*Improvement in Machines for Pressing Bonnets, Bonnet Frames, &c.*—I claim, as the invention of William Osborn, deceased, first, pressing the whole of a bonnet, frame, or similar article, at one operation by dies, substantially as specified, whether formed of one or of several pieces, and irrespective of the particular size or shape.

I also claim forming the side crown and flaring face piece of a bonnet frame in one piece, or at one operation, as specified.

MARY J. OSBORN,
Executrix.

No. 934.—*Improved Air Heating Furnace*.—I claim the improved furnace, constructed with its dome F, closed at top, and made to open into the radiator only through a series of columns, extending upward into the same, with a radiator having its bottom plate to cover the entire dome F, in manner substantially as described.

I also claim the improvement in the construction of the radiator arranged over the dome of the fire pot, the same consisting in making its bottom a concavo-convex plate, or arch, and with the concave side disposed downwards, and directly over said dome, whereby the ascending heat from the top of the dome is retained in the concavity of said bottom, and not only made to warm, to great advantage, the air that rushes into the same, but to heat the radiator, so as to improve the draft through the fire pot and supporting columns of the radiator.

WALTER BRYENT.

No. 935.—*Improvement in Harvesters*.—I claim, first, in an automatic raking device, the combination of the bar *f*, standing at an angle with the wing C, the bar S, and the rake A, arranged in relation to the taper space R, in the manner and for the purpose substantially as above specified.

Second. The combination of the bar S and the rake A so arranged and operating that the rake which at first moves longitudinally with the straw shall afterwards change its relation thereto and compress it laterally against the bar S, so as to hold it firmly in place until it is deposited at the opening R in a compact gavel lying nearly parallel with the direction in which the machine moves, substantially as above set forth.

Third. The combination of the elastic metal cap or sheath *c* connecting the divider *b* with the main wing *C*, with the reversed hook or bent projecting end *d*, for an automatic rake, when said parts are so constructed and arranged for joint operation, essentially in the manner and for the purposes set forth.

PELLS MANNY.

No. 936.—*Improvement in the Production of Illuminating Gas.*—I claim the production of an illuminating gas by passing the vapor of water and a hydro-carbon, or its equivalent, mixed previously to decomposition, into a retort containing carbon at a high red heat, substantially in the manner above set forth.

J. MILTON SANDERS.

No. 937.—*Improved Low Water Alarm for Steam Boilers.*—I claim, first, so combining a steam valve and chamber with a ball or float as that the pressure of the steam in the boiler, in conjunction with the weight of the ball or float, will, when the water falls so low in the boiler that the upward force of the float does not sustain said valve, open said valve and make a free escape of the steam, substantially as described.

Second. I claim, in combination with a valve that is opened by the pressure of the steam and the aid of the ball or float, another valve *e*¹ of lesser area, that closes one end of the steam cylinder, so long as the water in the boiler remains at the proper height therein and the pressure of the steam does not exceed a certain amount, substantially as described.

Third. I claim, in combination with a valve, opened by the pressure of the steam, and by the aid of the ball or float, and which are not resisted by a weight or weighted lever, a steam whistle, bell, or other means of giving an alarm, by the escape of the steam, substantially as described.

Fourth. I claim the combination of the float and the differential valves with the steam chamber for the purpose of opening said valves by immersing the float deeper in the water to sound an alarm when there existed an excessive pressure of steam in the boiler, substantially as described.

SELAH DUSTIN.

No. 938.—*Improvement in Straw Cutters.*—I claim, first, arranging the flange or flanges on one cylinder so that they will meet the knife or knives on the other cylinder as the two cylinders rotate, substantially in the manner described, and this I claim whether the flange is or is not made of, or armed on its face with, soft material.

Second. I also claim, in combination with the flanged cylinders, the throat placed in such relative position to said cylinders as to nearly meet the latter at a desired point in their revolution, thus assisting to give a long cut if said throat be expanded, and a shorter cut when the throat is contracted, substantially as described.

WARREN GALE

No. 939.—*Improvement in Manure Excavators.*—I claim, first, the employment of the hinged pitch fork or rake, having an oblong slot *e* and a stop notch *g* in its handle *E*, in combination with the curved hinged locking bar *F* and a draft bar *B a*, substantially as and for the purposes set forth.

Second. The combination of the devices mentioned above with a sled or carriage *A*, substantially as and for the purposes set forth.

ABRAHAM R. HURST.

No. 940.—*Improvement in Machines for Enamelling Mouldings.*—I claim the combination of the mechanism, or the equivalent thereof, for propelling the moulding with the plate, the lower edge of which is formed the reverse of the moulding to strike off the surplus enamelling, and to rub it down, and with the bed or gauge which sustains the moulding in its proper relations to the said plate, substantially as and for the purpose specified.

I also claim, in combination with the combination above claimed, the employment of the side plates at the sides of the moulding, substantially as and for the purpose specified.

And I also claim, in combination with the parts enumerated as claimed in combination in the second of the above claims, the employment of the other of the plates specified as having its lower edge of the reverse form of the moulding, substantially as and for the purpose specified.

And, finally, I claim making each of the said end plates, and each of the said side plates, or all of them, self-adapting by yielding pressure, substantially as described, when combined with the mechanism, or its equivalent, for feeding the moulding and with the bed or gauge, substantially as and for the purpose specified.

ROBERT MARCHER.

No. 941.—*Improvement in Machines for Folding Paper.*—I claim, first, a slotted plate *B*, table or contrivance for receiving and supporting the sheet.

Second. Two parallel planes or plates (L M) extending at right angles from such support, and so arranged that there shall be one of the said plates on each side of the slot *b* of the first element or support of the sheet.

Third. A striking and folding frame or plate D so arranged and operated as to press the paper against the middle or other part of it, force it downward through the slot and between the two parallel plates, the said parallel plates operating to complete the fold and hold the sheet of paper during the return or retrograde movement of the striking frame or plate.

And in combination therewith I claim a second striking and folding plate N, arranged at right angles to the said two parallel plates, and made so as to press or operate through them or their slots, and directly after the said retrograde movement of the first one as to press against the sheet of paper and force it through one of the said slots and thereby once more or a second time fold it.

And I claim in combination with such second combination of mechanism a third striking and folding plate R, and slotted parallel folding plate S, and friction rollers *p q*, or equivalent contrivances, the same being for supporting the twice folded sheet of paper, folding it a third time, and subsequently discharging it, such discharge taking place in consequence of the return or retrograde movement of the striking or doubling plate, as above described.

I also claim the combination of one or more register points or a registering apparatus with the sheet receiving table or platform, and an apparatus for producing one or more folds in the sheet.

I also claim a combination composed not only of machinery for folding sheets of paper, but machinery for receiving and piling or packing such sheets in a regular pile or pack.

And I also claim the combination of mechanism which is applied to the striking plate and its rollers or folding contrivances and used for packing the sheets; the said mechanism consisting of the stationary plate T and the spring plate U, or plate and its springs or other proper equivalents, which permit the recession of the plate in proportion as the pack of sheets increases in size; the whole being arranged and made to operate substantially in the manner as hereinbefore specified.

I also claim the combination of one or more edged gauges C C¹ C², with the sheet-receiving platform, and an apparatus for folding paper, substantially as described.

GEORGE K. SNOW.

No. 942.—*Improvement in Dispensing Switches on Railroads.*—I claim the employment, in connection with the sidings or turnouts on railways, of supplementary inclined and elevated rails in combination with car wheels so constructed as regards the said inclined rails, which are so arranged, as regards the rails of the siding or turnout, that the wheels may be elevated above and free from the control of the rails of one track and be placed under the control of those of another track, as herein set forth.

WILLIAM WHARTON, JR.

No. 943.—*Mode of Constructing Matrices, &c.*—I claim, first, to render the copper of alloy and tin (when even mixed with other metals or ingredients) pliable, soft, and in such a state as to admit of an easy and perfect impression of any proper design, figure, mould, or object of or on metal; this figure, design, or mould, may be engraved or be produced by the art of electrotyping, as a copy of any design or figure, thus yielding and producing a perfect mould, matrix, or die.

Second. I claim the discovery that the alloy of copper and tin possesses the property to be pliable, soft almost like wax, when under a red heat, and enabling us to press it into any proper mould, and that this alloy will receive a perfect and sharp impression of such mould, article, or design, while under a red heat, without applying a great power in pressing.

Third. I claim, in connection, to manufacture printing type out of the alloy of copper and tin, (when even mixed with other metals or ingredients,) by rendering the alloy so pliable and soft by fire that it may be forced into any type-mould by applying pressure, receiving a perfect impression of such mould and in the mould already described.

JOHN JOSEPH CHARLES SMITH.

No. 944.—*Improvement in Coal Stoves.*—What we claim as the invention of Henry Stanley is, first, the combination of the grate *i* with the chamber E, substantially as and for the purposes set forth.

We also claim the upper section and flues, with the chamber E, or its equivalent, as and for the purposes specified.

We also claim the combination of the shell or projection *x*, and the opening *s*, to diffuse and heat the air before it enters the combustion chamber.

CHARLES EDDY.
JACOB SHAVOR.

No. 945.—*Improved Machine for Planing Lumber "out of wind."*—We claim, first, the peculiar construction of cutter head herein described; the cutter head itself being made use of to

turn and break the shaving, in the manner of a double iron plane, and being furthermore made concave for the purpose of facilitating this operation.

Second. The clamp as herein described for the purpose of dogging the lumber to the bed of the machine, the body of the clamp being pivotted at *d*, and forced up by the screw *F*, or its equivalent, the dog *h* being adjustable therein, in the manner and for the purpose set forth.

Third. The within described method of securing the dog *M* to the bed of the machine by means of the teeth or cogs *l*, and the mortises in the side pieces *m*, for the purpose set forth.

Fourth. I claim the bar *D*, or its equivalent, in combination with a rotary cutter head and travelling bed *I*, provided with suitable dogs, for planing straight, and out of wind, substantially as set forth.

SOLOMON S. GRAY.

S. A. WOODS.

No. 946.—*Improved Automatic Boiler Feeder*.—I claim, first, the oscillation of the chambers *L L*¹, by the gravity of the water, for the purpose of alternately filling the chambers and emptying their contents into the boiler as set forth, when the said chambers are combined with the arrangement of means for filling and emptying them, as described.

Second. The combination of the chambers *L L*¹, oscillated as described, with the cylinder *C* and shell *K* constructed as set forth, for the purpose of producing a communication between one of the chambers and the interior of the boiler, at the same time that a communication is produced between the other chamber and the tank *F*, to allow one chamber to be filled with water from the tank, while the contents of the other chamber is being emptied into the boiler.

Third. The combination, with the chambers *L L*¹, oscillated as described, of the pipe *D*, to govern the movement of the chambers as set forth.

SIMON B. HUNT,

Assignee of *H. B. Adams*.

No. 947.—*Improvement in Looms for Weaving Figured Fabrics*.—I claim combining with the jacks that operate the series of leaves of heddles, and with the lifter and depresser, and pattern chain, or any equivalent apparatus for determining the pattern, a mechanism for holding the jacks either in their elevated or depressed position, when not required to be operated, substantially as and for the purpose specified.

I also claim imparting an irregular motion, substantially such as herein described, to the jacks, by means of eccentric cog wheels, substantially as and for the purpose specified.

MOSES MARSHALL.

No. 948.—*Improvement in Knitting Machines*.—I claim the improvement of driving the rough roller *A* of the herein specified take-up mechanism of a rotary knitting machine, by means of the friction apparatus herein set forth, or their mechanical equivalents, substantially in the manner and for the purposes herein described, instead of giving a positive rotary motion to this roller as heretofore; so that this draft roller with its incumbent take-up roller *B*, by the combination of a friction driver, without any additional mechanism or any adjustment, continually gives the same tension to the web in knitting, however much the yarn varies in size, or whether much or little yarn is fed to the needles, or whatever quantity of web is on the take-up roller.

CLARK TOMPKINS.

No. 949.—*Improvement in Apparatus for Making Glass Stoppers for Bottles, &c.*—I claim forming the projections on the cap of the vessel by means of the radial punches or their equivalents, and the vertical recesses on the plunger or die, which recesses allow the said plunger to be withdrawn after the formation of the projection as set forth.

THOMAS R. HARTELL.

No. 950.—*Improvement in Casting Boxes for Wheel Hubs*.—What we claim as the invention of Thomas Ellis is, supporting the sand core *E* between two sand heads *F*, or their equivalents, when used in combination with a chamber *D* of uniform taper, in the manner and for the purpose substantially as herein set forth.

THOMAS ELLIS.

WILLIAM A. ELLIS.

A. D. ELLIS.

No. 951.—*Improvement in Grain and Grass Harvesters*.—What is claimed as the invention of Collins B. Brown is, first, the bent main beam so constructed as to serve as an axle for the driving wheel, a finger beam and a support for the rear end of the tongue, and the greater portion of the gearing, whereby the machine is rendered compact, strong, and simple, substantially as described.

Second. Constructing the main beam of a reaper and mower with a variable bend, for the purposes substantially as described.

Third. The combination of the pallets J j, geared together, and the arm G, or its equivalent, with the tappet wheel C, or its equivalent, for imparting to the cutter a vibrating motion, substantially as described.

CORNELIUS AULTMAN.
LEWIS MILLER.
T. R. TONNER.
JACOB MILLER.
GEORGE COOK.

No. 952.—*Improvement in Grain and Grass Harvesters.*—What is claimed as the invention of Collins B. Brown is, first, the combination of a skeleton track clearer with the cutting apparatus of a mowing machine, substantially as described.

Second. The construction of skeleton track clearers of a series of fingers, substantially as described.

Third. A yielding finger, or the equivalent thereof, in track clearers, substantially as described.

CORNELIUS AULTMAN.
LEWIS MILLER.
T. R. TONNER.
JACOB MILLER.
GEORGE COOK.

No. 953.—*Improved Machine for Cutting Loaf Sugar.*—We claim, first, the application and use of two or more rollers, having brushes around their circumferences, and acting upon both sides of slabs of sugar, for the purpose of cleaning off the dust adhering to the same, by the process of sawing, thereby reproducing the appearance of the crystals, as described.

Secondly. We claim in a machine for cutting loaf sugar the combination of two circular surfaces, with knives or cutters on each, and the knives or cutters opposite each other substantially corresponding in form, and so combined that in operation the knives or cutters will act simultaneously on each side of the slab of sugar, in the manner and for the purpose substantially as described.

ADOLPH BROWN.
FELIX BROWN.

No. 954.—*Improvement in Grinding the Inner Surfaces of Cast Iron Kettles.*—I claim forcing around the interior surface loose pieces of grinding material by means of revolving wings or other sufficient apparatus which shall cause said loose pieces to revolve around while they are left free to act upon the surface with which they are brought into contact, substantially in the manner and for the purpose set forth.

C. C. BRADLEY, JR.

No. 955.—*Improved Mode of Hanging Bells.*—What I claim is, securing the bell firmly in the yoke and suspending the bell upon the shoulder of the bolt c, passing up through a round hole cast or made in the top of the bell and shank, by the nut and thread upon the end of such bolt, in combination with the round tapering shank of the bell, and corresponding tapering hole in the yoke.

G. W. HILDRETH.

No. 956. *Improvement in Cooking Ranges.*—I claim, first, the combination of the flanges or projections attached to the side plates of the boiler chambers, with the grate constructed so as to admit air to the fuel from below, and hung so as to allow of its free play, and made narrower than the fire chamber as described, whereby the contraction and expansion of the grate is prevented from injuriously affecting the remaining portions of the range or stove.

Second. In combination with the back plate constructed as described, I claim providing the boiler chamber with flanges or projections of such shape and width as to lap over the lateral end of said back plate, whereby the plate is allowed to expand and contract without deteriorating the parts adjacent thereto, and without leaving open spaces for the escape at the sides of the products of combustion, substantially as herein set forth.

Third. The use of the sliding covers q q, in combination with the top plate, arranged to operate substantially as described.

H. H. STIMPSON.

No. 957.—*Improvement in Cellular Iron Pavement.*—We claim combining together a series of hexagonally formed ribs and cells, so as to constitute a block of pavement of the form shown upon the drawing.

We also claim constructing each cell perfect in itself, and by such construction making the cells of the upper periphery of the block not only uniform, but answering as ledges to sup-

port the same upon the adjoining block, and thereby distribute the superincumbent weight equally along the whole side of the block, substantially in the firm manner herein described.

S. H. TITUS.
O. DES GRANGES.

No. 958.—*Improvement in Coal Stoves.*—What we claim as the invention of Henry Stanley is the manner in which he arranged and combined, as a whole, the two sections or stories thereof, consisting of two cylinders, each with four triangular radiating flues arranged around and in contact with the same, one at each corner of the said plinth or base, which flues communicate with the flue space in the plinth or base, with the intermediate chamber E and with the cornice space G, as herein described and set forth.

We also claim the combination of the grate *i* with the intermediate chamber E, substantially as and for the purposes herein set forth.

We also claim the combination of the upper section or story, and the flues arranged and connected therewith, with the intermediate chamber E, or its equivalent, as and for the purpose herein specified.

We also claim the combination of the said shell or projection *x* with the said opening *s* to diffuse and heat the air preparatory to its entrance under and into the fire to aid, facilitate, and promote the combustion of the fuel, and to increase the volume or quantity of heat by means thereof, as herein described.

We also claim the combination of the chamber H, having therein the damper *o*, and thereto attached the exit pipe F, with the intermediate chamber E and the cornice G, as herein described and set forth.

CHARLES EDDY.
JACOB SHAVOR.

No. 959.—*Improvement in Bonnet Frames.*—What I claim in the manufacture of ladies' bonnet frames, is making the tip of bonnet frames of two separate thicknesses of the fabric known as cape net by subjecting the same while in a moist state to heat and pressure in metallic moulds of the required form to impart the required shape and effect the union of the two thicknesses at one and the same operation, substantially as described.

I also claim making the crown of bonnet frames of two separate thicknesses of the fabric known as cape net by subjecting the same while in a moist state to heat and pressure in the metallic moulds of the required form to impart the required shape and effect the union of the two thicknesses at one and the same operation, substantially as described.

And I also claim making the entire bonnet frame of two separate thicknesses of the fabric known as cape net by subjecting the same while in a moist state to heat and pressure in metallic moulds of the required form to impart the required shape and effect the union of the two thicknesses at one and the same operation, substantially as described.

WHITTEN E. KIDD.

No. 960.—*Improved Composition for Preventing the Incrustation of Steam Boilers.*—We claim the application of a compound of alum, glue, wood ashes, and wheat bran, prepared and applied, as above specified, to prevent incrustations on the interior of steam boilers and pipes of whatever kind pertaining thereto, as herein specified and substantially set forth.

H. FREDERICK KNODERER.
LEVI F. KNODERER.

No. 961.—*Improvement in Water Proof Leather Goods.*—I claim the article of manufacture herein named, prepared for the undressed skin, exposed to heat, coated with the charged rubber solution or compound, and then subjected to the vulcanizing process, as herein set forth.

SAMUEL LAFORGE.

No. 962.—*Improvement in Corn Huskers.*—I claim the combination of husking rollers and pressure flap, operating substantially as and for the purpose set forth.

DAVID M. MEFFORD.

No. 963.—*Improvement in Knitting Machines.*—We claim the apparatus for revolving the take-up machinery in unison with the needle cylinder, as herein specified, substantially in the manner and for the purpose set forth.

We also claim revolving the shaping plates S and C by a positive motion with and at the same velocity as the take-up motion, substantially as described and for the purpose specified.

CLARK TOMPKINS.
JOHN JOHNSON.

No. 964.—*Improvement in Burglar's Alarms.*—I claim, first, the employment, in connection with the within described gun, or alarm, an adjustable gimlet screw D, which is secured in the dovetailed groove in the body while in use, and which is secured in the barrel or bore by a screw when not in use, substantially as herein specified.

Second. The employment of the two slides A¹ A¹, between which the hammer falls, which serve to prevent particles of the cap from flying off, and at the same time forming a snug protection for the hammer and causing a louder report of the cap, as herein fully described.

Third. Securing the rear of the spring F to the body of the gun by means of the nipple, which passes through said spring and screws into the body, substantially as and for the purpose specified.

J. A. REQUA,

President of the Wilson Manufacturing Company.

No. 965.—*Improvement in Curtain Fixtures.*—I claim operating the lever c, which arrests the curtain roll, by means of the cord which raises the curtain, whereby the curtain is held stationary when the cord hangs vertically and is set free to be raised or lowered when the cord is drawn at an angle, as set forth.

LEWIS WHITE.

No. 966.—*Improvement in Harvesters.*—I claim, first, the combination of the crank, operated by the main shaft, with the rake and sweep post to which it is attached, and the eighth arm, when arranged in the manner described.

Second. The wire gauze divider, or its equivalent, when arranged on the rake head, as set forth, to divide the falling grain from that which is being removed by the rake, as described, and for the purpose specified.

Third. The pivotted sweep post, with its eighth arm, in combination with the crank H, and the mechanism connecting them, giving the reciprocating motion to the rake; the whole being constructed, arranged, and operated substantially as described.

Fourth. The arrangement, substantially as described, of the connecting rods O and N, the sleeve L, and slide M, in advance of and in relation to the main shaft and rake shank, as and for the purpose specified.

Fifth. The spring catch marked C and dog marked a, in combination, and the location of said catch to break the forward motion of the rake and aid its return by the spring, substantially as described.

Sixth. The projection on the lower side of the slot or notch in the dog to arrest the catch with certainty, in the manner described.

Seventh. The application and arrangement of the toothed rack, connected with the spring, by which the rake is caught and held after its descent upon the cut grain on the platform, and whereby its rebound is prevented, and the gavel is removed with greater certainty and regularity.

Eighth. The placing of a rake, having spring teeth, in the rear of the machine, for the purpose of gleaning and contracting the gavels into sheaf form, substantially as described.

Ninth. The combination of the cam attached to the main shaft, with the arm of the rear rake, to cause it to pass over the gavels at the proper time, as described.

Tenth. The ratchet cam I, and lever, in combination, substantially as described, for throwing both rakes into or out of action, as set forth.

CORNELIUS R. BRINCKERHOFF.

No. 967.—*Improvement in Sugar Mould Carriages.*—I claim, first, the construction and arrangement of carriages for the holding and conveying of sugar moulds, the same consisting essentially in the combination of a platform provided with a suitable train of wheels of small diameter, for vertically supporting the moulds, with a series of semicircular braces, or their equivalents, and guard chains or bars, for laterally holding said moulds, substantially as set forth.

Second. In sugar mould carriages, constructed as described, with a brace plate arranged at a higher level relatively to the platform, I claim the two wheels running on or with one or two axles fixed to the platform, in combination with a swivel wheel, the shank or standard of which is made to bear against the said brace plate, whereby the carriage may be moved about with greater facility than this has ever been done heretofore.

Third. The combination and arrangement of stationary pins and India rubber washers, or their equivalents, in the platform, so that the moulds, when in position upon and supported by the platform, shall have their drip holes closed by their own weight, substantially in the manner and for the purposes herein specified.

Fourth. The general construction, combination, and arrangement of sugar mould carriages, as herein shown and described, so as to operate substantially in the manner and for the purposes set forth.

C. E. BERTRAND.

No. 968.—*Apparatus for Heating or Cooking by Gas.*—I claim the combination of an air and gas burner, and an air guide or concentrator G, operating in the manner substantially as set forth, for the purpose specified.

Second. I claim the flue space X, around the chamber H², with its openings Y and Z, operating as an air heater when the oven is in place, and as a passage for the escape of the gases when other utensils are employed, as set forth.

W. F. SHAW.

No. 969.—*Improvement in Coating Hose Pipe.*—What is here claimed is: constructing hose or flexible tubing of textile and fibrous material, with an internal water-proof coating, by first applying said coating on the outside of the cloth, or other pipe, and then inverting the coated pipe by drawing it over and through a metallic cylinder, or otherwise, suitably inverting the same.

BENJAMIN F. LEE,
Treasurer of New York Rubber Company.

No. 970.—*Improvement in Grain and Grass Harvesters.*—I claim, first, the combination of the main frame A, (carrying the cutting apparatus,) and the finger bar C, with the vibratable coupling arm Q, the whole constructed and operating substantially as hereinbefore described, and for the purpose set forth.

Second. In combination with the main frame A, vibratable coupling arm Q, finger bar C, shoe or shield C¹, upright post P, arm I, hinge pins *u* and *v*, the guiding slot *o*, and set screw *d*, or their equivalent, the whole arranged and operating as hereinbefore specified, for each or all of the purposes set forth.

Third. The combination of the main frame A, finger bar C, and cutter bar *y*, when the finger bar is connected to the main frame by the vibratable coupling arm Q, and the whole is arranged so that the relation between the finger and cutter bars is not materially changed in raising and lowering the cutting apparatus, substantially as hereinbefore described.

Fourth. I claim the combination of the main frame A, shoe or shield C¹, and the vibratable coupling arm Q, or its equivalent, when the whole are constructed and operate substantially as specified, for the purpose set forth.

Fifth. I claim the combination of the short finger bar C, and the shoe or shield C¹, (connected to the main frame by a hinged coupling arm,) with the main frame A, when the several parts are constructed, arranged, and operate in the manner and for the purposes specified.

Sixth. I claim the combination of the short finger bar C, the shoe C¹, divider *g*², and main frame A, when the said finger bar, shoe, and divider, are each constructed in the peculiar manner specified, and the whole arranged together and with the main frame, as and for the purposes herein described.

JACOB SWARTZ.

No. 971.—*Improvement in Grain and Grass Harvesters.*—I claim, first, so combining a hinged finger bar, and main frame, with levers, substantially as described, extending towards the driver's or conductor's seat, as that the occupant of said seat can, without leaving his position, raise up either end of the finger bar independently of its other end, or raise up both ends thereof at pleasure, substantially as described.

Second. I claim the platform bar Q, as a means of securing the platform to the finger beam, and for strengthening said finger beam when it has the platform to carry, substantially as described.

Third. I claim the inclined castor wheel S, arranged as represented, and in combination with the platform, whereby the latter is elevated when the machine is being turned short around to the right, substantially as described.

Fourth. I claim, in combination with a finger beam and platform, placed in rear of the main supporting wheel, the two castors N S, arranged as described, for allowing the machine to turn short around to the right, for the purposes specified.

Fifth. I claim a revolving track clearer, when operated from a ground wheel through gearing, substantially as described.

CYRENUS WHEELER, JR.

No. 972.—*Improvement in Reaping and Mowing Machines.*—What is claimed as the invention of Leander J., William S., and Cyrus H. McCormick, is, making the finger beam of a mowing machine of a bar of iron, wedge-formed in its cross section with its forward edge, which carries the fingers made thin that the sickle may act upon and cut leaning grass, and with its rear edge thick to obtain the required strength, and the under surface inclined and so arranged that it may act like a runner to pass and ride over the surface of the ground, to keep the cutting edge of the sickle clear of obstructions, whilst at the same time it can have access to leaning grass, all substantially as described.

C. H. McCORMICK.

No. 973.—*Improvement in Reaping and Mowing Machines.*—What is claimed as the invention of Leander J., William S., and Cyrus H. McCormick, is, first, an improvement adapting the machine to mowing grass, consisting of the segmental pivotted frame, its gearing and the driving wheel, in combination with the main frame, having the cutting apparatus projecting on one side thereof and carrying the other portion of the gearing, the whole arranged substantially as and for the purpose specified.

Second. An improvement adapting the machine to reaping grain, consisting in the combination of the main frame carrying one portion of the gearing and having a platform, grain wheel, divider and cutting apparatus projecting on side thereof, with auxiliary frame-work, the other portion of the gearing, the driving wheel, a pivotal connection for uniting the two portions of the gearing and the two frames, and the toothed hinged sector and detent, to provide for shifting the main frame and platform to, and holding them at, different heights, substantially as described.

Third. An improvement applicable to the machine when adapted for either mowing grass or reaping grain, and consisting of the combination of the sector with the reversible detent adapted to performing the double duty of detent and guide, substantially as described.

C. H. McCORMICK.

No. 974.—*Improvement in Reaping and Mowing Machines.*—What is claimed as the invention of Leander J., William S., and Cyrus H. McCormick, is, the guard finger having a thin shank, a narrow neck, and a strengthening rib, substantially as described.

C. H. McCORMICK.

No. 975.—*Improvement in Machines for Cutting Grass, &c.*—I claim the combination of the sickle having the scalloped or indented edge and serrated reversed teeth, with a series of fingers, having the back reversed angles for supporting the grain or grass to be cut to the edge of the sickle, both above and below the edge, or above the edge only, substantially as described.

I also claim cutting out the middle of the upper parts of the fingers that project over the sickle as described, in combination with the vibrating sickle, as described, for the purpose specified.

C. H. McCORMICK.

No. 976.—*Improvement in Cutting Apparatus for Machines for Cutting Grass, &c.*—I claim the combination of a series of slotted fingers, with a vibrating scalloped cutter having projections on both its upper and under sides to facilitate the detachment and discharge of clogging matter, substantially as described.

C. H. McCORMICK.

No. 977.—*Improvement in Machines for Cutting Grass, &c.*—I claim, in the combined blade and bar of a scalloped vibrating cutter, making the bar extend behind the blade, substantially as described, for the purposes specified.

C. H. McCORMICK.

No. 978.—*Improvement in Water Closets.*—I claim, first, a cylindrical plunger or plug 3, substantially as specified, acting to close the water passage 2, at the time the water closet seat is depressed, irrespective of the weight on the seat as distinguished from a valve which requires compression to a given point before closing, as set forth.

Second. I claim the valve *g*, cylinder 3, and openings *x*, in combination with the seat *v*, and acting in the manner and for the purposes set forth.

Third. I claim in a valve for water closets a cup leather for controlling the motion of said valve in closing gradually, substantially as specified, said cup leather moving freely in one direction and closing against the containing cylinder in the other direction, and the leakage of water in said cylinder allowing the movement of said cup leather, as set forth.

Fourth. I claim the lever *p*, acted on by the seat simultaneously controlling the movements of the pan *r* and valve or cock for admitting water, as specified.

Fifth. I claim the combination of the lever *p*, latch *t*, and valve spindle *g h*, as described, for regulating the movements of the pan *r*, as set forth.

Sixth. I claim the valve for admitting water to the closet in combination with the trunk or hopper, when said valve is connected directly to the said hopper, for the purposes and as set forth.

Seventh. I claim, in a water closet in which the cock is attached to the hopper, a hollow arm *o*, or opening into said hopper, substantially as specified, for conveying leakage from said cock into the hopper, as set forth.

WILLIAM S. CARR.

No. 979.—*Improved Water Wheel*.—I claim, first, the arrangement of the lighter plate L, in the particular manner specified, and for the purpose set forth.

Second. The arrangement, in the particular manner specified, of the packing ring *i*, for the purpose set forth.

Third. The arrangement, in the particular manner specified, of the lip or projecting piece *e* of the buckets, for the purpose set forth.

Fourth. The arrangement, in the particular manner specified, of the regulating plate J, in combination with the peculiar specified device for operating it, for the purpose set forth.

Fifth. The employment or use of the dividing strip or ring inserted in the buckets, substantially as and for the purpose set forth.

Sixth. The fitting of the lower part of the box G, over the annular flanch *n* of the wheel, as shown, or in an equivalent way, so as to form a joint as nearly water tight as may be, in connection with the openings *l l*, in the plate *d*, and the oblique plates *m*, at the sides of the openings, as and for the purpose herein set forth.

Seventh. The employment for united use in one wheel of the lighter plate B, packing *i*, projecting lip or flanches *e*, or regulating plate J, and annular dividing plate A*, the whole being constructed, arranged, and operating in the manner and for the purpose set forth.

JAMES P. COLLINS.

No. 980.—*Improvement in Corn Shellers*.—First. I claim the combination of a plate E, which presses directly upon the ear while the corn is being shelled therefrom, with a spring F, arranged and operating as and for the purposes set forth.

Second. I claim the combination of the adjustable guard chain *j*, with the plate E, and spring F, whereby the plate is prevented from falling against the shelling wheels, although free to adapt itself to different sized ears; and whereby the plate E and spring F can be raised by an attendant while the machine is in operation, substantially as described.

Third. I claim the combination of the plate E, spring F, with the wheels B and D, constructed and arranged to operate in relation to each other, as and for the purpose set forth.

Fourth. I claim the combination of the adjustable shaft *e*, with the plate E, substantially as set forth.

Fifth. I claim the arrangement and combination of the obliquely acting adjustable spring F, set screw *k*, plate E, and adjustable guard chain *j*, as and for the purpose herein shown and described.

NATHANIEL DRAKE.

No. 981.—*Improvement in Springs for Railroad Cars and Carriages*.—What I claim as my invention is, primarily, combining and arranging two blades bent elliptically, with an intermediate plate curved or corrugated, so as that the intermediate plate acts only by tension or strain, apart from end to end, in the manner and for the purposes described.

Second. I claim the manner described of securing together the elliptical blades and tension bar at the ends, without rivets, pins, bolts, hinges, or screws.

P. G. GARDINER.

No. 982.—*Improved Night Light Reflector*.—I claim the arrangement of a series of reflecting surfaces, in an arch or dome form, over gas burners, so as to permit a current of air through the reflector, and strongly illuminate objects below the light.

JNO. WYBERD.

No. 983.—*Improved Steering Apparatus*.—I claim the above described steering apparatus, consisting essentially of the toothed segment M, traversing on the curved way P, and operating substantially as described.

WILLIAM GODSOE.

No. 984.—*Improved Window Stop*.—I claim the within described window stop, consisting of the roller C, the shank *m*, spring E, and lever K, or their equivalents, in combination with the inclined surface *d*, and operating substantially as set forth.

TURNER WILLIAMS.

No. 985.—*Improvement in Clover and Grass Seed Harvesters*.—What is claimed as the invention of Thomas S. Steadman, is the main frame or box A, which carries the pinion which drives the cutters, in combination with the arm or supplementary frame J, provided with axle *t*, and the main wheel and gearing, substantially as described, for the purposes specified.

I also claim the arm or supplementary frame, in combination with the master wheel and gearing, when said arm or supplementary frame is so connected with the main frame as to vibrate from and around the pinion shaft, substantially as shown and described, for the purpose set forth.

W. N. WHITELY, JR.

No. 986.—*Improvement in Clover and Grass Seed Harvesters*.—What is claimed as the invention of Thomas S. Steadman, is: in combination with the main frame or box A, and arm or supplementary frame F, on which is formed or secured the master wheel axle, the employment of a retaining arc H, or its equivalent, the whole constructed and arranged in such a manner that the main frame or box, and arm or supplementary frame, with its master wheel axle, will be held in parallel planes relatively to each other while they are moving up and down, substantially as and for the purposes herein set forth.

W. N. WHITELEY, JR.

No. 987.—*Improvement in Clover and Grass Seed Harvesters*.—What is claimed as the invention of Thomas S. Steadman is: Constructing the machine in such a manner that the attendant can, while riding on the machine, raise and lower in the arc of a circle and hold at different heights either end of the cutting apparatus, as herein before described, for the purpose specified.

W. N. WHITELEY, JR.

No. 988.—*Improvement in Vulcanizing India Rubber*.—What I claim is the process or method of curing India rubber, gutta purcha, or other vulcanizable gums or compounds thereof, by means of a hyposulphite of zinc, or other artificial preparation of zinc and sulphur, having like chemical constitution, properties, and qualities, as hereinbefore described, for vulcanizing India rubber and other vulcanizable gums or compounds thereof, without the use of raw or free sulphur, for the purposes of curing the rubber.

JONA T. TROTTER.

No. 989.—*Improvement in Fluid Lenses*.—I claim, first, the application and use of a magnet, or its equivalent, in the bottom of a glass globe filled with a colored fluid, for the purpose as herein set forth.

Secondly. I claim the arrangement and combination in a lantern of a light and glass globe filled with a colored liquid, when said globe is surrounded by two reflectors, facing opposite directions, and when said light is placed either before or behind the glass globe, so as to produce and reflect, by the use of only one light, a colored light in one direction and a white or colorless light in the opposite direction, in the manner substantially as described.

S. KAKELES.

No. 990.—*Improved Machine for Finishing Hair Brush Handles*.—I claim, first, the employment, in combination with a brush clamp G, or pattern H, or their equivalents, of a wheel D, is provided with V or gouged-shaped cutters b, or their equivalents, and which act upon the wood substantially as and for the purposes herein shown and described.

Second. The combination, with the pattern H of the brush clamp, of a supporting ledge or projection a*, or its equivalent, as and for the purpose herein shown and described.

Third. The combination of the guide F with the pattern H and cutter D, as and for the purpose herein shown and described.

Fourth. Centring the unfinished brushes in the clamp G by means of the bristles i, in connection with the strip or plate J, and the inner curved edge H, or its extension H¹, substantially as described.

THOMAS MITCHELL.

No. 991.—*Improvement in Skeleton Hoop Skirts*.—I claim a skeleton skirt constructed as herein described.

CÆSAR NEWMAN.

No. 992.—*Improvement in Printing Oil Cloths*.—I claim forming ornamental figured surfaces on oil cloths by raising at right angles with each other, by means of properly prepared blocks, parallel ridges or surfaces b d, substantially as described, to form, by the action or reflection of light, and with or without a plurality of colors, the damask ground and figure. It being understood that I claim the privilege of having either the ground or figure, one only, if desired, composed of dots or broken lines in order to obtain a similar effect.

JAS. ALBRO.

No. 993.—*Improvement in Oil Cloths*.—I claim, as a new article of manufacture, an oil cloth with an ornamental figured surface produced by means of raised lines or ridges, those forming the ground being at right angles to those forming the figure, substantially as described.

JAS. ALBRO.

No. 994.—*Improvement in Artificial Legs*.—I claim, first, curving or deflecting the jointed

extremities of the bars J so as to bring their axes of motion back of their line of direction, substantially as and for the purposes set forth.

Second. I claim the cord T and spring X acting upon the parts D and L, substantially in the manner and for the purpose herein set forth.

Third. I am aware that metallic springs have been employed to simulate the functions of the natural muscles, but experience has proved their inadequacy, both as respects the result obtained and their durability. I am also aware that India rubber or elastic cords have been used for the same purpose, and with no better results, and these I do not claim; but I claim the combination of the non-elastic tendon F, with the India rubber spring E, in such a manner that the required effect is derived from the compression and expansion of the material and not from its elongations and contractions, substantially as set forth.

Fourth. I claim the use of the block A, with its longitudinal and transverse axes, for producing the direct or antero-posterior, lateral and diagonal motions of the ankle joint in walking, while retaining the foot in its proper relative position to the leg, substantially as described.

Fifth. I claim providing the ends of the cords F with the enlargements, and with the conical socket fastenings G, to receive the same, substantially as described, in order to apply adjusting screws, for the purposes herein specified.

Sixth. I claim the manner of constructing the bearing portions of the knee joint, consisting of the upper and lower bearing blocks N N, each of which forms the quarter of a circle, more or less, corresponding with the axial bolt, the one being fixed in position, and the other adjustable by means of the screws s s, to admit of adjusting the parts together to prevent looseness and noise and to reduce and regulate the friction, substantially as and for the purpose herein set forth.

DOUGLAS BLY.

No. 995.—*Improvement in Attaching Paddle Wheels to Canal Boats.*—I claim, first, the bow wheels B, the connecting rods K, the rudder L, the operating lever O, constructed and arranged substantially as and for the purposes described.

Second. I claim the wheels B, constructed with twisted floats, in combination with the preceding.

Third. I claim the arrangement of the vertical slotted shaft N supporting the wheels B and gear wheel E, in combination with the preceding; the whole operating as described and set forth.

REUBEN JANE.

No. 996.—*Improvement in Apparatus for the Manufacture of Paper Pulp.*—We claim, first, having the pipe b, which passes through the hollow journal of the boiler, divided by a partition so that the steam may find exit through one compartment of the pipe and the contents of the boiler through the other compartment, as set forth.

Second. The employment of the perforated diaphragm p p¹, when arranged substantially as described, to protect the pipes h h¹ s s¹ and strain the liquids from the stock, as and for the purposes herein set forth.

Third. The arrangement of the boilers J J¹ with the surrounding envelope, substantially as herein shown and described, so that the resultant liquids of the boiling may be evaporated and also employed to cool down the boilers and surrounding envelope, as set forth.

Fourth. The arrangement of the basin g g below the boiler to receive the falling liquid, as and for the purposes described.

Fifth. We do not claim broadly the transferring of steam from one steam boiler to another, but we claim the injection of the steam arising from the boiling of the alkaline and other contents of the boiler J into the boiler J, and *vice versa*, substantially as and for the purposes herein shown and described.

Sixth. We claim the arrangement of the warming chamber S between the two boilers, and the combination therewith of the pipes T V W W, as and for the purposes described.

Seventh. We claim the arrangement and combination of the boilers J J¹, furnace A, and doors D D¹ E E¹ F F¹, so as to apply the furnace heat to either or both boilers at pleasure, substantially as herein shown and described.

Eighth. We claim the combination of the cylindrical bottomed vats K K¹, having the chimneys N N passing through them with the boilers J J¹, and for the purposes described.

GARDNER HOWLAND.
JOSEPH B. PALSER.

No. 997.—*Improvement in Manufacture of Paper Pulp.*—We claim the destruction or carbonization of the gummy, resinous, and other matters from which the fibre is to be set free, without injury to the fibre itself by the process herein described.

GARDNER HOWLAND.
JOSEPH B. PALSER.

No. 998.—*Improvement in Harvesters and Binders.*—What is claimed as the invention of Joseph E. Nesen is, first, in combination with the cutting apparatus, the endless apron C, having an intermittent motion for the purpose of carrying the cut grain to the binding hooks at intervals and in proper quantity to form a sheaf, substantially as herein described.

Second. The binding hooks D, or their equivalents, for gathering the cut grain in bundles, or sheaves, arranged and operating substantially as herein described.

Third. The combination of the endless intermittently moving apron C, with the binding hooks D, substantially as herein described.

Fourth. The combination of the discharging roller Z, with the apparatus for gathering and compressing the cut grain into sheaves, substantially as herein described.

HENRY BALDWIN, JR.

No. 999.—*Improvement in Harvesters and Binders.*—What is claimed as the invention of Joseph E. Nesen is, first, constructing the blade of the cutter of a reaping or mowing machine with a projection or rib *e*, or its equivalent, for the purpose of strengthening it, substantially as described.

Second. The combination of a scalloped cutter, having the projections or ribs *e*, or their equivalents, on its blade, with the slotted fingers through which the blade with its projection is arranged to play, substantially in the manner and for the purposes described.

Third. The combination of the angular projections or ribs *e*, or their equivalents on the blade, with corresponding angular shoulders in the slot of the finger, substantially as described, the shoulders and projections being so arranged that the angles of one will vibrate past those of the other in such near proximity as to facilitate the detachment and discharge of clogging matter, substantially as described.

HENRY BALDWIN, JR.

No. 1,000.—*Improvement in Grain Separators and Cleaners.*—I claim, first, the combination of the distributing and equalizing cylinder I, with the separating cylinders D and E, the same being used as and for the purpose specified.

Second. The arrangement of the cylinder I, and adjusting spring N, or their equivalents, with the cylinders D and E, and with the brush F, when the same are used substantially as and for the purpose specified.

WM. M. ARNALL.

No. 1,001.—*Improvement in Seeding Machines.*—What I claim as the invention of J. H. Bonham, deceased, is a revolving peripheral seed discharger, having its axis in a horizontal position and in a line with the forward motion of the machine, or in a position suitably approximating thereto.

I also claim adjusting the seed discharger to different positions approximating to said horizontal and line of motion position.

In combination with a revolving peripheral seed discharger, having its axis placed as above specified,

I also claim adjusting or regulating the quantity of seed discharged through the said seed discharger.

I also claim the conducting spout L, in combination with the stopper block *q*, and tilting pins *n n*, arranged and operating substantially in the manner and for the purpose herein specified.

A. E. BONHAM,

Administrator of the Estate of J. H. Bonham, deceased.

No. 1,002.—*Improvement in Circular Saw Mills.*—I claim, first, the application to circular saw frames, of rocker boxes and a swing frame, for the purpose of affording end play to the arbor, as set forth.

Second. The application of a reaching agent to the central part of a circular saw through the medium of the mandrel, or by any other substantially equivalent means, for the purpose of restoring the saw to line after it has been deflected.

Third. Suspending a circular saw frame in position and restoring it to line, by means of the driving belt, arranged and operating substantially as set forth.

NICHOLAS G. NORCROSS.

No. 1003.—*Improvement in Reaping Machines.*—I claim, first, supporting the arm or lever of a vibrating sweep rake, at each end, substantially as described.

Second. Operating an automatic sweep rake by gearing on both ends thereof, in combination with the platform of the harvesting machine, for delivering the grain in gavels, substantially as described.

WM. H. SEYMOUR.

No. 1,004.—*Improvement in Reaping Machines.*—I claim the combination of the arm, rod,

or lever, which carries a vibrating sweep rake, with a guide rod, which forms a movable fulcrum for the rake head, substantially as described, for the purpose set forth.

WM. H. SEYMOUR.

No. 1,005.—*Improvement in Reaping Machines*.—I claim the arrangement of a quadrant-shaped platform, immediately behind the cutting apparatus, so to receive the cut grain as it falls, and from which it is discharged in the arc of a circle, substantially as described.

WM. H. SEYMOUR.

No. 1,006.—*Improved Method of Uniting the Panels of Portable Fences*.—I claim forming or providing the ends of the panels or sections of a fence with hooks and eyes, substantially as herein specified, to receive each other respectively in succession, and thereby to sustain and lock the said panels or sections together, in the manner and for the purposes set forth.

CHARLES VAN DE MARK.

No. 1,007.—*Improvement in Mowing Machines*.—I claim, first, hinging the right end of the coupling arm R to the lugs R¹ R¹, in combination with curving up the coupling arm, as it extends towards the machine, substantially as shown and set forth.

Second. I claim the combination of the shoe or brace, which supports the heel of the finger beam, with the hinge by which it is drawn, arranged above the plane of the cutter and in advance of the heel of the finger beam, substantially as set forth.

Third. I claim connecting the coupling arm to the shoe by a hinge whose axis of motion is on a line with that of the draught hinge of the finger beam, in combination with so arranging said hinges as respects the main frame, as that the strain due to the draught or drawing of the finger beam forward will be borne by one end of the main frame, and on one side of the axes of the driving and bearing wheels, while the lateral strain, through the coupling arm, will be borne by the other end of the main frame, and on the other side of the axes of the driving and bearing wheels.

EPHRAIM BALL.

No. 1,008.—*Improvement in Mowing Machines*.—I claim, first, extending and hinging the coupling arm R, to the shoe which supports the heel of the finger beam, outside of the frame, in combination with the draught hinge of the shoe, also outside of the main frame, whereby the finger beam and cutting apparatus can be first raised up bodily until the coupling arm strikes against the under side of the frame, and then the outer end thereof turned up towards the frame, substantially as set forth.

Second. I claim mounting the two driving gear wheels and main gear wheel on separate axes, in combination with a ratchet wheel and small gear wheel for each driving gear wheel, each ratchet wheel being fitted with a pawl that can be made to stand in gear by the forward motion of the machine, and out of gear by the backward motion of the machine, the whole arranged and operating substantially as set forth.

Third. I claim the combination of a ratchet wheel, a pawl, a spring acting on the pawl, and a case with one or both ends of the shaft of the main gear wheel, whereby the case is made to perform four duties, namely: a support to the pawl, a support to the spring, a cover to protect the pawl, spring, and ratchet, and the connection by which motion is communicated to the shaft of the main gear wheel, substantially as set forth.

Fourth. I claim the combination of a shield E², with each of the cases G G¹, and ratchet wheels H, substantially as set forth.

Fifth. I claim the combination of the balance wheel L, with shaft R, and gear wheels I J, whereby the balance wheel is made to perform not only the function of a balance wheel to regulate the motion of the crank shaft, but also that of a guide or guard and shield to keep the gear wheels I J in their proper and relative positions, substantially as set forth.

Sixth. I claim the combination of a balance wheel with each end of the crank shaft and its hangers or bearings, substantially as set forth.

Seventh. I claim making the pitman in two parts N N¹, in combination with uniting said parts, substantially as set forth.

Eighth. I claim the combination of a hinged cutting apparatus with a pitman or connecting rod swivelled at both ends, substantially as set forth.

EPHRAIM BALL.

No. 1,009.—*Improvement in Mowing Machines*.—I claim, first, the combination of the hangers which support the crank shaft, and coupling arm, with the central pieces A¹ A¹, whereby the hangers are made to perform the additional function of braces to the main frame, substantially as set forth.

Second. I claim so constructing and combining a hinged finger beam with a main frame as that no part of the finger beam will project by the rear of the main frame, nor any part of the main frame by the rear of the finger beam, whereby an attendant can freely approach the

finger beam from the rear and raise up the outer end thereof to avoid an obstruction, while the heel of the finger beam is free to rest on the ground, and to conform to the inequalities thereof independently of the up and down motions of the main frame, substantially as set forth.

Third. I claim the combination of the coupling arm and finger beam with the slotted metallic part S, whereby the finger beam and cutting apparatus, when turned up towards the main frame to avoid and pass obstructions, will be prevented from falling over against the main frame, substantially as set forth.

Fourth. I claim the combination of the finger beam with the coupling arm and a stop, whereby a portion of the weight of the finger beam as it is raised up bodily, after the outer end has been turned up to pass an obstruction, will rest on the left hinge of the coupling arm, substantially as and for the purposes set forth.

EPHRAIM BALL.

No. 1,010.—*Improvement in Mowing Machines.*—I claim, first, the combination with the main frame of a mowing machine, of two independent driving wheels, and a hinged cutting apparatus, whereby the cutters are kept in operation when the machine is turned either to the right or left, while the cutting apparatus, or either end thereof, is free to conform to the inequalities of the ground, independently of the up and down motions of the main frame, substantially as set forth.

Second. I claim hinging one end of the coupling arm R to lugs on the shoe which supports the heel of the finger beam and cutter bar, in combination with hinging the other end on a line with the longitudinal centre of the crank shaft, which operates the pitman and cutters, substantially as set forth.

Third. I claim the combination of the heel of the finger beam P, and one end of the coupling arm R, with a strong metallic draught shoe, substantially as set forth.

Fourth. I claim so hinging the shoe which supports the heel of the finger beam to the main frame, as that it will permit the heel of the finger beam, to which it is rigidly attached, to move freely in the arc of a circle, as it rises and falls, so as not to cramp or bind the joints of the coupling arm R, or its equivalent, substantially as set forth.

EPHRAIM BALL.

No. 1,011.—*Improvement in Mowing Machines.*—I claim the combination in a mowing machine of the following elements, namely: a rigid tongue to draw and steady the machine by a frame to support and carry the driver and gearing, two independent driving and bearing or supporting wheels to carry the frame and give motion to the cutters, and a short finger beam so hinged to the main frame that its progressive movement over the ground will be controlled by the main frame and the upward and downward movements of the entire finger beam or of either end thereof, independently of the other, by the undulations of the ground over which it is drawn.

EPHRAIM BALL.

No. 1,012.—*Improvement in Mowing Machines.*—I claim, first, the combination of the finger beam and the main frame, with a single yielding brace bar or shoe, whereby the progressive movement of the finger beam over the ground will be controlled by the main frame, and the free upward and downward movements of the entire finger beam, or of either end independently of the other, and of the up and down movements of the main frame by the undulations of the ground over which it is drawn, substantially as set forth.

Second. I claim the combination of a yielding brace bar or shoe Q, and a yielding coupling arm R, with the main frame, substantially as set forth.

Third. I claim the combination of the short finger beam, with the yielding connection with the main frame, substantially as set forth.

EPHRAIM BALL.

No. 1,013.—*Improvement in Mowing Machines.*—I claim, first, the combination of a hinged folding finger beam with the main frame, whereby the finger beam can be raised, turned, or folded up, on or over the main frame, without detaching the draught hinge, to facilitate the removal of the machine from place to place, or from field to field, substantially as set forth.

Second. I claim so hinging the finger beam to the main frame as that the weight of the finger beam, when folded up thereon, shall rest on or be borne by the main frame in front of the axes of the main supporting wheel or wheels, substantially as set forth.

Third. I claim the combination of the finger beam with the main frame and mechanism, so constructed and combined therewith as that the finger beam can be raised bodily, and when turned and held up, to render the removal of the machine from place to place more convenient, expeditious, and safe, substantially as set forth.

Fourth. I claim the combination of the finger beam with the main frame, whereby the finger beam can be raised, turned, or folded over, on or above the main frame, so that its

weight shall be borne by the main frame in rear of the axis of the supporting wheels, substantially as herein described.

Fifth. I claim the combination of the finger beam with the main frame, whereby the finger beam can be raised and turned over above the main frame, with its weight resting either in front or in rear of the axis of the main supporting wheels, substantially as and for the purposes herein set forth.

Sixth. I claim so hinging the finger beam to the main frame as that the main frame shall be nearly balanced laterally when the finger beam is folded up thereon, substantially as set forth.

Seventh. I claim so hinging the finger beam to the main frame as that it can be folded under the main frame, substantially and for the purposes set forth.

Eighth. I claim the combination of the finger beam with the main frame so that the finger beam can be either folded over or under the main frame, substantially as set forth.

Ninth. I claim the combination of the following elements in a shoe or metallic device for supporting the heel of the finger beam, viz: a curved surface, to run upon the ground like a runner; a recess, or arrangement of parts, whereby the heel of the finger beam will have a rigid metallic support in front, on the bottom, and in rear; a suitable groove for the heel of the cutter bar and inner cutter to play in; two metallic lugs on the side next to the main frame, between which to hinge a coupling arm; all combined in one rigid and permanent shoe device.

Tenth. I claim the combination of the following elements in a metallic shoe for supporting the outer end of the finger beam, viz: a curved surface to run upon the ground like a runner; a recess for the outer end of the finger beam, whereby it can be bolted to the shoe so as to have a rigid support in front, on the bottom, and in the rear; a groove for the outer end of the cutter bar and outer cutter to work through; and two lugs in the rear; said elements being combined and arranged in relation to each other, substantially as shown and described.

EPHRAIM BALL.

No. 1,014.—*Improvement in Air Engines.*—I claim the within described auxiliary heater, constructed and arranged as set forth, the exhaust air and the products of combustion being passed through in one direction, while the cold air from the the force pump is passed through in the other, by which means the heat is extracted from the heated air and smoke and transferred to the cold air on its way to the engine, the latter being pumped in against a pressure much less than that at which it is worked off from the main heater, as explained.

Second. I do not claim the use of cold water for the purpose of refrigerating the cylinder or piston of hot air or other engines; but what I do claim as my invention, and desire to secure by letters patent, is the arrangement herein described of the tubes within the piston rod, the reservoir R, and the India rubber tubes S S¹, for the purpose set forth.

Third. I claim passing the exhaust air which has propelled the piston directly through the fire, for the purpose of economizing heat, as set forth.

PHILANDER SHAW.

No. 1,015.—*Improvement in Folding Bedsteads.*—I claim, first, the employment of a frame hinged in the centre and connected to the two ends of a bedstead, for the purpose of folding the whole bedstead together endways, in the manner described.

Second. In combination with said folding frame, I claim the hook-shaped ends to the side rails, taking bolts attached to the posts, and forming hinges at these points for folding the hinged frame, or allowing said frame to be disconnected from the posts as specified.

Third. In combination with said frame hinged to the centre, I claim the pendent legs, Fig. 9, and the braces k, for the purposes and as specified.

THOMAS B. BLUCKER.

No. 1,016.—*Improved Feed Water Apparatus for Steam Boilers.*—I claim the combination of the cylinder A, connected with the boiler as described, the piston D working in the said cylinder and having an attached valve, whose movements to open and close the communication between the said cylinder and the boiler are effected by the said piston or its rod, substantially as herein described; a lifting and disengaging apparatus for lifting and dropping the said piston and valve, and a connection between the piston and a cock or valve in the suction pipe, or its equivalent, the whole operating substantially as herein described to control the supply of water to the boiler.

And in combination with the above specified apparatus, I claim the alarm cock V, applied in connection with the piston, to operate substantially as herein set forth.

GEORGE W. RAINS.

No. 1,017.—*Improved Shoe for Grain Separators.*—I claim, first, the combination and arrangement of an inclined lagged chaff and straw elevator C I, primary inclined return sieve or board F, and separator shoe A, substantially and for the purposes set forth.

Second. The combination of a secondary inclined extension tail or return board R, with

the chaff elevator C I, incline sieve, or primary return board F, and separator shoe A, substantially as and for the purposes set forth.

Third. The combination of an inclined lagged elevator C I, with a separator shoe A, when said elevator is placed in rear of and above the main cleaning sieve of the shoe in an inclined position, substantially as set forth.

HIRAM ALDRIDGE.

No. 1,018.—*Improvement in Gas Regulators*.—I claim, as my invention and improvement in gas regulators, a stop-cock, situated in, and controlling the passage way, from the gas holder or other source of supply to the variable chamber, in combination with the removing part of the variable chamber, substantially as described.

SALMON BIDWELL.

No. 1,019.—*Improvement in Photolithography*.—We claim the employment of a solution of gumarabic sensitized by bichromate of potash, or its equivalent, in combination with the surface of a lithographic stone or plate of zinc, when acted upon by light, as a resistant to the effects of a solution of soap and application of printer's ink, for the purpose of combining the soap and ink with the stone or plate of zinc, as substantially set forth in this specification.

We also claim the employment of sugar, or its equivalent, in combination with gumarabic and bichromate of potash, in connection with a lithographic stone or plate of zinc, for the purpose of modifying the adhesive quality of the coating to the stone or zinc in the parts not acted upon by the light, in the manner as set forth in the specification.

We also claim the employment of a solution of soap, or its equivalent, for the purpose of forming the printing surface with the stone or plate of zinc, in combination with the sensitized gumarabic, to produce the positive photographic picture, in the manner as set forth in this specification.

J. A. CUTTING.
L. H. BRADFORD.

No. 1,020.—*Improvement in Ship's Windlasses*.—I claim the combination applied to each chain wheel H and the shaft wheel B, the same consisting of the part pinions G G¹, the guard sectors I I, the pawls J J, the levers K K, and the studs h¹ h¹, the whole being made to operate together and be operated by the shaft B, substantially in manner and for the purpose as specified.

I also claim the combination and arrangement of the gears C D N O, and their ratchet and pawl mechanisms, or equivalents therefor, applied to the two shafts B E, substantially in manner and for the purposes as specified.

I also claim the arrangement of the auxiliary capstan F with the main capstan a and its shaft E when the latter is connected and made to operate another shaft B by gears C D, as described.

WM. H. GILMORE.

No. 1,021.—*Improvement in Printing Presses*.—I claim, first, a bed vibrating to and from the impression, in combination with a rocking platen, rocking to and from the impression, for the purpose herein set forth, substantially as described.

Second. I claim rocking the inking roller arms or frame upon a centre so that the inking rollers may pass and repass over the form of types for each and every impression, whether said rocking frame be constructed in the precise manner described or in some equivalent way to produce a like result.

Third. I claim the bearers, or their equivalents, in combination with the rocking inking roller arms or frame for the purpose of passing and repassing the inking rollers over the type or form in a line parallel with the face of the type, when each rocking roller frame shall carry the inking rollers forward and backward over the type for each and every impression.

Fourth. I claim vibrating the bed from the point of its receiving the inking rollers to the point of impression, as described.

Fifth. I claim the rocking inking roller arms or frame, in combination with a vibrating bed, substantially as herein specified.

Sixth. I claim constructing a printing press with a rocking platen, so that the pressman, while feeding and driving the press, may stand directly in front of said press for such purpose, and be enabled, without changing his position, to see the face of such rocking platen as it rocks or turns towards him for the reception of the sheet to be printed, the face of the type or form as it moves to and from the impression, the ink distributing cylinder, or its equivalent, from its being placed at the top of the press, and the inking rollers when inking the type or form; thereby enabling said pressman to detect any imperfection in the working of these parts of the press; all substantially as herein set forth.

GEO. P. GORDON.

No. 1,022.—*Improvement in Printing Presses*.—I claim, first, supporting upon a centre or

centres a platen which shall rock or turn between the point necessary for the reception of the impression, and the point necessary for the reception of the sheet to be printed, when the face of such rocking platen shall stand out of a horizontal position, or at any angle from a horizontal position, at the time the impression is given, substantially as herein set forth, and for the purposes described, whether the same be accomplished in the precise manner specified, or in some equivalent way.

Second. I claim the frisket grippers, or their equivalents, for relieving the sheet from the type, in combination with a rocking platen.

Third. I claim giving to a rocking platen, when receiving the sheet to be printed, or when receiving the impression, a period of rest during the continued motions of other parts of the press.

GEO. P. GORDON.

No. 1,023.—*Improvement in Wooden Soled Shoes*.—I claim the manufacture of boots and shoes as described, viz: a boot or shoe having a wooden sole made in two parts or pieces, (an inner sole *b* and an outer sole *a*,) with the edge of the upper secured between them, and the two soles fastened together by any suitable fastenings, substantially as described.

HENRY WRIGHT.

No. 1,024.—*Improvement in Apparatus for Naphthalizing Gases*.—I claim the above specified arrangement and application of the float, scroll, and disk, whereby they are rendered capable of easy and proper adjustment, as explained.

Also the combination of one or more propelling wings, or the equivalents thereof, with the scroll and float when applied and used within a cistern, substantially in manner and for the purpose as described; such propelling devices being to facilitate or effect the rotation of the said float and scroll while buoyed within the liquid, as described.

Also the application and arrangement of the foraminous diaphragm with respect to the cistern and eduction pipe of the apparatus, as described.

E. H. ASHCROFT.

No. 1,025.—*Improvement in Lamp Shades*.—We claim, first, the combination of the metallic shade *A A¹ A²* with the paper pictures *C¹ D¹ E¹* between sheets of mica, as above described.

Second. We also claim the combination of the metallic frame *A A¹ A²*, and the pictures *C¹ D¹ E¹*, upon paper, or any other suitable substance, substantially as above described.

Third. We also claim the combination of the metallic frame *A A¹ A²* and the pictures *C¹ D¹ E¹* upon paper, or any other suitable substance, and the mica lining; the whole being arranged substantially as herein set forth.

CHARLES WILHELM

ANNA CATHERINE WILHELM.

No. 1,026.—*Improvement in Fire Plugs*.—I claim, first, the construction of the chamber *J*, so as to make it answer the double purpose of a thoroughway for one or more branch pipes, and a readily accessible chamber for the reception of a valve or valves, thus making one pit and one cover common to two, three, four, or more mains, instead of several, as now required, all substantially as set forth.

Second. Combining a fire plug with the chamber *J* and its branches when the valve *V* is located, as described, for the purpose of effecting a circulation of the water under the valve of the fire plug to prevent it freezing.

Third. The combination with the fire plug and chamber *J* and branch pipes of the detachable many-valved hose branch, (Figs. 8 and 10,) when the said parts are constructed, as described and arranged, so that the nozzles of the hose branch stand at a convenient height above ground for attaching the hose, substantially as herein shown and described.

Fourth. The removable gasket *c*, in the ends of the branches or bowls *y*, so as to renew the seats for the valves *b*, when necessary, without disturbing the main or stop cock, access to these gaskets being through the common chamber *j*, as herein stated.

JOSEPH L. LOWRY.

No. 1,027.—*Improvement in Stoves*.—I claim the employment of diffusing plates, constructed substantially as herein shown and described, to promote the uniform distribution of the hot air, as set forth.

I also claim the arrangement and combination of the perforated plates *N R*, the partitional plate *B*, the flue *H*, the fire guard *I*, hot air pipe *L*, and chamber *K*, substantially as and for purpose shown and described.

PETER N. BURKE.

No. 1,028.—*Improved Method of Elevating and Delivering Water from Wells*.—I claim, first, operating the valve in the bottom of the bucket by the rear end of the trough, the lever

actuating the trough being moved by the bucket, and the trough having a more rapid advance than the bucket, as herein set forth.

Second. I also claim, in combination with the above, the employment of a grooved pulley and weight, to operate the bucket, having a strip of India rubber fastened in the groove of said pulley, in the manner and for the purpose set forth.

JOHN W. WHEELER.

No. 1,029.—*Improvement in Trigger Operating Revolving Fire Arms.*—What I claim as the invention of Stanhope W. Marston is, first, so constructing the lock of revolving breech fire arms, which may be operated by trigger, as that the hammer, when raised to full cock preparatory to firing, may be retained in that position of unstable equilibrium until the piece is fired, on a further pressure of the trigger, by means of a vibrating tooth or fly tumbler, independently of any dog, pawl, catch, or other mechanical device for that purpose.

Second. So constructing and arranging the lock of revolving breech fire arms, susceptible of operation by trigger, as that, when the hammer is raised to cock, preparatory to firing, the trigger shall be held back or retained in a drawn position by means of a vibrating tooth or fly tumbler.

Third. The use, in revolving breech fire arms, of a vibrating tooth or fly tumbler, interposed between the hammer and trigger, and operating, substantially as hereinbefore described, by an upward pressure on the hammer, so as gradually to increase the leverage and consequently the power applied to raise the hammer, and thereby reduce the effective resistance of the main spring, for the purpose of securing steadiness of aim and greater ease in firing, and also to allow the recovery of the trigger, after firing, for repeated action.

JAMES M. COOPER.

No. 1,030.—*Improvement in Machinery for Making Hat Bodies.*—I claim the combination of a vibrating concave surface, substantially as described, with an exhausted pervious cone, on which the bat of flocculent fibres is held by the pressure of the surrounding air, substantially as and for the purpose specified.

I also claim facilitating the removal of the bat from the pervious cone, on which it is formed, by means of a blast of air forced into the cone, substantially as specified.

ALVA B. TAYLOR.

No. 1,031.—*Improvement in Safety Apparatus for Steam Boilers.*—I claim the employment of a flexible vessel, substantially as described, when the inside of such vessel is combined and connected with a steam boiler, to be expanded by the steam generated therein, and the outside with the mechanism which operates the damper, or its equivalent, for regulating the draught or blast of the furnace, substantially as and for the purpose specified.

TIMOTHY CLARK.

No. 1,032.—*Improvement in Lamps.*—I claim an air chamber, in combination with the chamber formed by the concavity of the deflector of a lamp top, substantially as described.

I also claim the combination of an air chamber for supplying air to the interior of the cone with openings for the admission of air, on the outside of the cone, between the latter and the inside of the chimney, substantially as set forth.

I also claim forming a communication between the oil chamber and the cone chamber *o*, by means of openings in the shell of the lamp top, substantially as described, for the purpose set forth.

MICHAEL A. DEITZ.

No. 1,033.—*Improved Machine for Making Paper Bags.*—I claim, first, cutting off the paper from a continuous roll in a machine for making bags by a cut of such form that when a bag is completed one side of the mouth is caused by the form of the said cut to project beyond the other side, substantially as represented in Fig. 12, to afford facility for opening the bag and to form a flap for closing the mouth.

Second. Giving the blades of the side shears *J J¹ J J¹* a curved angular or irregular form near the point, for the purpose of cutting out each by a single cut the whole piece necessary to leave the lap on one side of the bag, substantially as represented in Figs. 4 and 10.

Third. Hanging the movable blades *J¹ J¹* of the said shears on shafts or pivots *j j* perpendicular to their faces, for the purpose of allowing them to cut slightly across the fixed blades by a slight lateral movement, which they receive simultaneously with the movement usually given to shears, substantially as described.

Fourth. The intermittently rotating folder, arranged and operating substantially as described, to receive the bag pieces from the apron *L*, after the cutting and pasting operations, and to support or partly support them until the creasers come into their operative positions and afterward to hold them over the creasers.

Fifth. The combination of the side lappers *N N* and the folding stands *d d* substantially

as described; that is to say, the stands being so placed as to support the bag piece and the creasers during the folding and lapping operations, and to allow the folder to pass between them and the lapping pieces, being attached to the said folding stands in such a manner as to be capable of falling over those creasers which are supported by the folding stands. This I claim irrespective of any manner of operating the lappers and whether the folding stands have the lateral movement described or are stationary.

Sixth. The toothed roller T, hung in a frame T¹ from the axle of one of the pressing and delivery rollers, and operating substantially as described, to commence the removal of the bags from the creasers.

Seventh. The general arrangement and combination of the several working parts of the machine, substantially as herein described.

E. W. GOODALE.

No. 1,034.—*Improvement in Vapor Lamps.*—I claim, first, combining the cap or heat retainer H with vaporizing tube or retorts, constructed substantially as described, when so arranged over the flame as to operate in the manner set forth.

Second. I also claim the combination of the heat retainer H, and vaporizing tube connected substantially as described, with the elevated reservoir, the whole arranged and operating with respect to the valve C¹, and burner K, as set forth.

Third. The syphonic vapor or gas generating tube or retort B A, or its equivalent, whereby the material, from which the gas is generated, is carried over or above the flame of the gas or vapor burner, and subjected to the heat of the flame issuing therefrom, and converted into gas or vapor, substantially as set forth.

ALONZO M. MACE.

No. 1,035.—*Improvement in Bakers' Ovens.*—I claim the method of "setting" and "drawing" bread, &c., substantially as herein set forth, namely, by means of cars or detached platforms made to move into and out of the oven automatically, in the manner described.

I also claim the method of baking bread, &c., substantially as herein described, that is to say, by the employment, in combination with an oven, of cars or detached platforms, so arranged and supported, that, while in the oven, they shall be conveyed in vertical tiers through the same, and shall be made to move horizontally into and out of the said oven.

I also claim transferring each car, as it arrives successively at the end of its series, to a tier or series which is moving in an opposite direction, whereby said cars may readily be operated automatically, both while in the oven and while entering and emerging from the same.

H. BERDAN.

No. 1,036.—*Improvement in Seed Planters.*—I claim a seed planting machine, constructed principally of frame work, the front part of which is supported on not less than two runners or shoes, with upward inclining edges, and the rear part supported on not less than two wheels, the latter being arranged to follow the former, substantially as and for the purpose set forth.

GEO. W. BROWN.

No. 1,037.—*Improvement in Seed Planters.*—I claim the construction of a shoe or runner for seed planting machines, with an upward inclining edge, and its point sufficiently high or raised as that it will climb up and over, or cut or break through, intervening obstacles, without materially forcing the earth laterally at its front part, and widening towards its rear end, so as to open out a gash or furrow in which the seed to be planted may be deposited, and long enough to furnish a support to the frame work, substantially as described.

GEO. W. BROWN.

No. 1,038.—*Improvement in Seed Planters.*—I claim, in combination with a seed planting machine, constructed principally of frame work, with not less than two runners, and not less than two wheels, a hinged joint between the point of the tongue, and with the rear part of the machine, so that one part of the frame work may be raised, lowered, adjusted, or supported on the other part, substantially as described.

GEO. W. BROWN.

No. 1,039.—*Improvement in Seed Planters.*—I claim a seed planting machine, wherein the seed dropping mechanism is operated by hand, or by an attendant, in contradistinction from "mechanical dropping," the mounting of said attendant upon the machine in such position that he may readily see the previously made marks upon the ground, and operate the dropping mechanism to conform thereto, substantially as herein set forth.

I also claim, in combination with a seed planting machine composed substantially of frame work, and upon which the person who works the seed slides or valves, sits or stands, a lever,

or its equivalent, by which a driver or second attendant may raise or lower that part of the frame work that carries the attendant and the seeding devices, and thus ease the machine in passing over intervening obstacles, or in turning around, substantially as described.

GEO. W. BROWN.

No. 1,040.—*Improvement in Seed Planters*.—I claim, in combination with a seed planting machine carried mainly by, or supported mainly upon, not less than two runners, and two covering wheels, a pair of auxiliary wheels and an axle, for the double purpose of taking a portion of the weight off from said runners and covering wheels, and for affording the means of readily converting the machine from a hand planter to an automatic seed sower, substantially as described.

I also claim hanging the axle of the auxiliary wheels in hinged and adjustable arms or levers, so that more or less of the weight of the machine may be placed upon said auxiliary wheels, substantially as described.

GEO. W. BROWN.

No. 1,041.—*Improvement in Gang Ploughs*.—I claim, first, the combination of the driving shaft *d*, and pinions *e*, the counter shaft *f*¹, and pinions *f*, the short shafts *g*, and the pinions *i*, with the internally geared spur wheels *h*, when arranged and operating with ploughs, substantially as and for the purpose set forth.

Second. Raising and lowering the ploughs, substantially in the manner described, by an apparatus operated by the power of the engine when the said apparatus is under the control of the engineer.

Third. A projecting frame at the rear of the engine, when the same is arranged to overhang the ploughs and is sufficiently elevated to permit them to be raised above the axle of the supporting wheels, or the lowest position of the frame, whereby the engine is enabled to pass over obstructions with facility.

Fourth. The combination, in a steam plough, of a hoisting apparatus, operated by the power of the engine, with an overhanging frame, substantially as described, for the purposes set forth.

Fifth. The steering apparatus, arranged and operating as described, in combination with the frame gearing and ploughs herein described, for the purpose set forth.

Sixth. The combination of the steering wheel *c*, driving wheels *b*, overhanging frame *r*, and gangs of ploughs I, II, III, when arranged and operating substantially as described for the purpose of cultivating between the rows of standing crops.

Seventh. The combination of the straining frame *n*, and adjusting screws *n*³, with the hinged side pieces *m*², of the plough frame, substantially as described for the purpose set forth.

Eighth. The ratoon or stubble cutter C, Fig. 5, applied substantially in the manner set forth, in combination with a gang of ploughs.

Ninth. The plate Y, applied at the lower part of subsoil ploughs, substantially as explained, for the purpose of elevating the subsoil previous to turning.

HENRY COWING.

No. 1,042.—*Improvement in Hay Making Machines*.—I claim, first, the rake head shaft furnished with friction wheels or rollers, which are arranged on pivotted lever bearings, in combination with driving wheels, which are furnished with a plain flange for the friction rollers to act against, so that the necessary friction may be produced either by means of the specified lever arrangement or by the same, in combination with the gravity of the rake head, substantially as and for the purpose set forth.

Second. I further claim arranging or setting the bars N, in the heads D D, in such a manner that the teeth may be adjusted and given any desired angle by the mechanism, and essentially in the manner herein described.

J. C. STODDARD.

No. 1,043.—*Improvement in Sleeping Cars for Railroads*.—I claim the use of two cushioned backs C C, so that they, when standing on edge and resting against the partitions, form, with the bottom cushions, comfortable seats for passengers, and when adjusted so as to lie horizontally on a level with the bottom cushions within the space, existing between the two seats, form, with the bottom cushions and the partitions, a comfortable enclosed sleeping couch, substantially as set forth.

ELI WHEELER.

No. 1,044.—*Improvement in Roofing Composition*.—I claim, first, saturating the canvas in the mixture or composition herein described and set forth, under the head of No. 1, and then applying the soap stone, in the manner described, to the saturated canvas.

Second. Covering the soap stone saturated canvas with the cements compounded from the ingredients, and in the proportions set forth under the heads of Nos. 2, 3, and 4 of this speci-

fication; the whole being intended to form one composition for roofing and similar purposes, produced from the mixture of the ingredients herein described, in the proportions and for the purposes set forth.

HENRY LESTER.

No. 1,045.—*Improvement in Grain Separators*.—I claim, first, the combination of the zig-zag screens and boxes B C, having a shake motion given them, so as to have the grain pass consecutively over and through them, and arranged relatively with each other, to operate substantially as and for the purpose set forth.

Second. The inclined zig-zag screens and boxes B C, with or without the troughs E, in connection with the revolving fan G, and spout H, arranged substantially as and for the purpose set forth.

JONATHAN L. BOOTH.

No. 1,046.—*Machine for Feeding Paper to Printing Presses*.—We claim feeding single sheets of paper to a printing press, paper ruling, or other machine, requiring the feed of a single sheet at a time, by means of the feed roller I, and friction stop J, or the equivalents thereof, when the same are arranged and combined essentially as set forth.

We also claim, in combination with the roller I and friction stop J, the feed roller G, or its equivalent, substantially as described, for the purposes herein set forth.

GEO. H. FERGUSON,
SYLVESTER FERGUSON.

No. 1,047.—*Improvement in Lamps*.—I claim, first, the perforated plate C, or the gauze wire C, for the purpose of regulating the elastic force of the air, so that it may be presented evenly to the flame, or their equivalent.

Second. I claim the perforations *b*, in the lower part of cap D, as shown in Fig. 1, in combination with the perforated or air distributing plate C, or the gauze wire C, or their equivalent.

Third. I claim the register formed of the perforations *e* in the bottom A, as shown in Fig. 5, in combination with the perforated plate or gauze wire C, and the holes *b*, in the lower part of cap D, as shown in Fig. 1, the whole being arranged substantially as and for the purpose herein described.

WM. FULTON.

No. 1,048.—*Improvement in Machinery for Manufacturing Cordage*.—What I claim in machinery for laying rope, is the employment of a condensing tube and laying block, or other equivalents thereof, in combination with the means of giving the fore twist to the strands, and the twist to the laid rope, substantially as described, or the equivalents thereof, for the purpose specified.

I also claim the series of flyers, turning in stationary bearings, to give the fore turn or twist to the strands, as described, in combination with the flyer for giving the twist to the rope, and provided with cross capstan, and means of giving tension to the rope, substantially as described.

WM. JOSLIN.

No. 1,049.—*Improved Plate Holder for Cameras*.—I claim bringing the different portions of a single plate, or several smaller plates, successively into the field of the lens of the camera, substantially in the manner and for the purpose specified.

ALBERT S. SOUTHWORTH.

No. 1,050.—*Improvement in Machines for Drying Cloth*.—I claim combining with the wheels armed with tenter hooks, substantially as described, the arrangement of rollers, or equivalent thereof, for presenting and drawing off the cloth, so that it shall form part of the periphery of a hollow vessel, substantially as described, and an apparatus, substantially as described, for introducing a blast of air through the segment of the periphery of the said hollow vessel, between the end wheels and between the place where the wet cloth begins to form the periphery of the said hollow vessel, and where the dry cloth is drawn off, substantially as and for the purpose specified.

B. SEXTON.

No. 1,051.—*Improved Regulator Valve for Steam Engines*.—We claim, first, the arrangement and combination of the valve box A, and casing C, as and for the purposes herein shown and described.

Second. The arrangement and combination of the screw socket *k*, stem *j*, rod *l*, arm *p*, groove *q*, and hand wheel J, so that, by turning the hand wheel J, the stem *j* may be ele-

vated and depressed irrespectively of the rise and fall of the rod *l*, and without rotating the latter; all as herein shown and described.

NATHAN C. TRAVIS,
NATHAN JOHNSON,
RICHARD EMERSON.

No. 1,052.—*Improvement in Heating Ores.*—I claim the described arrangement of the ore heater *E*, gate *F*, rod *G*, and doors *D* and *D*¹, in connection with the tunnel head *A*; the whole being constructed, combined, and operated in the manner and for the purposes herein set forth.

I also claim the open work basket grate *E*, in combination with the conical or bell-shaped open work *F*, when used in connection with the tunnel head of a blast furnace, substantially as described.

I also claim the conical or bell-shaped open work gate *F*, for the purpose of more readily diffusing the heat and gases through the ore, and of discharging the ore into the furnace when heated, substantially as described.

A. C. VANDYKE.

No. 1,053.—*Improvement in Breech-loading Fire Arms.*—I claim, first, the method herein described for operating or closing the breech, and forming a tight joint at the junction of the barrel with the breech, by the employment of a screw ferule or sleeve, fitting an outer screw thread on the barrel, and provided with a projecting annular flange for grasping and releasing the breech, and for drawing the same backwards and forwards in the direction of the barrel, to or from the rear end thereof upon said screw-threaded sleeve, being operated substantially as herein described.

Second. I claim, in combination with a movable box within the breech, constructed and operating as described, the packing thereof by means of asbestos, or its equivalent, substantially in the manner and for the purposes described.

Third. Locking the screw-threaded sleeve, that operates the breech, by forming the pivotted lever, which serves to turn said sleeve, with an eccentric or cam, arranged to act upon a locking pin by pressing down said lever after the breech is drawn tight, as herein set forth.

EDWARD LINDNER.

No. 1,054.—*Improvement in Breech Loading Fire Arms.*—I claim the employment of a hollow screw arranged to fit the rear end of the barrel, and serving to lock and open a suitable shifting breech piece, substantially as and for the purpose or purposes herein set forth.

EDWARD LINDNER.

No. 1,055.—*Improvement in Railroad Cars.*—I claim, first, the application of corrugated metal plates, combined with, and secured to, and upon, the angle irons *a, b, c, d*, for the construction of the bodies of railroad cars and other vehicles, as herein set forth.

Second. The application of the said corrugated metal plates and angle irons, combined with the trough irons *E*, as set forth, for the purposes described.

SAMUEL J. SEELY.

No. 1,056.—*Improvement in Machines for Drying Paper and Other Fabrics.*—I claim a drying apparatus, consisting of the combination of a drying chamber with inlet and outlet passages for insuring a circulation through it, an apparatus for heating the same, and suitable carrying rolls for suspending the fabric vertically, or nearly so, in the drying chamber, and for carrying it into and through the same.

Second. I claim the within described arrangement of the carrying rolls *e* and *e*¹, with regard to each other, for the purpose of deflecting the fabric from a vertical plane and into a series of zig-zag planes, thereby making a series of bearing points, the effect of which is to distend the fabric equally and prevent it from roping up, as set forth.

EDWARD L. PERKINS.

No. 1,057.—*Improvement in Percussion Seeders.*—I claim, first, the employment of the horizontal wheel *F*, provided with tapering flanges when said wheel has a backward and forward rotary motion imparted to it for the purpose of seeding by percussion and for lapping the grain, substantially as specified.

Second. The seed shaker and regulator *c*, in combination with the eccentric shaft *E*, when the same are used as and for the purpose specified.

Third. The use of the rod *H* and cord *a*, in combination with the shaft *E* and the flanged wheel *F*, substantially as and for the purpose herein specified

J. R. ROGERS.

No. 1,058.—Cancelled.

No. 1,059.—*Improvement in Revolving Fire Arms.*—We claim the spring bolt *k*, applied to the outer or curved part of the cylinder, in combination with the nose of the hammer, one of them being furnished with a wedge-shaped piece or projection, and the other with a spring projection, for the purpose specified.

HORACE SMITH.
DANIEL B. WESSON.

No. 1,060.—*Improved Machine for Making Horse Shoe Nails.*—First, I claim the anvil *I*, the same having both a rocking and reciprocating motion, in combination with adjustable or stationary dies, the faces of which shall be provided with a recess or groove for the purpose of preventing the pointing of the nail until its head and shank have been formed, substantially as set forth.

Second. I claim the pin *K*¹, upon which is secured permanently the anvil *I*, when the same shall be operated substantially as and for the purpose specified.

Third. I claim the mode of operating the shears or cutters, the same being made to advance at the proper moment to sever the nail from the rod and then to fall back out of the way, substantially as and for the purpose described.

Fourth. I claim the various parts which constitute the feeding apparatus, consisting of upright *5*, levers *S* and *c*, spiral spring *a*, and rod *b*, the whole being operated in the manner and for the purpose specified.

Fifth. I claim the levers *m* and *e*, acting in conjunction to hold the rod while the nail is undergoing its formation, substantially as and for the purpose specified.

Sixth. I claim the sliding frame *D*, in combination with the hammers *H H*, each being operated upon, substantially as and for the purpose described.

AMOS WHITTEMORE.

No. 1,061.—*Improved Machine for Grinding Saws.*—I claim, first, so arranging the saw supporting disk shaft *I*, the feed carriage and the gearing, that said shaft is moved laterally independently of the carriage, and simultaneously therewith the shaft and carriage move together longitudinally, substantially as and for the purposes set forth.

Second. The combination of the gauge stop *R*, and its adjusting screws with the sliding shaft *I*, and the mechanism by which it is controlled and actuated, substantially as and for the purposes set forth.

Third. The combination of a sliding bearing of the disk shaft with a double eccentric upon the disk shaft, and a friction roller upon an independent shaft, substantially as and for the purposes set forth.

Fourth. Holding the saw to the disk by means of two centre pins and an adjustable friction roller, substantially as and for the purposes set forth.

Fifth. The arrangement and combination of the set screw *U*, bearing *P* and shaft *I* of the saw supporting disk, so that the face of said disk may be adjusted parallel to or oblique to the circumference of the grindstone, substantially as and for the purposes set forth.

H. R. BURGER.

No. 1,062.—*Improved Egg Beater.*—What we claim as the invention of J. F. and E. P. Monroe is, in combination with a rotary egg beater, an arm *a*, having at one end bearings for the journals to rotate in, and at the other a clamping device for the purpose of securing the beater to the table with its shaft or bearings in a vertical line, as set forth.

Second. We claim the beaters *I* and *J*, revolved in opposite directions by suitable mechanism, substantially as set forth.

EDWIN P. MONROE,
Assignee of J. F. and E. P. Monroe.

No. 1,063.—*Improvement in Locks.*—I claim, first, a series of tumblers provided with openings or notches into which the shackle or stud of the bolt passes, in combination with a key having bits on opposite sides, by the turning of which said tumblers are moved in reverse directions to bring the notches or openings into line for receiving or liberating the shackle or stud of the bolt, as set forth.

Second. I claim a V-shaped sliding bar, and spring, combined with said reverse moving tumblers to restore them to a normal position when the key is not in action, as set forth.

THOS. L. PYE.

No. 1,064.—*Improved Needle Case and Index.*—I claim a cylindrical case constructed with cells, substantially such as described, for containing the needles, and combining therewith an index of letters or figures for designating the size of the needles, substantially as and for the purposes set forth and specified.

I also claim arranging the cover or some convenient part of said case with an index which shall designate the appropriate sizes of thread and needles to properly work together, as set forth.

CALVIN D. WHEELER.

No. 1,065.—*Improvement in Steam Boilers*.—I claim the longitudinally fluted boiler braced, as described.

I also claim, in combination with this construction of boiler, the conformable under surface of the exterior flue B¹, operating as described.

I further claim the longitudinally fluted flue, as described.

L. LEFEBVRE.

No. 1,066.—*Improvement in Door Plates*.—I claim, first, a frame or perforated plate attached to a door, in combination with a hinged plate upon which the name of the occupant of the house is depicted, and with a slot or aperture through the door to which the name plate serves as a cover, the combination being substantially such as is specified, and this combination I also claim when the hinged name plate is combined with an alarm bell, which is struck when the plate is lifted.

Second. I claim a hinged door plate and a bell pull on the outside of a door, in combination with a single bell and a single striking mechanism attached to the inside of the same door, when the whole are arranged and combined substantially in the manner specified.

JEREMY W. BLISS.

No. 1,067.—*Improvement in Harvester Rakes*.—I claim, first, in combination with a curved horizontal platform of a harvesting machine, a continually revolving raking device, the rakes of which rise and fall, and as they rotate, and as they approach the front part of the platform, descend to the level of the latter and sweep over it, raking the cut grain therefrom, and then rise at the discharge end of the platform out of the way, and move towards the front end of the same to repeat the operation, substantially as described.

Second. The construction of the raking device, shown and described, to wit: the rake arms *c c c c*, each pair being slotted at their centres and pivotted on the rotating shaft *i* to admit of the rotating and undulating or rising and falling movement of the rakes, substantially as described.

Third. In combination with the rake arms *c*, the inclined cam way or rail *f*, the latter serving as a guide for the former, as specified.

OWEN DORSEY.

No. 1,068.—*Improved Refrigerator*.—I claim, first, the insulated and cooled preserving chamber *J*, provided with an atmospheric agitator *K*, and absorbent *F*, operating substantially as and for the purposes set forth.

Second. The construction of the beam *T*, having a metallic upper portion *x*, and a water collecting trough *y*, substantially as and for the purposes explained.

Third. The insulating cover *O* of the ice reservoir, arranged and applied substantially as and for the purposes set forth.

BENJAMIN M. NYCE.

No. 1,069.—*Improvement in Apparatus for Hoisting and Storing Ice*.—We claim the method of transporting ice upon inclined planes by carrying the ice up between parallel endless chains having bars extended between said chains to hold the ice and to propel the same, the planes being pierced with openings for the passage of the ice to the successive stories of the ice house, and the propelling bars being so arranged that the descending bars shall not interfere with the free passage of ice through the openings in the plane.

We also claim the use of inclined planes for elevating ice, when each is provided with two parallel endless chains, with suitable bars between them, at proper distances apart to hold and propel the ice, when the planes are provided with spaces which can be left open when the ice is to be elevated to the height of those openings, respectively, and which can be successively closed when the ice is to be elevated to a greater height, substantially in the manner herein set forth.

We further claim the use of the hatches described to close the openings in the plane, in order to permit the ice to pass beyond a lower to an upper story of the ice house, when used in combination with two parallel endless chains, substantially as herein described and set forth.

HIRAM VAN STEENBURGH.
JOEL EGNOR.

No. 1,070.—*Improved Machine for Raising and Transporting Stones*.—I claim my improved stone carriage, or arrangement of derrick *C*, open bed frame *A*, and two separate or disconnected wheel axles or journals, substantially as specified.

I also claim the combination and arrangement of the auxiliary windlass *K*, its line *l*, pawl *h*, and ratchet *i*, or mechanical equivalents therefor, with the main windlass *I*, the crank shaft *L*, and their working gears *s t*, the whole being to enable the machine to be operated substantially as specified.

SOLOMON E. BOLLES.

No. 1,071.—*Improved Method of Governing the Action of Valve Cocks.*—I claim, first, the combination of these three elements or devices, viz., first, a variable chamber, provided with proper apertures for admission and discharge of fluid; second, two valves acting to open and close a passage through which water may flow, the one being on its seat or closing the passage when the variable chamber is of largest capacity, and the other being in a like position or performing the same office when the capacity of the chamber is smallest; and third, a proper connection between the valves and the variable chamber, so applied that the motions of the former shall be controlled by the latter, the whole three being constructed and acting in combination, substantially in the manner and for the purposes hereinbefore described, when operated upon by any competent force.

Second. I claim the combination of two valves, a variable chamber, and a connection between them all, substantially such as hereinbefore last enumerated, with a seat or platform, substantially such as is herein described, by means of a connection, substantially such as set forth, whereby the seat or platform, the valves, and the variable chamber, all act in unison, substantially as set forth.

Third. As a means of preventing concussions on pipes supplying urinals, or hopper closets, where the amount of water used is not a material consideration, and where yielding seats or platforms are employed to open a supply valve, I claim the combination, substantially as hereinbefore described, of a variable chamber, a single valve, and a yielding seat or platform with proper connections and attachments, so that the motions of the valve may be caused by the seat, and governed by the variable chamber, substantially as described.

Fourth. I claim the combination of a diaphragm, performing the duty of a stuffing box, with a valve or valves, and with a variable chamber controlling the valve or valves, the whole constructed and operating substantially as hereinbefore recited.

FREDERICK H. BARTHOLOMEW.

No. 1,072.—*Improved Method of Governing the Action of Valve Cocks.*—I claim, first, a pan provided with a proper rock shaft arm, or its equivalent.

Second. A valve or cock to open and close a passage way leading from a street main, or its equivalent, to a basin of a pan closet.

Third. A variable chamber connected with the valve, so as to control its motions in either or both directions by retarding either its opening, or closing, or both.

Fourth. A spring, or its equivalent, compressed when the valve is opened and expanding to close the valve when the pressure upon the spring is released.

Fifth. A lever so connected to the pan and to the valve as to open both when force is applied to the lever.

Sixth. A counterbalance, or its equivalent, acting to raise or shut the pan, but not operating to close the valve; intending to claim none of these parts separately, but in combination only, and when all of them are constructed and operate in combination, substantially as herein described.

FREDERICK H. BARTHOLOMEW.

No. 1,073.—*Improvement in Sewing Machines.*—I claim forming the moving feeding surface of the material cork, or its equivalent, for the purpose and in the manner substantially as described.

ROBT. M. BERRY.

No. 1,074.—*Improvement in Photographic Baths.*—I claim, first, the construction of a silver bath for photographic and ambrotype purposes made out of two plates of glass, with India rubber packing between, and fastened together between wooden or other frame work, in the manner and for the purpose substantially as specified.

Second. I claim the construction of the outer, or wooden box or case, and the manner of fastening the same together by screws S, for the purpose and in the manner as set forth.

Third. I claim the arrangement of doors or panels D D¹, in the front and back sides B and B¹, of the outer box or casing, for the purpose substantially as described.

BERNHARD HUFNAGLE.

No. 1,075.—*Improvement in Skates.*—I claim, first, a skate, composed of two sheet metal parts A a A a, cut and bent into the proper form and applied together as herein shown.

Second. The employment of the central stiffening bar D, in skates of the character above described, for the purpose herein set forth.

WILLIAM SCARLETT.

No. 1,076.—*Improvement in Harvesters.*—I claim the single head piece a, or its equivalent, as an intermediate automatically adjusting attachment for the reciprocating cutting apparatus to the carriage of harvesting machines, when combined with two or more main driving or

bearing wheels, and with the actuating gear, in such a manner as to permit of the cutting apparatus being attached at the side of the carriage of the machine, and allow it to adjust itself to the inequalities of the ground, independently of the acting gear, and other main portions of the machine, for the purposes and in the manner substantially as described.

S. W. TYLER.

No. 1,077.—*Improvement in Hemp Cutters*.—First, in combination with a cutting apparatus, extending out from the side of the main frame at about right angles to the path of motion of the machine, substantially as described, I claim the employment of the horizontal reel, supported entirely outside of or near the stubble end of the cutting apparatus, and so constructed with curved beaters or arms, or their equivalents, that it will press or hold the standing grain against the cutting apparatus, and then sweep the falling, and cut material off to the rear of the cutting apparatus, and discharge it sufficiently to one side of the machine to admit of the latter passing between the thus discharged material and the standing material to make the next cut, substantially as described.

Second. I claim, in combination with the cutting apparatus and reel, the employment of the curved guide rod *n*, arranged and operating as specified, for the purpose set forth.

Third. I claim, in combination with the cutting apparatus and the horizontal reel, combined and operating substantially as hereinbefore described, making the end of the curved reel arms to pass around in the "open space" formed by the divider, as hereinbefore described, for the purposes set forth.

WILLIAM N. WHITELY, JR.

No. 1,078.—*Improvement in Coal Stoves*.—We claim, as the invention of Henry Stanley, the manner in which he arranged and combined "as a whole" the exterior parts, consisting of a projecting plinth or base, radiating columns, cornice or abacus *E*, cornice *G*, and of two cylinders, the first, a fire cylinder *A*, having four triangular radiating flues or columns arranged, connected, and combined with the same, one at each corner of the said projecting plinth or base, each forming a communication with the air chamber *a* in said plinth or base, and with the said intermediate chambers *E* and *E*¹, in the said cornice or abacus, the second a surmounting cylinder *A*¹, having four triangular radiating flues or columns arranged, connected, and combined with the same, one at each corner of the said cornice or abacus *E*, having also the chamber *H*, and having the cornice *G* upon the top thereof, substantially as herein described and set forth.

We also claim the arrangement and combination of the said shell *x*, at or near, and with the lower end of the said fire cylinder *A*, and with the fire grate *d*, substantially as herein described and set forth.

We also claim the arrangement and combination of the conical ring *i*, having therein the grate *k*, with the intermediate chamber *E*, substantially as herein described and set forth.

We also claim the arrangement and combination of the conical ring *i*, and the solid part thereof, with the rear intermediate chamber *E*¹, substantially as herein described and set forth.

We also claim the arrangement and combination of the upper cylinder *A*¹, and the flues or columns *B*¹, and the chamber *H* connected therewith, with the cornice or abacus *E*, or its equivalent, as and for the purposes herein described and set forth.

We also claim the arrangement and combination of the chamber *H*, having therein the damper *o*, and thereto attached the exit pipe *F*, with the rear intermediate chamber *E*¹, substantially as and for the purpose herein described and set forth.

We also claim the arrangement and combination of the said shell *x*, with the opening *S* or its equivalent, to diffuse and heat the air preparatory to its entrance under and into the fire, to aid, facilitate, and promote the combustion of the fuel, and to increase the volume or quantity of heat by means thereof, as herein described and set forth.

We also claim the arrangement and combination of the cornice *G* with the flues or columns *B*¹, and with the cylinder *A*¹, substantially as herein described and set forth.

CHARLES EDDY.
JACOB SHAVOR.

No. 1,079.—*Improved Carpet Sweeper*.—I claim, first, inclining or grooving the brush shaft, as at *o* and *k*, as described, for the purposes specified, in combination with the cylinder brush for sweeping, as before described.

Second. I claim protecting the bearings from dust, by means of the plates *l*, *m*, and *n*, operating in the manner described, for the purpose specified.

Third. I claim two receptacles for receiving dust, the trough *I* and the principal dust pan, with the projecting lip, all arranged as and for the purposes specified, in combination with the cylindrical dust brush.

Fourth. I claim dividing the brush in the centre, and connecting each half with one of the driving wheels, as set forth, in combination with the method herein described of pivoting the inner ends to a suspended support, as described, whereby the continuity of the brush is not interrupted, as set forth.

HIRAM H. HERRICK.

No. 1,080.—*Lubricating Compound*.—I claim the compound made of the herein named ingredients by combining them together, substantially in the manner and in about the proportions herein set forth.

JOHN B. McMUNN.

No. 1,081.—*Improvement in the Manufacture of Flint Glass*.—I claim the substitution of oxide of zinc for the oxide of lead in the composition of ordinary flint glass, substantially in the manner and for the purpose herein fully set forth.

HORACE TRUMBULL.

No. 1,082.—*Improved Air Engine*.—I claim, first, the arrangement of the passages *e e*, relatively to the working cylinder A, regenerator chamber E, and changing cylinder B, so as to connect them at their hot ends, substantially as and for the purpose herein specified.

Second. The within described arrangement of the working cylinder A, changing cylinder B, regenerator F, and the valve or valves by which the piston *b* is made, both to change the air from the cold to the hot end of the cylinder, and to receive a fresh volume of air for the next stroke, with the advantages within set forth.

Third. Automatically regulating the temperature of the interior of the heating surfaces by the employment of the parts H and L, arranged relatively to the heating surfaces of the cylinders A and B, and to the damper *n*, or its equivalent, substantially as within described.

Fourth. Giving the regenerator an increasing area from the cold to the hot side, substantially as and for the purpose herein set forth.

Fifth. Working the single valve M, in combination with the two pistons *a* and *b*, as described, so as to thereby accomplish the threefold purpose of induction, eduction, and equilibrium valve, substantially in the manner and with the advantages herein set forth.

STEPHEN WILCOX, JR.

No. 1,083.—*Improved Air Engine*.—I claim, in air engines in which changing and working cylinders are combined, substantially as above shown, employing as heating surface a portion of both the changing and the working cylinder, substantially as and for the purposes above set forth.

STEPHEN WILCOX, JR.

No. 1,084.—*Improvement in the Manufacture of Caoutchouc*.—What is claimed as the invention of Charles Goodyear, deceased, is the new manufacture called vulcanized India rubber, which is a combination of India rubber with sulphur, (whether with or without other ingredients,) chemically altered by the application of heat, substantially as described.

CHAS. GOODYEAR.

No. 1,085.—*Improvement in the Art of Preparing Caoutchouc*.—What is claimed as the invention of Charles Goodyear, deceased, is subjecting caoutchouc, or India rubber, or other vulcanizable gums, mixed with or in the presence of sulphur, (whether with or without other ingredients,) to the action of heat, for the purpose of affecting its qualities or properties, as described.

CHAS. GOODYEAR.

No. 1,086.—*Improvement in Manufacturing Hat Bodies*.—What I claim as the invention of Henry A. Wells, in machinery forming bats of fur fibres in the manufacture of fur hat bodies, is the mode of operation, substantially as herein described, of forming bats of fur fibres of the required varying thickness from brim to tip; which mode of operation results from the combination of the rotating picking mechanism, or equivalent thereof, the pervious former and its exhausting mechanism, or the equivalent thereof, and the means for directing the fur-bearing current, or the equivalent thereof, as set forth.

I also claim the combination of the rotating picking mechanism, or the equivalent thereof, the pervious former with its exhausting mechanism, and the lower deflector, substantially as described, to regulate the deposit of the fur fibres on the lower part of the former, as described.

I also claim the combination of the rotating picking mechanism, or the equivalent thereof, the pervious former with its exhausting mechanism, and the upper deflector, substantially as described, to regulate the deposit of the fur fibres on the tip of the pervious former, as set forth.

And, finally, I claim the combination of the rotating picking mechanism, the pervious former with its exhausting mechanism, and the means described, or the equivalent thereof, for inducing a current of air to aid in carrying and giving direction to the fur, and insuring its proper deposit on the surface of the pervious former, as required, as set forth.

H. A. BURR.

No. 1,087.—*Improvement in Machinery for Making Hat Bodies.*—What I claim as the invention of Henry A. Wells, is the combined process of forming fur hat bodies by depositing fur fibres to a suitable thickness on the surface of a pervious former of the required shape, and holding them thereon by the pressure of the surrounding air as they are deposited, and then hardening or partially felting the hat so formed, and while it is held by suitable pressure on the surface of the former, to give it the required consistency to admit of removing it therefrom in a suitable condition for the after process of sizing by felting, as set forth.

H. A. BURR.

No. 1,088.—*Improvement in Machines for Grinding and Sizing Paper Pulp.*—What we claim, therefore, is our improved machine for the manufacture and sizing of pulp, that is, as constructed of a simple conical grinder and outer shell, and with pipes for the introduction of the rags and the size, and the eduction of both, arranged with reference to the axis and ends of the grinder, substantially in manner and so as to enable the grinder to operate to reduce the rags to pulp, and mix the sizing therewith, as hereinbefore explained.

We also claim the introduction of the sizing into the grinder case, and directly between the reducing surface, when employed as specified, in the grinding of pulp or material used in making paper.

JOSEPH JORDAN, JR.,
HENRY KENEY,
GRANT, WARREN & Co.

No. 1,089.—*Improvement in Steering Apparatus.*—I claim the arrangement and combination of the adjustable guide and guard rails M M, with the screw shaft, or its mechanical equivalent, and its slides, or two divisions of the nut I.

I also claim the application of the pedestals to their stanchions, by means substantially as described, for enabling the pedestals and parts supported by them to move either fore and aftwise, or up and down, under the action of the rudder, as specified.

CATHARINE MULLER HUNT.

No. 1,090.—*Improvement in Manufacture of Hard Rubber.*—I claim the use of fatty substances, formed in or derived from organic matter of vegetable origin, when incorporated with the rubber compound in the manufacture of hard vulcanized rubber, as described, for the purpose or purposes specified.

THOS. J. MAYALL.

No. 1,091.—*Improvement in Seed Planters.*—I claim, in combination with a seed planting machine that is operated by hand, the placing of both the driver and the person who operates the seed slides or valves upon the machine in such position as that each may attend to his particular duty without interfering with that of the other, substantially as described.

I also claim, in combination with a seed planting machine that is operated by hand, and upon which the driver and the person who works the seed slides or valves sit or stand, the so locating of said seats or stands as that the weight of one of the persons may be used to counterbalance or overbalance the weight of the other, for the purpose of more readily raising or lowering the seeding apparatus, substantially as and for the purpose described.

GEORGE W. BROWN

No. 1,092.—*Improvement in Seed Planters.*—I claim, in combination with a seed planting machine, operated by hand, and having its seeding device forward of the centre of the wheels and forward of the driver's seat and a hinged connection, the locating of the seat in such relation to a line drawn through the centres of the wheels or ground supports as that the occupant of said seat may, by moving himself, or throwing his weight forward or backward on his seat, without the necessity of rising, walking, or standing over or near the seeding devices, force the seeding apparatus into or raise it from the ground, substantially as described.

GEORGE W. BROWN.

No. 1,093.—*Improvement in Seed Planters.*—I claim, in combination with a seed planting machine, that has a hinged or yielding joint between its fixed points of support, and with its seeding devices between said points, the so connecting of the parts between said fixed points of support as that that portion of the machine carrying the seeding devices may be raised up out of the ground by the attendant riding on the machine, and be carried by the tongue or horses' necks and the supporting wheels, substantially as and for the purpose described.

GEORGE W. BROWN.

No. 1,094.—*Improvement in Seed Planters.*—I claim, in combination with a seed planting

machine, so made as that the forward part of the machine can be raised up on the supporting wheels and there carried, a lock, block, or stop *h*, which prevents the rear part of the frame from descending so low as to strike the ground or inconvenience the occupant of the seat upon said rear portion of the frame, substantially as and for the purpose described.

GEORGE W. BROWN.

No. 1,095.—*Improvement in Seed Planters*.—I claim so combining with a lever, by which both may be operated, a valve or slide in the seed hopper and a valve in the seed tube, as that a half motion of the lever by the operator riding on the machine, by which they are operated, shall both open and close the seed passages at regular periods, and pass measured quantities only, substantially as described.

GEORGE W. BROWN.

No. 1,096.—*Improvement in Corn Shellers*.—I claim, first, the combination and arrangement of the two shelling disks, running on the same plane in opposite directions, as herein described and for the purpose set forth.

Second. The combination of the said disks with guide spring or press plates, or their equivalents, as herein described and for the purpose set forth.

JAMES J. JOHNSTON.

No. 1,097.—*Improvement in Curing Provisions*.—What I claim is salting and curing food and hides in any latitude and at times when the temperature at the surface of the earth is too high for the ordinary process, by means of operating in excavations or shafts made in the earth to a depth sufficient to attain the mean temperature of the earth or to a depth at which meats have not heretofore been salted and cured, and further to cool by artificial refrigeration, substantially as set forth.

D. E. SOMES.

No. 1,098.—*Improvement in Projectiles*.—I claim the employment of an expansible packing surrounding the projectile and so combined therewith substantially as described, that the force of the discharge, acting on the inside of such packing, shall force it outward against the bore of the gun and into the grooves thereof if the gun be rifled, substantially as set forth.

CHARLES T. JAMES.

No. 1,099.—*Improvement in Threshing Machines*.—I claim, first, the swinging blind *G*, fitted to the throat of the machine, to operate as specified.

Second. The guard beam *x*, constructed as described, placed in front of the cylinder and arranged relatively therewith, for the purpose described.

Third. The combination of the guard board *H* and swinging blind *G*.

Fourth. The swinging blind *G*, guard board *H*, and guard beam *x*, arranged for joint operation, as set forth.

SPENCER MOORE.

No. 1,100.—*Improvement in Portable Copying Apparatus*.—I claim a scroll-shaped back or holder, constructed and operated as described, in combination with a book, substantially as described.

WILLIAM VAN ANDEN.

No. 1,101.—*Improvement in Folding Bedsteads*.—I claim determining the relative position of the head or foot guards with the side rails when the bedstead is in an unfolded position, by means of a stop or support, substantially as specified.

And I claim the pins 5, 5, inserted as set forth, in combination with the stops or supports, as specified.

JOHN B. WICKERSHAM.

No. 1,102.—*Improved Folding Bedstead*.—I claim connecting the wire or metallic work 6, 6, forming the head or foot guards, to the cross bar 2, upon which the parts turn, as set forth.

JOHN B. WICKERSHAM.

No. 1,103.—Suspended.

No. 1,104.—*Improvement in Raking Attachments to Harvesters*.—What I claim as the invention of J. A. St. John is, the use of two pitmen and a slide interposed between the main driving gear and the rake, shank or shaft, for the purpose of transmitting motion to the rake from the driving power, substantially as herein described.

D. S. MORGAN.

No. 1,105.—*Improvement in Preserve Cans.*—I claim the arrangement of the flaring flange on the lid, and a rib or ridge on, and a groove in, the neck of the jar or can, when used for holding the detached elastic band on the lid or neck of the jar or can, and also for causing the greatest pressure of the band to be directly over the joint, for the purpose of hermetically sealing it and excluding the air, as herein described and set forth.

CARLTON NEWMAN.

CLAIMS OF PATENTS FOR DESIGNS GRANTED DURING THE YEAR 1860.

No. 1,183.—*Design for a Trade Mark.*—I claim the combination of the labels of the firm with the mark of the boxes and the brand of the cork of the firm, Jules, Mumm & Co., of Reims, with my name as sole agent of said house, arranged in an artistic as well as in a new and useful manner, as herein described and fully represented in the accompanying print.

JAMES MEYER, JR.

No. 1,184.—*Design for the Doors of Cook's Stoves.*—We claim the ornamental design herein described and represented in the annexed photographic drawing for the doors or the panels of the stove.

N. S. VEDDER.
ARCHIBALD MURRAY.

No. 1,185.—*Design for the Side Plates of Box Stoves.*—We claim the ornamental design herein described and represented in the annexed photographic drawing for a stove plate or plates.

N. S. VEDDER.
EZRA RIPLEY.

No. 1,186.—*Design for the Side Plates of Stoves.*—What I claim is, the ornamental design herein described and represented in the annexed photographic drawing for stove plates.

N. S. VEDDER.

No. 1,187.—*Design for the Doors of Cook's Stoves.*—I claim the ornamental design herein described and represented in the annexed photographic drawing for the doors and panels of stoves.

N. S. VEDDER.

No. 1,188.—*Design for Stoves.*—I claim the design and configuration of the mouldings and ornaments as herein described, forming an ornamental design for stoves.

S. W. GIBBS.

No. 1,189.—*Design for Fire Dogs.*—I claim the herein described configuration and ornamentation, consisting of the oak vine A, and the base B, as a new and original ornamental design for "fire dogs."

THEODORE W. LILLAGORE.

No. 1,190.—*Design for Bedsteads.*—I claim the configuration of the head and foot boards A C, the same comprising the panels, moulding and sinuous rails, as shown and described, to form a new and original design for a bedstead.

P. C. CAMBRIDGE, JR.

No. 1,191.—*Design for a Trade Mark.*—I claim the accompanying design, to be used as a trade mark.

NAPTHALI EZEKIEL.

No. 1,192.—*Design for Back Combs.*—I claim forming the frame A of the back comb with a

string of balls C, as described, in combination with the standards *b*, and wave-like projections *a*, so as to form a new and ornamental design, in the manner herein specified.

ABEL GRAY.

No. 1,193.—*Design for Cistern Pumps*.—I claim the design or configuration described and shown, consisting of the rectangular base, cylindrical central division *b*, and open octagon top.

BIRDSILL HOLLY.

No. 1,194.—*Design for Fire Dogs*.—I claim the herein described configuration and ornamentation, consisting of the two angular open parts A and B, and the base C, as a new and original or ornamental design for "fire dogs."

THEODORE W. LILLAGORE.

No. 1,195.—*Design for Carpet Patterns*.—I claim the configuration of the design hereunto annexed, when made by being inwrought into three-ply ingrain, or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,196.—*Design for Carpet Patterns*.—I claim the configuration of the design hereunto annexed, when made by being inwrought into three-ply ingrain or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,197.—*Design for Floor Oil Cloth*.—I claim the design for floor oil cloth fully represented in the accompanying pattern.

JAMES BOGLE.

No. 1,198.—*Design for Floor Oil Cloth*.—I claim the design for floor oil cloth fully represented in the accompanying pattern.

JAMES BOGLE.

No. 1,199.—*Design for Carpet Patterns*.—I claim the design or pattern for carpets and other fabrics, herein set forth.

E. J. NEY.

No. 1,200.—*Design for a Cooking Stove*.—I claim the configurations and ornaments above described and shown in the drawings as a design for a cooking stove.

WILLIAM W. STEVENS.

No. 1,201.—*Design for Parlor and Cook's Stove*.—I claim the ornamental design of the stove plates, herein described and shown, as represented in the annexed photographic drawing.

N. S. VEDDER.

No. 1,202.—*Design for Parlor Stoves*.—I claim the ornamental design of the stove plate or plates herein specified and represented in the annexed photographic drawing.

N. S. VEDDER.

No. 1,203.—*Design for a Statuette of Stephen A. Douglas*.—I claim the design for a statuette as above described and represented in the accompanying drawings.

LEONARD W. VOLK.

No. 1,204.—*Design for a Cooking Stove*.—I claim the combination of ornamental figures and forms represented in and by the accompanying drawing, forming together an ornamental design for the plates of a cooking stove.

N. S. VEDDER.

No. 1,205.—*Design for Iron Railings*.—I claim the ornamental configuration and design of iron railing, as herein described and shown in the annexed drawing.

ISAAC DE ZOUCHE.

No. 1,206.—*Design for a Sewing Machine*.—I claim the peculiar form and figure herein described and set forth as the design for the casting of a sewing machine.

JAMES E. A. GIBBS.

No. 1,207.—*Design for Stoves.*—We claim the general design and configuration represented in the accompanying photograph.

HENRY S. HUBBELL.
THOMAS H. WOOD.
JOHN E. ROBERTS.

No. 1,208.—*Design for Stoves.*—I claim the configuration, herein shown and described, of the top, door, and frame, base and feet, to form a new and ornamental design for a stove.

WM. H. SMITH.

No. 1,209.—*Design for Carpet Patterns.*—I claim the design or pattern for carpets, herein set forth.

ELIMER J. NEY.

No. 1,210.—*Design for Carpet Patterns.*—I claim the design or pattern for carpets herein set forth.

ELIMER J. NEY.

No. 1,211.—*Design for Tops and Bases of Stoves.*—I claim the ornamental design and configuration of the top, base, and door and frame, of a sheet iron stove, as herein described and shown in the accompanying perspective drawing.

S. W. GIBBS.

No. 1,212.—*Design for the Plates of a Cooking Stove.*—I claim the ornamental configuration of the plates of a square oven cook stove, as herein described and set forth.

S. W. GIBBS.

No. 1,213.—*Design for a Copying Press.*—I claim, first, the within described form of the columns C, fishes F, and nut G, arranged as described, so as to compose a new and ornamental design for the arch of a copying press.

Second. The within described form of the lever I, consisting of a boss k, fluted from top to bottom, in combination with fluted arms l, beads m, and handles n, as described, so as to produce a new and ornamental design.

Third. The within described form of the socket J, composed of the flange o, spherical boss p, ornamented by leaves q, and surmounted by a cylindrical portion r, in the manner herein specified.

FRANCIS HOVEY.

No. 1,214.—*Design for Stove Plates.*—I claim the ornamental design and configuration of the top, sides, front, and hearth plate or damper, which in combination form a cast iron parlor stove, as described.

SAMUEL H. RANSOM.

No. 1,215.—*Design for Trade Mark for Neuralgic Pills.*—I claim the aforesaid design, consisting of picture, shown and described, in combination with the words "S. Armitage's Neuralgic Pills" and the words "a sure cure of neuralgic affections."

SAMUEL ARMITAGE.

No. 1,216.—*Design for Andirons.*—I claim the above described design for andirons, made, as set forth and illustrated, in its general configuration and component parts.

SAMUEL BOYD.

No. 1,217.—*Design for Andirons.*—I claim the above described and illustrated composition or design.

SAMUEL BOYD.

No. 1,218.—*Design for Coffins.*—I claim the form and configuration for a design for coffins, herein shown.

J. C. KARR.

No. 1,219.—*Design for Ice Pitchers.*—I claim the configuration of the projections a and beads b, as shown, to form a new and original design for an ice or refrigerating pitcher.

GEO. W. SMITH.

No. 1,220.—*Design for Fire Dogs*.—I claim the eagle pattern design for fire dogs, described and set forth.

THEODORE W. LILLAGORE.

No. 1,221.—*Design for Fire Dogs*.—I claim the rose pattern design for fire dogs, described and set forth.

THEODORE W. LILLAGORE.

No. 1,222.—*Design for Fire Dogs*.—I claim the configurations and ornamentations, arranged and combined together as herein described and set forth, as a new and original design for a fire dog.

THEODORE W. LILLAGORE.

No. 1,223.—*Design for Fire Dogs*.—I claim the configuration and ornamentations, herein described and set forth, as a new and original design for fire dogs.

THEODORE W. LILLAGORE.

No. 1,224.—*Design for Fire Dogs*.—I claim the configuration and ornamentations, herein described and set forth, as a new and original design for fire dogs.

THEODORE W. LILLAGORE.

No. 1,225.—*Design for Fire Dogs*.—I claim the configuration and ornamentations, arranged and combined together as herein set forth and described, as a new and original design for a fire dog.

THEODORE W. LILLAGORE.

No. 1,226.—*Design for Carpets*.—I claim, as my invention, the design in the annexed photographic drawings.

DAVID McNAIR.

No. 1,227.—*Design for Water Coolers*.—I claim the cylindrical body A with the configuration of the handles B, basso relievo C, base E, mouldings D a d e f g h, and cover F, all forming a new and original design for a water cooler.

CH. MÜLLER.

No. 1,228.—*Design for Carpets*.—I claim, as my invention, the design in the annexed photographic drawing.

FRANCIS I. PIERCE.

No. 1,229.—*Design for Trade Marks for Lead Pencils*.—I claim the new trade mark for labels for lead pencils, herein described, composed of the eagle, with its several appurtenances, as herein described, and of the words, "eagle pencil," combined in the manner and so to produce the distinctive trade mark herein shown and described.

JOSEPH ROSENTHAL.

No. 1,230.—*Design for Stamping on Lead Pencils*.—I claim the above ornamental design or trade mark, composed of a spread eagle and the word "eagle," combined as represented, to be fixed on pencils, as above described.

JOSEPH ROSENTHAL.

No. 1,231.—*Design for a Cooking Range*.—We claim the ornamental figures and forms represented in and by the accompanying drawing, the whole forming the front and end plates of a cooking range

JOHN MARTINO.
JAMES HORTON.

No. 1,232.—*Design for Spoon Handles. &c.*—I claim the ornamental design to be struck up or embossed upon the handles of spoons, forks, or articles of table cutlery, as described and represented in the drawing.

JOHN POLHAMUS.

No. 1,233.—*Design for Parlor Stoves*.—I claim the ornamental configuration and design of parlor stove herein described, as shown in the annexed drawings.

ISAAC DE ZOUCHE.

No. 1,234.—*Design for Floor Cloth.*—I claim the ornamental design represented in the accompanying pattern.

JEREMIAH MEYER.

No. 1,235.—*Design for Stoves.*—I claim the ornamental design and configuration for the front and side plates of a stove, as herein described and shown, by the accompanying drawings.

N. S. VEDDER.

No. 1,236.—*Design for Floor Oil Cloth.*—I claim the combination of figures and devices, herein described and represented in the accompanying drawings, to form an ornamental pattern or design for a floor oil cloth.

J. B. VIROLET.

No. 1,237.—*Design for Paint Cans.*—I claim a vessel of the cylindrical form described, whose periphery is ornamented with the plain surfaces A A¹ A¹, mouldings B B, and mouldings B¹ B¹, arranged in relation to each other, and the vessel, as set forth, as a new and original design for a paint vessel.

WASH. L. GILROY.

No. 1,238.—*Design for Paint Cans.*—I claim a vessel of the cylindrical form described, whose periphery is ornamented with the plain surfaces A, grooves B, and mouldings C, arranged in relation to each other, as set forth, as a new and original design for a paint vessel.

WASH. L. GILROY.

No. 1,239.—*Design for Paint Cans.*—I claim a vessel of the form described, and whose sides are ornamented with the grooves b b, and flat surfaces c c, as set forth, as a new and ornamental design for a paint vessel.

WASH. L. GILROY.

No. 1,240.—*Design for Paint Cans.*—I claim a vessel of the cylindrical form described, whose periphery is ornamented with the plain surfaces A, grooves B, and mouldings C, arranged in relation to each other, as set forth, as a new and original design for a paint vessel.

WASH. L. GILROY.

No. 1,241.—*Design for Spoon and Fork Handles.*—I claim the application and use of the combination and arrangement of the ornamental devives for the purpose of ornamenting the obverse or reverse sides of forks, spoons, or other articles of table cutlery, whether made of silver or other material or metal.

M. GIBNEY.

No. 1,242.—*Design for a Stove.*—We claim the ornamental design for stoves exhibited in the accompanying drawings.

JAMES GREER.

R. I. KING.

No. 1,243.—*Design for Stove Plates.*—We claim the general design and configuration represented in the accompanying photograph.

HENRY S. HUBBELL.

THOMAS H. WOOD.

No. 1,244.—*Design for Stoves.*—I claim the design for stove plates, as above described and illustrated in the accompanying drawing.

JACOB RESOR.

No. 1,245.—*Design for a Stove Plate.*—We claim the stove plate shown in the drawings, consisting of the arrangement of heads, cyma reversa, and ornamental figures therein exhibited.

JOHN SIDDONS,

JAS. C. HART.

No. 1,246.—*Design for a Parlor Stove.*—I claim the configurations and ornaments above described and shown in the drawings, as a design for a parlor stove.

WM. W. STEVENS.

No. 1,247.—*Design for a Cooking Range.*—I claim the new design for cooking range, consisting of the ornamental configurations, as herein described and represented in the drawings.
A. C. BARSTOW.

No. 1,248.—*Design for a Cook's Range.*—I claim the design for the cast metal front of the range, as formed and ornamented with rosetted panels and mouldings, or other ornamental characteristics, as shown in the said drawing.

I also claim, as part of such design, the panel formed with mouldings and the rosettes arranged on a tapering projection.

GARDNER CHILSON.

No. 1,249.—*Design for a Nut Cracker.*—I claim the bird's head A, with a feather G, projecting out from the back of the head, as represented, and for the purposes set forth.

SAMUEL J. SMITH.

No. 1,250.—*Design for a Bust of Abraham Lincoln.*—I claim the design for a bust, as above described, and represented in the accompanying print.

LEONARD W. VOLK.

No. 1,251.—*Design for a Stove.*—I claim the design and configuration of the mouldings and ornaments, as herein described, forming an ornamental design for stoves.

S. W. GIBBS.

No. 1,252.—*Design for an Ornamental Ridge for Roofs.*—I claim the ornamental design for a ridge for roofs, represented in and by the accompanying drawing.

JOHN L. JONES.

No. 1,253.—*Design for Carpet Patterns.*—What I claim is the design or pattern for carpets, or other fabrics, herein set forth.

ELIMER J. NEY.

No. 1,254.—*Design for Carpet Patterns.*—I claim the design or pattern for carpets, or other fabrics, herein set forth.

ELIMER J. NEY.

No. 1,255.—*Design for a Cook's Stove.*—I claim the above described ornamental design for stove plates.

N. S. VEDDER.

No. 1,256.—*Design for a Pump.*—What I claim, as a new design for the tops of pumps, is the form and configuration of the side plates, as shown and described, and the combined configuration of the side plates with the transverse rods, lever, and yoke, as described and shown in Fig. 1.

BIRDSILL HOLLY.

No. 1,257.—*Design for a Parlor Stove.*—I claim the ornamental design for a parlor stove, herein described and represented.

LOUIS MEYER.

No. 1,258.—*Design for Decanter Stoppers.*—I claim the forming and designing of the upper part of a decanter stopper in the shape of a fireman's cap or helmet, as set forth and described.

WILLIAM POUNTNEY.

No. 1,259.—*Design for Plates of a Cooking Stove.*—I claim the ornamental design of the plates A E N and S, of a cooking stove, as herein specified, and represented in the annexed photographs.

REUBEN H. N. BATES.

No. 1,260.—*Design for a Fire Shovel.*—I claim the design for a cast metal fire shovel, as herein above illustrated and described.

LEMUEL MORGAN.

No. 1,261.—*Design for a Fire Shovel.*—I claim a new pattern for a fire, coal, or ash shovel, having the shape and configuration illustrated and described.

LEMUEL MORGAN.

No. 1,262.—*Design for a Fire Shovel*.—I claim the form and configuration of a pattern or design for fire, coal, or ash shovel, as described and represented.

LEMUEL MORGAN.

No. 1,263.—*Design for a Fire Shovel*.—I claim a new plain pattern fire shovel having a handle shank enlargement, configuration as illustrated and described.

LEMUEL MORGAN.

No. 1,264.—*Design for a Carpet Pattern*.—I claim the configuration of the design hereunto annexed, when made by being inwrought into three-ply ingrain, or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,265.—*Design for a Carpet Pattern*.—I claim the configuration of the design hereunto annexed, when made by being inwrought into three-ply ingrain, or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,266.—*Design for a Carpet Pattern*.—I claim the configuration of the design hereunto annexed, when made by being inwrought into three-ply ingrain, or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,267.—*Design for a Carpet Pattern*.—I claim the configuration of the design hereunto annexed, when made by being inwrought into three-ply ingrain, or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,268.—*Design for a Carpet Pattern*.—I claim the configuration of the design hereunto annexed, when made by being inwrought into three-ply ingrain, or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,269.—*Design for a Carpet Pattern*.—I claim the configuration of the design hereunto annexed, when made by being inwrought into three-ply ingrain, or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,270.—*Design for a Carpet Pattern*.—I claim the configuration of the design hereunto annexed, when made by being inwrought into three-ply ingrain, or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,271.—*Design for a Carpet Pattern*.—I claim the configuration of the design hereunto annexed, when made by being inwrought into three-ply ingrain, or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,272.—*Design for a Carpet Pattern*.—I claim the configuration of the design hereunto annexed, when made by being inwrought into two-ply ingrain, or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,273.—*Design for a Carpet Pattern*.—I claim the configuration of the design hereunto annexed, when made by being inwrought into two-ply ingrain, or other carpeting in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,274.—*Design for a Carpet Pattern*.—I claim the configuration of the design hereunto annexed, when made by being inwrought into two-ply ingrain or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,275.—*Design for a Carpet Pattern*.—I claim the configuration of the design hereunto

annexed, when made by being inwrought into two-ply iagrain, or other carpeting, in the form similar to the drawing accompanying this specification.

HENRY G. THOMPSON.

No. 1,276.—*Design for Spoon Handles*.—I claim the said design for the purpose set forth.

HENRY C. FOSTER.

No. 1,277.—*Design for a Cooking Stove*.—I claim the combination and arrangement of ornamental figures and forms represented on the accompanying drawings, forming together the ornamental design of a cooking stove.

S. H. RANSOM.

No. 1,278.—*Design for a Parlor Stove*.—I claim the combination and arrangement of ornamental figures and forms represented on the accompanying drawings, forming together the ornamental design for a parlor or heating stove.

S. H. RANSOM.

No. 1,279.—*Design for a Cooking Stove*.—I claim the combination and arrangement of ornamental figures and forms represented on the accompanying drawings, forming together the ornamental design for a cooking stove.

S. H. RANSOM.

No. 1,280.—*Design for a Stove*.—I claim the ornamental configuration and design of box heating stoves, herein described and shown, in the annexed drawings.

ISAAC DE ZOUCHE.

No. 1,281.—*Design for a Cooking Stove*.—We claim, first, the ornamentations *e f g*, on each of the two side plates A, the name "Continental" being in letters surrounded by the bead *g*, as described.

Second. We claim the ornamentations *h*, on the door B, and the ornamentations *i*, on the door B¹, of both the right and left sides of the stoves, as described.

Third. We claim the ornamentation *l*, on each of the front doors D.

Fourth. We claim the ornamentations *k k*, on the front plate C, and also the form of the projecting damper *k*¹, on the same, as shown in the figure.

Fifth. We claim the moulding *o*, around the top plate M.

Sixth. We also claim the moulding *p*, around the bottom plate N, all as and for the purpose herein set forth and specified.

GARRETTSON SMITH.
HENRY BROWN.

No. 1,282.—*Design for a Cooking Stove*.—We claim, first, the ornamentations *e f g*, on each of the two side plates A, as described.

Second. We claim the ornamentation *h*, on each of the two side doors B, as described.

Third. We claim the ornamentation *i*¹, the letters forming the name "Herald," and the projecting form of the damper *i*¹, respectively, on the front plate C, as described.

Fourth. We claim the moulding *k*, on the two front doors D.

Fifth. We claim the moulding *n*, around the top plate L; and

Sixth. We also claim the moulding *o*, around the bottom plate M, all as and for the purpose set forth and specified.

GARRETTSON SMITH.
HENRY BROWN.

No. 1,283.—*Design for a Cook's Stove*.—We claim the ornamental figures and forms represented in and by the accompanying drawing, the whole forming an ornamental design for plates of a cooking stove.

G. SMITH.
H. BROWN.

No. 1,284.—*Design for a Cook's Stove*.—We claim the ornamental figures and forms represented in and by the accompanying drawing, the whole forming plates for an ornamental cooking stove.

G. SMITH.
H. BROWN.

No. 1,285.—*Design for a Cook's Stove*.—We claim the ornamental figures and forms represented in and by the accompanying drawing, the whole forming door plates for the Express cooking stove.

G. SMITH.
H. BROWN.

No. 1,286.—*Design for a Cook's Stove.*—We claim the ornamental figures and forms on the front and side plates and doors, as represented in and by the accompanying drawing, the whole forming an ornamental design for plates of a cooking stove.

G. SMITH.
H. BROWN.

No. 1,287.—*Design for a Gridiron.*—I claim the plain ornamental design or pattern herein described and represented in the accompanying photographic view for a gridiron.

ELNATHAN PECK.

No. 1,288.—*Design for the Plates of a Cook's Stove.*—We claim the ornamental figures and forms represented in and by the accompanying drawing, the whole forming an ornamental design for the plates of a cooking stove.

G. SMITH.
H. BROWN.

No. 1,289.—*Design for a Cook's Stove.*—I claim the ornamental arrangement of the figures on the plates of a cooking stove as herein described and represented in the accompanying drawings.

WALTER W. STANARD.

No. 1,290.—*Design for a Six Plate Stove.*—I claim the ornamental design of the top plate, side plate, and door of a six plate stove, as herein described and represented in the annexed drawings.

DAVID HATHAWAY.

No. 1,291.—*Design for a Coal Stove.*—I claim the ornamental design of stove plates herein described and represented in the annexed drawings.

DAVID HATHAWAY

No. 1,292.—*Design for a Trade Mark.*—I claim the above picture or design to be used as a trade mark upon any medicine or other article which I may manufacture.

D. L. MEINEKE.

No. 1,293.—*Design for Hub Bands.*—I claim a hub band made of taper form from its inner to its outer end, by means of the step-like declivities *a b*, the same forming a new and original design for the article specified.

BENJAMIN S. PARDEE.

No. 1,294.—*Design for a Cook's Stove.*—I claim the above described design upon a panel of a stove plate.

N. S. VEDDER.

No. 1,295.—*Design for a Cooking Range.*—We claim the ornamenting of the front plates of a cooking range, in the manner above described.

A. K. SANDERS.
N. S. VEDDER.

No. 1,296.—*Design for a Cook's Stove.*—I claim the ornamental figures and mouldings upon the plates of the stove, formed and arranged in relation to each other as herein described and shown in the accompanying drawings.

WALTER W. STANARD.

No. 1,297.—*Design for a Parlor Stove.*—I claim the ornamental design for a parlor stove herein described.

WALTER W. STANARD.

No. 1,298.—*Design for a Cook's Stove.*—I claim the ornamental design for cooking stoves herein described.

WALTER W. STANARD.

No. 1,299.—*Design for Carpet Patterns.*—I claim the design or pattern for carpets and other fabrics herein set forth.

E. J. NEY.

No. 1,300.—*Design for Carpet Patterns*.—I claim the design or pattern for carpets and other fabrics herein set forth.

E. J. NEY.

No. 1,301.—*Design for Carpet Patterns*.—I claim the design or pattern for carpets or other fabrics herein set forth.

E. J. NEY.

No. 1,302.—*Design for Carpet Patterns*.—I claim the configuration of the design hereunto annexed, when made by being inwrought into three-ply ingrain, or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,303.—*Design for Carpet Patterns*.—I claim the configuration of the design hereunto annexed, when made by being inwrought into three ply ingrain, or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,304.—*Design for Carpet Patterns*.—I claim the configuration of the design hereunto annexed, when made by being inwrought into three-ply ingrain, or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,305.—*Design for Carpet Patterns*.—I claim the configuration of the design hereunto annexed, when made by being inwrought into three-ply ingrain, or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,306.—*Design for Carpet Patterns*.—I claim the configuration of the design hereunto annexed, when made by being inwrought into three-ply ingrain, or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,307.—*Design for Carpet Patterns*.—I claim the configuration of the design hereunto annexed, when made by being inwrought into two-ply ingrain, or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,308.—*Design for Carpet Patterns*.—I claim the configuration of the design hereunto annexed, when made by being inwrought into two-ply ingrain, or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,309.—*Design for Carpet Patterns*.—I claim the configuration of the design hereunto annexed, when made by being inwrought into two-ply ingrain, or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,310.—*Design for Coffins*.—I claim the configuration and form of the within represented coffin.

J. D. CUNNINGHAM.

No. 1,311.—*Design for a Medallion for Washington Irving*.—I claim a medallion alto-relievo likeness of said Washington Irving, as designed and formed in the description herein contained.

M. L. LIVINGSTON.

No. 1,312.—*Design for Stoves*.—I claim the design and configuration of the mouldings and ornaments, as herein described, forming an ornamental design for stoves.

N. S. VEDDER.

No. 1,313.—*Design for Sad Irons*.—I claim the shape and configuration of the sad iron represented in and by the accompanying drawing.

THOMAS LORING.

No. 1,314.—*Design for the Plates of a Stove.*—We claim the combination of ornamental figures and forms represented in and by the accompanying drawing, forming together an ornamental design for the body, base, and bottom plate of a stove.

JAMES HORTON.
JOHN MARTINO.

No. 1,315.—*Design for the Plates of a Cylinder Stove.*—We claim the combination of ornamental figures and forms represented in and by the accompanying drawing, forming together an ornamental design for the plates of a cylinder stove.

JAMES HORTON.
JOHN MARTINO.

No. 1,316.—*Design for Cook's Stoves.*—I claim the ornamental design for a cooking stove herein described and represented in the accompanying photographic drawings.

WALTER W. STANARD.

No. 1,317.—*Design for Cook's Stoves.*—I claim the ornamental design for a cooking stove herein described and represented in the accompanying photographic drawings.

WALTER W. STANARD.

No. 1,318.—*Design for Centre Pieces.*—I claim the design in centre pieces for the decoration of ceilings, substantially as described.

HENRY BERGER.

No. 1,319.—*Design for a Lady's Hat.*—I claim the above described form or design for a knit or crocheted hat, the same being constructed of Berlin or Shetland worsted of any suitable material capable of being knit into the form above described and as shown more particularly by the drawings.

ELIZA A. MURDOCK.

No. 1,320.—*Design for Spoons.*—I claim the general configuration as herein shown and described, to form a new and original design for table and tea spoons.

ALONZO HEBBARD

No. 1,321.—*Design for Carpets.*—I claim the design or pattern for carpets or other fabrics herein set forth.

E. J. NEY.

No. 1,322.—*Design for Stoves.*—We claim the design and configuration of the mouldings and ornaments as herein described, forming an ornamental design for stoves.

GARRETTSON SMITH.
HENRY BROWN.

No. 1,323.—*Design for the Plates of a Cook's Stove.*—We claim the ornamental figures and forms represented in and by the accompanying drawing, the whole forming an ornamental design for the plates of a cooking stove.

GARRETTSON SMITH.
HENRY BROWN.

No. 1,324.—*Design for Carpeting, &c.*—I claim the configuration of the design hereunto annexed, when made by being inwrought into three-ply ingrain or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,325.—*Design for Carpeting, &c.*—I claim the configuration of the design hereunto annexed, when made by being inwrought into three-ply ingrain or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,326.—*Design for Carpeting, &c.*—I claim the configuration of the design hereunto annexed, when made by being inwrought into three-ply ingrain or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,327.—*Design for Carpeting, &c.*—I claim the configuration of the design hereunto

annexed, when made by being inwrought into two-ply ingrain or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON

No. 1,328.—*Design for Carpeting, &c.*—I claim the configuration of the design hereunto annexed, when made by being inwrought into three-ply ingrain, or other carpeting in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,329.—*Design for Carpeting, &c.*—I claim the configuration of the design hereunto annexed, when made by being inwrought into two-ply ingrain, or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,330.—*Design for Carpeting, &c.*—I claim the configuration of the design hereunto annexed, when made by being inwrought into two-ply ingrain, or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON

No. 1,331.—*Design for Carpeting, &c.*—I claim the configuration of the design hereunto annexed, when made by being inwrought into two-ply ingrain, or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON

No. 1,332.—*Design for Carpeting, &c.*—I claim the configuration of the design hereunto annexed, when made by being inwrought into two-ply ingrain, or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON

No. 1,333.—*Design for Carpeting, &c.*—I claim the configuration of the design hereunto annexed, when made by being inwrought into two-ply ingrain, or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON

No. 1,334.—*Design for Carpeting, &c.*—I claim the configuration of the design hereunto annexed, when made by being inwrought into two-ply ingrain, or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,335.—*Design for Carpeting, &c.*—I claim the configuration of the design hereunto annexed, when made by being inwrought into two-ply ingrain, or other carpeting, in the form similar to the drawings accompanying this specification.

HENRY G. THOMPSON.

No. 1,336.—*Design for Stove Registers.*—I claim the general design and configuration of said stove register.

N. S. VEDDER.

No. 1,337.—*Design for Stoves.*—We claim the design and configuration of the mouldings and ornaments as herein described, forming an ornamental design for stoves.

S. H. SAILOR.

JACOB STEFFE.

No. 1,338.—*Design for Heater Fronts.*—I claim the combination and arrangement of the various architectural mouldings, so as to produce, by their combined artistical effect and their relative positions, the design for heater fronts, hereinbefore set forth.

ELIAS TOMPKINS.

No. 1,339.—*Design for Parlor Cooking Stoves.*—I claim the ornamental design for parlor cooking stoves, herein described and represented by the annexed photographic drawings.

N. S. VEDDER.

No. 1,340.—*Design for a Medallion Likeness of Theodore Parker.*—I claim the above described likeness in relief of the Reverend Theodore Parker.

THOMAS A. CAREW.

No. 1,341.—*Design for Stove Doors*.—I claim the arrangement of ornamental figure and form represented in the accompanying drawings, forming the ornamental design for the doors of a cook stove.

J. D. MARSHBANK.

No. 1, 342.—*Design for the Handles of Spoons, Forks, &c.*—I claim the ornamental design to be struck up or embossed upon the handles of spoons, forks, or other articles of table cutlery, as represented in the drawing and set forth herein.

JOHN POLHAMUS.

No. 1,343.—*Design for Tea Service*.—I claim the design as above explained, and as represented in the accompanying drawing.

H. G. REED.

No. 1,344.—*Design for Stoves*.—We claim the ornamental figures and forms on the plates A B C D E F G and H, as represented in and by the accompanying drawing, the whole forming an ornamental design for a stove.

J. STEFFE.
S. H. SAILOR.

No. 1,345.—*Design for Drawer Pull*.—We claim the ornamental design and configuration of the drawer pull herein shown and described.

PURMOT BRADFORD.
J. B. SARGENT.

No. 1,346.—*Design for Cook's Stove Plates*.—I claim the above described ornamental design for cooking-stove plates.

N. S. VEDDER.

No. 1,347.—*Design for Stoves*.—I claim the combination and arrangement of figures, forms, and mouldings, herein specified and represented in the annexed drawings, forming the ornamental design of the plates and castings of a cooking-stove.

ZEBULON HUNT.

No. 1,348.—*Design for the Doors of Cooking Stove*.—I claim the configuration and arrangement of said ornament, as herein designated and represented.

CHARLES J. WOOLSON.

No. 1,349.—*Design for Stove Plates*.—I claim the configuration and arrangement of said ornaments, as herein designated and represented.

CHARLES J. WOOLSON.

No. 1,350.—*Design for Stoves*.—I claim the ornamental configuration and design of cylinder heating stove, herein described and shown in the annexed drawings.

ISAAC DE ZOUCHE.

No. 1,351.—*Design for Floor Cloths*.—I claim the ornamental design represented in the accompanying pattern.

CHAS. T. MEYER.

No. 1,352.—*Design for Iron Shutters*.—I claim the design or configuration of the rolling iron shutter, substantially as herein described and represented.

E. H. BROWN.

No. 1,353.—*Design for Carpet*.—I claim the design or pattern for carpets, or other fabrics, herein set forth.

E. J. NEY.

No. 1,354.—*Design for Carpet*.—I claim the design or pattern for carpets, or other fabrics, herein set forth.

E. J. NEY.

No. 1,355.—*Design for Carpet*.—I claim the design or pattern for carpets, or other fabrics, herein set forth.

E. J. NEY.

No. 1,356.—*Design for Carpet.*—I claim the design or pattern for carpets, or other fabrics herein set forth.

E. J. NEY.

No. 1,357.—*Design for Carpet.*—I claim the design or pattern for carpets, or other fabrics herein set forth.

E. J. NEY.

No. 1,358.—*Design for Carpet.*—I claim the design or pattern for carpets, or other fabrics, herein set forth.

E. J. NEY.

No. 1,359.—*Design for Carpet.*—I claim the design or pattern for carpets, or other fabrics, herein set forth.

E. J. NEY.

No. 1,360.—*Design for Carpet.*—I claim the design or pattern for carpets, or other fabrics, herein set forth.

E. J. NEY.

No. 1,361.—*Design for Carpet.*—I claim the design or pattern for carpets, or other fabrics, herein set forth. I also claim the particular form of the small work shown in figures A B 1 and 2, in the drawings.

E. J. NEY.

No. 1,362.—*Design for Stoves.*—We claim, first, the ornamentations 1 and 2 on the side and rear plates, as seen in plate A, as set forth and specified.

Second. We claim the moulding on each of the four edges of plate B, the same being ornamented with the beads 3, as seen in the figure, and also the figures *o* on the upper side of the plate B.

Third. We claim the ornamented moulding 4 on the front edge of the plate C, and also the ornamented moulding on the side and rear edges of the said plate C, as shown at 6 and 7.

GARRETTSON SMITH,
HENRY BROWN.

No. 1,363.—*Design for Cooking Stoves.*—I claim the combination of ornamental figures and forms represented in and by the accompanying drawing, the whole forming plates for a cooking stove.

JACOB STEFFE.

No. 1,364.—*Design for Stove Plates.*—We claim the ornamental design for box stove plates, herein described.

N. S. VEDDER,
EZRA RIPLEY.

No. 1,365.—*Design for Stove Plates.*—We claim the ornamental design for parlor stove plates, herein described.

N. S. VEDDER,
WM. L. SANDERSON.

CLAIMS OF ADDITIONAL IMPROVEMENTS GRANTED DURING THE YEAR 1860.

No. 261, to original Letters Patent No. 20,545.—*Improvement in Operating Churns.*—I claim, in combination with the rotating tread wheel A, the vertical pins *a*, vibrating levers *b b*, and connecting rods *d d*, arranged and operating with the rock shaft which drives the churn dashers, as specified.

ADDISON G. BRUSH.

No. 262, to original Letters Patent No. 24,055.—*Improved Water Wheel.*—I claim the application of the three-cornered piece within the scroll case, constructed as described for the purposes set forth.

SYLVANUS RICHARDSON.

No. 263, to original Letters Patent No. 22,126.—*Improvement in Furnaces for Evaporating Sugar Juices.*—I claim the cylindrical flue enclosing the kettle, connected to the exit flue, and communicating with the undulating flue at top, by graduated draft channels, substantially as set forth.

L. LEFEBVRE.

No. 264, to original Letters Patent No. 25,277.—*Improvement in Gelatinizing Oils.*—I claim the jellification of cod liver oil by means of the process hereinbefore described.

E. QUERU.

No. 265, to original Letters Patent No. 11,419; reissue No. 806.—*Improvement in Revolving Fire Arms.*—I claim, first, the combination of the cam *i* on the hammer, and cam *i*¹ on the trigger, constructed and arranged substantially as described for the purpose of drawing back the trigger and retaining it and the hammer at the point of full cock, without the use of any pawl or catch to retain them in that position.

Second. The use in fire arms, cocking as well by hammer as by trigger, of a pawl, in combination with a notch on the front edge of the hammer, for the purpose of preventing the complete fall of the hammer and the discharge of the piece in case of the partial raising of the hammer or drawing of the trigger, substantially as described.

Third. The combination and arrangement of the cam *i*¹ and pawl *n* on the trigger, and the cam *i* on the hammer, and stud *r* and lifter *z* in the trigger, so that their conjoined action will effect the entire operation of the arm, viz: in half cocking or full cocking the hammer, and rotating the breech into position, locking it, and setting the trigger in a drawn position preparatory to the discharge by the manipulation of either the hammer or the trigger.

Fourth. The spring stop on the arbor or spindle, and ratchet grooves in the bore of the cylinder in which it works, to prevent the backward rotation of the breech, in combination with the spring stop on the hammer spring and ratchet grooves on the external circumference of the breech in which it works to prevent the forward rotation of the breech for the purpose, by their combined action, of perfectly locking the breech in position before the hammer reaches the point of full cock by either mode of manipulation preparatory to firing.

Fifth. The lever and spiral spring in the trigger, combined and arranged as described, for the purpose of operating the vibrating stud.

JOSIAH ELLS.

No. 266, to original Letters Patent No. 26,341.—*Improvement in Skate Fastenings.*—I claim the employment or use of a lateral screw or bolt *o*¹, (Fig. No. 1,) running horizontally through a horizontal socket *o*, (Fig. No. 3,) the upright bolt *c*¹, (Fig. C, No. 2,) and socket *a*, (Fig. No. 1,) arranged as shown in the manner and for the purposes set forth; and a plug or bolt *c*, (Fig. No. 5,) to be put in socket *a*, (Fig. No. 1,) after the runner is removed and fastened therein, for the purposes set forth as described.

THOMAS P. CASTELLO.

No. 267, to original Letters Patent No. 18,705.—*Improvement in Pump Packings*.—I claim employing the piece G¹, in combination with the packing leather and with a groove or recess in the bridge D, to hold the valves E in place, and form a packing for the oscillating shaft B, substantially in the manner and for the purposes set forth.

WASHBURN RACE.

No. 268, to original Letters Patent No. 24,079.—*Improved Machine for Sawing Staves from the Bolt*.—I claim the employment and use of the rotating block carriage, as described, in combination with the saw H, as shown and for the purposes set forth in the specification.

HARRY EVARTS.

No. 269, to original Letters Patent No. 19,144.—*Improvement in Seeding Machines*.—I claim the arrangement of the stop bar N, shares C, spout tube E, slides *d d*, levers F G I, rock shaft H, scrapers M, and rollers B, as and for the purposes herein set forth and described.

JOHN HUSTON.

No. 270, to original Letters Patent No. 24,708; reissue No. 925.—*Improvement in Mode of Staying Piles for Wharves, Piers, &c.*—I claim, first, the mode set forth of bracing the rear piles of a system of piling by the use of the shoes and rods, constructed and operating substantially in the manner described.

Second. The flat plate A placed around the foot of each front pile, as and for the purpose specified.

Third. Preventing abrasion in sandy and shifting bottoms by the use of canvas, or its equivalent, applied to the bottom and protected by flexible metallic sheathing, substantially as set forth.

E. H. ANGAMAR.

No. 271, to original Letters Patent No. 25,725.—*Improvement in Spring Back Carriage Seats*.—We claim the upright spring blades *c c*, supporting the lazy back B, the arm rest springs D D, when combined and arranged substantially in the manner and for the purposes set forth.

A. HULBERT.

N. COWLES.

No. 272, to original Letters Patent No. 21,056.—*Improved Governor for Steam Engines*.—I claim the change from a disk revolving on an extended arm, to a disk revolving over the centre of the moving frame, and the consequent change in the mode of generating and applying the resultant force which arises from the combined movements of the disk and frame; which change in the mode of production and application of the power, brings the machine within a smaller compass, gives it more simplicity of construction, renders it safe to increase the velocity of its movements, and thus increase its sensitiveness and power, and especially it renders the attraction of gravitation inoperative, so that it does not at all act as a disturbing power.

ALBAN ANDERSON.

No. 273, to original Letters Patent No. 21,903.—*Improved Washing Machine*.—I claim the brake bar with the double ridged upper surface as described, in combination with hollowed bearings *a b*, and annular slotted bearings pieces *c*, lever and rod, arranged and operating with the roller A and apron D, as hereinbefore set forth.

J. F. POND.

No. 274, to original Letters Patent No. 24,794.—*Improved Canal Boat Propeller*.—I claim the arrangement of the shaft F to the bed plate R, being made detachable by means of the strap J, so that the apparatus as described in patent to which this is an additional improvement, with the exception of the bed plate, may be taken out or put in its place without docking the boat.

ROBERT CARTWRIGHT.

No. 275, to original Letters Patent No. 13,506.—*Improvement in Ship's Windlasses*.—I claim, first, the ratchets N and O, when made substantially as described and shown by the drawings, for the purpose of controlling the gears L and M of my windlass.

Second. I claim combining the lever and screw for working the friction bands on my windlass, for the purpose and in the manner described.

JAMES EMERSON.

No. 276, to original Letters Patent No. 26,229.—*Improvement in Coffee Pots*.—I claim the

special arrangement of the inclined planes, or sections of screws H and K, the bail E, and the filtering cup, for the purpose specified.

H. P. GATCHELL.

No. 277, to original Letters Patent No. 19,360.—*Improvement in Cutters for Harvesters.*—I claim the combination of the removable cutters b^1 with bar d and intermediate teeth d^1 , the two latter formed of the same piece, all the parts being arranged and connected together in the manner and for the purposes specified.

JOHN GORE.

No. 278, to original Letters Patent No. 13,039.—*Improvements in Revolving Fire Arms.*—I claim the application to cylinders having their cones placed within cells, or to cylinders so fitted as to require their being capped from the rear of a guard constructed of a ring of metal, closed at its end by a disk having appropriate openings for the access of the hammer to each cone, and with a door giving access to the cone cells, the guard being fitted to move independently of the cylinder, or in connection with it as required, substantially in the manner and for the purposes set forth in the above specification.

F. D. NEWBURY.

No. 279, to original Letters Patent No. 19,292.—*Improved Machine for Cutting Tenons on Spokes.*—I claim operating the carrier B and bearer C upon the face plate A, by means of the eccentrics f and g , the same being constructed and arranged together substantially in the manner and for the purpose specified.

I also claim adjustably securing the cutter pieces D D by means of the nutted T-bolt E, when the same are arranged and applied together in relation to each other and the carrier B, in the manner described and set forth.

MAHLON GREGG.

No. 280, to original Letters Patent No. 20,356.—*Improved Protractor.*—First, I claim the arrangement of the several verniers, limbs, scales, and rule, in one instrument, in the manner described for the purposes set forth.

Second. I also claim the peculiar arrangement of the sliding vernier scale plate, by which it can be applied with equal readiness and facility to either side of the rule, so as to read the given angle and its complement in connection with the given distance, or be used separately, as the case may require.

Third. I claim as an improvement the arrangement set forth for adjusting the several verniers of the scale plate to their corresponding scales.

JOSIAH LYMAN.

No. 281, to original Letters Patent No. 24,754.—*Improved Washing Machine.*—I claim the arrangement described of the bars 1, 2, 3, and 4, and the springs 6, in the manner described, by which I am enabled to secure particular parts of the clothing with greater facility in such a manner as to concentrate the action of the rubber upon them, while at the same time the rubbing bar, which forms a part of this arrangement, is allowed to so yield by the compression of the springs as to protect fine fabrics and delicate articles from injury, as set forth.

CHARITY PENDLETON.

No. 282, to original Letters Patent No. 28,163.—*Improved Machinery for Crushing Quartz, &c.*—I claim a stamper, or stampers working in a mortar made on the top of a stationary cone by a hollow revolving cone working on and projecting above the top of the said stationary cone, with the pulverizing surfaces made by the said cones coming in contact with each other, in combination with the projections ll , made on the base of the said revolving cone working in and on the side of one or more channels made on the base of the said stationary cone, for the purpose of crushing, grinding, and pulverizing quartz rock and earth containing gold, and forcing the said pulverized rock and earth into the bottoms of the said channels in contact with the quicksilver, for the purpose of securing the gold.

JULIUS C. DICKEY.

No. 283, to original Letters Patent No. 26,540.—*Improvement in Attaching Skates to Boots.* I claim the male and female vertical dovetail portions, substantially as herein described and represented, whereby the heel portion of the skate iron will be secured against lateral or longitudinal movement independent of the front attachment.

THOMAS S. WHITMAN.

No. 284, to original Letters Patent No. 25,624.—*Improvement in Apparatus for Laying Drain Tile.*—I claim the herein described ball B, the double acting clutches or fingers F F, with its

notched slide *g*, and lock attachment *H*, the mole attachments as in Fig. 2, when used in combination with the rope *R*, or its equivalent.

B. B. BRIGGS.

No. 285, to original Letters Patent No. 27,223.—*Improved Steering Apparatus*.—I claim the arrangement and combination of parts herein described, the same consisting in placing the thwartship screw *H* directly above the rudder post, and operating it by means of a bevel wheel fixed at its middle and gearing into a similar wheel on the after end of the shaft of the steering wheel, all substantially as set forth and shown.

DANIEL JONES.

No. 286, to original Letters Patent No. 25,767.—*Improvement in Cutting and Panning Cakes*. I claim the scrap clearer *B*, the annular jumble cutters *C*, and the bottoms *A* and *A*¹, substantially as and for the purposes specified.

JOHN H. SHROTE.

No. 287, to original Letters Patent No. 27,261.—*Improvement in Moulding Machines*.—I claim the circular guide or rest *O*, and the spring *Z*, when constructed as and used for the purposes substantially as set forth.

ELISHA M. SMITH.

No. 288, to original Letters Patent No. 25,352.—*Improvement in Grates*.—I claim the combination of the adjustable back *E*, with the stationary back *B*, when they are arranged with reference to each other, and with the flue *T* behind them and under the grate, in the manner shown and described.

JOSEPH TIBERI.

No. 289, to original Letters Patent No. 22,913.—*Improved Instrument for Taking Altitudes of the Sun*.—I claim the arrangement of the cylinder *F*, with the spirally curved lines drawn upon it, and the bar *P*, with the hour lines drawn upon it, in such relation to each other, and the limb *H*, and the declination arc *J*, and limb *K*, and plates *f f f f*, and the solar lenses in said plates, that it operates substantially as and for the purposes specified.

FREDERICK YEISER.

No. 290, to original Letters Patent No. 25,326.—*Improved Machine for Cutting and Finishing Shoe Heels*.—I claim the combination of the former *U*, the rod *V*, plates *W*, arms and pins *X*, lever *Y*, and eccentric *Z*, acting as hereinbefore substantially set forth, for adjusting the boot and shoe in machine for shaping, cutting, and finishing heels after they are fastened to the shoe.

WM. F. EDSON.

No. 291, to original Letters Patent No. 24,657.—*Improvement in Clover Hullers*.—I claim constructing the hopper frame, substantially in the manner herein specified, for the purpose of stopping the draught created by the cylinder and returning it to the screens, as is fully set forth.

ANTHONY OVEROCKER.

No. 292, to original Letters Patent No. 25,071.—*Improvement in Roofs for Railroad Cars*.—I claim the T-shaped piece of timber *C*, in combination with the roof, constructed substantially as described, for the purpose of more readily renewing the roofs of cars, which having been used require to be renewed.

A. P. WINSLOW.

No. 293, to original Letters Patent No. 19,117.—*Improved Churn*.—I claim the herein modification in the structures of the beaters, whereby I am enabled to avoid the sharp angle *m*, seen in Fig. 5, in the manner and for the purpose set forth.

M. L. BAUDER.

No. 294, to original Letters Patent No. 28,467.—*Improvement in Vapor Lamps*.—I claim, first, expanding the lower portion of the wick tube into a chamber or reservoir for the reception of the fluid, as it flows through valve *E*, thereby securing a more steady and regular supply to the wick, and also preventing the fluid from being vaporized too far from the burner.

Second. I claim the combination of the chamber *H*, with the wick tube *C*, and heaters *A* *A*, all being arranged substantially as and for the purposes specified.

ALBERTUS GEIGER.

No. 295, to original Letter Patent No. 28,051.—*Improvement in Corn Planters.*—I claim, in connexion with the seeding wheel F, with its flanges *b*, spring clearer *d*, and adjusting device *c*, as therein claimed, the spring holder *r*, surrounding a portion of the seeding wheel to prevent the seeds from dropping from the cells, until said cells arrive at or over the exit opening, as herein fully set forth and represented.

WM. C. BANKS.

No. 296, to original Letters Patent No. 28,868.—*Improvement in Loading Hay.*—I claim the sectional gathering teeth F, constructed of stationary sections *f*, and sliding sections *f*¹, combined and operating in a machine for loading hay, in the manner and for the purpose set forth.

THOS. J. JOLLY.

No. 297, to original Letters Patent No. 23,587.—*Improvement in Stoves.*—I claim the combination and arrangement of the annular channel or groove *f*, (connected with the air passages *e e*,) with the fire pot A, and surrounding flues *b b*, substantially as and for the purposes shown and described.

I also claim the arrangement of the pivotted door G, with its lower portion extended to form a plane, in combination with the flange F, for safely supplying fuel to the cylinder E when open, and leaving a space for the passage of the products of combustion when closed, substantially as set forth.

G. J. KINGSBURY.

No. 298, to original Letters Patent No. 28,846.—*Improved Watch Key and Guard Bar.*—I claim making that portion *f* of the slot in the sheath, which provides for the longitudinal movement of the sheath upon the tube, of a spiral form, substantially as and for the purpose herein described.

D. F. ELMER.

No. 299, to original Letters Patent No. 27,188.—*Improvement in Ploughs.*—What I claim is the segmental ring D, provided with the screw threads and nuts for adjusting it in the beam A, in combination with the share piece E, constructed, arranged, and operating substantially as and for the purposes herein specified.

WILLIAM H. JOHNSON.

No. 300, to original Letters Patent No. 27,302.—*Improved Paper and Letter File.*—I claim the hollow cylinder or tube A, provided with a bottom *a*, lid *c*, and band or rim *d*, the latter having, in connection with the open end *b* of the cylinder, spiral edges, when said cylinder is used in connection with the link B, and wires or rods *e*, for the purpose specified.

J. B. McENALLY.

No. 301, to original Letters Patent No. 25,438.—*Improvement in Lamps.*—I claim a spring attached to the outside of the upper half of a burner, and extending each way around it from the point where it is attached, with a catch on each end, suitably shaped, to fasten the glass to the burner, and the two parts of the burner to each other.

I claim, also, the oval-shaped dome or cap, made in one piece with the flooring, in combination with the partitions which divide the currents of air which flow to the wick from those which pass through the side openings between the cap or dome and the chimney.

I claim, also, the snuffing blade attached to the interior of the lamp, and actuated by mechanism outside of the same, all made substantially as described, or their mechanical equivalents, and operating in the manner set forth.

G. T. PARKHURST.

No. 302, to original Letters Patent No. 22,957.—*Improvement in Tape Primers for Fire Arms.*—I claim making a continuous tape primer, by inserting a cup or pellet containing the percussion powder, in a recess or indentation formed in a strip of soft metal, alloy, India rubber, gutta percha, or other suitable material, and holding the cup or pellet in place by pressing the metal or substance of the strip partly over the outer edge of the pellet or cup, or by an easily fusible solder securing the cup to the strip, or by means of a cement for that purpose.

T. T. S. LAIDLEY.

No. 303, to original Letters Patent No. 28,571.—*Improvement in Corn and Cob Crushers.*—I claim the revolving arms or claws *u* and *v*, operating and driven substantially as and for the purposes set forth in this specification.

AMOS GLOVER.

No. 304, to original Letters Patent No. 29,104.—*Improvement in Ploughs.*—I claim the

arrangement of a hinged frame, consisting of a succession of angles $A A^1 A^2 A^3 A^4 A^5$, in combination with the beams I of an equal number of ploughs; all constructed and operating substantially as set forth.

HENRY H. ROBERTSON.

No. 305, to original Letters Patent No. 22,897.—*Improved Refrigerator*.—I claim the induction pipe B , in combination with escape pipe C , and fan E , when applied to a refrigerator, to operate essentially as and for the purpose set forth.

WM. SIMS.

No. 306, to original Letters Patent No. 25,542.—*Improved Washing Machine*.—I claim sliding bar C , attaching thereto spiral sprigs $b b b b$, and cord D , circular board B , suspended by spiral springs $b b b$, &c., with a rotary corrugated roller, in combination with pulleys $i i$, and catch F , ratchet wheel m , segment H , cog wheel N , as set forth and described.

ASBURY WILKINSON.

No. 307, to original Letters Patent No. 22,015.—*Improvement in Rendering Paper and other Fabrics Incorrodible*.—I claim the interposing of a mixed powder of calcined feldspar, sulphate of lime, with the metallic oxides of magnesium, calcium, and iron, between the block of caustic alkali, coated with paraffine and the paraffine wrapper.

I also claim the composition of paraffine and rosin, for the purposes described.

THOS. G. CHASE, M. D.

No. 308, to original Letters Patent No. 29,317.—*Improved Coupling for Thills to Axles*.—I claim the substitution of the axle itself for the permanent bolt, whereto, in my original specification, the clasps connected with the spring coupling were designed to be attached, thereby doing away with the band and clip and bolt, ordinarily attached to the axle.

JAMES SADLER.

No. 309, to original Letters Patent No. 27,637.—*Composition to Prevent the Depredations of Insects*.—I claim the grinding or pulverizing, to an impalpable dust or powder, of the "composition to prevent depredations of insects," invented and patented by me, as aforesaid, substantially in the manner and for the purposes herein described.

FRANK G. JOHNSON.

CLAIMS OF EXTENSIONS GRANTED DURING THE YEAR 1860.

Letters Patent No. 4,363, dated January 23, 1846.—Reissue No. 538, dated March 23, 1858.—*Improvement in Machinery for Making Hat Bodies*.—I claim the herein described automatic method of forming hat bodies, having the required variation in thickness at their different parts, by supplying picked fibres to an exhausted former of the size and shape required, in such manner that a larger portion of picked fibres is supplied to that part of the former which corresponds with the thickest portion of the hat body and a less portion to the other parts of the former, substantially as herein set forth.

I also claim the combination of a picking apparatus, a hat body former, an air exhausting apparatus, and a conductor, the whole combined substantially as herein set forth.

I also claim a bow string picking apparatus, constructed and operating substantially as herein set forth, to pick fur presented to it by a suitable feeding and nipping apparatus.

WILLIAM FOSKETT.

Letters Patent No. 4,417, dated March 14, 1846.—*Improvement in Tea Kettles*.—I claim making the spouts of tea kettles, at its junction with the body, to extend from the bulge of the body to within a short distance of the top, whereby, in moulding, the spout can be formed by means of a green instead of a dry sand core, as herein described.

EZRA RIPLEY.

Letters Patent No. 4,411, dated March 7, 1846.—Reissue No. 169, dated May 7, 1850.—*Improvement in Feeders for Screw Machines.*—I claim, first, the method substantially as described of arranging screw blanks, &c., by the motion of oppositely inclined bevelled or curved surfaces with sufficient space between them to receive freely the shanks of the blanks whilst they hang suspended by their heads, the said motion of such surfaces being in the direction of the space between them, substantially as described.

Second. Making one of the said inclined bevelled or curved surfaces in two parts, one above the other, substantially in the manner and for the purpose specified.

Third. Combining with the said oppositely inclined bevelled or curved surfaces a fence or guard plate, placed across from the one towards the other and over the space in which the blanks are suspended, substantially in the manner and for the purpose specified.

Fourth. In combining, with oppositely inclined bevelled or curved surfaces, revolving arms, wings, or beaters, substantially in the manner and for the purpose specified.

And, lastly, in combining with the said oppositely inclined bevelled or curved surfaces, a checking and delivering apparatus, substantially in the manner and for the purpose specified.

SOLYMAN MERRICK.

Letters Patent No. 4,456, dated April 11, 1846.—*Improvement in Saw Mills.*—I claim the combination of the slides with eccentric clamps, slightly pressed together, and so formed upon their faces that, however the thickness of the stuff may vary, the line drawn as a radius from the face of the clamp, at the point of contact with the stuff, shall always make nearly the same angle with the face of the material and the direction of the feed.

THOMAS J. WELLS.

Letters Patent No. 4,442, dated April 4, 1846.—*Improvement in Checking the Momentum of Printing Presses.*—I claim the method herein described of arresting the momentum of the carriage which carries the form of types in printing presses by means of plungers that compress air in cylinders only towards the end of the motions of the carriage, as herein described.

A. B. TAYLOR.

Letters Patent No. 4,452, dated April 11, 1846.—*Improvement in Door Locks.*—I claim the arrangement of the circular plates, for elevating the tumblers into notches in the main bolt and raising and lowering the levers *z z*, which act upon the movable talon, in combination with the movable talon and the preventive stop or flying tumbler, all as herein set forth.

JOSHUA H. BUTTERWORTH.

Letters Patent No. 4,443, dated April 4, 1846.—*Improvement in Registers for Stoves.*—I claim the manner in which I combine the expansion rod B with the register or valve C, by means of the lever K, the whole constructed and operating in the manner and for the purpose herein set forth, or in any manner substantially the same, by which the ordinary connecting joints are avoided.

WASHBURN RACE.

Letters Patent No. 4,453, dated April 11, 1846.—Reissue No. 118, dated June 13, 1848.—*Improvement in Electro-Magnetic Telegraphs.*—I claim, first, the employment in a main telegraphic circuit of a device or contrivance called the receiving magnet, in combination with a short local independent circuit or circuits, each having a register and register magnet, or other magnetic contrivances for registering and sustaining such a relation to the register magnet or other magnetic contrivances for registering, and to the length of circuit of telegraphic line as will enable me to obtain, with the aid of a main galvanic battery and circuit and the intervention of a local battery and a local circuit, such motion or power for registering as could not be obtained otherwise without the use of a much larger galvanic battery, if at all.

Second. I also claim as my invention the combination of the apparatus called the self-stopping apparatus, connected with the clock work of the register, for setting said register in action and stopping it, with the pen lever F, as herein described.

Third. I also claim as my invention the combination of the point or points of the pen and pen lever, or its equivalent, with the grooved roller or other equivalent device over which the paper or other material suitable for marking upon may be made to pass, for the purpose of receiving the impression of the characters, by which means I am enabled to mark or print signals upon paper or other fabric by indentation, thus dispensing with the use of coloring matter for marking, as specified in my letters patent of January 15th, 1846.

SAMUEL F. B. MORSE.

Letters Patent No. 4,470, dated April 25, 1846.—*Improvement in Curry Combs.*—I claim the so combining of the trough-like bars which constitute the comb teeth with the other parts, in

the manner set forth, as to constitute a curry comb with an open back. I do not claim the trough-like combs, or the hollow back, individually, but only in their combination, as herein fully made known.

WILLIAM WHEELER.

Letters Patent No. 4,464, dated April 18, 1846.—Reissue No. 813, dated September 20, 1859.—*Improvement in Magnetic Printing Telegraphs*.—I claim, first, a series of keys, each corresponding to a character, in combination with a revolving part of a circuit, so that the touching of one of the former may cause circuit to be broken or closed for the purpose of printing, substantially as specified, when the revolving part of the circuit is in a certain required angular position properly corresponding to the key struck.

Second. I claim a series of keys, each corresponding to a character, in combination with a revolving portion of a circuit, and a shaft provided with pins arranged in a helix, all substantially such as specified, or the equivalents of the whole, acting to cause circuit to be broken or closed when the revolving part is in a circular angular position in proper correspondence with the key struck, for the purpose of printing a proper corresponding letter by means of any suitable machinery.

Third. I claim a key board, or series of keys, in combination with a rotating portion of a circuit and a type wheel, or its equivalent, so governed as to present a proper letter corresponding with a key touched to produce an impression, the combination being substantially such as set forth.

Fourth. I claim, in combination, a single circuit of conductors, a key board or series of keys, a revolving portion of a circuit, and a type wheel, substantially such as specified, and these, also, in combination with a printing press, and with a key shaft, or either of them, each part being substantially such as described.

Fifth. I claim a series of keys each corresponding to a character, in combination with a type wheel having similar corresponding characters, both substantially as specified when so connected by any appropriate devices that a certain type shall be in a certain locality when a corresponding key is actuated, and I claim these two elements in combination with a single circuit of conductors, and with a printing apparatus, or either of them.

Sixth. I claim actuating or driving a revolving portion of a circuit, or a key shaft, or both of them, by means of a prime mover, acting upon them through a friction connection, the mode of operation being substantially as specified, and doing away with sudden jars, and increasing rapidity of operation, when contrasted with a positive connection between such parts and a prime mover, and also permitting the two to move with varying velocities.

Seventh. I claim actuating or driving a key shaft and a revolving portion of a circuit, or either of them, by means of a friction connection with a prime mover, when the velocity of such prime mover is controlled by a governor, or some equivalent, for the purpose, which either prevents its moving too fast or increases its velocity when going too slow, or performs both these duties substantially under the mode of operation described.

Eighth. I claim governing or controlling the motions of a prime mover, which actuates a printing apparatus by the breaking and closing of an electric or galvanic circuit, so that such apparatus is put in operation both by the breaking of a circuit and by the closing thereof, substantially in the manner specified, and also the controlling of a printing apparatus, so that it shall be permitted to print when a spring returns to its normal position at the time that a circuit is broken, the mode of operation being substantially such as set forth.

Ninth. I claim in a printing telegraph moving the paper to the types to produce an impression on the former, substantially in the manner described, as distinguished from former modes of operation by which the types were moved towards the paper.

Tenth. I claim, in combination, a revolving type wheel and a roller, or its equivalent, charged with coloring matter, so as to deposit such matter on the types as they in succession come in contact with the roller, the combination being substantially such as set forth; and this I claim, also, when the roller is grooved as described.

Eleventh. Being aware of the facts that type wheels have been permitted to revolve step by step when controlled by escapements, and when such escapements have been actuated either by a prime mover governed by a pendulum or by electric magnetic force, I claim actuating an escapement which controls the motions of a type wheel by a prime mover, whose motions are regulated by the breaking and closing of a circuit, under a mode of operation substantially such as described, whereby a small force derivable from magnetism controls any necessary power of a prime mover, there being a breaking and a closing of circuit correspondent with each vibration of the escapement.

Twelfth. I claim a hydraulic regulator, substantially such as described and for the purposes set forth.

Thirteenth. I claim a hydraulic regulator in combination with a type wheel, and a printing apparatus, and a prime mover, the combination being substantially as specified, and causing the press to print when the type wheel ceases to move for a longer time than usual.

Fourteenth. In combination with a type wheel and a printing press or apparatus, I claim apparatus substantially such as specified for making an alarm when that apparatus is per-

mitted or caused to act by the breaking and closing of the same circuit of conductors which, by its breaking and closing, permits the printing apparatus to come into action.

ROYAL E. HOUSE.

Letters Patent No. 4,472, dated April 25, 1846.—Reissue No. 396, dated September 30, 1856.—*Improvement in Manufacturing Hat Bodies*.—What is claimed as the invention of Henry A. Wells, deceased, is forming bats of fur fibres by throwing the fur in properly regulated quantities, substantially as herein described, against a section of the circumference of a perforated cone or other form, as the same is rotated, to present in succession every part of the circumference thereof to the current of impelled fur to obtain the required thickness of bat, substantially as described, in combination with the method of holding the fibres on to the cone or other form during the operation, substantially as described and for the purpose specified.

CHARLES ST. JOHN.
H. A. BURR.
A. H. WRIGHT.
JAMES M. RIBLET.

Letters Patent No. 4,472, dated April 25, 1846.—Reissue No. 400, dated October 7, 1856.—*Improvement in Manufacturing Hat Bodies*.—What we claim as the invention of Henry A. Wells, deceased, in the process of making fur hat bodies, is the forming of the bat of fur fibres on a perforated cone, or other form, in manner substantially as described, in combination with the hardening of such bat while on such cone, or other form, to give it the required consistency to admit of taking it off in a suitable condition for sizing by the well known process of felting, substantially as described.

CHARLES ST. JOHN.
H. A. BURR.
A. H. WRIGHT.
JAS. M. RIBLET.

Letters Patent No. 4,493, dated May 2, 1846.—*Improvement in Ploughs*.—I claim the making the landside, the mould board, and post of ploughs, all of one piece of plate metal, as herein described thereby saving much expense in making, and being more firm and substantial than when made of separate pieces.

I also claim the adaptation of a guard superficially applied to finished ploughs, as herein described, thereby adding to their durability by protecting the parts most liable to wear, when removed leaving that part of the plough as perfect as when new, and may be used or omitted at pleasure.

I also claim the method of attaching and securing the movable progressive share by means of the bolts passing down below the mould board, in combination with the notches in the back edge of the share, substantially as herein described, thereby saving, when this form of plough is used, the great expense of shares, as one progressive share equals in service several of the ordinary kinds.

And, finally, I claim the method of fastening and adjusting the coulter as herein described, thereby presenting successively a great length of cutting edge to sever obstructions before the plough.

JOHN M. MAY.

Letters Patent No. 4,519, dated May 16, 1846.—*Improvement in Sugar Pans*.—I claim so combining them as to present the cane, after it has been crushed by the first set of rollers, to the second set in a body much thicker than when it left the first, the more effectually to express the saccharine matter, and to prevent the second set of rollers from cutting through the mass, the whole being effected on the principle substantially as herein described.

ALFRED STILLMAN.

Letters Patent No. 4,700, dated August 18, 1846.—Reissue No. 645, dated January 4, 1859.—*Improvement in Machinery for Dressing Screw Heads*.—What is claimed as the invention of Thomas W. Harvey is: First. The employment of a pair of spring pincers, which receive the blanks one at a time and present them to the jaws point foremost, substantially as described.

Second. In combination with the mandrel and jaws, or equivalent means for receiving and holding the screw blanks, the employment of a punch or driver for inserting the blank to the required distance, substantially as described.

Third. The combination of the pincers for transferring and presenting the blank to the jaws, or equivalent therefor, with the punch or driver, substantially as described, for driving the blanks out of the pincers and into the jaws, as set forth.

Fourth. The combination of the movable rest with the movable cutter head, substantially as described, and for the purpose of giving support to the blank while under the operation

of the cutter, and to relieve the blank and get out of the way so soon as the cutting operation is completed, and this is claimed whether the cutting operation be performed on the head or any other part of the blank.

Fifth. The particular manner herein described of constructing the adjustable turning head, the slide or seat piece C, the tool holder D sliding on the piece C between the check pieces B¹, with the respective adjustments thereof combined, arranged, and operating so as to effect the setting of the tool substantially as herein set forth.

The manner of operating the griping dies and of separating the blanks in the hopper and conveying them to the feeding fingers, being similar to those described and used in the machine for cutting the threads, is not herein claimed.

H. A. HARVEY,
Assignee.

Letters Patent No. 4,704, dated August 20, 1846.—Reissue No. 107, dated February 22, 1848.—Reissue No. 626, dated November 23, 1858.—*Improvement in Wood Screws.*—What is claimed as the invention of Thomas J. Sloan is: First. Making the core with a conical point, substantially as described, in combination with a body of a cylindrical form, or nearly so, substantially as and for the purpose specified.

Second. Making the core with a conical point, substantially as described, in combination with the thread formed on such conical point of a gradually less depth as it approaches the apex of the core, and with the several convolutions on the conical point, and on the body at equal distances apart, substantially as and for the purpose specified.

Third. Making wood screws with the core of a conical shape along that part of the length of the screw, extending from where the thread begins on the shank to where it becomes of full depth, substantially as and for the purpose specified.

Fourth. Making wood screws with the core of a cylindrical or nearly cylindrical form and with a conical point, in combination with the thread of equal pitch along the conical point and body, that is, with all the convolutions at equal distances apart, and of gradually less depth from the base to the apex of the core, substantially as described.

EAGLE SCREW CO.,
Per WM. G. ANGELL, *Agent.*

Letters Patent No. 4,726, dated August 28, 1846.—*Improvement in Truss Bridges.*—I claim, first, the manner in which I have combined the arch beam with the counter braces, and the other part of the truss frame, by means of the regulating screws that are made to bear on the arch beam, or upon the bearing blocks or wedge pieces C C, so as to effect the same purpose.

Second. I also claim the manner of sustaining the bearing of the braces on the string pieces, by passing the metallic sockets E E entirely through the string pieces, so that the bearing blocks C C, and the nuts F, operate on the upper and lower ends of the sockets, and are not affected by the shrinkage of the wood work.

WM. HOWE.

Letters Patent No. 4,547, dated May 30, 1846.—*Improvement in Dredging Machines.*—We claim the manner herein described, in which we have connected and combined the scraper staff, or arm, with the machine, so that it may be raised or lowered by means of the racks and pinions, by the aid of the triangular piece, arranged and operating as set forth, thereby dispensing entirely with the hollow mast and with the toothed gearing and chains combined with said mast, as used for that purpose in the original machine of Otis.

DANIEL CARMICHAEL.
JASON C. OSGOOD.

Letters Patent No. 4,567, dated June 13, 1846.—*Improvement in Cooking Stoves.*—I claim locating the pipe communicating from the body of the stove to the elevated oven, between the two back boilers, so that its front lower edge shall be contiguous to the fire, in combination with the division strips *h h h h*, and the damper *j j*, arranged and operating as herein described and shown, viz: so as to form one centre flue beneath the connecting pipe *k*, which flue may be closed at pleasure by the damper *j j*, in order to throw the heat through two side flues *i i*, and cause it to pass under the rear boilers before it escapes into the connecting pipe *k*.

I further claim forming the connecting pipe of the horizontal section herein shown and described, that is to say, having the pipe made broad on its front side next the fire for the purpose of obtaining a large capacity of pipe, and also to bring the broadest portion of its section in contiguity with the fire and accommodate the boilers in the rear.

R. D. GRANGER.

Letters Patent No. 4,595, dated June 27, 1846.—*Improvement in Horse Power.*—I claim the special arrangement and combination of the gearing as herein set forth, said gearing con-

sisting of the single large wheel A, driving two pinions C C, on the shafts of the two horizontal wheels E, which horizontal wheels gear into two pinions J J, on the line shaft, there being a bridge G to admit of the passage of the line shaft; the whole arrangement being substantially the same with that herein represented and made known.

DANIEL CARY.

Letters Patent No. 4,606, dated June 27, 1846.—Reissue No. 454, dated April 21, 1857.—*Improvement in Looms*.—I claim supporting the wag staff at its lower end, so that it may slide longitudinally in connection with supporting it in other respects by a joint link, or its equivalent, applied so as to cause that part of the staff which strikes the shuttle to move in a line parallel or about parallel to the race beam, as specified.

And I also claim connecting the lower end of the two staffs below their fulcra, by means of a spring having an intermittent action for drawing them back, in combination with the application of a positive motion above for driving the shuttle, whereby the returning staff aids in arresting the momentum of the shuttle, substantially as herein described.

WARREN W. DUTCHER.

Letters Patent No. 4,608, dated June 27, 1846.—*Improvement in Netting Machines*.—I claim, first, the forming of a true fisherman's or weaver's knot in netting woven in a loom by beaming a regular warp from the yarn to the cloth beam, and the forming of loops thereon, of the nature of those herein described, through which loops a thread of filling is thrown by a shuttle, these operations being effected under an arrangement of parts, substantially the same with that herein set forth.

Second. I claim the combination of parts as herein made known, for giving motion to the thread conductors, so as to wind the thread of warp, beamed as described, around the teeth $n n^1$ and o , in such manner as to constitute a loop, such as is represented in Fig. 13, leaving a middle thread c^2 , to be carried up by the forked teeth. I do not claim the use of thread conductors for winding threads around teeth, they having been used in other manner and for other purposes; but I limit my claim in this particular to the arrangement and combination of parts by which I form, simultaneously, a series of loops of the particular kind herein described for producing the so called fisherman's knot.

Third. I claim the employment of the bearers and forked teeth $r r^1$, which are made to raise the thread c^2 , and then to open out, so as to leave spaces between the threads a^2 and c^2 , through which a thread of filling is to be thrown by a shuttle.

Fourth. I claim the employment of the reed, as herein described, with its hooked teeth, as combined with my machine, for drawing up the thread of filling against the teeth o to aid by its respective movements herein made known in the regular formation of the knots.

Fifth. I claim the taking up the portion of the warp that is liberated in the drawing up or tying of the knots, whether the same be effected by the action of the weight P, operating on a pulley Q, and the other parts concerned in giving the reversed motion to the yarn beam at the proper time, or by the aid of a roller, or other analogous device made to raise or depress the warp between the yarn beam and the thread conductor, or in any other way that is substantially the same, producing a like effect by analogous means. And I do hereby declare that I do not intend by the foregoing claim to limit myself to the particular form of the respective parts herein described, or to the particular position of the angles of the meshes, but to vary these as I may think expedient, whilst I do not depart from the general principle upon which my machine is made to operate, as herein set forth.

JOHN McMULLEN.

Letters Patent No. 4,645, dated July 20, 1846.—*Improvement in Operating Treadle Cams in Looms for Tweeling*.—I claim shifting the cams of looms by means of three or more grooves, running from one into the other, and the last running back into the first and crossing the others, while the cams do not touch the treadles, in manner and for the purpose substantially as herein described.

RICHARD GARSED.

Letters Patent No. 4,548, dated May 30, 1846.—Reissue No. 641, dated December 28, 1858.—*Improvement in Machines for Cutting Screws*.—What is claimed as the invention of Thomas W. Harvey, is the combination and arrangement of two inclined rollers, one or both rotating, and placed at a sufficient distance apart to permit the shanks of the blanks to hang therein freely suspended by their heads, substantially as described, and for the purpose of arranging the blanks, (when presented in a promiscuous mass,) all in a row with their heads up, causing the row to travel toward the lower end, and to be delivered one by one, as set forth.

Second. Combining with the delivery end of the inclined rollers, or equivalent ways, for supplying the blanks in order, a delivery and check slide, and a receiving and conducting tube, or equivalent therefor, substantially as described, to receive the blanks from the row,

deliver them one by one, and conduct them to the place where they are required for after operations, and at the periods required, as set forth.

Third. Combining with the receiving and conducting tube, substantially as described, a transfer, or equivalent thereof, substantially such as described, to receive the blanks from the conductor and transfer them to the mandrel or place where they ought to be subjected to the cutting action, as set forth.

Fourth. Combining with the mandrel or spindle, and with suitable means for holding the screw blanks in line, substantially as described, a sliding turn screw and spring, or equivalent therefor, substantially as described, and for the purposes set forth.

Fifth. Governing the motions of the chaser towards and from the axis of the blank, by combining the chaser head with a carriage and sway bar moved by a cam, substantially as described, and also connecting one end of the sway bar with an adjusting slide, when this is combined with the chaser, or chaser head, as described, whereby the amount of taper to be given to the screw can be regulated at pleasure.

Sixth. Changing the directions of the various cam grooves by means of sliding switches, operated by sliding rods within the hollow cam shafts, and shifted by an index cam by which the various changes of the motions of the machine are effected, substantially as described.

And, finally, making the cam, which operates the sway bar, adjustable on its shaft, substantially as described, for the purpose of adjusting the motions of the chaser to the length of the blank, to insure the proper formation of the point of the screw, as described.

H. A. HARVEY,
Assignee.

Letters Patent No. 4,735, dated September 3, 1846.—*Improvement in Separating Oleic and Stearic Acids.*—I claim the application of heat through a liquid or aeriform medium to the mass, to be pressed in such a manner that the said mass, before it is subjected to pressure, shall be heated gradually and uniformly throughout to such a degree that, while the stearic acid is at no time during the process melted, the oleic acid is rendered fluid enough to be afterwards expressed in the manner above described.

JAS. S. GWYNNE.

Letters Patent No. 4,744, dated September 5, 1846.—*Improvement in Stoves.*—I claim the employment of a stove, such as described, so constructed and placed within the ordinary fire place as to heat the room by its direct radiation, as well as by heating air entering the room from the outside, as described, serving the double purpose of a stove and hot air furnace.

JNO. H. B. LATROBE.

Letters Patent No. 4,750, dated September 10, 1846.—*Improvement in Sewing Machines.*—I claim, first, the forming of the seam by carrying a thread through the cloth by means of a curved needle on the end of a vibrating arm, and the passing of a shuttle, furnished with its bobbin, in the manner set forth, between the needle and the thread which it carries, under a combination and arrangement of parts, substantially the same with that described.

Second. I claim the lifting of the thread that passes through the needle eye, by means of the lifting rod W, for the purpose of forming a loop of loose thread that is to be subsequently drawn in by the passage of the shuttle, as herein fully described, said lifting rod being furnished with a lifting pin u, and governed in its motions by the guide pieces and other devices, arranged and operating substantially as described.

Third. I claim the holding of the thread that is given out by the shuttle, so as to prevent its unwinding from the shuttle bobbin after the shuttle has passed through the loop, said thread being held by means of the lever, or clipping piece g^1 , as herein made known, or in any other manner that is substantially the same in its operation and result.

Fourth. I claim the manner of arranging and combining the small lever $m^1 n^1$ with the sliding box M, in combination with the spring piece Z, for the purpose of tightening the stitch as the needle is retracted, as described.

Fifth. I claim the holding of the cloth to be sewn by the use of a baster plate, furnished with points for that purpose, and with holes enabling it to operate as a rack in the manner set forth, thereby carrying the cloth forward, and dispensing altogether with the necessity of basting the parts together.

ELIAS HOWE, JR.

Letters Patent No. 4,816, dated October 17, 1846.—Reissue No. 127, dated December 26, 1848.—*Bell Telegraph.*—We claim the combination of the bell, pulling wires, and machinery of the enunciator or telegraph as described, or equivalents thereto, with a face or register for indicating signals, whereby we are enabled to represent when needed a plurality of such signals at the same moment, and have them all remain permanent and visible until the object for which they are made is answered.

And secondly, we claim the combination and arrangement of the drops with the tumblers, drop levers, and slides, substantially in the manner and for the purpose herein set forth.

T. D. JACKSON.
ALFRED JUDSON.

Letters Patent No. 4,834, dated November 4, 1846.—*Improvement in Artificial Legs.*—I claim the leg tendon *E*, the spring *k*, and the cord *l*, respectively combining and acting upon the parts *a*, *b*, *c*, and *d*, substantially in the manner and for the purpose herein set forth.

I also claim the improved manner of forming the knee joint, uniting the parts *a* and *b* to each other by means of the hemisphere at the lower end of *a*, the partial concave bevelled to a thin edge on the front side of the upper end of *b*, and the pivot *g*, combined and operating substantially in the manner herein set forth, for the purpose of obviating noise or friction in working the joint, and producing a perfect contour thereof.

I also claim the improved manner of forming the ankle joint, uniting the parts *b* and *c* to each other, the rear side of the lower end of *b* being bevelled to a thin edge passing over and enclosing the heel portion of that part of *c* in the rear of the joint pivot *h*, and the front upper part of *c* at *n* being brought to a thin edge and overlapping the lower end of the front side of *b*, substantially as herein set forth, thus forming a phable joint that will work without noise and preserve its contour in all positions.

BENJAMIN F. PALMER.

Letters Patent No. 4,907, dated December 28, 1846.—*Improvement in Machines for Carving.*—I claim the circular adjustable chucks, by means of which the cutting tool can be made to operate not only on a greater variety of surface, but also with much more accuracy and dispatch as well as convenience.

And I also claim the manner in which I have arranged and combined the several parts and movements of the machine, to wit: combining the two lateral motions of the carriages at right angles, with the motion to incline the tablets, and the manner of shifting the chucks in the course of the operation, so as to bring all parts of the surface (except the bottom) of the block or material to be carved, equally within the operation of the cutting tool, while the cutting tool is governed by the guide working on the pattern, thereby enabling the workman to carve five sides of a cubical figure, and, consequently, to carve all parts (except the bottom) of irregular figures generally by the machine, operating substantially as herein described.

HEZEKIAH AUGUR.

DISCLAIMERS ENTERED DURING THE YEAR 1860.

Letters Patent No. 9,450, dated December 7, 1852.—*Improvement in Machines for Manufacturing Hat Bodies.*—Your petitioner prays that he may be permitted to disclaim, and he hereby does disclaim, so much of the claims in the specification of the said patent as is in the following words: "I also claim covering the perforated cone preparatory to a deposition of the fur thereon with a covering of thin cloth easily pervious to air, upon which the fur is to be deposited, said cloth or fabric to be removed at each operation with the hat body deposited thereon."

H. A. BURR.

Letters Patent No. 1,980, dated February 13, 1841.—Extended for seven years from February 13, 1855.—*Improvement in the Mode of Applying Water to Fire Engines, so as to render their operation more effective.*—Your petitioners, therefore, hereby enter this their disclaimer to so much of the said claim as extends the employing the pressure of a column of falling water, or the tendency of the hydraulic pressure of a column of falling water, or the tendency of the hydraulic pressure on water at rest to pumps other than movable fire engines, and by means of an inflexible pipe.

Which said disclaimer to operate to the extent of the whole interest in the said letters from the date of its grant until the 31st day of May, 1856, and from that date to the extent of one undivided third part of said letters patent, the remaining two thirds interest having, on the 31st day of May, 1856, been assigned.

FRANKLIN RANSOM.
UZZIAH WENMAN.

Letters Patent No. 4,861, dated November 20, 1846.—*Improvement in Mowing Machines.*—Your petitioner, therefore, hereby enters his disclaimer to that part of the claim in the aforementioned specification which is in the following words, to wit:

"I also claim the arrangement for steering the machine as herein fully described, in combination with the grain cutting apparatus, as herein fully set forth."

ANDREW J. COOK,
By his Attorney in Fact, O. S. X. Peck.
WILLIAM D. BALDWIN.
